 - myeloid progenitors: pneumonia, other acute bacterial infections, intoxications, burns, malignant disease, severe hemorrhage or hemolysis
 - lymphoid progenitors: pertussis, TB, infectious mononucleosis
- monocytic progenitors: TB

Approach to Lymphadenopathy

History

- constitutional/B-symptoms: seen in TB, lymphoma, other malignancies
- exposures: cats (cat scratch – *Bartonella henselae*), ticks (Lyme disease – *Borrelia burgdorferi*), high risk behaviors (HIV)
- joint pain/swelling, rashes (connective tissue disorder)
- pruritus (seen in Hodgkin lymphoma)
- medications (can cause serum sickness → lymphadenopathy)

Physical Exam

- basic assessment: occipital, preauricular, submandibular, cervical, supra-/infra-clavicular, axillary, epitrochlear, inguinal, popliteal nodes
 - characteristics of lymph nodes
 - look for signs of infection in regions which lymph nodes drain
- determine if lymphadenopathy is localized or generalized
- localized: typically reactive or neoplastic
 - cervical (bacterial/mycobacterial infections, ENT malignancies, metastatic cancer)
 - supraclavicular
 - ♦ right (mediastinal, bronchogenic, esophageal cancer)
 - ♦ left (gastric, gall bladder, pancreas, renal, testicular/ovarian cancer)
 - axillary (cat scratch fever, breast cancer, metastatic cancer)
 - epitrochlear (infections, sarcoidosis, lymphoma)
 - lower/inguinal (STDs, skin, cervix, vulva/penis, rectum/anus cancer)
- generalized: see Table 8
- thorough examination required to assess for systemic disease

Investigations

- CBC and differential, blood film
- ± tuberculin test, HIV RNA, RPR/VDRL, monospot/EBV serology, ANA, imaging as indicated
- if localized and no symptoms suggestive of malignancy, can observe 3-4 wk (if no resolution → biopsy)
- excisional biopsy is preferred as it preserves node architecture (essential for diagnosing lymphoma)
- in difficult to access areas (retroperitoneal, mediastinal/hilar) multiple core biopsies may be more practical/feasible
- FNA should NOT be used for diagnostic purposes in lymphoproliferative disease (use excisional biopsy instead)
 - helpful for recurrence of solid tumor malignancy

Table 7. Inflammatory vs. Neoplastic Lymph Nodes

Feature	Inflammatory	Neoplastic
Consistency	Rubbery	Firm/hard
Mobility	Mobile	Matted/immobile
Tenderness	Tender	Non-tender
Size	<2 cm	>2 cm

*Note: these classifications are not absolute; lymphoma and CLL nodes can feel rubbery and are frequently mobile, non-tender

Table 8. Differential Diagnosis of Generalized Lymphadenopathy

Reactive	Inflammatory	Neoplastic
Bacterial (TB, Lyme, brucellosis, cat scratch disease, syphilis)	Collagen disease (RA, dermatomyositis, SLE, vasculitis, Sjögren's)	Lymphoproliferative disorder/lymphoma
Viral (EBV, CMV, HIV)	Drug hypersensitivity	Metastatic cancer
Parasitic (toxoplasmosis)	Sarcoidosis, amyloidosis	Histiocytosis X
Fungal (histoplasmosis)	Serum sickness	

B-Symptoms

- Unexplained temperature >38°C
- Unexplained weight loss (>10% of body weight in 6 mo)
- Night sweats

Drugs That Can Cause Lymphadenopathy

- Allopurinol
- Atenolol
- Captopril
- Carbamazepine
- Cephalosporins
- Gold
- Hydralazine
- Penicillin
- Phenytoin
- Primidone
- Pyrimethamine
- Quinidine
- Sulfonamides

Approach to Splenomegaly

Table 9. Differential Diagnosis of Splenomegaly

Increased Demand for Splenic Function		Congestive	Infiltrative
Hematological	Infectious	Inflammatory	Cirrhosis
Spherocytosis	CMV	Felty syndrome	Splenic vein thrombosis
Hemoglobinopathies	Bacterial endocarditis	Still's disease	Portal vein obstruction
Hemolysis	TB	SLE	Portal HTN (including right heart failure)
Sequestration crisis	<u>HIV/AIDS</u>	Sarcoidosis	
Nutritional anemias	EBV		
Eliptocytosis	<u>Malaria</u>		
	Histoplasmosis		
	<u>Leishmaniasis</u>		
			Non-Malignant
			Benign metaplasia
			Amyloidosis, Sarcoidosis
			<u>Lysosomal storage diseases</u>
			(Gaucher's, Niemann-Pick)
			Glycogen storage diseases
			Hamartomas
			Cysts
			Vascular abnormalities
			Malignant
			<u>Leukemia (CML, CLL)</u>
			<u>Lymphoproliferative disease</u>
			<u>Hodgkin lymphoma</u>
			<u>Myeloproliferative disorders</u>
			Metastatic tumor

The underlined conditions cause *massive splenomegaly* (spleen crosses midline or reaches pelvis)

History

- constitutional symptoms, feeling of fullness in LUQ
- signs or symptoms of infection or malignancy
- history of liver disease, hemolytic anemia, or high-risk exposures

Physical Exam

- jaundice, petechiae
- signs of chronic liver disease
- percussion (Castell's sign, Traube's space, Nixon's method) and palpation
- associated lymphadenopathy or hepatomegaly
- signs of CHF

Investigations

- CBC and differential, blood film
- as indicated: liver enzymes/liver function tests, reticulocyte count, Monospot®, haptoglobin, LDH, infectious, and autoimmune workup
- imaging
 - ultrasound of abdomen/liver to rule out cirrhosis and portal vein thrombosis
 - echo for cardiac function
 - CT to rule out lymphoma

Causes of Splenomegaly

CHINA

Cirrhosis/**C**ongestion (portal HTN)
Hematological
Infectious
Neoplasm (malignant, non-malignant)
Autoimmune

Does This Adult Patient Have Splenomegaly?

From The Rational Clinical Examination
 JAMA 2009; <http://www.jamaevidence.com/content/3487298>

Study: Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for detecting splenomegaly.

Results: On percussion, Nixon sign had a positive likelihood ratio (+LR) of 3.6 (95% CI 1.8-7.3) and a negative likelihood ratio (-LR) of 0.41 (95% CI 0.26-0.64). Percussion of Traube's space had a +LR of 2.3 (95% CI 1.8-2.9) and -LR of 0.48 (95% CI 0.39-0.60), while Castell sign had a +LR of 1.2 (95% CI 0.98-1.6) and -LR of 0.45 (95% CI 0.19-1.1). On palpation, supine 1-handed palpation had a +LR of 8.2 (95% CI 5.8-1.2) and -LR of 0.41 (95% CI 0.30-0.57). Middleton hooking maneuver had a +LR of 6.5 (95% CI 3.1-1.5) and -LR of 0.16 (95% CI 0.08-0.32).

Conclusions: Palpation may have greater accuracy than percussion, but may be best when both are used in tandem. Specifically, Nixon sign and supine one-handed palpation are the most accurate, respectively.

Microcytic Anemia

- MCV <80 fL
- see Figure 2, *Approach to Anemia*, H6

Table 10. Iron Indices and Blood Film in Microcytic Anemia (MCV <80)

	Lab Tests				Blood Film
	Ferritin	Serum Iron	TIBC	RDW	
Iron Deficiency Anemia	↓↓	↓	↑	↑ (>15)	• Hypochromic, microcytic
Anemia of Chronic Inflammation	N/↑	↓	↓	N	• Normocytic/microcytic
Sideroblastic Anemia	N/↑	↑	N	↑	• Dual population • Basophilic stippling
Thalassemia	N/↑	N/↑	N	N/↑	• Hypochromic, microcytic • Basophilic stippling • Poikilocytosis

Causes of Microcytic Anemia

TAILS

Thalassemia
Anemia of chronic inflammation
Iron deficiency
Lead poisoning
Sideroblastic anemia

Iron Metabolism

Iron Intake (Dietary)

- average North American adult diet = 10-20 mg iron (Fe) daily
- absorption is 5-10% (0.5-2 mg/d); enhanced by citric acid, ascorbic acid (vitamin C) and reduced by polyphenols (e.g. in tea), phytate (e.g. in bran), dietary calcium, and soy protein
- males have positive Fe balance; up to 20% of menstruating females have negative Fe balance

Iron Indices

- bone marrow aspirate: gold standard test for iron stores (rarely done)
- serum ferritin: most important blood test for iron stores
 - decreased in iron deficiency anemia
 - elevated in:
 - ♦ infection, inflammation, malignancy
 - ♦ liver disease, hyperthyroidism, and iron overload
- serum iron: measure of all non-heme iron present in blood
 - varies significantly daily
 - virtually all serum iron is bound to transferrin, only a trace is free or complexed in ferritin
- TIBC: total amount of transferrin present in blood
 - normally, one third of TIBC is saturated with iron
 - high specificity for decreased iron, low sensitivity
- saturation:
 - serum Fe divided by TIBC, expressed as a proportion or a percentage
 - low in iron deficiency anemia
- sTfR
 - reflects the availability of iron at the tissue level
 - the transferrin receptor is expressed on the surface of erythroblasts and is responsible for iron uptake – some is cleaved off and is present in circulation as sTfR
 - in iron deficient states more transferrin receptor is expressed on erythroblasts leading to an increase in sTfR
 - low in reduced erythropoiesis and iron overload
 - useful in determining iron deficiency in the setting of chronic inflammatory disorders (see *Iron Deficiency Anemia*, H15)

Iron Absorption and Transport

- dietary iron is absorbed in the duodenum (impaired by IBD, celiac disease, etc.)
- in circulation the majority of non-heme iron is bound to transferrin which transfers iron from enterocytes and storage pool sites (macrophages of the reticuloendothelial system and hepatocytes) to RBC precursors in the bone marrow

Iron Levels

- hepcidin that regulates systemic iron levels
 - a hormone produced by hepatocytes
 - binds to iron exporter ferroportin on duodenal enterocytes and reticuloendothelial cells, and induces its degradation thereby inhibiting iron export into the circulation
 - hepcidin production is increased in states of inflammation (thereby mediating anemia of chronic inflammation) or iron overload, and decreased in states where erythropoiesis is increased (e.g. hemolysis) or oxygen tension is low

Iron Storage

- ferritin
 - ferric iron (Fe^{3+}) complexed to a protein called apoferritin (hepatocytes are main ferritin storage site)
 - small quantities are present in plasma in equilibrium with intracellular ferritin
 - also an acute phase reactant – can be spuriously elevated despite low Fe stores in response to a stressor
- hemosiderin
 - aggregates or crystals of ferritin with the apoferritin partially removed
 - macrophage-monocyte system is main source of hemosiderin storage

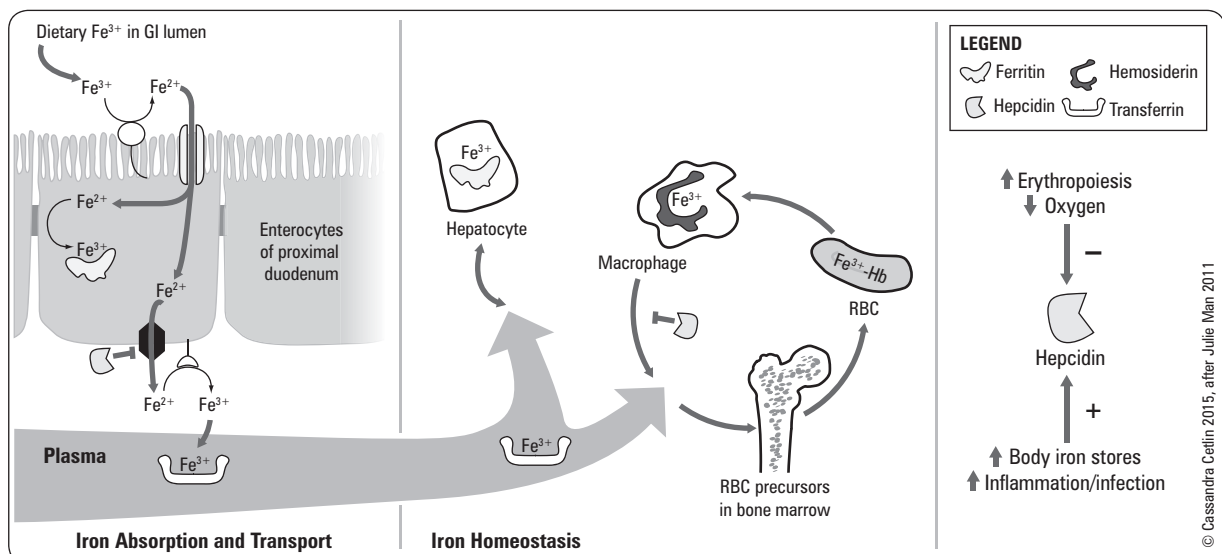

Figure 5. Iron metabolism

Iron Deficiency Anemia

- see [Pediatrics, P47](#)
- most common cause of anemia in North America

Etiology

- increased demand
 - increased physiological need for iron in the body (e.g. pregnancy)
- decreased supply: dietary deficiencies (rarely the only etiology)
 - cow's milk (infant diet)
 - "tea and toast" diet (elderly)
 - absorption imbalances
 - post-gastrectomy
 - malabsorption (IBD of duodenum, celiac disease, autoimmune atrophic gastritis)
- increased losses
 - hemorrhage
 - ♦ obvious causes: menorrhagia, abnormal uterine bleeding, frank GI bleed
 - ♦ occult: peptic ulcer disease, GI cancer
 - hemolysis
 - ♦ intravascular (e.g. PNH, cardiac valve RBC fragmentation)
 - ♦ extravascular (e.g. immune hemolytic anemias)

Clinical Features

- iron deficiency may cause fatigue before clinical anemia develops
- signs/symptoms of anemia: see [Anemia, H6](#)
- brittle hair, nail changes (brittle, koilonychia)
- Plummer-Vinson syndrome: dysphagia (esophageal webs), glossitis, angular stomatitis (inflammation and fissuring at the corners of the mouth)
- pica (appetite for non-food substances e.g. ice, paint, dirt)

Investigations

- iron indices, including soluble transferrin receptor
 - low ferritin (<45 µg/L) is diagnostic of iron deficiency
 - ferritin is an acute phase reactant and is elevated in the setting of inflammatory conditions and liver disease; serum ferritin <100 µg/L in these settings is suggestive of iron deficiency, necessitating further workup (Figure 6)
- peripheral blood film
 - hypochromic microcytosis: RBCs have low Hb levels due to lack of iron
 - pencil forms, anisocytosis
 - target cells (thin)
- bone marrow (gold standard but rarely done)
 - iron stain (Prussian blue) shows decreased iron in macrophages and in erythroid precursors (sideroblasts)
 - intermediate and late erythroblasts show micronormoblastic maturation

Plummer-Vinson Syndrome Triad

- Dysphagia (esophageal)
- Glossitis
- Iron deficiency anemia

Table 11. The Utility of Ferritin in the Diagnosis of Iron Deficiency Anemia

Ferritin (µg/L)	Likelihood ratio for iron deficiency anemia
>100	0.13
45-100	0.46
18-45	3.12
≤18	41.47

Am J Med 1990;88:205-209

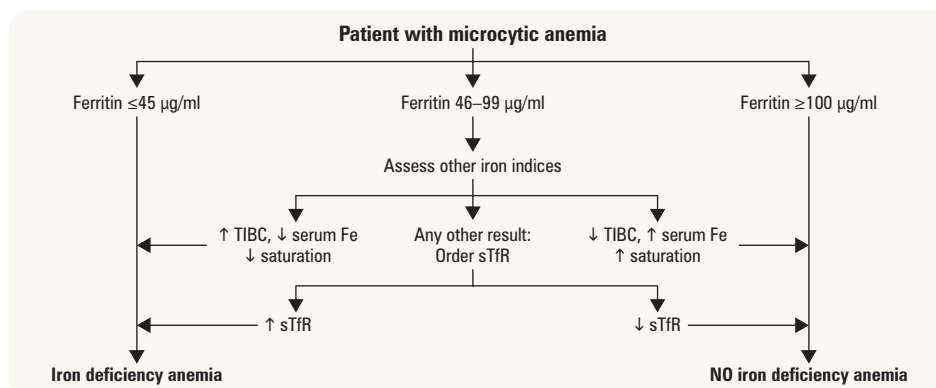

Figure 6. Approach to interpreting iron indices

Adapted from: *Am Fam Physician* 2007;75:671-678

Treatment

- treat underlying cause
- supplementation
 - oral (tablets, syrup)
 - ♦ ferrous sulphate 325 mg tid, ferrous gluconate 300 mg tid, or ferrous fumarate 300 mg tid
 - ♦ supplement until anemia corrects, then continue for 3+ mo until serum ferritin returns to normal
 - ♦ oral iron should be taken with citrus juice to enhance absorption
 - IV (iron sucrose or dextran) can be used if patient cannot tolerate or absorb oral iron

Iron deficiency anemia is a common presentation of chronic lower GI bleeds (right-sided colorectal cancer, angiodysplasia, etc.)

In males and in post-menopausal women, a GI workup is always warranted

- monitoring response
 - reticulocyte count will begin to increase after one wk
 - Hb normalizes by 10 g/L per wk (if no blood loss)
 - iron supplementation required for 4-6 mo to replenish stores

Anemia of Chronic Inflammation

Etiology

- infection, malignancy, inflammatory and rheumatologic disease, chronic renal and liver disease, endocrine disorders (e.g. DM, hypothyroidism, hypogonadism, hypopituitarism)

Pathophysiology

- an anemia of underproduction due to impaired iron utilization (hepcidin is a key regulatory peptide)
 - enterocyte trapping of iron → increased hepcidin inhibits ferroportin (↓ iron into circulation)
 - macrophage trapping of iron → reduced plasma iron levels making iron relatively unavailable for new hemoglobin synthesis
 - marrow unresponsive to normal or slightly elevated EPO
- mild hemolytic component is often present
- RBC survival is modestly decreased

Investigations

- diagnosis of exclusion
- associated with elevation in acute phase reactants (ESR, CRP, fibrinogen)
- “classic” serum iron indices (see Table 11)
 - serum iron and TIBC low, % saturation normal
 - serum ferritin is normal or increased
- anemia of chronic inflammation often co-exists with iron deficiency
- peripheral blood
 - mild: usually normocytic and normochromic
 - moderate: may be microcytic and normochromic
 - severe: may be microcytic and hypochromic
 - absolute reticulocyte count is frequently low, reflecting overall decrease in RBC production
- bone marrow
 - normal or increased iron stores
 - decreased or absent staining for iron in erythroid precursors

Treatment

- treat underlying disease
- only treat anemia in patients who can benefit from a higher hemoglobin
- IV iron if no benefit from PO iron
- erythropoietin indicated in chronic renal failure; not to be used if patient has concomitant curative solid tumor malignancy; ensure Hb target <110 g/L

Iron-deficiency anemia commonly co-exists with anemia of chronic inflammation; suggested by:

- Serum ferritin <100 µg/L in setting of a chronic inflammatory disease
- Elevation of soluble transferrin receptor
- Absence of stainable iron on bone marrow aspiration/biopsy
- Response to a therapeutic trial of oral iron

Sideroblastic Anemia

- uncommon compared to iron deficiency anemia or anemia of chronic inflammation

Sideroblasts

- erythrocytes with iron-containing (basophilic) granules in the cytoplasm
- “normal”: granules are small, randomly spread in the cytoplasm
 - found in healthy individuals
- “ring”: iron deposits in mitochondria, forming a ring around the nucleus
 - abnormal, large granules
 - the hallmark of sideroblastic anemia

Etiology

- due to defects in heme biosynthesis in erythroid precursors
- hereditary (rare): X-linked; median survival 10 yr
- idiopathic (acquired)
 - refractory anemia with ringed sideroblasts: a subtype of MDS (see *Myelodysplastic Syndromes, H38*)
 - may be a preleukemic phenomenon (10% transform to AML)
- reversible
 - drugs (isoniazid, chloramphenicol), alcohol, lead, copper deficiency, zinc toxicity, hypothyroidism

Clinical Features

- anemia symptoms (see *Anemia*, H6)
- hepatosplenomegaly, Fe²⁺ overload syndrome

Investigations

- serum iron indices
 - increased serum Fe²⁺, normal TIBC, increased ferritin, increased sTfR
- blood film/bone marrow biopsy
 - ringed sideroblasts (diagnostic hallmark)
 - RBCs are hypochromic; can be micro-, normo-, or macrocytic
 - anisocytosis, poikilocytosis, basophilic stippling

Treatment

- depends on etiology
 - X-linked: high dose pyridoxine (vitamin B₆) in some cases
 - acquired: EPO and G-CSF
 - reversible: remove precipitating cause
- supportive transfusions for severe anemia

Consider lead poisoning in any child with microcytic anemia who lives in a house built before 1977

**Features of Lead Poisoning****LEAD**

Lead lines on gingivae and epiphyses of long bones on x-ray
 Encephalopathy and Erythrocyte basophilic stippling
 Abdominal colic and microcytic Anemia (sideroblastic)
 Drops (wrist and foot drop)

**Causes of Normocytic Anemia****ABCD**

Acute blood loss
 Bone marrow failure
 Chronic disease
 Destruction (hemolysis)

Lead Poisoning

Definition/Etiology

- blood lead levels greater than 80 µg/dL, possible symptomatology at 50 µg/dL

Clinical Features

- identify source: consider occupational history, exposures history
- abdominal pain, constipation, irritability, difficulty concentrating

Treatment

- chelation therapy: dimercaprol and EDTA are first line agents

Thalassemia

- see *Hemolytic Anemia – Thalassemia*, H19

Normocytic Anemia

- MCV 80-100 fL
- see Figure 2, *Approach to Anemia*, H6

Aplastic Anemia

Definition

- destruction of hematopoietic cells of the bone marrow leading to pancytopenia and hypocellular bone marrow

Epidemiology

- occurs at any age
- slightly more common in males

Etiology

Table 12. Etiology of Aplastic Anemia

Congenital	Acquired	
Fanconi's anemia Shwachman-Diamond syndrome	Idiopathic Often T-cell mediated Drugs Dose-related (i.e. chemotherapeutics) Idiosyncratic (chloramphenicol, phenylbutazone) Toxins Benzene/organic solvents DDT, insecticides	Ionizing Radiation Post-Viral Infection Parvovirus B19, EBV, HDV, HEV, HBV, HHV6, HIV Autoimmune (rare) SLE, Graft-versus-host disease Others PNH, pregnancy, anorexia nervosa, thymoma

Clinical Features

- can present acutely or insidiously
- symptoms of anemia (see *Anemia*, H6), thrombocytopenia (see *Thrombocytopenia*, H7), and/or infection
- ± splenomegaly and lymphadenopathy (depending on the cause)

Investigations

- exclude other causes of pancytopenia (Figure 4)
- CBC
 - anemia or neutropenia or thrombocytopenia (any combination) \pm pancytopenia
 - decreased reticulocytes ($<1\%$ of the total RBC count)
- blood film
 - decreased number of normal RBCs
- bone marrow
 - aplasia or hypoplasia of marrow cells with fat replacement
 - decreased cellularity

Treatment

- remove offending agents
- supportive care (red cell and platelet transfusions, antibiotics)
 - judicious use so as to not increase the risk of immune sensitization to blood products
- immunosuppression
 - anti-thymocyte globulin: 50-60% of patients respond
 - cyclosporine
- allogenic bone marrow transplant
- growth factors: e.g. Eltrombopag (TPO receptor agonist)

Hemolytic Anemia

- uncommon cause for anemia ($<5\%$ of cases) with many etiologies (>200)

Classification

- hereditary
 - abnormal membrane (spherocytosis, elliptocytosis)
 - abnormal enzymes (pyruvate kinase deficiency, G6PD deficiency)
 - abnormal hemoglobin synthesis (thalassemias, hemoglobinopathies)
- acquired
 - immune
 - ♦ autoimmune: warm vs. cold autoimmune hemolytic anemias (AIHA), see [Table 15](#)
Classification of AIHA, H22
 - ♦ alloimmune: hemolytic disease of the fetus/newborn
 - non-immune
 - ♦ MAHA: thrombus in blood vessel causes RBCs to be sheared
 - associated with DIC, HUS/TTP, preeclampsia/HELLP, vasculitides, malignant HTN
 - ♦ other causes: PNH, hypersplenism, march hemoglobinuria (exertional hemolysis), infection (e.g. malaria), snake venoms, mechanical heart valves
- also classified as intravascular or extravascular
 - intravascular: G6PD deficiency, TTP, DIC, and PNH
 - extravascular: AIHA and hereditary spherocytosis

Clinical Features Specific to HA

- jaundice
- dark urine (hemoglobinuria, bilirubin)
- cholelithiasis (pigment stones)
- potential for an aplastic crisis (i.e. BM suppression in overwhelming infection)
- iron overload with extravascular hemolysis
- iron deficiency with intravascular hemolysis

Investigations

Table 13. Investigations for Hemolytic Anemia

Screening Tests	Tests Specific For Intravascular Hemolysis
Increased LDH	Schistocytes on blood film
Decreased haptoglobin	Free hemoglobin in serum
Increased unconjugated bilirubin	Methemalbuminemia (heme + albumin)
Increased urobilinogen	Hemoglobinuria (immediate)
Reticulocytosis	Hemosiderinuria (delayed)
	Plasma hemoglobin
Tests Specific for Extravascular Hemolysis	
Direct Coombs test (direct antiglobulin test)	
• Detects IgG or complement on the surface of RBC	
• Add anti-IgG or anti-complement Ab to patient's RBCs; positive if agglutination	
• Indications: hemolytic disease of newborn, AIHA, hemolytic transfusion reaction	
Indirect Coombs test (indirect antiglobulin test)	
• Detects antibodies in serum that can recognize antigens on RBCs	
• Mix patient's serum + donor RBCs + Coombs serum (anti-human Ig Ab); positive if agglutination	
• Indications: cross-matching donor RBCs, atypical blood group, blood group Ab in pregnant women, AIHA	

Laboratory Findings in HA

- \uparrow retics
- \downarrow haptoglobin
- \uparrow unconjugated bilirubin
- \uparrow urobilinogen
- \uparrow LDH

Disruption of the heme breakdown pathway causes the **porphyria** disorders

Heme Breakdown

Thalassemia

Definition

- defects in production of the α or β chains of hemoglobin
 - resulting imbalance in globin chains leads to ineffective erythropoiesis and hemolysis in the spleen or BM
- clinical manifestations and treatment depends on specific gene and number of alleles affected
- common features
 - increasing severity with increasing number of alleles involved
 - hypochromic microcytic anemia
 - basophilic stippling, abnormally shaped RBCs on blood film

Pathophysiology

- defect may be in any of the Hb genes
 - normally 4 α genes in total; 2 on each copy of chromosome 16
 - normally 2 β genes in total; 1 on each copy of chromosome 11
 - fetal hemoglobin, HbF ($\alpha_2\gamma_2$), switches to adult forms HbA ($\alpha_2\beta_2$) and HbA₂ ($\alpha_2\delta_2$) at 3-6 mo of life
 - HbA constitutes 97% of adult hemoglobin
 - HbA₂ constitutes 3% of adult hemoglobin

Thalassemia

β -Thal → prevalent in Mediterranean

α -Thal → prevalent in **South East Asia (SEA)** and Africa (α = Asia, Africa)

β -Thalassemia Minor (Thalassemia Trait)

Definition

- defect in single allele of β gene (heterozygous)
- common in people of Mediterranean and Asian descent

Clinical Features

- None; a palpable spleen is very rare

Investigations

- Hb 100-140 g/L or 9-14 g/dL, MCV < 70, normal Fe, normal RBC count
- peripheral blood film – microcytosis basophilic stippling
- Hb electrophoresis
 - specific: HbA₂ increased to 3.5-5% (normal 1.5-3.5%)
 - non-specific: 50% have slight increase in HbF

Treatment

- no treatment required
- genetic counseling for patient and family

Microcytosis in β -Thal Minor

Microcytosis is much more profound and the anemia is much milder than that of iron deficiency

β -Thalassemia Major

Definition

- defect in both alleles of β gene (homozygous, autosomal recessive)

Pathophysiology

- ineffective chain synthesis leading to ineffective erythropoiesis, hemolysis of RBCs, and increase in HbF

Clinical Features

- initial presentation at age 6-12 mo when HbA normally replaces HbF
 - severe anemia, jaundice
- iron overload
 - secondary to repeated transfusions and ineffective erythropoiesis
 - leads to iron-induced organ damage (liver, spleen, anterior pituitary, pancreas, and heart affected)
- stunted growth and development (hypogonadal dwarf)
- gross hepatosplenomegaly (due to extramedullary hematopoiesis)
- radiologic changes (due to expanded marrow cavity) and extramedullary hematopoietic masses (erythroid tissue tumors)
 - skull x-ray has “hair-on-end” appearance
 - pathologic fractures common
- evidence of increased Hb catabolism (e.g. pigmented gallstones)

- death can result from
 - untreated anemia (should transfuse)
 - infection (should identify and treat early)
 - iron overload: late complication secondary to repeated transfusions and ineffective erythropoiesis

Investigations

- CBC: Hb 4-6 g/dL
- Hb electrophoresis
 - HbA: 0-10% (normal >95%)
 - HbA₂ >2.5%
 - HbF: 90-100%

Treatment

- lifelong regular transfusions to suppress endogenous erythropoiesis
- iron chelation (e.g. deferoxamine, deferasirox, deferiprone) to prevent iron overload in organs and the formation of free radicals (which promote tissue damage and fibrosis)
- folic acid supplementation if not transfused
- allogenic bone marrow transplantation
- splenectomy (now performed less frequently)

β-Thalassemia Intermedia

Definition

- clinical diagnosis in patients whose clinical manifestations are too mild to be classified as thalassemia major, but too severe to be classified as thalassemia minor

Clinical Features

- wide variety of clinical phenotypes
- in most cases of TI, both β-globin genes affected
- three main mechanisms account for the milder phenotype compared to thalassemia major: (1) subnormal (vs. absent) beta-chain synthesis, (2) increased number of gamma chains, (3) coinheritance of alpha thalassemia
- complications more commonly seen in TI than thalassemia major include extramedullary hematopoiesis, leg ulcers, gallstones, thrombosis, and pulmonary HTN

α-Thalassemia

Definition

- defect(s) in α genes
- similar geographic distribution as β-thalassemia, but higher frequency among Asians and Africans

Clinical Features

- 1 defective α gene (aa/a-): clinically silent; normal Hb, normal MCV
- 2 defective α genes (cis: aa/-- or trans: a-/a-): decreased MCV, normal Hb
 - N.B. cis 2-gene deletion more common in Asia vs. trans 2-gene deletion more common in Africa – this leads to increased risk of fetal hydrops in offspring of Asian patients vs. African patients
- 3 defective α genes (a-/--): HbH (β₄) disease; presents in adults, decreased MCV, decreased Hb, splenomegaly
- 4 defective α genes (---/---): Hb Barts (γ₄) disease (hydrops fetalis); usually incompatible with life

Investigations

- peripheral blood film – screen for HbH inclusion bodies with special stain
- Hb electrophoresis not diagnostic for α-thalassemia
- DNA analysis using α gene probes is the only way to confirm the diagnosis
- referral to genetic counselor prior to childbearing for patients with 2-gene cis deletion (or 3-gene deletion), due to risk of fetal hydrops if partner also carries thalassemia trait

Treatment

- depends on degree of anemia
 - 1 or 2 defective α genes: no treatment required
 - HbH disease: similar to β-thalassemia intermedia
 - HbBarts: intrauterine transfusion

Sickle Cell Disease

- see [Pediatrics, P48](#)

Definition

- sickling disorders arise due to a mutant β -globin chain, most commonly caused by a Glu \rightarrow Val substitution at position 6 (chromosome 11) resulting in HbS variant, rather than HbA (normal adult Hb)
 - increased incidence of HbS allele with African or Mediterranean heritage (thought to be protective against malaria)
- sickle cell disease occurs when an individual has two HbS genes (homozygous, HbSS) or one HbS gene + another mutant β -globin gene (compound heterozygote) – most commonly HbS- β -thal and HbSC disease

Pathophysiology

- at low pO_2 , deoxy HbS polymerizes leading to rigid crystal-like rods that distort membranes \rightarrow 'sickles'
- the pO_2 level at which sickling occurs is related to the percentage of HbS present
 - heterozygotes (HbAS); sickling occurs at a pO_2 of 40 mmHg
 - homozygotes (HbSS); sickling occurs at a pO_2 of 80 mmHg
- sickling aggravated by acidemia, increased CO_2 , increased 2,3-DPG, fever, and osmolality
- fragile sickle cells then cause injury in two main ways:
 - (1) fragile sickle cells hemolyze (nitric oxide depletion)
 - (2) they also occlude small vessels (ischemia-reperfusion injury)

Clinical Features

- HbAS (sickle cell trait): patient will be asymptomatic except during extreme hypoxia or infection
 - increased risk of renal medullary carcinoma
- SCD-SS (HbSS)
 - chronic hemolytic anemia
 - jaundice in the first year of life
 - retarded growth and development \pm skeletal changes
 - splenomegaly in childhood; splenic atrophy in adulthood
- SCD-SS often presents with acute pain episode
 1. aplastic crises
 - ♦ toxins and infections (especially parvovirus B19) transiently suppress bone marrow
 2. splenic sequestration crises
 - ♦ usually in children; significant pooling of blood in spleen resulting in acute Hb drop and shock
 - ♦ uncommon in adults due to asplenia from repeated infarction
 3. vaso-occlusive crises (infarction)
 - ♦ may affect various organs causing ischemia-reperfusion injury (especially in back, chest, abdomen, and extremities), fever, and leukocytosis
 - ♦ precipitated by infections, dehydration, rapid change in temperature, pregnancy, menses, and alcohol
 4. acute chest syndrome (see sidebar)
- SCD-SC (most common compound heterozygote)
 - 1:833 live births in African-Americans, common in West Africa
 - milder anemia than HbSS
 - similar complications as HbSS although typically milder and less frequent (exception is proliferative sickle retinopathy, glomerulonephritis, and avascular necrosis)
 - spleen not always atrophic in adults

Investigations

- sickle cell prep (detects sickling of RBCs under the microscope in response to O_2 lowering agent): determines the presence of a HbS allele, but does not distinguish HbAS from HbSS
- Hb electrophoresis distinguishes HbAS, HbSS, HbSC, and other variants

Table 14. Investigations for Sickle Cell Disease

	HbAS	HbSS
CBC	Normal	Increased reticulocytes, decreased Hb, decreased Hct
Peripheral Blood	Normal; possibly a few target cells	Sickled cells
Hb Electrophoresis	HbA fraction of 0.65 (65%) HbS fraction of 0.35 (35%)	No HbA, only HbS and HbF (proportions change with age); normal amount of HbA2

Treatment

- genetic counseling
- HbAS: no treatment required
- HbSC: treatment as per HbSS, but is dictated by symptom severity

Figure 7. Pathophysiology of sickling

Functional asplenia: increased susceptibility to infection by encapsulated organisms

- *S. pneumoniae*
- *N. meningitidis*
- *H. influenzae*
- *Salmonella* (osteomyelitis)

Acute Chest Syndrome

Affects 30% of patients with sickle cell disease and may be life threatening. Presentation includes dyspnea, chest pain, fever, tachypnea, leukocytosis, and pulmonary infiltrate on CXR. Caused by vaso-occlusion, infection, or pulmonary fat embolus from infarcted marrow.

Organs Affected by Vaso-Occlusive Crisis

Organ	Problem
Brain	Ischemic or hemorrhagic stroke, vasculopathy
Eye	Hemorrhage, blindness
Liver	Infarcts, RUQ syndrome
Lung	Chest syndrome, long-term pulmonary HTN
Gallbladder	Stones
Heart	Hyperdynamic flow murmurs
Spleen	Enlarged (child); atrophic (adult)
Kidney	Hematuria, loss of renal concentrating ability, proteinuria
Intestines	Acute abdomen
Placenta	Stillbirths
Penis	Priapism
Digits	Dactylitis
Femoral and Humeral Head	Avascular necrosis
Bone	Infarction, infection
Ankle	Leg ulcers

- HbSS
 1. folic acid to prevent folate deficiency
 2. hydroxyurea to enhance production of HbF
 - ♦ mechanism of action: stops repression of Hb- γ chains and/or initiates differentiation of stem cells in which this gene is active
 - ♦ presence of HbF in the SS cells decreases polymerization and precipitation of HbS
 - ♦ N.B. hydroxyurea is cytotoxic and may cause bone marrow suppression
 3. treatment of vaso-occlusive crisis
 - ♦ oxygen
 - ♦ hydration (reduces viscosity)
 - ♦ correct acidosis
 - ♦ analgesics/opioids
 - ♦ indication for exchange transfusion: acute chest syndrome, stroke, multi-organ failure, ICU admission
 - ♦ less routinely: antimicrobials for suspected infection
 4. prevention of crises
 - ♦ establish diagnosis
 - ♦ avoid conditions that promote sickling (hypoxia, acidosis, dehydration, fever)
 - ♦ vaccination in childhood (pneumococcus, meningococcus, *H. influenzae* b)
 - ♦ prophylactic penicillin (start age 3 mo and continue until at least 5 yr then continue on case by case basis)
 - ♦ good hygiene, nutrition, and social support
 5. screen for complications
 - ♦ regular blood work (CBC, reticulocytes, iron indices, BUN, LFTs, creatinine)
 - ♦ urinalysis annually (proteinuria, glomerulopathy)
 - ♦ transcranial doppler annually until 16 yr old (stroke prevention)
 - ♦ retinal examinations annually from 8 yr old (screen for retinopathy)
 - ♦ echocardiography starting at 10 yr old (screen for pulmonary HTN)

**NIH Consensus Development Conference
Statement: Hydroxyurea Treatment for Sickle Cell Disease**

Ann Intern Med 2008;148:932-938

Efficacy: Strong evidence for adolescents and adults and there is emerging data supporting its use in children. In the single RCT, the Hb level was higher in hydroxyurea recipients than placebo recipients after 2 yr (difference, 6 g/L), as was HbF (absolute difference, 3.2%). The median number of painful crises was 44% lower than in the placebo arm. The 12 observational studies that enrolled adults reported a relative increase in HbF of 4-20% and a relative reduction in crisis rates by 68-84%. Hospital admissions declined by 18-32%.

Effectiveness: Data is limited but seems to be highly effective but is currently underutilized.

Short-Term Harms (within 6 mo): Dose-related leukopenia, thrombocytopenia, anemia, and decreased reticulocyte count. Others include decreased sperm production and dry skin.

Long-Term Harms: Birth defects in offspring of people receiving the drug, growth delays in children receiving the drug, and cancer in both children and adults who receive the drug.

Autoimmune Hemolytic Anemia

Table 15. Classification of AIHA

	Warm	Cold
Antibody Allotype	IgG	IgM
Agglutination Temperature	37°C	4-21°C
Direct Coombs Test (direct anti-globulin test)	Positive for IgG \pm complement	Positive for complement
Etiology	Idiopathic Secondary to lymphoproliferative disorder (e.g. CLL, Hodgkin lymphoma) Secondary to autoimmune disease (e.g. SLE) Drug-induced (e.g. penicillin, quinine, methyldopa)	Idiopathic Secondary to infection (e.g. mycoplasma pneumonia, EBV) Secondary to lymphoproliferative disorder (e.g. macroglobulinemia, CLL)
Blood Film	Spherocytes	Agglutination
Management	Treat underlying cause Corticosteroids Immunosuppression Splenectomy Folic acid	Treat underlying cause Warm patient Immunosuppression Plasmapheresis Folic acid

Figure 8. Schistocyte

Microangiopathic Hemolytic Anemia

Definition

- hemolytic anemia due to intravascular fragmentation of RBCs

Etiology

- see *Thrombotic Thrombocytopenic Purpura and Hemolytic Uremic Syndrome*, H30
- see *Disseminated Intravascular Coagulation*, H32
- eclampsia, HELLP syndrome, AFLP (see [Obstetrics](#), OB17)
- malignant HTN
- vasculitis
- malfunctioning heart valves
- metastatic carcinoma
- drugs (calcineurin inhibitors, quinine, simvastatin)
- infections (severe CMV or meningococcus)
- catastrophic antiphospholipid antibody syndrome

Investigations

- blood film: evidence of hemolysis, schistocytes
- hemolytic workup
- urine: hemosiderinuria, hemoglobinuria

Hereditary Spherocytosis

- most common type of hereditary hemolytic anemia
- abnormality in RBC membrane proteins (e.g. spectrin)
 - spleen makes defective RBCs more spherocytotic (and more fragile) by membrane removal; also acts as site of RBC destruction
- autosomal dominant with variable penetrance

Investigations

- blood film shows spherocytes, increased osmotic fragility, molecular analysis for spectrin gene

Treatment

- in severe cases, splenectomy + vaccination against pneumococcus, meningococcus, and *H. influenzae b* (avoid in early childhood)

Hereditary Elliptocytosis**Definition/Etiology**

- abnormality in spectrin interaction with other membrane proteins
- autosomal dominant
- 25-75% elliptocytes
- hemolysis is usually mild

Treatment

- immunizations; splenectomy for severe hemolysis

Glucose-6-Phosphate Dehydrogenase Deficiency**Definition**

- deficiency in glucose-6-phosphate dehydrogenase (G6PD) leads to RBC sensitivity to oxidative stress due to a lack of reduced glutathione (GSH)

Pathophysiology

- X-linked recessive, prevalent in individuals of African, Asian, and Mediterranean descent

Clinical Features

- frequently presents as episodic hemolysis precipitated by
 - oxidative stress
 - drugs (e.g. sulfonamide, antimalarials, nitrofurantoin)
 - infection
 - food (fava beans)
- in neonates: can present as prolonged, pathologic neonatal jaundice

Investigations

- neonatal screening
- G6PD assay (may not be useful if result is normal)
 - should not be done in acute crisis when reticulocyte count is high (reticulocytes have high G6PD levels)
- blood film
 - Heinz bodies (granules in RBCs due to oxidized Hb); passage through spleen results in the generation of bite cells
 - may have features of intravascular hemolysis (e.g. RBC fragments)

Treatment

- folic acid
- stop offending drugs and avoid triggers
- transfusion in severe cases

**Figure 9. Spherocyte****Figure 10. G6PD deficiency**

Macrocytic Anemia

- MCV >100 fL
- see Figure 2, *Approach to Anemia*, H6

Table 16. Comparison Between Megaloblastic and Non-Megaloblastic Macrocytic Anemia

	Megaloblastic	Non-Megaloblastic
Morphology	Large, oval, nucleated RBC precursor Hypersegmented neutrophils	Large round RBC Normal neutrophils
Pathophysiology	Failure of DNA synthesis resulting in asynchronous maturation of RBC nucleus and cytoplasm	Reflects membrane abnormality with abnormal cholesterol metabolism

Causes of Macrocytic Anemia

ABCDE F

- Alcoholism (liver disease)
- B₁₂ deficiency
- Compensatory reticulocytosis
- Drugs (cytotoxic, AZT)/Dysplasia
- Endocrine (hypothyroidism)
- Folate deficiency/Fetus (pregnancy)

Characteristics of Megaloblastic Macrocytic Anemia

- Pancytopenia
- Hypersegmented neutrophils
- Megaloblastic bone marrow

Schilling Test

Part 1

- Tracer dose (1 µg) of radiolabeled B₁₂, given PO
- Flushing dose (1 mg) of unlabeled B₁₂ IM 1 h later to saturate tissue binders of B₁₂ thus allowing radioactive B₁₂ to be excreted in urine
- 24 h urine radiolabeled B₁₂ measured
- Normal > 5% excretion (a normal excretion will only be seen if the low B₁₂ was due to dietary deficiency)

Part 2

- Same as part 1, but radiolabeled B₁₂ given with oral intrinsic factor
- Should be done only if first stage shows reduced excretion
- Normal test result (> 5% excretion) = pernicious anemia
- Abnormal test result (< 5% excretion) = intestinal causes (malabsorption)

Oral Vitamin B₁₂ vs. Intramuscular Vitamin B₁₂ for Vitamin B₁₂ Deficiency

Cochrane DB Syst Rev 2005;3:CD004655

Study: Systematic review. 2 RCTs met inclusion criteria; total 108 patients with follow-up from 90 d-4 mo.

Intervention: One study evaluated 1,000 µg of oral B₁₂ compared to 1,000 µg IM B₁₂ on the same dosing schedule. The other compared 2,000 µg daily oral B₁₂ to 1,000 µg IM B₁₂ on a less frequent dosing schedule. Neurological and hematological end points were evaluated.

Results: Meta-analysis was not attempted due to study heterogeneity. Both studies reported improvements in hematological and neurological end-points in both oral and IM groups. No significant difference was observed between groups in either study.

Conclusions: Limited data suggesting high dose oral vitamin B₁₂ (1,000-2,000 µg) is equivalent to IM vitamin B₁₂ on the same or less frequent dosing schedule. This data is severely limited by small sample sizes and short follow-up periods. Insufficient numbers of patients with malabsorption conditions were included to generalize these results to the entire primary care population.

Vitamin B₁₂ Deficiency

B₁₂ (cobalamin) see [Gastroenterology](#), G17 and [Family Medicine – Nutrition](#), FM6

- binds to intrinsic factor (IF) secreted by gastric parietal cells
- absorbed in terminal ileum
- total body stores sufficient for 3-4 yr

Etiology

Table 17. Etiology of Vitamin B₁₂ Deficiency

Diet	Gastric	Intestinal Absorption	Genetic
Strict vegan More likely to present in pediatric population	Mucosal atrophy Gastritis, autoimmune	Malabsorption Crohn's, celiac sprue, pancreatic insufficiency	Transcobalamin II deficiency
Vegetarian in pregnancy	Pernicious anemia (see below) Post-gastrectomy	Stagnant bowel Blind loop, stricture Fish tapeworm Resection of ileum Drugs Neomycin, biguanides, PPI, N ₂ O anesthesia	

Pathophysiology of Pernicious Anemia

- auto-antibodies produced against gastric parietal cells leading to achlorhydria and lack of intrinsic factor secretion
- intrinsic factor is required to stabilize B₁₂ as it passes through the bowel
- decreased intrinsic factor leads to decreased ileal absorption of B₁₂
- may be associated with other autoimmune disorders (polyglandular endocrine insufficiency)
- F:M = 1.6:1; often >60 yr old

Clinical Features

- neurological
 - cerebral (common, reversible with B₁₂ therapy)
 - ♦ confusion, delirium, dementia
 - cranial nerves (rare)
 - ♦ optic atrophy
 - cord (irreversible damage)
 - ♦ subacute combined degeneration
 - posterior columns: decreased vibration sense, proprioception, and 2-point discrimination
 - pyramidal tracts: spastic weakness, hyperactive reflexes
 - peripheral neuropathy (variable reversibility)
 - ♦ usually symmetrical, affecting lower limbs more than upper limbs

Investigations

- CBC, reticulocyte count
 - anemia often severe ± neutropenia ± thrombocytopenia
 - MCV >110 fL
 - low reticulocyte count relative to the degree of anemia (<2%)
- serum B₁₂ and RBC folate
 - caution: low serum B₁₂ leads to low RBC folate because of failure of folate polyglutamate synthesis in the absence of B₁₂
 - alternatively, can measure urine metabolites (methylmalonate, homocysteine)
- blood film
 - oval macrocytes, hypersegmented neutrophils

- bone marrow
 - hypercellularity
 - nuclear-cytoplasmic asynchrony in RBC precursors (less mature nuclei than expected from the development of the cytoplasm)
- bilirubin and LDH
 - elevated unconjugated bilirubin and LDH due to breakdown of cells in BM
- Schilling test (see sidebar H24) to distinguish pernicious anemia from other causes
 - anti-intrinsic factor antibody, anti-parietal cell antibody

Treatment

- vitamin B₁₂ 1,000 µg IM monthly for life or 1,000-1,200 µg PO daily if intestinal absorption intact
- less frequent, higher doses may be as effective (e.g. 1,000 µg IM q3mo)
- watch for hypokalemia and rebound thrombocytosis when treating severe megaloblastic anemia

Folate Deficiency

- uncommon in developed countries due to extensive dietary supplementation
- folate stores are depleted in 3-6 mo
- folate commonly found in green, leafy vegetables and fortified cereals

Etiology

Table 18. Etiology of Folate Deficiency

Diet/Deficiency	Malabsorption	Drugs	Increased Demand
Alcoholism	Celiac sprue	Anti-folates (methotrexate)	Pregnancy
Substance abuse	IBD	Anticonvulsants (phenytoin)	Hemolysis
Elderly/infants	Infiltrative bowel disease	Alcohol	Prematurity
Poor intake	Short bowel syndrome	Oral contraceptive	Exfoliative dermatitis/psoriasis
			Hemodialysis

Clinical Features

- mild jaundice due to hemolysis of RBCs secondary to ineffective hemoglobin synthesis
- glossitis and angular stomatitis
- melanin pigmentation (rare)
- purpura secondary to thrombocytopenia (rare)
- unlike B₁₂ deficiency, folate deficiency has no neurologic manifestations

Investigations

- similar to B₁₂ deficiency (CBC, reticulocytes, blood film, RBC folate, serum B₁₂)
- if decreased RBC folate, rule out B₁₂ deficiency as cause

Management

- folic acid 1-5 mg PO OD x 1-4 mo; then 1 mg PO OD maintenance if cause is not reversible

Never give folate alone to an individual with megaloblastic anemia because it will mask B₁₂ deficiency and neurological degeneration will continue

Hemostasis

Three Phases of Hemostasis

1. Primary Hemostasis

- goal is rapid cessation of bleeding; main effect is on mucocutaneous bleeding
- vessel injury results in collagen/subendothelial matrix exposure and release of vasoconstrictors
- blood flow is impeded and platelets come into contact with damaged vessel wall (Figure 11a)
 - adhesion: platelets adhere to subendothelium via von Willebrand factor (vWF)
 - activation: platelets are activated resulting in change of shape and release of ADP and thromboxane A₂
 - aggregation: these factors further recruit and aggregate more platelets resulting in formation of localized hemostatic plug

2. Secondary Hemostasis

- platelet plug is reinforced by production of fibrin clot in secondary hemostasis (Figure 11b)
- extrinsic pathway
 - initiation of coagulation *in vivo*
- intrinsic pathway
 - amplification once coagulation has started

3. Fibrin Stabilization and Fibrinolysis (resolution)

- conversion from soluble to insoluble clot
- once healing initiated, clot dissolution (anticoagulant pathway)

Normal hemostasis occurs as a result of the balance between procoagulant and anticoagulant factors

3 Phases of Hemostasis

- Primary hemostasis
 - Vascular response and platelet plug formation via vWF
- Secondary hemostasis
 - Fibrin clot formation
- Resolution
 - Fibrinolysis

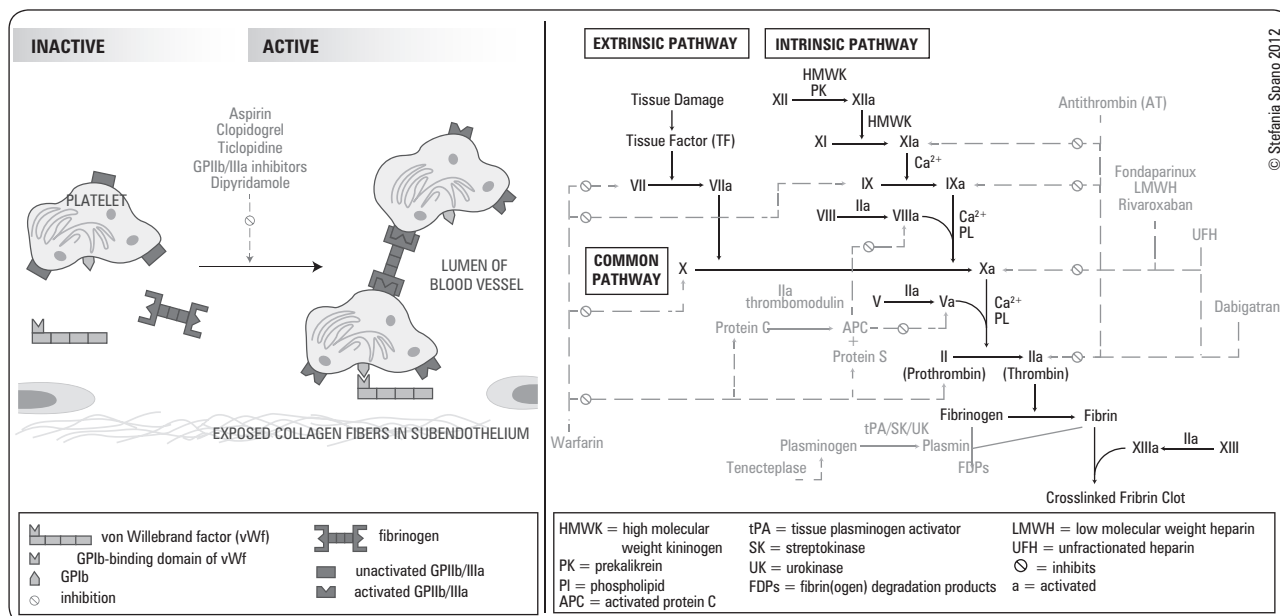

Figure 11a. Platelet activation cascade

Figure 11b. Coagulation cascade

Table 19. Commonly Used Tests of Hemostasis

Type of Hemostasis	Test	Reference Range	Purpose	Examples of Associated Diagnoses
Primary	Platelet count	150,000-400,000/ mm ³	To quantitate platelet number	Low in ITP, HUS/TTP, DIC
Secondary	aPTT	22-35 s	Measures intrinsic pathway (factors VIII, IX, XI, XII) and common pathway Used to monitor heparin therapy and intrinsic pathway factors	Prolonged in hemophilias A and B N.B. High if antiphospholipid antibodies (i.e. lupus anticoagulant) are present
	PT	11-24 s	Measures extrinsic pathway (factor VII in particular) and common pathway	Prolonged in factor VII deficiency
	INR	0.9-1.2	Only used to monitor warfarin therapy	
	Mixing studies		Differentiate inhibitors of clotting factor(s) from a deficiency in clotting factor(s) Mix patient's plasma with normal plasma in 1:1 ratio and repeat abnormal test	Clotting factor(s) deficiency if test becomes normal Inhibitors of clotting factor(s) if test still abnormal
Fibrinolysis	Euglobulin lysis time	N > 90 min	Looks for accelerated fibrinolysis	May be accelerated in DIC or factor XIII deficiency Decreased in hereditary deficiency of fibrinogen
Other	Fibrinogen Fibrinogen degradation products (FDPs), D-dimers Specific factor assays Tests of physiological inhibitors (antithrombin, protein S, protein C, hereditary resistance to activated protein C [APC]) Tests of pathologic inhibitors (e.g. lupus anticoagulant)			

Tests of Secondary Hemostasis

PT/INR: Tennis is played outside
(Extrinsic pathway)

PTT: Table Tennis is played inside
(Intrinsic pathway)

Figure 12. Clotting factors involved in PT and PTT

Table 20. Signs and Symptoms of Disorders of Hemostasis

	Primary (Platelet)	Secondary (Coagulation)
Surface Cuts	Excessive, prolonged bleeding	Normal/slightly prolonged bleeding
Onset After Injury	Immediate	Delayed
Site of Bleeding	Superficial i.e. mucosal (nasal, gingival, GI tract, uterine), skin	Deep i.e. joints, muscles, GI tract, GU tract Excessive post-traumatic
Lesions	Petechiae, ecchymoses	Hemarthroses, hematomas

Table 21. Lab Values in Disorders of Hemostasis

	PT	PTT	Platelet Count	RBC Count
Hemophilia A/B	N	↑	N	N
vWD	N	±	N/↓	N
DIC	↑	↑	↓	N/↓
Liver Failure	↑	N/↑	N/↓	N
ITP	N	N	↓	N
TTP	N	N	↓	↓

DIC = disseminated intravascular coagulation; ITP = idiopathic thrombocytopenic purpura; TTP = thrombotic thrombocytopenic purpura; vWD = von Willebrand disease

Disorders of Primary Hemostasis

Definition

- inability to form an adequate platelet plug due to:
 - disorders of blood vessels
 - disorders of platelets: abnormal function/numbers
 - disorders of vWF

Classification

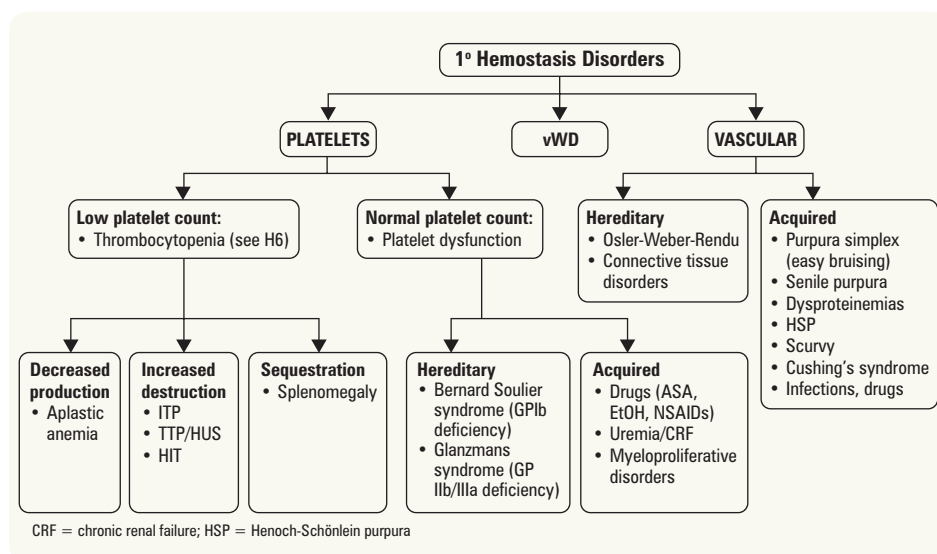

Figure 13. Approach to disorders of primary hemostasis

Immune Thrombocytopenic Purpura

Table 22. Immune Thrombocytopenic Purpura

Features	Acute ITP	Chronic ITP
Peak Age	2-6 yr	20-40 yr
Gender	None	F > M (3:1)
History of Recent Infection	Common	Rare
Onset of Bleed	Abrupt	Insidious
Duration	Usually weeks	Months to years
Spontaneous Remissions	80% or more	Uncommon

ACUTE (CHILD-TYPE) ITP

- see [Pediatrics, P50](#)

CHRONIC (ADULT-TYPE) ITP

- most common cause of isolated thrombocytopenia
- diagnosis of exclusion (i.e. isolated thrombocytopenia [platelets <100,000/mm³] and the absence of any obvious initiating and/or underlying cause)

Drugs Associated with Thrombocytopenia

TMP-SMX	Heparin	NSAIDs
Vancomycin	Digoxin	Acetaminophen
Rifampin	Amiodarone	Ethanol
Ethambutol	Quinidine	H ₂ -antagonists
Amphotericin B	Quinine	

Mechanisms for HIV-associated Thrombocytopenia

- Direct effect of HIV on marrow
- Immune-mediated platelet destruction
- Some antiretrovirals reduce platelet production

Should Rituximab be Used Before or After Splenectomy in Patients with Immune Thrombocytopenic Purpura (ITP)?

Curr Opin Hematol 2007;14:642-646

Purpose: To determine whether the optimal timing for rituximab is before splenectomy, or after failure of splenectomy.

Results: Rituximab produces an initial response in approximately 60% of cases, with no significant difference between splenectomized and non-splenectomized patients. Long-term complete responses are observed in 15-20% of cases. Adverse events related to the drug were usually mild or moderate, with a low incidence of infections. Long-term safety data, however, are still lacking. Deaths have been reported for 2.9% of ITP cases treated with rituximab, but they could not be attributed to the study drug.

Conclusion: Both the response rate and the response duration appear lower following rituximab than following splenectomy. Although the side effects may be fewer, there is insufficient evidence to support the replacement of splenectomy with rituximab as a second-line treatment of chronic ITP outside a clinical trial. At the present time, the use of immunotherapy before splenectomy can be recommended only in patients at high risk for splenectomy and in those not willing to undergo surgery.

Pathophysiology

- an acquired immune-mediated disorder with
 - anti-platelet antibodies bind to platelet surface → increased splenic destruction and clearance
 - impaired platelet production
 - helper T-cell and cytotoxic T-cell activation also implicated in platelet destruction

Clinical Presentation

- can present asymptomatic, minimal bruising, or serious bleed (GI bleed, skin and mucosal hemorrhage or intracranial hemorrhage), lethargy, fatigue

Investigations

- CBC and reticulocyte count: thrombocytopenia (request retic count if not an isolated thrombocytopenia)
- PT and aPTT: normal
- peripheral blood film: decreased platelets, giant platelets (to rule out platelet clumping)
- HIV, HCV (if risk factors are present)
- bone marrow aspirate and biopsy: increased number of megakaryocytes
 - recommended in patients >60 yr of age, pre-splenectomy or have failed multiple lines of ITP treatment, those with systemic symptoms, an abnormal blood film, and/or abnormal signs to rule out other causes of thrombocytopenia (e.g. myelodysplasia)

Treatment

- rarely indicated if platelets $>30,000/\text{mm}^3$ unless active bleeding, trauma, or surgery

A. Emergency Treatment (active bleeding (CNS, GI, or GU) or in need of emergency surgery)

- general measures: stop drugs reducing platelet function, control blood pressure, minimize trauma
- corticosteroids: prednisone (1 mg/kg) or methylprednisolone (1 g/d x 3 d) or dexamethasone (40 mg PO x 4 d)
- antifibrinolytic: tranexamic acid (1 g PO tid or 1 g IV q6h) if refractory bleeding
- IVIg 1 g/kg/d x 2 doses, or 2 g/kg over 5 d
- platelet transfusion: for life-threatening bleeding
- emergency splenectomy: may be considered, vaccinations prior (pneumococcus, meningococcus, *H. influenzae* b)
- management of intracranial bleeding: IV steroids, IVIg, platelets, emergency splenectomy, and then craniotomy; maintain Plt $>100,000/\text{mm}^3$ for at least 7 wk post intracranial hemorrhage

B. Non-Urgent Treatment (platelet count $<20,000$ - $30,000/\text{mm}^3$ and no bleeding OR platelet count $<50,000/\text{mm}^3$ and significant bleeding symptoms)

- platelet transfusion does **not** work
- 1st Line
 - ♦ corticosteroids (dexamethasone 40 mg/d x 4 wk or prednisone 1 mg/kg/d)
 - ♦ IVIg
 - ♦ anti-D: appropriate for Rh+ non-splenectomized patients, but can cause hemolysis (avoid if low Hb at baseline or if DAT is positive) (warning label now attached to this medication regarding risk of intravascular hemolysis)
- 2nd Line
 - ♦ splenectomy (need vaccinations prior to splenectomy: pneumococcus, meningococcus, *H. influenzae* b)
 - ♦ immunosuppressants (azathioprine, cyclophosphamide)
 - ♦ rituximab
 - ♦ danazol, vincristine
 - ♦ thrombopoietin (TPO) receptor agonists (romiplostim, eltrombopag)

Prognosis

- ~20% will not attain a hemostatic platelet count after first and second line therapy
- fluctuating course
- overall relatively benign, mortality 1-2%, (2x higher mortality than the unaffected population)
- major concern is cerebral hemorrhage at Plt $<5,000/\text{mm}^3$, although very rare

Heparin-Induced Thrombocytopenia

- heparin-induced thrombocytopenia: immune mediated reaction following treatment with heparin leading to coagulation activation
- heparin-associated thrombocytopenia: transient thrombocytopenia following administration of heparin

Table 23. Heparin-Induced Thrombocytopenia (HIT) (Previously Known as HIT Type II)

Pathophysiology	Immune mediated Ab recognizes a complex of heparin and platelet factor 4 (PF4) leading to platelet activation via platelet Fc receptor and activation of coagulation system
Diagnosis	50% reduction in platelets while on heparin within 5-15 wk of initiation
Onset of Decreased Platelets	5-15 wk (if previously exposed to heparin, HIT can develop in hours)
Risk of Thrombosis	~30% (25% of events are arterial)
Clinical Features	Bleeding complications uncommon Venous thrombosis: DVT, PE, limb gangrene, cerebral sinus thrombosis Arterial thrombosis: MI, stroke, acute limb ischemia, organ infarct (mesentery, kidney) Heparin-induced skin necrosis (with LMWH) Acute platelet activation syndromes: acute inflammatory reactions (e.g. fever/chills, flushing, etc.) Transient global amnesia (rare)
Specific Tests	Pre-test clinical scoring models can help rule-out HIT: 4-Ts (see Table 24) and the HIT Expert Probability (HEP) score ^{14}C serotonin release assay (uses donor platelets with ^{14}C serotonin and heparin with patient's plasma) ELISA for HIT-Ig (more sensitive, less specific than serotonin assay) Ultrasound of lower limb veins for DVT
Management	Clinical suspicion of HIT should prompt discontinuation of heparin and LMWH (specific tests take several days) Initiate anticoagulation with a non-heparin anticoagulant e.g. argatroban, danaparoid, fondaparinux, bivalirudin unless there is a strong contraindication (duration of treatment at least 2-3 mo if no thrombotic event, and at least 3-6 mo if thrombotic event has occurred) Warfarin should only be restarted when platelet count $>100 \times 10^9/\text{L}$ Allergy band and alert in patient records

Evaluation of Pretest Clinical Score (4 Ts) for the Diagnosis of Heparin-Induced Thrombocytopenia in Two Clinical Settings

J Thromb Haemos 2006;4:759-765

Study: Prospective and retrospective clinical score application in two clinical settings (Hamilton General Hospital, HGH; and Greifswald in Germany, GW).

Population: 336 patients with suspected HIT.

Intervention: Risk stratification with 4Ts clinical score compared with serology for HIT antibody.

Results: 1/64 (1.6%) in HGH and 0/55 (0%) in GW with low scores tested positive on HIT serology. 8/28 (28.6%) in HGH and 11/139 (7.9%) in GW with intermediate scores tested positive for HIT. 8/8 (100%) in HGH and 9/42 (21.4%) in GW with high scores tested positive for HIT.

Conclusions: A low pretest clinical score can help to rule out HIT in patients with thrombocytopenia.

LMWH is also associated with HIT, but the risk is less than unfractionated heparin (2.6% in UFH vs. 0.2% in LMWH)

Heparin-Associated Thrombocytopenia (previously known as HIT type I)

- Direct heparin mediated platelet aggregation (non-immune)
- Platelets $>100 \times 10^9/\text{L}$
- Self-limited (no thrombotic risk)
- May continue with heparin therapy
- Onset 24-72 h

Table 24. The 4-T Pre-Test Clinical Scoring Model for HIT

Category	2 Points	1 Point	0 Points
1. Thrombocytopenia	Platelet count fall $>50\%$ AND platelet nadir $\geq 20 \times 10^9/\text{L}$	Platelet count fall 30-50% OR platelet nadir $10-90 \times 10^9/\text{L}$	Platelet count fall $<30\%$ OR platelet nadir $<10 \times 10^9/\text{L}$
2. Timing of Platelet Count Fall	Clear onset between days 5-10 of heparin exposure OR platelet count fall at ≤ 1 d if prior heparin exposure within last 30 d	Consistent with fall in platelet count at 5-10 d but unclear (e.g. missing platelet counts) OR onset after day 10 OR fall ≤ 1 d with prior heparin exposure within 30-100 d	Platelet count fall <4 d of heparin exposure, and no recent heparin
3. Thrombosis or Other Sequelae	Confirmed new thrombosis, skin necrosis, or acute systemic reaction after IV unfractionated heparin bolus	Progressive or recurrent thrombosis, non-necrotizing (erythematous) skin lesions, or suspected thrombosis that has not been proven	None
4. Other Causes for Thrombocytopenia	None apparent	Possible	Definite

6-8 points = high probability of HIT; 4-5 points = intermediate probability of HIT; 0-3 points = low probability of HIT

J Thromb Haemos 2006;4:759-765

Thrombotic Thrombocytopenic Purpura and Hemolytic Uremic Syndrome

Table 25. TTP and HUS

	TTP	HUS
Epidemiology	Predominantly adult	Predominantly children
Etiology	Deficiency of metalloproteinase that breaks down ultra-large vWF multimers <ul style="list-style-type: none"> • Congenital (genetic absence of ADAMTS-13) • Acquired (drugs, malignancy, transplant, HIV-associated, idiopathic) 	Shiga toxin (<i>E. coli</i> serotype O157:H7)
Clinical Features	<ol style="list-style-type: none"> 1. Thrombocytopenia 2. MAHA 3. Neurological symptoms: headache, confusion, focal defects, seizures 4. Renal failure 5. Fever 	<ol style="list-style-type: none"> 1. Severe thrombocytopenia: purpura, epistaxis, hematuria, hemoptysis, GI bleed 2. MAHA 3. Renal failure: abnormal urinalysis, oliguria, acute renal failure
Investigations (both TTP, HUS)	CBC and blood film: decreased platelets and schistocytes PT, aPTT, fibrinogen: normal Markers of hemolysis: increased unconjugated bilirubin, increased LDH, decreased haptoglobin Negative Coombs test Creatinine, urea, to follow renal function Stool C&S (HUS)	
Management (both TTP, HUS)	Medical emergency Plasmapheresis ± steroids Platelet transfusion is contraindicated (increased microvascular thrombosis) Plasma infusion if plasmapheresis is not immediately available TTP mortality ~90% if untreated	

Pathophysiology of TTP

- vWF secreted by endothelial cells is a very large polymer rapidly cleaved by the ADAMTS-13 protease
- Congenital TTP is due to a deficiency in ADAMTS-13
- Antibodies against ADAMTS-13 are present in acquired TTP

Differential Diagnosis of TTP

- Sepsis
- DIC
- HELLP
- Antiphospholipid Ab syndrome
- Evans syndrome (AIHA + ITP)

von Willebrand Disease

Pathophysiology

- heterogeneous group of defects, usually mild in severity
- usually autosomal dominant (type 3 is autosomal recessive)
- qualitative or quantitative abnormality of vWF
 - vWF needed for platelet adhesion and acts as carrier for Factor VIII; abnormality of vWF can affect both primary and secondary hemostasis
 - vWF exists as a series of multimers ranging in size
 - ♦ largest multimers are most active in mediation of platelet adhesion, both large and small multimers complex with Factor VIII

Classification

- type 1: mild quantitative defect (decreased amount of vWF and proportional decrease in vWF activity) – 75% of cases
- type 2: qualitative defect (vWF activity disproportionally lower than quantity) – 20-25% of cases
- type 3: severe total quantitative defect (no vWF produced) – rare

Clinical Features

- mild
 - asymptomatic
 - mucosal and cutaneous bleeding, easy bruising, epistaxis, menorrhagia
- moderate to severe
 - as above but more severe, occasionally soft-tissue hematomas, petechiae (rare), GI bleeding, hemarthroses

Investigations

Table 26. Investigations in vWD

Test	Expected Result	Test	Expected Result
PTT	N/↑	von Willebrand antigen	↓
Factor VII	N/↓	Blood group	Affects antigen quantification (↓ in group O)
Plt Count	N/↓	vWF multimer analysis	Multimer variants
Ristocetin Activity	↓ (cofactor for vWF-Plt binding)		

Consider vWD in all women with menorrhagia

Treatment

- desmopressin (DDAVP®) is treatment of choice for type 1 vWD
 - causes release of vWF and Factor VIII from endothelial cells
 - variable efficacy depending on disease type; tachyphylaxis occurs
 - need good response before using with further bleeding
 - caution in children due to hyponatremia
- tranexamic acid (Cyklokapron®, antifibrinolytic) to stabilize clot formation
- high-purity Factor VIII concentrate containing vWF (Hemate P®) in select cases and type
 - frozen plasma (FP) is not useful
 - need to monitor vWF and factor VIII levels (very high factor VIII level can cause thrombosis)
- conjugated estrogens (increase vWF levels)

Prognosis

- may fluctuate, often improves during pregnancy, inflammation, and with age

Disorders of Secondary Hemostasis

Definition

- inability to form an adequate fibrin clot
 - disorders of clotting factors or co-factors
 - disorders of proteins associated with fibrinolysis
- characterized by delayed bleeding, deep muscular bleeding, spontaneous joint bleeding

Table 27. Classification of Secondary Hemostasis Disorders

Hereditary	Acquired
Factor VIII: Hemophilia A, vWD	Liver disease
Factor IX: Hemophilia B (Christmas Disease)	DIC
Factor XI	Vitamin K deficiency
Other factor deficiencies are rare	Acquired inhibitors

Hemophilia A (Factor VIII Deficiency)

Pathophysiology

- X-linked recessive, 1/5,000 males
- mild (>5% of normal factor level), moderate (1-5%), severe (<1%)

Clinical Features

- see Table 20 – *Signs and Symptoms of Disorders of Hemostasis, H26*
- older patients may also have HIV or HCV from contaminated blood products

Investigations

- prolonged aPTT, normal INR (PT)
- decreased Factor VIII (<40% of normal)
- vWF usually normal or increased

Treatment

- desmopressin (DDAVP®) in mild hemophilia A
- recombinant Factor VIII concentrate for
 - prophylaxis (2-3x/wk at home)
 - minor but not trivial bleeding (e.g. hemarthroses)
 - major potentially life-threatening bleeding (e.g. multiple trauma)
- anti-fibrinolytic agents (e.g. tranexamic acid)

**Hemophilia A****Five Hs**

Hemarthroses
Hematomas
Hematochezia
Hematuria
Head hemorrhage

Hemophilia B (Factor IX Deficiency)

- i.e. Christmas disease
- X-linked recessive, 1/30,000 males
- clinical and laboratory features identical to hemophilia A (except decreased Factor IX)
- treatment: recombinant Factor IX concentrate, anti-fibrinolytic agents

Factor XI Deficiency

- i.e. Rosenthal syndrome
- autosomal recessive; more common in Ashkenazi Jewish population
- usually mild, often diagnosed in adulthood
- Factor XI level does not correlate with bleeding risk
- treatment: frozen plasma, Factor XI concentrate

Liver Disease

- see [Gastroenterology, G28](#)

Pathophysiology

- deficient synthesis of all factors except VIII (also made in endothelium and in acute phase response)
- aberrant synthesis of fibrinogen
- deficient clearance of hemostatic 'debris' and fibrinolytic activators
- accelerated destruction due to dysfibrinogenemias: increased fibrinolysis, DIC
- miscellaneous: inhibition of secondary hemostasis by FDPs

Investigations

- peripheral blood film: target cells
- primary hemostasis affected
 - thrombocytopenia 2° to hypersplenism, folate deficiency, alcohol intoxication, DIC, decreased production of thrombopoietin
 - platelet dysfunction (e.g. alcohol abuse)
- secondary hemostasis affected
 - elevated INR (PT), aPTT and TT, low fibrinogen in end-stage liver disease

Treatment

- supportive, treat liver disease, blood products if active bleeding (frozen plasma, platelets, cryoprecipitate)

Investigations in Liver Disease

Factor V, VII, VIII. Expect decreased V and VII because they have the shortest half-life. Factor VIII will be normal or increased because it is produced in the endothelium

PT should improve within 24 h of vitamin K administration (onset is in 6-12 h). If not, search for other causes

Vitamin K Deficiency

Etiology

- drugs
 - oral anticoagulants which inhibit Factors II, VII, IX, X, proteins C and S
 - antibiotics eradicating gut flora, altering vitamin K uptake
- poor diet (especially in alcoholics)
- biliary obstruction
- chronic liver disease (decreased stores)
- malabsorption (e.g. celiac disease)
- hemorrhagic disease of newborn, see [Pediatrics, P70](#)

Investigations

- INR (PT) is elevated out of proportion to elevation of the aPTT
- decreased Factors II, VII, IX, X (vitamin K-dependent)

Treatment

- hold anticoagulant
- vitamin K 1 mg PO for INR between 4.5 and 10 and no active bleeding (excludes hemorrhagic disease of the newborn)
- if bleeding, give vitamin K 10 mg IV
- if life-threatening bleeding and vitamin K antagonist use, give frozen plasma or prothrombin complex concentrate (PCC)
 - PCCs are contraindicated if there is a previous history of HIT
 - use FFP if PCC is contraindicated or unavailable
- note: excessive vitamin K will delay therapeutic warfarin anticoagulation once re-started

American Society of Hematology Choosing Wisely Recommendation

Do not administer plasma or prothrombin complex concentrates for non-emergent reversal of vitamin K antagonists (e.g. outside of the setting of major bleeding, intracranial hemorrhage, or anticipated emergent surgery)

Factor Levels in Acquired Coagulopathies

Factor	Liver Disease	Vitamin K Def	DIC
V	↓	N	↓
VII	↓	↓	↓
VIII	N/↑	N	↓

DIC is a spectrum which may include thrombosis, bleeding, or both

Disseminated Intravascular Coagulation

- see [Obstetrics, OB20](#)

Definition

- uncontrolled release of plasmin and thrombin leading to intravascular coagulation and depletion of platelets, coagulation factors and fibrinogen
- risk of life-threatening hemorrhage

Etiology

- occurs as a complication of many other conditions
- widespread endothelial damage ± extensive inflammatory cytokine release

Important Etiologies of DIC

OMITS
 Obstetric complications
 Malignancy
 Infection
 Trauma
 Shock

Levels of fibrinogen can still be normal in DIC as it is an acute phase reactant
 Serial fibrinogen levels should be measured to see if there is a trending decrease along with an increase in D-dimer

Table 28. Etiology of DIC

Activation of Procoagulant Activity	Endothelial Injury	Reticuloendothelial Injury	Vascular Stasis	Other
Antiphospholipid antibody syndrome (APS) Intravascular hemolysis Incompatible blood, malaria Tissue injury Obstetric complications, trauma, burns, crush injuries Malignancy Solid tumors, hematologic malignancies (especially APLM) Snake venom, fat embolism, heat stroke	Infections/sepsis Vasculitis Metastatic adenocarcinoma Aortic aneurysm Giant hemangioma	Liver disease Splenectomy	Hypotension Hypovolemia Pulmonary embolus	Acute hypoxia/acidosis Extracorporeal circulation

Clinical Features

- presence of both hemorrhage and clotting

Table 29. Clinical Features of DIC

Signs of Microvascular Thrombosis	Signs of Hemorrhagic Diathesis
Neurological: multifocal infarcts, delirium, coma, seizures Skin: focal ischemia, superficial gangrene Renal: oliguria, azotemia, cortical necrosis Pulmonary: ARDS GI: acute ulceration RBC: microangiopathic hemolysis	Bleeding from any site in the body (2° to decreased platelets and clotting factors) Neurologic: intracranial bleeding Skin: petechiae, ecchymosis, oozing from puncture sites Renal: hematuria Mucosal: gingival oozing, epistaxis, massive bleeding

Investigations

- primary hemostasis: decreased platelets
- secondary hemostasis: prolonged INR (PT), aPTT, TT, decreased fibrinogen and other factors
- fibrinolysis: increased FDPs or D-dimers, short euglobulin lysis time (i.e. accelerated fibrinolysis)
- extent of fibrin deposition: urine output, urea, RBC fragmentation

Treatment

- recognize early and treat underlying disorder
- individualized critical care support
- in hemorrhage: replacement of hemostatic elements with platelet transfusion, frozen plasma, cryoprecipitate
 - maintain platelets $>50,000/\text{mm}^3$ and hemoglobin $>80 \text{ g/L}$
 - 4-5 units of FFP if INR >1.5 or aPTT >38
 - 10 units of cryoprecipitate if fibrinogen $<100 \text{ mg/dL}$
 - 1 adult dose of buffy-coat platelets if $<10,000$ ($<20,000$ if febrile, $<50,000$ before invasive procedure)
- in thrombotic phase: UFH or LMWH in critically ill, non-bleeding patients

Table 30. Screening Test Abnormalities in Coagulopathies

Increased INR Only	Increased PTT Only	Both Increased
Warfarin	Hemophilia A and B	Prothrombin deficiency
Vitamin K deficiency	vWD	Fibrinogen deficiency
Factor VII deficiency	Heparin	Factor V and X deficiency
Liver disease	Antiphospholipid Ab	Severe liver disease
Factor VII inhibitors	Factor inhibitors	Factor V and X, prothrombin, and fibrinogen inhibitors
	Factor XI and XII deficiency	Excessive anticoagulation

**Risk of VTE in Hospitalized Patients Receiving Ineffective Antithrombotic Therapy**

Risk Factor	RR (95% CI)	P-value
Age >75 yr	1.79 (1.18-2.71)	0.007
Cancer	1.58 (1.01-2.51)	
Previous VTE	1.67 (1.01-2.77)	0.08
Obesity	0.94 (0.59-1.51)	0.91
Hormone therapy	0.51 (0.08-3.38)	0.70
Heart failure	1.08 (0.72-1.62)	0.82
NYHA III	0.89 (0.55-1.43)	0.72
NYHA IV	1.48 (0.84-2.6)	0.27
Acute infectious disease	1.50 (1.00-2.26)	0.06
Acute rheumatic disease	1.45 (0.84-2.50)	0.27

Source: JAMA 2004;164:963-968

**Differential Diagnosis of Elevated D-Dimer**

- Arterial thromboembolic disease (MI, CVA, acute limb ischemia, AFib, intracardiac thrombus)
- Venous thromboembolic disease (DVT, PE)
- DIC
- Preeclampsia and eclampsia
- Abnormal fibrinolysis; use of thrombolytic agents
- Cardiovascular disease, CHF
- Severe infection/sepsis/inflammation
- Surgery/trauma (tissue ischemia, necrosis)
- Systemic inflammatory response syndrome
- Vasoocclusive episode of sickle cell disease
- Severe liver disease
- Malignancy
- Renal disease (nephrotic syndrome, acute/chronic renal failure)
- Normal pregnancy
- Venous malformation

**Virchow's Triad**

- Endothelial damage
- Stasis
- Hypercoagulability

**American Society of Hematology Choosing Wisely Recommendations**

1. Do not test for thrombophilia in adult patients with venous thromboembolism occurring in the setting of major transient risk factors (surgery, trauma, or prolonged immobility)
2. Do not use inferior vena cava filters routinely in patients with acute venous thromboembolism

Venous Thromboembolism

Definition

- thrombus formation and subsequent inflammatory response in a superficial or deep vein
- superficial thrombophlebitis, deep vein thrombosis (DVT), and pulmonary embolism (PE)
- thrombi propagate in the direction of blood flow (commonly originating in calf veins)
- more common in lower extremity than upper extremity
- incidence $\sim 1\%$ if age >60 yr
- most important sequelae are pulmonary embolism ($\sim 50\%$ chance with proximal DVT) and chronic venous insufficiency

Etiology (Virchow's Triad)

- endothelial damage
 - exposes endothelium to prompt hemostasis
 - leads to decreased inhibition of coagulation and local fibrinolysis
- venous stasis
 - immobilization (post-MI, CHF, stroke, post-operative) inhibits clearance and dilution of coagulation factors
- hypercoagulability
 - inherited (see [Hypercoagulable Disorders, H36](#))
 - acquired
 - ♦ age (risk increases with age)
 - ♦ surgery (especially orthopedic, thoracic, GI, and GU)
 - ♦ trauma (especially fractures of spine, pelvis, femur or tibia, spinal cord injury)
 - ♦ neoplasms (especially lung, pancreas, colon, rectum, kidney, and prostate)
 - ♦ blood dyscrasias (myeloproliferative neoplasms, especially PV, ET), PNH, hyperviscosity (multiple myeloma, polycythemia, leukemia, sickle cell disease)
 - ♦ prolonged immobilization (CHF, stroke, MI, leg injury)
 - ♦ hormone related (pregnancy, OCP, HRT, SERMs)
 - ♦ APS
 - ♦ heart failure (risk of DVT greatest with right heart failure and peripheral edema)
- idiopathic (10-20% are later found to have cancer)

Clinical Features of DVT

- absence of physical findings does not rule out disease
- unilateral leg edema, erythema, warmth, and tenderness
- palpable cord (thrombosed vein)
- phlegmasia cerulea dolens and phlegmasia alba dolens with massive thrombosis
- Homan's sign (pain with foot dorsiflexion) is unreliable

Differential Diagnosis of DVT

- muscle strain or tear, lymphangitis or lymph obstruction, venous valvular insufficiency, ruptured popliteal cysts, cellulitis, arterial occlusive disease

Investigations for DVT

- D-dimer test only useful to rule out DVT if negative with low clinical suspicion of disease and no other acute medical issues
- doppler ultrasound is most useful diagnostic test for DVT
 - sensitivity and specificity for proximal DVT ~95%
 - sensitivity for calf DVT ~70%
- other non-invasive tests include MRI and impedance plethysmography
- venography is the gold standard, but is expensive, invasive, and higher risk

Post-Thrombotic Syndrome

- development of chronic venous stasis signs and symptoms secondary to a deep venous thrombosis
- symptoms: pain, venous dilatation, edema, pigmentation, skin changes, venous ulcers
- clinical severity can be estimated based on the Villalta score
- large impact on quality of life following a DVT
- treatment: extremity elevation, exercise, continuous compression stockings, intermittent pneumatic compression therapy, skin/ulcer care
- for Clinical Features and Treatment of PE, see [Respirology, R18](#)

Wells' Score for VTE Criteria (Score)

- Paralysis, paresis, or recent orthopedic casting of lower extremity (1)
- Recently bedridden (>3 d) or major surgery within past 4 wk (1)
- Localized tenderness in deep vein system (1)
- Swelling of entire leg (1)
- Calf swelling >3 cm than other leg (measured 10 cm below the tibial tuberosity) (1)
- Pitting edema greater in the symptomatic leg (1)
- Collateral non-varicose superficial veins (1)
- Active cancer or cancer treated within 6 mo (1)
- Alternative diagnosis more **likely** than DVT (e.g. Baker's cyst, cellulitis, muscle damage, superficial venous thrombosis) (-2)

Total Score Interpretation

3-8: High probability, 1-2: Moderate probability, -2-0: Low probability

Low-Molecular-Weight Heparin vs. Coumarin for the Prevention of Recurrent Venous Thromboembolism in Patients with Cancer

NEJM 2003;349:146-153

Study: RCT comparing the efficacy of LMWH (dalteparin) with an oral anti-coagulant agent (coumarin) in preventing recurrent thrombosis in patients with cancer.

Methods: Patients with cancer who had acute, symptomatic proximal DVT, PE, or both were randomly assigned to either dalteparin or coumarin treatment for 6 mo.

Results: 27 of 336 patients in the dalteparin group had recurrent VTE vs. 53 of 336 patients in the coumarin group (hazard ratio, 0.48; $p=0.002$). The probability of recurrent thromboembolism at 6 mo was 9% and 17% in dalteparin and coumarin groups respectively. There was no significant difference in bleeding rates. The mortality rate was 39% in the dalteparin group and 41% in the coumarin group.

Conclusions: In patients with cancer and acute VTE, dalteparin was more effective than coumarin decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding.

Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism

Cochrane DB Syst Rev 2009;CD001367

Study: Meta-analysis of 8 RCTs (2,994 patients) comparing different durations of treatment with vitamin K antagonists in patients with symptomatic VTE.

Results: In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of time since the index event (OR 0.18; 95% CI 0.13-0.26). In addition, there was no observed excess of VTE recurrences following cessation of prolonged treatment (i.e. rebound phenomenon) (OR 1.24; 95% CI 0.91-1.69). However, patients who received prolonged treatment had a persistent increase in their risk of major bleeding complications (OR 2.61; 95% CI 1.48-4.61).

Conclusion: Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of harm from major bleeding (which remains constant over time) is of greater concern than the absolute risk of recurrent VTE (which declines over time). No specific recommendation was made regarding optimal duration of treatment.

Approach to Treatment of Venous Thromboembolism

Purpose

- prevent further clot extension (3 mo duration is optimal)
- prevent acute pulmonary embolism (occurs in up to 50% of untreated patients)
- reduce the risk of recurrent thrombosis (duration depends on presence of other risk factors)
- treatment of massive iliofemoral thrombosis with acute lower limb ischemia and/or venous gangrene (phlegmasia cerulea dolens)
- limit development of late complications, e.g. postphlebotic syndrome, chronic venous insufficiency, and chronic thromboembolic pulmonary HTN

Absolute Contraindications to Treatment	Relative Contraindications to Treatment
Active bleeding	Mild-moderate bleeding diathesis or thrombocytopenia
Severe bleeding diathesis or platelet count <20,000/mm ³	Brain metastases
Intracranial bleeding	Recent major trauma
Neurosurgery or ocular surgery within 10 d	Recent stroke
	Major abdominal surgery within past 2 d
	GI/GU bleeding within 1-4 d
	Endocarditis
	Severe HTN (sBP >200 or dBP >120)

Initial Treatment

- low molecular weight heparin (LMWH)
 - administered SC, at least as effective as UFH with a lower bleeding risk
 - advantages: predictable dose response and fixed dosing schedule; lab monitoring not required; <1% HIT; safe and effective outpatient therapy
 - disadvantages: only partially reversible by protamine, long-term use associated with osteoporosis
 - renally cleared – must adjust dose in patients with renal dysfunction
- unfractionated heparin (UFH)
 - in patient with average risk of bleed; use hospital-based nomograms that use bleeding risk and patient weight to determine appropriate dose
 - advantages: rapidly reversible by protamine
 - disadvantages: must monitor aPTT with adjustment of dose to reach therapeutic level (~2x normal value); monitor platelet counts for development of HIT
- alternatives to LMWH and UFH
 - heparinoids (patients with HIT), direct thrombin inhibitors (hirudin, lepirudin, argatroban, dabigatran), Factor Xa inhibitors (fondaparinux, rivaroxaban)
 - thrombolytic drugs (e.g. streptokinase, tPA) reserved for acute limb/life-threatening thrombosis, and low bleeding risk

Long-Term Treatment

- warfarin
 - standard treatment; should be initiated with heparin overlap: dual therapy for at least 5 d, due to initial prothrombotic state, half life of vitamin K factors and risk of warfarin-induced skin necrosis
 - discontinue heparin after INR >2.0 for two consecutive days
 - warfarin should be dosed to maintain INR at 2-3 except in select cases
 - monitor INR twice weekly for 1-2 wk, then weekly until INR stable, then every 2-4 wk
 - LMWH more effective than warfarin at preventing recurrence of venous thrombosis in cancer patients (see sidebar, H34)
- duration of anticoagulant treatment (with warfarin unless otherwise noted)
 - first episode DVT with transient risk factor: 3 mo
 - first episode DVT with ongoing risk factor (e.g. cancer, antiphospholipid antibody) or >1 risk factor: consider indefinite therapy
 - first episode DVT with no identifiable risk factor (idiopathic) or single inherited risk factor (e.g. Factor V Leiden): 6-12 mo or indefinite therapy (controversial)
 - recurrent DVT (2 or more episodes): indefinite therapy
- IVC filters
 - temporary filter indicated only if distal acute DVT (<4 wk) with significant contraindications to anticoagulant therapy (i.e. active bleeding)
 - must remove once safe to do so as filter is pro-thrombotic in the longterm (anticoagulation if left in)
- special considerations
 - pregnancy: treat with LMWH during pregnancy, then warfarin for 4-6 wk post-partum (minimum total anticoagulation time of 3-6 mo)
 - surgery: avoid elective surgery in the first month after a venous or arterial thromboembolic event
 - ♦ pre-operatively: IV heparin may be used up to 6 h pre-operatively
 - ♦ perioperatively: surgery safe when INR <1.5; warfarin should be discontinued for at least 4 wk pre-operatively to allow INR to fall
 - ♦ post-operatively: IV heparin or LMWH can be used for anticoagulation (start 12 h after major surgery until therapeutic INR reached after restarting warfarin)
 - ♦ for patients at high risk for thromboembolism (VTE <12 wk, recurrent VTE, lupus anticoagulant, atrial fibrillation with prior stroke, mechanical heart valve), IV heparin or LMWH (bridging) should be given before and after the procedure while the INR is below 2.0

Prophylaxis

- see sidebar
- consider for those with a moderate to high risk of thrombosis without contraindications
- non-pharmacological measures include: early ambulation, elastic compression stockings (TEDs), intermittent pneumatic compression (IPC)
- UFH 5,000 IU SC bid for moderate risk
- UFH 5,000 IU SC tid or LMWH as per hospital protocol (i.e. enoxaparin 40 mg SC daily) or UFH 5,000 IU SC tid for high risk

Contraindications and Adverse Reactions of Anticoagulant Therapy

- absolute: active bleeding, severe bleeding diathesis, or platelets <20 x 10⁹/L (<20,000/mm³), intracranial bleeding, neuro or ocular surgery within <10 d
- relative: mild-moderate neurologic diathesis or thrombocytopenia, brain metastases, recent major trauma, major abdominal surgery within past 2 d, GI/GU bleed within 14 d, endocarditis, severe HTN (sBP >200 or dBP >120), recent stroke

Treatment of Pulmonary Embolism

- see [Respirology, R20](#)

Common Medications that Interact with Warfarin

- Acetaminophen (interference with vit K metabolism)
- Allopurinol
- NSAIDs (GI injury)
- Fluconazole
- Metronidazole
- Sulfamethoxazole
- Tamoxifen

Initiation of Warfarin Therapy Requires Overlap with Heparin Therapy for 4-5 d

- 10 mg loading dose of warfarin causes a precipitous decline in protein C levels in first 36 h resulting in a transient hypercoagulable state
- Warfarin decreases Factor VII levels in first 48 h INR is prolonged (most sensitive to Factor VII levels), however full antithrombotic effect is not achieved until Factor IX, X, and II are sufficiently reduced (occurs after ~4 d)

Low Risk Surgical Patients

<40 yr, no risk factors for VTE, general anesthetic (GA) <30 min, minor elective, abdominal, or thoracic surgery

Moderate Risk Surgical Patients

>40 yr, >1 risk factor for VTE, GA >30 min

High Risk Surgical Patients

> yr, surgery for malignancy or lower extremity orthopedic surgery lasting >30 min, inhibitor deficiency, or other risk factor

High Risk Medical Patients

Heart failure, severe respiratory disease, ischemic stroke and lower limb paralysis, confined to bed and have >1 additional risk factor (e.g. active cancer, previous VTE, sepsis, acute neurologic disease, IBD)

Hypercoagulable Disorders

Hypercoagulability Workup – Venous Thrombosis

- workup for malignancy or hypercoagulable state indicated for idiopathic VTE in presence of the following: age <50, recurrent VTE, family history of VTE and age <50, unusual site of DVT (portal, hepatic, mesenteric vascular beds), heparin-resistant disease (AT deficiency), warfarin-induced skin necrosis or neonatal purpura fulminans (proteins C or S deficiency); consider for women with VTE within 12 mo of exposure to OCP
- workup
 - initial
 - CBC, blood smear, coagulation studies, liver/renal function, urinalysis, fasting homocysteine
 - malignancy workup (see sidebar)
 - antiphospholipid antibodies (APLA): anticardiolipin antibodies (ACA) and lupus anticoagulant (LA)
 - activated protein C resistance (APCR)
 - DNA/Molecular: FVL (Factor V Leiden), PT (prothrombin G20210A), JAK-2
 - Flow Cytometry: PNH
 - post initial insult (>72 h) (as protein levels depleted/consumed by clot)
 - antithrombin (not on heparin)
 - Factor VIII (increased levels predict recurrence)
 - post-treatment
 - proteins C, S (not on warfarin)
- Note: most of these tests do not change management, and a negative test does not rule out a hypercoagulable state. Thus more focus is on the reversible/treatable causes (APLA, cancer, etc.)

CAUSES OF HYPERCOAGULABILITY LEADING TO VENOUS THROMBOEMBOLISM

Activated Protein C Resistance (Factor V Leiden)

- most common cause of hereditary thrombophilia
- 5% of general population are heterozygotes
- point mutation in the Factor V gene (R506Q) results in resistance to inactivation of Factor Va by activated protein C

Prothrombin (PT) G20210A

- G to A transposition at nucleotide position 20210 of the prothrombin gene promoter region results in increased levels of prothrombin, thus increased thrombin generation

Protein C and Protein S Deficiency

- protein C inactivates Factor Va and VIIIa using protein S as a cofactor
- protein C deficiency
 - homozygous: neonatal purpura fulminans
 - heterozygous:
 - type I: decreased protein C levels
 - type II: decreased protein C activity
 - acquired: liver disease, sepsis, DIC, warfarin
 - 1/3 of patients with warfarin necrosis have underlying protein C deficiency
- protein S deficiency
 - type I: decreased free and total protein S levels
 - type II: decreased protein S activity
 - type III: decreased free protein S levels
 - acquired: liver disease, DIC, pregnancy, nephrotic syndrome, inflammatory conditions, warfarin

Antithrombin Deficiency

- antithrombin slowly inactivates thrombin in the absence of heparin, rapidly inactivates thrombin in the presence of heparin
- autosomal dominant inheritance or urinary losses in nephrotic syndrome
 - type I: decreased AT levels
 - type II: decreased AT activity
- diagnosis must be made outside window of acute thrombosis and anticoagulation treatment (acute thrombosis, heparin, systemic disease all decrease antithrombin levels)
- deficiency may result in resistance to unfractionated heparin (LMWH must be used)

Elevated Factor VIII Levels

- an independent marker of increased thrombotic risk
- genetic basis for increased levels poorly understood

Disorders of Fibrinolysis

- include congenital plasminogen deficiency, tissue plasminogen activator deficiency

Antiphospholipid Antibody Syndrome (APS)

- definition: ≥ 1 clinical and ≥ 1 laboratory criteria
 - clinical: thrombosis, spontaneous abortions, fetal loss, premature birth before 34 wk
 - laboratory: anticardiolipin or lupus anticoagulant antibodies
- mechanism: not well understood, antibodies interact with platelet membrane phospholipid causing increased adhesion and aggregation; can also interfere with action of proteins C and S
- see [Rheumatology, RH12](#)

Common Causes of Hypercoagulability

CALM APES

Protein C deficiency
Antiphospholipid Ab
Factor V Leiden
Malignancy
Antithrombin deficiency
Prothrombin G20210A
Increased Factor VIII (Eight)
Protein S deficiency

Although lupus anti-coagulant prolongs PTT, its main clinical feature is thrombosis

Protein C, protein S, and ATIII are decreased during acute thrombosis – therefore to test for deficiency, must be tested outside of this time period

Causes of Both Venous and Arterial Thrombosis include:

- Antiphospholipid antibodies
- Myeloproliferative neoplasms
- Heparin induced thrombocytopenia
- Distal venous clot with patent foramen ovale

Malignancy is a common cause of acquired hypercoagulability

Workup may include (controversial):

- Complete history and physical
- Routine blood work
- Urinalysis
- CXR and abdominal ultrasound
- Age appropriate screening: mammogram, Pap, PSA, colonoscopy
- Close follow-up

Hematologic Malignancies and Related Disorders

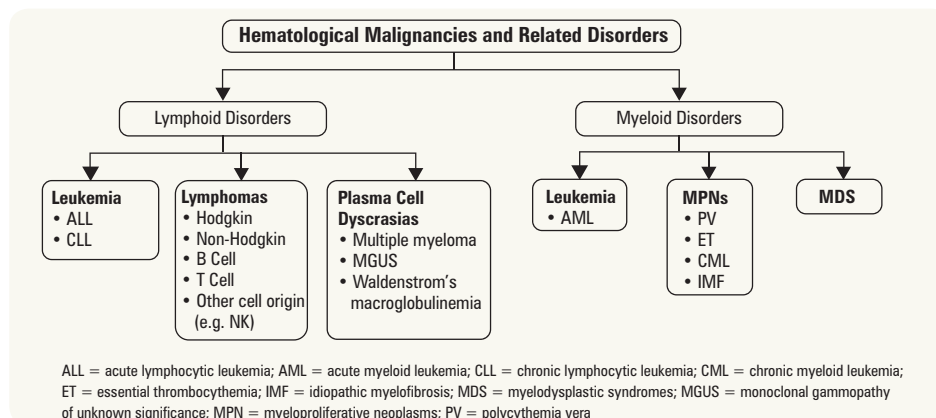

Figure 14. Overview of hematologic malignancies and related disorders

Myeloid Malignancies

Acute Myeloid Leukemia

Definition

- rapidly progressive malignancy characterized by failure of myeloid cells to differentiate beyond blast stage

Epidemiology

- incidence increases with age; median age of onset is 65 yr old
- accounts for 10-15% of childhood leukemias

Risk Factors

- myelodysplastic syndromes (MDS), benzene, radiation, alkylating agents as treatment for previous malignancy

Pathophysiology

- etiology subdivided into
 - primary: *de novo*
 - secondary: hematologic malignancies (e.g. myeloproliferative disorders and MDS) or previous chemotherapeutic agents (e.g. alkylating agents)
- uncontrolled growth of blasts in marrow leads to
 - suppression of normal hematopoietic cells
 - appearance of blasts in peripheral blood
 - accumulation of blasts in other sites (e.g. skin, gums)
 - metabolic consequences; tumor lysis syndrome

Clinical Features

- anemia, thrombocytopenia (associated with DIC in PML), neutropenia (even with normal WBC), leads to infections, fever
- thrombocytopenia (associated with DIC in promyelocytic leukemia)
- accumulation of blast cells in marrow
 - skeletal pain, bony tenderness (especially sternum)
- organ infiltration
 - gingival hypertrophy (particularly myelomonocytic leukemia) – may present to dentist first
 - hepatosplenomegaly (in ALL)
 - lymphadenopathy (not marked)
 - skin: leukemia cutis
 - gonads (in ALL)
 - eyes: Roth spots, cotton wool spots, vision changes (uncommon)
- leukostasis/hyperleukosis syndrome (medical emergency)
 - large numbers of blasts interfere with circulation and lead to hypoxia and hemorrhage – can cause diffuse pulmonary infiltrates, CNS bleeding, respiratory distress, altered mental status, priapism

Typical Age of Presentation of Leukemias

- ALL: Children and older adults
- CML: 40-60 yr
- AML, CLL: >60 yr

Leukemia: malignant cells arise in bone marrow and may spread elsewhere (including blood, lymph nodes, and lymphoid tissue)

Lymphoma: malignant cells arise in lymph nodes and lymphoid tissues and may spread elsewhere (including blood and bone marrow)

BUT the location where the malignant cells are found does not solely define the type of hematologic malignancy – classified based on the characteristics of the cell (histology, histochemistry, immunophenotyping, cytogenetics, molecular changes)

Acute Leukemia

Definition (WHO): presence of 20% blast cells or greater in bone marrow at presentation

Classification: divided into myeloid (AML) and lymphoid (ALL) depending on whether blasts are myeloblasts or lymphoblasts, respectively

Auer rods are pathognomonic for AML

2008 WHO Classification of AML and Related Neoplasms

- AML with recurrent genetic abnormalities
- AML with myelodysplasia-related changes
- Therapy-related myeloid neoplasms
- Myeloid sarcoma
- Myeloid proliferations related to Down syndrome
- Blastic plasmacytoid dendritic cell neoplasm
- AML, not otherwise specified (equivalent FAB classification)
 - Undifferentiated (M1)
 - Myeloblastic (M2)
 - Promyelocytic (M3)
 - Myelomonocytic (M4)
 - Monocytic (M5)
 - Erythroleukemic (M6)
 - Megakaryocytic (M7)
 - Acute basophilic leukemia
 - Acute panmyelosis with myelofibrosis

- metabolic effects; aggravated by treatment (rare)
 - increased uric acid → nephropathy, gout
 - release of phosphate → decreased Ca^{2+} , decreased Mg^{2+}
 - release of procoagulants → DIC (higher risk in acute promyelocytic leukemia)
- decreased or normal K^+ before treatment, increased K^+ after treatment (from lysed cells)

Investigations

- blood work
 - CBC: anemia, thrombocytopenia, variable WBC
 - INR, aPTT, fibrin degradation products (FDP), fibrinogen (in case of DIC)
 - increased LDH, increased uric acid, increased PO_4^{3-} (released by leukemic blasts), decreased Ca^{2+}
 - baseline renal and liver function tests
- peripheral blood film – circulating blasts with Auer rods (azurophilic granules) are pathognomonic for AML
- bone marrow aspirate
 - blast count: AML >20% (normal is <5%)
 - morphologic, cytochemical, and/or immunotypic features are used to establish lineage and maturation (see sidebar for WHO classification of AML, H37)
- CXR to rule out pneumonia, ECG, MUGA scan prior to chemotherapy (cardiotoxic)

Treatment

- mainstay of treatment is chemotherapy (rapidly fatal without treatment)
 - all AML subtypes treated similarly except promyelocytic variant with t(15;17) translocation
 - ♦ all-trans-retinoic acid (ATRA) added to induce differentiation; arsenic trioxide + ATRA combination therapy for APL is non-inferior to traditional chemotherapy
- treatment strategy
 1. **Induction:** chemotherapy to induce complete remission of AML (see sidebar)
 - ♦ several possible regimens (e.g. cytarabine with anthracycline [daunorubicin])
 - ♦ patients with poor response to initial induction therapy – worse prognosis
 - ♦ must ensure reversal of DIC, platelet transfusions if <10
 2. **Consolidation:** to prevent recurrence
 - ♦ intensive consolidation chemotherapy
 - ♦ stem cell transplantation – autologous or allogeneic (younger patients with better performance status)
- consider acceleration with hematopoietic growth factors (e.g. G-CSF) if severe infection develops
- supportive care
 - screening for infection via regular C&S of urine, stool, sputum, oropharynx, catheter sites, perianal area
 - fever: C&S of all orifices, CXR, start antibiotics
 - platelet and RBC transfusions (irradiated to prevent transfusion-related GVHD) ± EPO
 - prevention and treatment of metabolic abnormalities
 - ♦ allopurinol, rasburicase for prevention of hyperuricemia

Prognosis

- achievement of first remission
 - 70-80% if ≤60 yr old, 50% if >60 yr old
 - median survival 12-24 mo
 - 5 yr survival 40%
 - prognosis related to cytogenetics (favorable, intermediate, or adverse)

Cure: survival that parallels age-matched population

Complete Remission: tumor load below threshold of detectable disease (normal peripheral blood film, normal bone marrow with <5% blasts, normal clinical state)

2008 WHO MDS Classification

- Refractory cytopenia with unilineage dysplasia
 - Refractory anemia
 - Refractory neutropenia
 - Refractory thrombocytopenia
- Refractory anemia with ringed sideroblasts (RARS)
- Refractory cytopenia with multilineage dysplasia (RCMD)
- Refractory cytopenia with multilineage dysplasia and ringed sideroblasts (RCMD-RS)
- Refractory anemia with excess blasts (RAEB)
- Myelodysplastic syndrome with isolated del (5q)
- Myelodysplasia unclassified (seen in cases of megakaryocyte dysplasia with fibrosis and others)
- Childhood myelodysplastic syndrome

MDS is a cause of macrocytic anemia

Myelodysplastic Syndromes: ineffective maturation

Myeloproliferative Neoplasms: overproduction of mature cells

Myelodysplastic Syndromes

Definition

- heterogeneous group of malignant stem cell disorders characterized by dysplastic and ineffective blood cell production resulting in peripheral cytopenias
- syndromes defined according to World Health Organization (WHO) classifications (see sidebar)

Pathophysiology

- disordered maturation: ineffective hematopoiesis despite presence of adequate numbers of progenitor cells in bone marrow (usually hypercellular)
- intramedullary apoptosis: programmed cell death within bone marrow
 - both processes lead to reduced mature cells in periphery
- <30% develop AML

Risk Factors

- elderly, post-chemotherapy, benzene or radiation exposure
- occurs in 60/100,000 in patients >60 yr old

Clinical Features

- insidious onset: associated with those of pancytopenia
- infections and bleeding out of proportion with peripheral blood counts

Investigations

- diagnosed by
 - anemia \pm thrombocytopenia \pm neutropenia
 - CBC and peripheral blood film
 - RBC: usually macrocytic with oval shaped red cells (macro-ovalocytes), decreased reticulocyte count
 - WBC: decreased granulocytes and abnormal morphology (e.g. bilobed or unsegmented nuclei = Pelger abnormality)
 - platelets: thrombocytopenia, abnormalities of size and cytoplasm (e.g. giant hypogranular platelets)
- bone marrow aspirate and biopsy with cytogenetic analysis required for definitive diagnosis
 - bone marrow: dysplastic and often normocellular/hypercellular
 - cytogenetics: partial or total loss of chromosomes 5, 7, Y, or trisomy 8

Prognosis

- Revised International Prognostic Scoring System (IPSS-R) uses 5 factors to estimate mean survival
 - cytology, % bone marrow blasts, hemoglobin, platelets, absolute neutrophil count
 - based on the calculated score, a patient's MDS prognostic risk is "Very Low", "Low", "Intermediate", "High", or "Very High" with a mean survival of 8.7, 5.3, 3.0, 1.6, and 0.8 yr, respectively

Treatment

- **low risk** of transformation to acute leukemia (IPSS-R Very Low or Low)
 - erythropoietin stimulating agents weekly is first line in reducing transfusion requirements
 - 5q(-) cytogenetic: lenalidomide PO
 - supportive care: RBC and platelet transfusion (consider iron chelation if frequent RBC transfusions)
- **high risk** of transformation to acute leukemia (IPSS-R Intermediate, High or Very High)
 - supportive care
 - stem cell transplantation if age <65 yr
 - epigenetic therapy: DNA methyltransferase inhibitors (e.g. 5-azacytidine), histone deacetylase inhibitors

Use of Epoetin and Darbepoetin in Patients with Cancer

Blood 2008;111:25-41

Clinical practice guideline update by American Societies of Hematology and Clinical Oncology (2007).

Initial Recommendations

1. Initiate an erythropoiesis-stimulating agent (ESA) when hemoglobin (Hb) is 100 g/L (10 g/dL) in patients with palliative chemotherapy-associated anemia to decrease the need for transfusions.
2. Discontinue ESAs when patient not responding to treatment beyond 6-8 wk.
3. Monitor iron stores and supplement iron intake for ESA-treated patients when necessary.
4. Use ESAs cautiously with chemotherapy or in patients with an elevated risk for thromboembolic complications.
5. It is not recommended that ESA be used for therapy in patients with cancer who are not receiving chemotherapy, as it increases thromboembolic risks and lowers survival rate. Patients with low-risk myelodysplasia are an exception.

Myeloproliferative Neoplasms

Definition

- clonal myeloid stem cell abnormalities leading to overproduction of one or more cell lines (leading to abnormalities in erythrocytes, platelets, and other cells of myeloid lineage)

Epidemiology

- mainly middle-aged and older patients (peak 60-80 yr)

Prognosis

- may develop marrow fibrosis with time
- all disorders may progress to AML

Basophilia is uncommon in other medical conditions

Table 31. Chronic Myeloproliferative Disorders

	CML	PV	IMF	ET
Hct	↓/N	↑↑	↓	N
WBC	↑↑	↑	↑/↓	N
Plt	↑/↓	↑	↑/↓	↑↑↑
Marrow Fibrosis	±	±	+++	±
Splenomegaly	+++	+	+++	+
Hepatomegaly	+	+	++	—
Genetic Association	<i>bcr-abl</i> mut. (90+%)	JAK2 mut. (95%)	JAK2 mut. (~50%)	JAK2 mut. (~50%)

CML = chronic myeloid leukemia; ET = essential thrombocythemia; IMF = idiopathic myelofibrosis; PV = polycythemia vera

Chronic Myeloid Leukemia

Definition

- myeloproliferative disorder characterized by increased proliferation of the granulocytic cell line without the loss of their capacity to differentiate

Epidemiology

- occurs in any age group (mostly middle age to elderly) with a median age of 65 yr

Pathophysiology

- Philadelphia chromosome (Ph)
 - translocation between chromosomes 9 and 22
 - the c-abl proto-oncogene is translocated from chromosome 9 to "breakpoint cluster region" (bcr) of chromosome 22 to produce *bcr-abl* fusion gene, an active tyrosine kinase

Clinical Features

- 3 clinical phases
 - chronic phase:** 85% diagnosed here
 - few blasts (<10%) in peripheral film
 - ± slightly elevated eosinophils and basophils
 - no significant symptoms other than leukostasis
 - accelerated phase:** impaired neutrophil differentiation
 - circulating blasts (10-19%) with increasing peripheral basophils (pruritus)
 - CBC: thrombocytopenia <100,000/mm³
 - cytogenetic evidence of clonal evolution
 - worsening constitutional symptoms and splenomegaly (extramedullary hematopoiesis)
 - blast crisis:** more aggressive course, blasts fail to differentiate
 - blasts (>20%) in peripheral blood or bone marrow; reflective of acute leukemia (1/3 ALL, 2/3 AML)
- clinical presentation
 - 20-50% of patients are asymptomatic when diagnosed (incidental lab finding)
 - nonspecific symptoms
 - fatigue, weight loss, malaise, excessive sweating, fever
 - secondary to splenic involvement
 - early satiety, LUQ pain/fullness, shoulder tip pain (referred)
 - splenomegaly (most common physical finding)
 - anemia
 - bleeding: secondary to platelet dysfunction
 - pruritus, PUD: secondary to increased blood histamine
 - leukostasis, priapism, encephalopathy (rare): secondary to very elevated WBC (rare)

Investigations

- high increase in WBC, decreased/normal RBC, increased/decreased platelets, increased basophils
 - WBC differential shows a bimodal distribution, with predominance of myelocytes and neutrophils
- peripheral blood film
 - leukoerythroblastic picture (immature red cells and granulocytes present, e.g. myelocytes and normoblasts)
 - presence of different mid-stage progenitor cells differentiates it from AML
- bone marrow
 - myeloid hyperplasia with left shift, increased megakaryocytes, mild fibrosis
- molecular and cytogenetic studies of bone marrow or peripheral blood for Philadelphia chromosome
- abdominal imaging for spleen size

Treatment

- symptomatic**
 - allopurinol and antihistamines
- chronic phase**
 - imatinib mesylate inhibits proliferation and induces apoptosis by inhibiting tyrosine kinase activity in cells positive for *bcr-abl*
 - if loss of response or intolerance (~25%), trial of 2nd (dasatinib, nilotinib) or 3rd generation inhibitors
 - dasatinib may be considered for first line management (see sidebar)
 - interferon- α : may improve response to tyrosine kinase inhibitors
 - hydroxyurea in palliative setting
 - bone marrow transplantation if progression to accelerated or blast phases: CML (curative)
- accelerated phase or blast phase**
 - refer for clinical trial or 2nd/3rd generation (ponatinib only for T315I-mutated CML) TKI and prepare for allogeneic stem cell transplant patients, in blast phase typically get standard AML induction
- stem cell transplantation may be curative: to be considered in young patients who do not meet therapeutic milestones

Detection of the *bcr-abl* fusion gene is a diagnostic test for CML (present in over 90% of patients)

Chronic Myeloproliferative Neoplasias: Six Year Follow-Up of Patients Receiving Imatinib for the First-Line Treatment of CML
Leukemia 2009;23:1054-1061

Study: The Randomized Study of Interferon vs. ST1571 (IRIS) trial enrolled patients with chronic phase chronic myeloid leukemia (CML-CP) to either imatinib (n=533) or interferon- α (IFN) plus cytarabine (n=553).

Results: Assessing the imatinib arm specifically at the sixth year point, there were no reports of disease progression to accelerated phase (AP) or blast crisis (BC), toxicity profile was unchanged, and cytogenetic response rate was 82%. Estimated event-free survival was 83% and rate of freedom from progression to AP and BC was 93%.

Conclusion: This 6 yr update of IRIS demonstrates the efficacy and safety of imatinib as first-line therapy for CML patients.

Early Response with Dasatinib or Imatinib in Chronic Myeloid Leukemia
Blood 2014;123:494-500

Study: The DASatinib vs. Imatinib Study in treatment-Naïve CML patients (DASISION) trial is a randomized phase 3 trial comparing treatment with dasatinib (n=259) or imatinib (n=260) once daily in patients with newly diagnosed CML in chronic phase.

Results: Dasatinib was associated with superior efficacy during the first year of treatment, including significantly higher complete cytogenetic responses (83% vs. 72%) and major molecular responses (46% vs. 28%) compared to imatinib, respectively. Dasatinib was associated with faster and deeper responses at 3, 6, and 12 mo.

- treatment success is monitored based on therapeutic milestones
 - hematologic: improved WBC and platelet counts, reduced basophils
 - cytogenetic: undetectable Philadelphia-chromosome in the bone marrow
 - molecular: reduction/absence of *bcr-abl* transcripts in periphery and marrow

Prognosis

- survival dependent on response
 - those achieving complete cytogenetic response (CCR) on imatinib by 18 mo of therapy: 6 yr overall survival >90%
 - those who do NOT achieve CCR on imatinib: 6 yr overall survival of 66%
- acute phase (blast crisis – usually within 3-5 yr)
 - 2/3 develop a picture similar to AML
 - ♦ unresponsive to remission induction
 - 1/3 develop a picture similar to ALL
 - ♦ remission induction (return to chronic phase) achievable

Polycythemia Vera

Definition

- stem cell disorder characterized by elevated RBC mass (erythrocytosis) ± increased white cell and platelet production

Clinical Features

- symptoms are secondary to high red cell mass and hyperviscosity (see *Erythrocytosis, H6*)
- bleeding complications: epistaxis, gingival bleeding, ecchymoses, and GI bleeding
 - due to platelet abnormalities
- thrombotic complications: DVT, PE, thrombophlebitis, increased incidence of stroke, MI
 - due to increased blood viscosity, increased platelet number and/or activity
- erythromelalgia (burning pain in hands and feet and erythema of the skin)
 - associated with platelets >400,000/mm³
 - pathognomonic microvascular thrombotic complication in PV and ET
- pruritus, especially after warm bath or shower (40%)
 - due to cutaneous mast cell degranulation and histamine release
- epigastric distress, PUD
 - due to increased histamine from tissue basophils, alterations in gastric mucosal blood flow due to increased blood viscosity
- gout (hyperuricemia)
 - due to increased cell turnover
- characteristic physical findings
 - plethora (ruddy complexion) of face (70%), palms
 - splenomegaly (70%), hepatomegaly (40%)

Investigations

- see *Erythrocytosis, H6*
- must rule out secondary polycythemia
- diagnosis (WHO 2008) requires either both major criteria plus one minor criteria OR the first major criterion plus 2 minor criteria
 - Major Criteria
 1. hemoglobin >18.5 g/dL in men, 16.5 g/dL in women or other evidence of increased red cell volume
 2. presence of JAK2 V617F or other functionally similar mutation such as JAK2 exon 12 mutation
 - Minor Criteria
 1. bone marrow biopsy showing hypercellularity for age with trilineage growth (panmyelosis) with prominent erythroid, granulocytic, and megakaryocytic proliferation
 2. serum erythropoietin level below the reference range for normal
 3. endogenous erythroid colony formation *in vitro*

Treatment

- phlebotomy to keep hematocrit <45%
- hydroxyurea (prior thrombosis or symptoms, severe coronary artery disease, refractory to phlebotomy)
- low-dose Aspirin® (for antithrombotic prophylaxis, will also treat erythromelalgia)
- allopurinol: as needed
- antihistamines: as needed

Prognosis

- 10-20 yr survival with treatment
- complicated by thrombosis, hemorrhage, leukemia transformation (AML)

Erythromelalgia is a pathognomonic microvascular thrombotic complication in PV and ET

Efficacy and Safety of Low-dose Aspirin® in Polycythemia Vera

NEJM 2004;350:114-124

Study: Double-blind, placebo-controlled, RCT.

Participants: 518 patients with polycythemia vera (PV) with no clear indication for, or contraindication to, ASA therapy.

Intervention: Patients received either low-dose ASA 100 mg daily (n=253) or placebo (n=265) and were followed for up to 5 yr.

Primary Outcome: Cumulative rate of (I) nonfatal MI, nonfatal stroke, or death from cardiovascular causes and the cumulative rate of (II) the previous 3 plus PE and major venous thrombosis.

Results: Primary outcomes (I) and (II) were reduced with treatment compared to placebo (RR 0.41; p=0.09 and RR 0.4; p=0.03, respectively). There were no differences in overall or cardiovascular mortality and major bleeding episodes.

Conclusion: Low-dose ASA can safely prevent thrombotic complications in patients with PV.

Cardiovascular Events and Intensity of Treatment in Polycythemia Vera

NEJM 2013;368:22-33

Study: Prospective, RCT, mean follow-up of 28.9 mo. Blinding not described.

Population: 365 patients with JAK2-positive polycythemia vera being treated with phlebotomy, hydroxyurea, or both.

Intervention: Patients were randomized to a target hematocrit <45% (low-hematocrit group) or 45-50% (high-hematocrit group).

Outcome: Composite of time until death from cardiovascular causes of major thrombotic events.

Results: The hazard ratio (HR) for the primary outcome was 3.91 (95% CI 1.45-10.53, p=0.007), while the HR for the primary outcome plus superficial venous thrombosis was 2.69 (95% CI 1.19-6.12, p=0.02) for the high-hematocrit vs. low-hematocrit group.

Conclusions: The hematocrit target of <45% was associated with a lower incidence of CV death, major thrombotic events, and superficial venous thrombosis in patients with polycythemia vera.

Idiopathic Myelofibrosis

Definition

- excessive bone marrow fibrosis leading to marrow failure
- characterized by anemia, extramedullary hematopoiesis, leukoerythroblastosis, teardrop red cells in peripheral blood and hepatosplenomegaly

Epidemiology

- rare, median age at presentation is 65 yr

Pathophysiology

- abnormal myeloid precursor postulated to produce dysplastic megakaryocytes that secrete fibroblast growth factors
 - stimulates fibroblasts and stroma to deposit collagen in marrow
- increasing fibrosis causes early release of hematopoietic precursors leading to:
 - leukoerythroblastic blood film (primitive RBCs and WBCs present in blood)
 - migration of precursors to other sites: extramedullary hematopoiesis (leading to hepatosplenomegaly)
 - mutations in JAK2, c-mpl, and calreticulin define the clone

Clinical Features

- anemia (severe fatigue is most common presenting complaint, pallor on exam in >60%)
- weight loss, fever, night sweats → secondary to hypermetabolic state
- splenomegaly (90%) → secondary to extramedullary hematopoiesis; may cause early satiety
- hepatomegaly (70%) → may get portal HTN
- bone and joint pain → secondary to osteosclerosis, gout
- signs of extramedullary hematopoiesis (depends on organ involved)

Investigations

- CBC: anemia, variable platelets, variable WBC
- biochemistry: increased ALP (liver involvement, bone disease), increased LDH (2° to ineffective hematopoiesis), increased uric acid (increased cell turnover), increased B₁₂ (2° to increased neutrophil mass)
- blood film: leukoerythroblastosis with teardrop RBCs, nucleated RBCs, variable polychromasia, large platelets, and megakaryocyte fragments
- JAK2 PCR
- bone marrow aspirate: “dry tap” in as many as 50% of patients (no blood cells aspirated)
- bone marrow biopsy (essential for diagnosis): fibrosis, atypical megakaryocytic hyperplasia, thickening and distortion of the bony trabeculae (osteosclerosis)

Treatment

- allogeneic stem cell transplant is potentially curative
- JAK2 inhibitors
- symptomatic treatment
 - transfusion for anemia
 - erythropoietin: 30-50% of patients respond
 - androgens (e.g. danazol has shown transient response with response rates of <30%)
 - hydroxyurea for splenomegaly, thrombocytosis, leukocytosis, systemic symptoms
 - α-interferon (as second line therapy)
 - splenectomy (as third line therapy; associated with high mortality and morbidity)
 - radiation therapy for symptomatic extramedullary hematopoiesis, symptomatic splenomegaly
 - thalidomide, and etanercept may improve quality of life and spleen size, but not survival

Prognosis

- International Prognostic Scoring System (IPSS) for IMF uses 5 factors to determine mean survival
 - presence of constitutional symptoms; age >65; hemoglobin <10.0 g/dL; leukocyte count >25,000/mm³; circulating blast cells ≥1%
 - based on the calculated score, a patient's IMF is categorized as “low”, “intermediate 1”, “intermediate 2”, or “high” with a mean survival of 135, 95, 48, and 27 mo respectively
- risk of transformation to AML (8-10%)

Myelofibrosis can be either primary (idiopathic) or occur as a transformation of an antecedent PV or ET

A “leukoerythroblastic” blood film (RBC and granulocyte precursors) implies bone marrow infiltration with malignancy (e.g. leukemias, solid tumor metastases) or fibrosis (e.g. IMF)

IMF typically has a dry BM aspirate and teardrop RBCs (aspiration gives no blood cells)

A Double-Blind, Placebo-Controlled Trial of Ruxolitinib for Myelofibrosis
NEJM 2012;366:799-807

Study: Double-blinded RCT of 309 patients with myelofibrosis randomized to ruxolitinib or placebo. **Outcome:** Primary outcome was reduction in spleen volume of >35% at 24 wk. Secondary outcomes were durability of response, symptom burden, and overall survival.

Results: A greater proportion of patients on ruxolitinib had reduction in spleen volume >35% (41.9% vs. 0.7%) and this was sustained in 67% at 48 wk. Ruxolitinib also led to greater symptom improvement (45% vs. 5.3%) and less mortality (13 vs. 24). There was no difference in rate of discontinuation due to adverse events (11.0% vs. 10.6%) but anemia and thrombocytopenia were more common with ruxolitinib.

Conclusions: Ruxolitinib reduced spleen size, improved symptoms, and improved overall survival, compared with placebo.

Essential Thrombocythemia

Definition

- overproduction of platelets in the absence of recognizable stimulus
- must rule out secondary thrombocythemia

Epidemiology

- increases with age; F:M = 2:1, but F=M at older age

Diagnosis (2008 WHO Criteria) requires meeting all four criteria

- sustained platelet count $>450,000/\text{mm}^3$
- bone marrow biopsy specimen showing proliferation mainly of the megakaryocytic lineage with increased number of enlarged, mature megakaryocytes; no significant increase or left shift of neutrophil granulopoiesis or erythropoiesis
- not meeting WHO criteria for PV, primary myelofibrosis, *bcr-abl* CML, or myelodysplastic syndrome or other myeloid neoplasms
- demonstration of JAK2 V617F (or in its absence another clonal marker), no evidence for reactive thrombocytosis

Clinical Features

- often asymptomatic
- vasomotor symptoms (40%)
 - headache (common), dizziness, syncope
 - erythromelalgia (burning pain of hands and feet, dusky color, usually worse with heat, caused by platelet activation → microvascular thrombosis)
- thrombosis (arterial and venous)
- bleeding (often GI; associated with platelets $>1,000,000/\text{mm}^3$)
- constitutional symptoms, splenomegaly
- pregnancy complications; increased risk of spontaneous abortion
- risk of transformation to AML (0.6-5%), myelofibrosis

Investigations

- CBC: increased platelets; may have abnormal platelet aggregation studies
- JAK2 PCR assay
- bone marrow hypercellularity, megakaryocytic hyperplasia, giant megakaryocytes
- increased K^+ , increased PO_4^{3-} (2° to release of platelet cytoplasmic contents)
- diagnosis: exclude other myeloproliferative disorders and reactive thrombocytosis

Treatment

- low dose ASA if previous history of thrombotic event, ≥ 1 cardiovascular risk factors, older, or symptomatic
- cytoreductive therapy if thrombosis or thrombotic symptoms: hydroxyurea (HU) (1st line therapy), anagrelide, interferon- α , or ^{32}P (age >80 or lifespan <10 yr)
- splenectomy not recommended (increased risk of bleeding episodes, thrombosis)

Etiology of Secondary Thrombocythemia

- Infection
- Inflammation (IBD, arthritis)
- Malignancy
- Hemorrhage
- Iron deficiency
- Hemolytic anemia
- Post splenectomy
- Post chemotherapy

Anagrelide vs. Hydroxyurea for Essential Thrombocythemia: ANAHYDRET Study, A Randomized Controlled Trial

Blood 2013;121:1720-8

Study: Prospective, non-inferiority, RCT. Majority of patients followed beyond 1 yr.

Population: 259 previously untreated, high-risk patients with essential thrombosis as per the WHO guidelines.

Intervention: Patients were randomized to receive either non-immediate release formulation of anagrelide or hydroxyurea.

Outcome: Examined platelet counts, hemoglobin levels, leukocyte counts, and occurrence of ET-related events.

Results: The hazard ratio (HR) of developing thrombocythemia was 1.19 (95% CI 0.61-2.30). The HR for a reduction of hemoglobin was 1.03 (95% CI 0.57-1.81), and 0.92 (95% CI 0.57-1.46) for leukocytosis. There was no statistical difference in occurrence of major or minor arterial or venous thrombosis, severe or minor bleeding events, or rate of discontinuation between the two arms.

Conclusions: In patients with ET, anagrelide is non-inferior to hydroxyurea in the prevention of thrombotic complications.

There is an asymptomatic "benign" form of essential thrombocythemia with a stable or slowly rising platelet count. Treatment includes observation, ASA, sulfipyrazone, or dipyridamole

75% of ALL occurs in children <6 yr old; second peak at age 40

Lymphoid Malignancies

Acute Lymphoblastic Leukemia

Definition

- malignant disease of the bone marrow in which early lymphoid precursors proliferate and replace the normal hematopoietic cells of the marrow
- WHO subdivides ALL into two types depending on cell of origin
 - B-cell: precursor B lymphoblastic leukemia
 - T-cell: precursor T lymphoblastic leukemia
- The French-American-British (FAB) classification (L1, L2, L3) is no longer encouraged, as morphology is not prognostic and inferior to immunophenotyping and cytogenetics

Clinical Features

- see *Acute Myeloid Leukemia*, H37 for full list of symptoms
- distinguish ALL from AML based on Table 32
- clinical symptoms usually secondary to:
 - bone marrow failure:** anemia, neutropenia (50% present with fever; also infections of oropharynx, lungs, perianal region), thrombocytopenia
 - organ infiltration:** tender bones, lymphadenopathy, hepatosplenomegaly, meningeal signs (headache, N/V, visual symptoms; especially in ALL relapse)

Investigations

- CBC: increased leukocytes $>10 \times 10^9/\text{L}$ (occurs in 50% of patients); neutropenia, anemia, or thrombocytopenia
- may have increased uric acid, K^+ , PO_4^{3-} , Ca^{2+} , LDH
- PT, aPTT, fibrinogen, D-dimers for DIC
- leukemic lymphoblasts lack specific morphological (no granules) or cytochemical features, therefore diagnosis depends on immunophenotyping
- cytogenetics: Philadelphia (Ph) chromosome in $\sim 25\%$ of adult ALL cases

- CXR: patients with ALL may have a mediastinal mass
- LP prior to systemic chemotherapy to assess for CNS involvement (ensure adequate platelet count and PT/PTT)

Treatment

- eliminate abnormal cloned cells
 1. **Induction:** to induce complete remission (undetectable leukemic blasts, restore normal hematopoiesis)
 2. **Consolidation and/or intensification chemotherapy**
 - consolidation: continuing same chemotherapy to eliminate subclinical leukemic cells
 - intensification: high doses of different (non-cross-reactive) chemotherapy drugs to eliminate cells with resistance to primary treatment
 3. **Maintenance chemotherapy:** low dose intermittent chemotherapy over prolonged period (2-3 yr) to prevent relapse
 4. **Prophylaxis: Methotrexate (intrathecal or systemic) or CNS radiation therapy**
- hematopoietic stem cell transplantation: potentially curative (due to pre-implant myeloablative chemoradiation and post-implant graft-versus-leukemia effect) but relapse rates and non-relapse mortality high

Prognosis

- depends on response to initial induction or if remission is achieved following relapse
- good prognostic factors: young, WBC $<30 \times 10^9/L$, T-cell phenotype, absence of Ph chromosome, early attainment of complete remission
- achievement of first remission: 60-90%
- childhood ALL: 80% long-term remission (>5 yr)
 - higher cure rates in children because of better chemotherapy tolerance, lower prevalence of *bcr-abl* fusion gene (associated with chemotherapeutic resistance)
- adult ALL: 30-40% 5 yr survival

Table 32. Differentiating AML From ALL

AML	ALL
Big people (adults)	Small people (kids) but the incidence increases with age over 20
Big blasts	Small blasts
Big mortality rate	Small mortality rate (kids)
Lots of cytoplasm	Less cytoplasm
Lots of nucleoli (3-5)	Few nucleoli (1-3)
Lots of granules and Auer rods	No granules
Maturation defect beyond myeloblast or promyelocyte	Maturation defect beyond lymphoblast

Treatment of ALL vs. AML

- No proven benefit of maintenance chemotherapy in AML
- No routine CNS prophylaxis in AML

To Differentiate AML From ALL:
Remember **Big** and **SmALL**
(see Table 32)

Lymphomas

Definition

- collection of lymphoid malignancies in which malignant lymphocytes accumulate at lymph nodes and lymphoid tissues
 - leading to lymphadenopathy, extranodal disease, and constitutional symptoms

Table 33. Ann Arbor System for Staging Lymphomas

Stage	Description
I	Involvement of a single lymph node region or extralymphatic organ or site
II	Involvement of two or more lymph node regions or an extralymphatic site and one or more lymph node regions on same side of diaphragm
III	Involvement of lymph node regions on both sides of the diaphragm; may or may not be accompanied by single extra lymphatic site or splenic involvement
IV	Diffuse involvement of one or more extralymphatic organs including bone marrow

- subtypes
 - A = absence of B-symptoms (see *Approach to Lymphadenopathy*, H12)
 - B = presence of B-symptoms

- Ann Arbor staging can be used for both Hodgkin and non-Hodgkin lymphoma, but grade/histology is more important for non-Hodgkin lymphoma because the outcome differs significantly depending on type of lymphoma
- Prognostic scores are different for indolent vs. aggressive lymphomas
- Highly aggressive lymphomas act like acute leukemias

Hodgkin is distinguished from non-Hodgkin lymphoma by the presence of Reed-Sternberg cells

Table 34. Chromosome Translocations

Translocation	Gene Activation	Associated Neoplasm
t(8;14)	c-myc activation	Burkitt's lymphoma
t(14;18)	bcl-2 activation	Follicular lymphoma
t(9;22)	Philadelphia chromosome (<i>bcr-abl</i> hybrid)	CML, ALL in adults (25% of the time)
t(11;14)	Overexpression of cyclin D1 protein	Mantle cell lymphoma

**American Society of Hematology
Choosing Wisely Recommendation**
Limit surveillance CT scans in asymptomatic patients after curative-intent treatment for aggressive lymphoma

Hodgkin lymphoma classically presents as a painless, non-tender, firm, rubbery enlargement of superficial lymph nodes, most often in the cervical region

Common Chemotherapeutic Regimens

CHOP: cyclophosphamide, hydroxydoxorubicin (Adriamycin®), vincristine (Oncovin®), prednisone

VAD: vincristine, adriamycin, dexamethasone

ABVD: adriamycin, bleomycin, vinblastine, dacarbazine

BEACOPP: bleomycin, etoposide, adriamycin, cyclophosphamide, vincristine, procarbazine, and prednisone

Hodgkin Lymphoma

Definition

- malignant proliferation of lymphoid cells with Reed-Sternberg cells (thought to arise from germinal center B-cells)

Epidemiology

- bimodal distribution with peaks at 20 yr and >50 yr
- association with Epstein-Barr virus in up to 50% of cases, causal role not determined

Clinical Features

- asymptomatic lymphadenopathy (70%)
 - non-tender, rubbery consistency
 - cervical/supraclavicular (60-80%), axillary (10-20%), inguinal (6-12%)
- splenomegaly (50%) ± hepatomegaly
- mediastinal mass
 - found on routine CXR, may be symptomatic (cough)
 - rarely may present with SVC syndrome, pleural effusion
- systemic symptoms
 - B symptoms (especially in widespread disease; fever in 30%), pruritus
- non-specific/paraneoplastic
 - alcohol-induced pain in nodes, nephrotic syndrome
- starts at a single site in lymphatic system (node), spreads first to adjacent nodes
 - disease progresses in contiguity with lymphatic system

Investigations

- CBC
 - anemia (chronic disease, rarely hemolytic), eosinophilia, leukocytosis, platelets normal or increased early, decreased in advanced disease
- biochemistry
 - HIV serology
 - LFTs (liver involvement)
 - RFTs (prior to initiating chemotherapy)
 - ALP, Ca²⁺ (bone involvement)
 - ESR, LDH (monitor disease progression)
- imaging
 - CXR, CT chest (lymph nodes, mediastinal mass), CT abdomen/pelvis (liver or spleen involvement), gallium scan (assess treatment response), PET scans
 - cardiac function assessment (MUGA scan or echocardiography): for patients at high risk of pre-treatment cardiac disease (age >60, history of HTN, CHF, PUD, CAD, MI, CVA), treatment can be cardiotoxic
 - PFTs: if history of lung disease (COPD, smoking, previous radiation to lung)
- excisional lymph node biopsy confirms diagnosis
- bone marrow biopsy to assess marrow infiltration (only necessary if B-symptoms, stage III or IV, bulky disease or cytopenia)

Treatment

- stage I-II: chemotherapy (ABVD) followed by involved field radiotherapy (XRT)
- stage III-IV: chemotherapy (ABVD) with XRT for bulky disease
- relapse, resistant to therapy: high dose chemotherapy, bone marrow transplant
 - new imaging modalities increasingly used including PET scans used to follow response to treatment

Complications of Treatment

- cardiac disease: secondary to XRT, adriamycin is also cardiotoxic
- pulmonary disease: secondary to bleomycin (interstitial pneumonitis)
- infertility: recommend sperm banking
- secondary malignancy in irradiated field
 - <2% risk of MDS, AML (secondary to treatment, usually within 8 yr)
 - solid tumors of lung, breast; >8 yr after treatment
 - non-Hodgkin lymphoma
- hypothyroidism: post XRT

Prognosis

- Hasenclever adverse prognostic factors
 1. serum albumin <40 g/L (4 g/dL)
 2. hemoglobin <105 g/L (10.5 g/dL)
 3. male
 4. stage IV disease
 5. age \geq 45 yr
 6. leukocytosis (WBC >1,500/mm³)
 7. lymphocytopenia (lymphocytes <60/mm³ or <8% of WBC count or both)
- prognostic score
 - each additional adverse prognostic factor decreases freedom from progression at 5 yr (FFP)

International Prognostic Factors Project 1998

Prognostic Factors	FFP
0	84%
1	77%
2	67%
3	60%
4	51%
5-7	42%

FFP = freedom from progression at 5 yr

Non-Hodgkin Lymphoma

Definition

- malignant proliferation of lymphoid cells of progenitor or mature B- or T-cells

Classification

- multiple classification systems exist at present and may be used at different centers
- can originate from both B- (85%) and T- or NK- (15%) cells
 - B-cell NHL: e.g. diffuse large B-cell lymphoma, follicular lymphoma, Burkitt's lymphoma, mantle cell lymphoma
 - T-cell NHL: e.g. mycosis fungoides, anaplastic large cell lymphoma
- WHO/REAL classification system: 3 categories of NHLs based on natural history
 - **indolent** (35-40% of NHL): e.g. follicular lymphoma, small lymphocytic lymphoma/CLL
 - **aggressive** (~50% of NHL): e.g. diffuse large B-cell lymphoma
 - ♦ Note: mantle cell lymphoma (7% of NHL) may have features of aggressive or indolent lymphoma
 - **highly aggressive** (~5% of NHL): e.g. Burkitt's lymphoma

Clinical Features

- painless superficial lymphadenopathy, usually >1 lymph node region
- usually presents as widespread disease (exception is aggressive lymphoma)
- constitutional symptoms not as common as in Hodgkin lymphoma
- cytopenia: anemia \pm neutropenia \pm thrombocytopenia can occur when bone marrow is involved
- abdominal signs
 - hepatosplenomegaly
 - retroperitoneal and mesenteric involvement (second most common site of involvement)
- oropharyngeal involvement in 5-10% with sore throat and obstructive apnea
- extranodal involvement: most commonly GI tract; also testes, bone, kidney
- CNS involvement in 1% (often with HIV)

Investigations

- CBC
 - normocytic normochromic anemia
 - autoimmune hemolytic anemia
 - advanced disease: thrombocytopenia, neutropenia, and leukoerythroblastic anemia
- peripheral blood film may show lymphoma cells
- flow cytometry of peripheral blood is valuable for low-grade NHL
- biochemistry
 - increase in uric acid
 - abnormal LFTs in liver metastases
 - increased LDH (rapidly progressing disease, poor prognostic factor)
- CXR, CT neck, abdomen, pelvis for staging
- PET is useful for monitoring response to treatment and evaluation of residual tumor following therapy in aggressive histological disease
- diagnosed by
 - lymph node biopsy: excisional biopsy preferred, FNA unreliable
 - bone marrow biopsy: not optimal for diagnosis as BM may not be involved

Treatment

- localized disease (e.g. GI, brain, bone, head and neck)
 - radiotherapy to primary site and adjacent nodal areas
 - adjuvant chemotherapy
 - surgery: splenic marginal zone lymphoma

NHL: Associated Conditions

- Immunodeficiency (e.g. HIV)
- Autoimmune diseases (e.g. SLE)
- Infections (e.g. EBV)

CHOP-Like Chemotherapy With or Without Rituximab in Young Patients with Good-Prognosis Diffuse Large B-Cell Lymphoma (MInT)

Lancet Oncol 2011;12:1013-1022

Study: International RCT with a median follow-up of 72 mo.

Participants: 824 patients with good-prognosis diffuse large B-cell lymphoma who had \leq 1 risk factor, stage II-IV disease, or stage I disease with bulk (age 18-60 yr).

Intervention: Patients received either 6 cycles of CHOP-like chemotherapy and rituximab (CCR; n=413) or 6 cycles of CHOP-like chemotherapy alone (CLC; n=411). Bulky and extranodal sites received additional radiotherapy.

Primary Outcome: Event-free survival.

Results: Patients receiving CCR had an increased 6 yr event-free survival compared with the CLC group (74.3% vs. 55.8%; $p<0.0001$). Event-free survival was affected by treatment group, presence of bulky disease, and age-adjusted International Prognostic Index (IPI). Overall survival was affected by treatment group and presence of bulky disease. Within the CCR group, a favorable subgroup (IPI=0, no bulk) and less favorable subgroup (IPI=1 or bulk, or both) could be defined; event-free survival was 84.3% vs. 71.0%.

Conclusion: Rituximab added to six cycles of CHOP is an effective treatment for young patients with good-prognosis diffuse large B-cell lymphoma. The definition of two prognostic subgroups allows a more refined therapeutic approach to these patients than does assessment by IPI alone.

- **indolent lymphoma:** goal of treatment is symptom management
 - watchful waiting
 - radiation therapy for localized disease
 - bendamustine plus rituximab, an anti-CD20 antibody, is superior to CHOP + rituximab (CHOP-R) for advanced stage disease (StLL trial)
- **aggressive lymphoma:** goal of treatment is curative
 - combination chemotherapy: CHOP is mainstay, plus rituximab if B-cell lymphoma; different regimens for mantle cell lymphoma
 - radiation for localized/bulky disease
 - CNS prophylaxis with high-dose methotrexate if certain sites involved (testicular, nasopharyngeal)
 - relapse, resistant to therapy: high dose chemotherapy, BMT
- **highly aggressive lymphoma**
 - Burkitt lymphoma: short bursts of intensive chemotherapy
 - “CODOX-M” chemotherapy regimen also often used ± IVAC
 - CNS prophylaxis and tumor lysis syndrome prophylaxis

Complications

- hypersplenism
- infection
- autoimmune hemolytic anemia and thrombocytopenia
- vascular obstruction (from enlarged nodes)
- tumor lysis syndrome (particularly in very aggressive lymphoma) – see H52

Prognosis

- follicular lymphoma: Follicular Lymphoma International Prognostic Index is used (5 adverse prognostic factors): age >60; number of nodal areas >4; elevated LDH; Ann Arbor stage III-IV; hemoglobin <120 g/L
 - based on calculated risk, mean 5 yr survival ranges from 53-91%
 - rarely curative, typically relapsing and remitting course with risk of transformation to aggressive lymphoma such as diffuse large B-cell lymphoma
- diffuse large B-cell lymphoma: The International Prognostic Factor Index is used (5 adverse prognostic factors): age >60; Ann Arbor stage (III-IV); performance status (ECOG/Zubrand 2-4); elevated LDH; >1 extranodal site
 - based on calculated risk, mean 5 yr survival ranges from 26-73%
 - has ~40% rate of cure

Table 35. Characteristics of Select Non-Hodgkin Lymphomas

	Follicular Lymphoma	Diffuse Large B-Cell Lymphoma (DLBCL)	Burkitt Lymphoma	Mantle Cell Lymphoma
Percentage of NHLs	22-30%	33%	<1% adult NHLs 30% childhood NHLs	6%
Genetic Mutation	Bcl-2 activation	Bcl-2, Bcl-6, MYC rearrangements	c-myc activation	Overexpression of cyclin D1 (Bcl-1 activation)
Classification	Indolent	Aggressive (high-grade)	Very aggressive	Indolent
Risk Factors	Middle-age – elderly	Previous CLL (Richter's transformation: 5% CLL patients progress to DLBCL)	1. Endemic: African origin, EBV-associated 2. Sporadic: no EBV 3. HIV-related: AIDS-defining illness	Male (M:F = 4:1)
Clinical Features	<ul style="list-style-type: none"> • Widespread painless LAD* ± bone marrow involvement • Frequent transformation to aggressive lymphoma • Very responsive to chemoradiation treatment 	<ul style="list-style-type: none"> • Rapidly progressive LAD and extranodal infiltration • 50% present at stage I/II, 50% widely disseminated 	<ul style="list-style-type: none"> • Endemic form: massive jaw LAD • “Starry-sky” histology • High risk of tumor lysis syndrome upon treatment 	<ul style="list-style-type: none"> • Often presents Stage IV with palpable LAD • Involvement of GI tract (lymphomatosis polyposis), Waldeyer's Ring • Extremely aggressive, 5 yr survival 25%

*LAD = lymphadenopathy

Malignant Clonal Proliferations of Mature B-Cells

Table 36. Characteristics of B-Cell Malignant Proliferation

	CLL	Macroglobulinemia	Myeloma
Cell Type	Lymphocyte	Plasmacytoid	Plasma cell
Protein	IgM if present	IgM	IgG, A, light chain (rarely M, D, or E)
Lymph Nodes	Very common	Common	Rare
Hepatosplenomegaly	Common	Common	Rare
Bone Lesions	Rare	Rare	Common
Hypercalcemia	Rare	Rare	Common
Renal Failure	Rare	Rare	Common
Immunoglobulin Complications	Common	Rare	Rare

Rouleaux formation on peripheral blood smear, if not artifact, denotes hyperglobulinemia (but not necessarily monoclonality)

Chronic Lymphocytic Leukemia

Definition

- indolent disease characterized by clonal malignancy of mature B-cells

Epidemiology

- most common leukemia in Western world
- mainly older patients; median age 65 yr
- M>F

Pathophysiology

- accumulation of neoplastic lymphocytes in blood, bone marrow, lymph nodes, and spleen

Clinical Features

- 25% asymptomatic (incidental finding)
- 5-10% present with B-symptoms (≥ 1 of: unintentional weight loss $\geq 10\%$ of body weight within previous 6 mo, temperature $>38^\circ\text{C}$ or night sweats for ≥ 2 wk without evidence of infection, extreme fatigue)
- lymphadenopathy (50-90%), splenomegaly (25-55%), hepatomegaly (15-25%)
- immune dysregulation: autoimmune hemolytic anemia (Coombs positive), ITP, hypogammaglobulinemia \pm neutropenia
- bone marrow failure: late, secondary to marrow involvement by CLL cells

Investigations

- CBC: clonal population of CLL lymphocytes $>5 \times 10^9/\text{L}$
- peripheral blood film
 - lymphocytes are small and mature
 - smudge cells
- flow cytometry (CD5, CD20, CD23, etc.)
- cytogenetics: FISH (dictates response therapy and prognosis)
- bone marrow aspirate
 - lymphocytes $>30\%$ of all nucleated cells
 - infiltration of marrow by lymphocytes in 4 patterns: nodular (10%), interstitial (30%), diffuse (35%, worse prognosis), or mixed (25%)

Smudge cells are artifacts of damaged lymphocytes from slide preparation

Natural History and Treatment

- natural history: indolent but incurable, with slow progression; thus select gentlest treatment that will control symptoms
 - observation if early, stable, asymptomatic
 - intermittent chlorambucil or fludarabine chemotherapy combined with rituximab, chlorambucil in the elderly
 - corticosteroids, IVIg: especially for autoimmune phenomena
 - radiotherapy
- small minority present with aggressive disease; usually associated with chromosomal abnormalities (e.g. p53 deletion)
- 9 yr median survival, but varies greatly

- prognosis predicted by Rai staging
 - low risk: lymphocytosis in blood and bone marrow only
 - intermediate risk: lymphocytosis with enlarged nodes in any site or splenomegaly, hepatomegaly
 - high risk: lymphocytosis with disease-related non-immune-mediated anemia (<11.0 g/dL) or thrombocytopenia ($<100,000/\text{mm}^3$)
- molecular therapies
 - Idelalisib – PI3K inhibitor (not FDA-approved)
 - Ibrutinib – BTK (Bruton's tyrosine kinase) inhibitor (FDA-approved in relapsed setting)

Complications

- bone marrow failure
- immune complications: AIHA, ITP, immune deficiency (hypogammaglobulinemia, impaired T-cell function)
- polyclonal or monoclonal gammopathy (often IgM)
- hyperuricemia with treatment
- 5% undergo Richter's transformation: aggressive transformation to diffuse large B-cell lymphoma (see Table 35)

Multiple Myeloma

Definition

- neoplastic clonal proliferation of plasma cells producing a monoclonal immunoglobulin resulting in end organ dysfunction
- usually single clone of plasma cells, although biclonal myeloma also occurs; rarely non-secretory

Epidemiology

- incidence 3 per 100,000, most common plasma cell malignancy
- increased frequency with age; median age of diagnosis is 68 yr; M>F

Pathophysiology

- malignant plasma cells secrete monoclonal antibody
 - 95% produce M protein (monoclonal Ig = identical heavy chain + identical light chain, or light chains only)
 - ♦ IgG 50%, IgA 20%, IgD 2%, IgM 0.5%
 - ♦ 15-20% produce free light chains or light chains alone found in either:
 - serum as an increase in the quantity of either kappa or lambda light chain (with an abnormal kappa:lambda ratio)
 - urine has Bence-Jones protein
 - <5% are non-secretory

Clinical Features and Complications

- bone disease: pain (usually back), bony tenderness, pathologic fractures
 - lytic lesions are classical (skull, spine, proximal long bones, ribs)
 - increased bone resorption secondary to osteoclast activating factors such as PTHrP
- anemia: weakness, fatigue, pallor
 - secondary to bone marrow suppression
- weight loss
- infections
 - usually *S. pneumoniae* and Gram-negatives
 - secondary to suppression of normal plasma cell function
- hypercalcemia: N/V, confusion, constipation, polyuria, polydipsia
 - secondary to increased bone turnover
- renal disease/renal failure
 - most frequently causes cast nephropathy (see [Nephrology](#), NP30)
- bleeding
 - secondary to thrombocytopenia, may see petechiae, purpura
 - can also be caused by acquired von Willebrand disease
- extramedullary plasmacytoma
 - soft tissue mass composed of monoclonal plasma cells, purplish color
- hyperviscosity: may manifest as headaches, stroke, angina, MI
 - secondary to increased viscosity caused by M protein
- amyloidosis
 - accumulation of insoluble fibrillar protein (Ig light chain) in tissues; can cause infiltration of any organ system: cardiac infiltration – diastolic dysfunction, cardiac arrhythmias, syncope, sudden death; GI involvement – malabsorption, beefy large or laterally scalloped tongue; neurologic involvement – orthostatic hypotension, carpal tunnel syndrome
 - may cause Factor X deficiency if fibrils bind Factor X → bleeding (raccoon eyes)

Multiple Myeloma

CRAB

Increased Calcium

Renal failure

Anemia

Bony lesions (lytic lesions or osteoporosis felt to be caused by myeloma)

Routine urinalysis will not detect light chains as dipstick detects albumin. Need sulfosalicylic acid or 24 h urine protein for immunofixation or electrophoresis

Amyloid

The general term for a variety of proteinaceous materials that have a similar structural organization and are abnormally deposited in tissues

Found in a variety of clinical disorders and can cause systemic (e.g. MM [light chains]) or localized amyloidosis (e.g. Alzheimer disease [AB amyloid])

- neurologic disease: muscle weakness, pain, paresthesias
 - radiculopathy caused by vertebral fracture, extramedullary plasmacytoma
 - spinal cord compression (10-20% of patients) is a medical emergency

Investigations

- CBC
 - normocytic anemia, thrombocytopenia, leukopenia
 - rouleaux formation on peripheral film
- biochemistry
 - increased Ca^{2+} , increased ESR, decreased anion gap, increased Cr, albumin, β_2 -microglobulin (as part of staging), proteinuria (24 h urine collection)
- monoclonal proteins
 - serum protein electrophoresis (SPEP): demonstrates monoclonal protein spike in serum in 80% (i.e. M protein)
 - urine protein electrophoresis (UPEP): demonstrates light chains in urine = Bence-Jones protein (15% secrete only light chains)
 - immunofixation: demonstrates M protein and identifies Ig type; also identifies light chains
 - serum free light chain quantification: kappa and lambda light chains, calculated ratio
- bone marrow aspirate and biopsy
 - often focal abnormality, greater than 10% plasma cells, abnormal morphology, clonal plasma cells; send for FISH or cytogenetics (prognostic implications)
- skeletal series (x-rays), MRI if symptoms of cord compression
 - presence of lytic lesions and areas at risk of pathologic fracture
 - bone scans are not useful since they detect osteoblast activity
- β_2 -microglobulin, LDH, and CRP are poor prognosticators

Light Chain Disease

15% of MM produce only light chains. Renal failure is a major problem. Kappa > lambda light chain has better prognosis

Diagnosis

- International Myeloma Working Group Criteria
 1. serum or urinary monoclonal protein
 2. presence of clonal plasma cells in bone marrow or a plasmacytoma
 3. presence of end-organ damage related to plasma cell dyscrasia, such as
 - ♦ increased serum Ca^{2+}
 - ♦ lytic bone lesions or osteoporosis
 - ♦ anemia
 - ♦ renal failure

Treatment

- treatment is non-curative
- treatment goals
 - improvement in quality of life (improve anemia, reverse renal failure, bony pain)
 - prevention of progression and complications
 - increase overall survival
- autologous stem cell transplant as consolidation therapy
 - usually preceded by 4-6 mo of cytoreductive therapy: steroid based with novel agents
 - (i.e. immunomodulatory drugs or proteasome inhibitors)
- chemotherapy if >65 yr old or transplant-ineligible
 - melphalan, prednisone, and novel agent (i.e. bortezomib)
- dexamethasone and bortezomib if ARF; bortezomib \pm dexamethasone in light chain amyloidosis
- supportive management
 - bisphosphonates for those with osteopenia or lytic bone lesions (requires renal dosing)
 - local XRT for bone pain, spinal cord compression
 - kyphoplasty for vertebral fractures to improve pain relief and regain height
 - treat complications: hydration for hypercalcemia and renal failure, bisphosphonates for severe hypercalcemia, prophylactic antibiotics, erythropoietin for anemia, DVT prophylaxis
- all patients will relapse; choice of retreatment regimen depends on duration of remission, organ involvement, patient's comorbidities, and preferences

Prognosis

- International Staging System (β_2 -microglobulin and albumin) used to stage and estimate prognosis
 - cytogenetic profile (i.e. p53 mutation associated with poor survival and resistance to chemotherapy)
- median survival based on stage, usually 16-70 mo

Monoclonal Gammopathy of Unknown Significance

Definition

- presence of M protein in serum in absence of any clinical or laboratory evidence of a plasma cell dyscrasia or lymphoproliferative disorders
 - incidence: 0.15% in general population, 5% of people >70 yr of age
 - asymptomatic

Diagnosis

- presence of a serum monoclonal protein (M protein) at a concentration <3.0 g/dL
- <10% plasma cells in bone marrow
- absence of hyperCalcemia, Renal insufficiency, Anemia, Bony disease related to the plasma cell proliferative process (absence of "CRAB")
- 0.3-1% of patients develop a hematologic malignancy each year
 - patients with M protein peak ≥ 1.5 g/dL or patients with IgA or IgM MGUS are at higher risk of malignant transformation
 - patients with abnormal serum free light chains ratio are at increased risk of malignant transformation
- monitor with annual history, physical, CBC, Cr, calcium, albumin, serum protein electrophoresis (considered pre-malignant)

Serum Free Light Chain Ratio is an Independent Risk Factor for Progression in MGUS
Blood 2005;106:812-817

Purpose: To determine whether the presence of monoclonal free kappa or lambda immunoglobulin light chains in MGUS increases the risk of progression to malignancy.

Methods: Retrospective study with median follow-up of 15 yr. Baseline serum samples obtained from 1,383 MGUS patients seen at the Mayo clinic between 1960-1994. 1,148 baseline samples were obtained within 30 d of diagnosis.

Results: Malignant progression had occurred in 87 (7.6%) patients. In 379 (33%) patients, an abnormal serum free light chain (FLC) ratio was detected. There was a significantly higher risk of progression in patients with an abnormal FLC ratio relative to patients with a normal ratio (hazard ratio, 3.5; 95% CI 2.3-5.5; $p < 0.001$). This finding was independent of the size and type of the serum monoclonal (M) protein. In high-risk MGUS patients (abnormal serum FLC ratio, non-IgG MGUS, high serum M protein level [≥ 1.5 gm/dL]), the risk of progression at 20 yr was 58% compared to 37% in high-intermediate-risk MGUS (two risk factors), 21% low-intermediate risk (with one risk factor), and 5% low-risk (no risk factors).

Conclusions: The presence of an abnormal FLC ratio is a clinically and statistically significant predictor of progression in MGUS. The low-risk subset of patients with MGUS accounts for 40% of all MGUS patients and have a small lifetime risk of progression, thus less follow-up can be justified.

Waldenstrom's macroglobulinemia accounts for 85% of all cases of hyperviscosity syndrome

Lymphoplasmacytic Lymphoma (Waldenstrom's Macroglobulinemia)

Definition

- proliferation of lymphoplasmacytoid cells
 - presence of monoclonal IgM paraprotein

Clinical Features

- chronic disorder of elderly patients; median age 64 yr
- symptoms: weakness, fatigue, bleeding (oronasal), weight loss, recurrent infections, dyspnea, CHF (triad of anemia, hyperviscosity, plasma volume expansion), neurological symptoms, peripheral neuropathy, cerebral dysfunction
- signs: pallor, splenomegaly, hepatomegaly, lymphadenopathy, retinal lesions
- key complication to avoid: hyperviscosity syndrome
 - because IgM (unlike IgG) confined largely to intravascular space

Investigations and Diagnosis

- bone marrow shows plasmacytoid lymphocytes
- bone lesions usually not present
- blood work rarely see hypercalcemia
- cold hemagglutinin disease possible: Raynaud's phenomenon, hemolytic anemia precipitated by cold weather
- normocytic anemia, rouleaux, high ESR if hyperviscosity not present

Management

- R-CVP, alkylating agents (chlorambucil), nucleoside analogues (fludarabine), thalidomide, rituximab, or combination therapy
- corticosteroids
- plasmapheresis for hyperviscosity: acute reduction in serum IgM

Complications of Hematologic Malignancies

Hyperviscosity Syndrome

Definition

- refers to clinical sequelae of increased blood viscosity (when relative serum viscosity >5-6 units), resulting from increased circulating serum Igs or from increased cellular blood components in hyperproliferative disorders (e.g. multiple myeloma, leukemia, PV)
- Waldenstrom's macroglobulinemia accounts for 85% of cases

Clinical Features

- hypervolemia causing: CHF, headache, lethargy, dilutional anemia
- CNS symptoms due to decreased cerebral blood flow: headache, vertigo, ataxia, stroke
- retina shows venous engorgement and hemorrhages
- bleeding diathesis
 - due to impaired platelet function, absorption of soluble coagulation factors (e.g. nasal bleeding, oozing gums)
- ESR usually very low

Treatment

- plasmapheresis, chemotherapy

Tumor Lysis Syndrome

Definition

- group of metabolic complications that result from spontaneous or treatment-related breakdown of cancer cells
- more common in diseases with large tumor burden and high proliferative rate (high grade lymphoma, leukemia)

Clinical Features

- metabolic abnormalities
 - cells lyse, releasing K^+ , uric acid, PO_4^{3-} (increased levels)
 - PO_4^{3-} binds Ca^{2+} (decreased Ca^{2+})
- complications
 - lethal cardiac arrhythmia (increased K^+)
 - acute renal failure (urate nephropathy, see [Nephrology, NP30](#))

**Treatment**

- prevention
 - aggressive IV hydration
 - alkalization of the urine
 - allopurinol or rasburicase
 - correction of pre-existing metabolic abnormalities
- dialysis

Blood Products and Transfusions

Blood Products

- RBCs, platelets and coagulation factors (frozen plasma [FP], cryoprecipitate, factor concentrates) are available for transfusion
- donated blood (1 U = 450-500 mL) is fractionated into these various components
 - centrifugation separates whole blood into RBCs and platelet-rich plasma
 - platelet-rich plasma is further fractionated into platelets and plasma
 - ♦ need to pool together multiple units to obtain therapeutic amounts
 - ♦ FP (previously known as FFP) is plasma frozen within 24 h of collection
 - ♦ cryoprecipitate is the high MW precipitate generated when FP is thawed at low temperatures

Specialized Products

- irradiated blood products
 - prevent proliferation of donor T-cells in potential or actual BMT recipients
 - used for immunocompromised patients or for patients on purine analogue chemotherapy, first-degree relatives, HLA-matched products and intrauterine transfusions, Hodgkin lymphoma
- CMV-negative blood products
 - potential transplant recipients
 - neonates
 - AIDS patients
 - seronegative pregnant women

**Blood Groups**

Group	Antigen (on RBC)	Antibody (in serum)
O	H	Anti-A, anti-B
A	A	Anti-B
B	B	Anti-A
AB	A and B	Nil

Red Blood Cells

Packed Red Blood Cells

- stored at 4°C
- transfuse within 42 d of collection, otherwise cell lysis may result in hyperkalemia
- infuse each unit over 2 h, max of 4 h

Indications for packed RBC Transfusion

- Hb <7.0 g/dL; this may change as per patient's tolerance or symptoms
 - maintain Hb between 7.0 and 10.0 g/dL during active bleeds
- consider maintaining a higher Hb for patients with:
 - CAD/unstable coronary syndromes
 - uncontrolled, unpredictable bleeding
 - impaired pulmonary function
 - increased O₂ consumption

Selection of Red Cells for Transfusion

- when a need for RBC transfusion is anticipated, the following should be ordered
 - group and screen: determines the blood group and Rh status of the recipient as well as the presence of autoantibodies vs. major/minor blood group antigens in the patient's serum
 - crossmatch: involves mixing the recipient's blood with potential donor blood and looking for agglutination (takes 30-45 min)
- when blood is required, several options are available
 - 1st line: fully crossmatched blood, electronic crossmatch is becoming more widely used (not always available in emergency situations)
 - 2nd line: donor blood of the same group and Rh status as the recipient
 - 3rd line: O- blood for females of reproductive age; O+ blood for all others

1 unit of pRBC will increase Hb by approximately 10 g/L or increase Hct by 4%

American Society of Hematology Choosing Wisely Recommendation

Do not transfuse more than the minimum number of RBC units necessary to relieve symptoms of anemia or to return the patient to a safe hemoglobin range (70-80 g/L) in stable noncardiac patients

Transfusion Requirements in Critical Care (TRICC)

NEJM 1999;340:409-417

Study: Multicenter, RCT.

Participants: 838 critically ill patients with euvolemia after initial treatment and hemoglobin less than 9 g/dL within 72 h of ICU admission.
Intervention: Patients receiving a transfusion followed either (1) a restrictive strategy (RS; n=418) in which red cells were transfused if hemoglobin was less than 7.0 g/dL and then maintained at 7-9 g/dL or (2) a liberal strategy (LS; n=420) in which transfusions occurred when the hemoglobin was less than 10.0 g/dL and then maintained at 10-12 g/dL.

Primary Outcome: Mortality at 30 d and severity of organ dysfunction.

Results: Mortality rates at 30 d were similar between groups. However, mortality rates were significantly lower with the RS among less acutely ill patients (8.7% and RS group and 16.1% in LS group; p=0.03) and among those less than 55 yr of age (5.7% RS and 13% LS; p=0.02), but did not differ in a subgroup with clinically significant cardiac disease.

Conclusion: A RS of red cell transfusion is at least as effective as, and possibly superior to, a LS transfusion in critically ill patients.

Liberal or Restrictive Transfusion in High-Risk Patients After Hip Surgery (FOCUS)

NEJM 2011;365:2453-2462

Study: Multicenter RCT.

Participants: 2,016 patients aged >50 yr with a history of or risk factors for cardiovascular disease and hemoglobin (Hb) level below 10 g/dL after hip-fracture surgery.

Intervention: Patients were randomly assigned to a liberal transfusion strategy (a Hb threshold of 10 g/dL) or a restrictive transfusion strategy (anemia symptoms or at physician discretion for a Hb level less than 8 g/dL).

Primary Outcome: Mortality or inability to walk across a room without human assistance on a 60 day follow-up.

Results: Primary outcome rates were 35.2% in the liberal transfusion strategy group and 34.7% in the restrictive transfusion strategy group. Rates of complications were similar in the two groups.

Conclusion: A liberal transfusion strategy did not reduce mortality rates or the inability to walk independently on 60 day follow-up compared to a restrictive transfusion strategy in elderly patients with high cardiovascular risk factors after hip surgery.

Platelets

Table 37. Platelet Products

Product	Indication
Random donor (pooled)	Thrombocytopenia with bleeding
Single donor platelets	Potential BMT recipients
HLA matched platelets	Refractory to pooled or single donor platelets, presence of HLA antibodies

- stored at 20-24°C
- random donor platelets are transfused from a pool of 4 units; this should increase the platelet count by $\geq 15,000/\text{mm}^3$
- single donor platelets (transfused as single units) should increase the platelet count by $40-60,000/\text{mm}^3$
- if an increase in the platelet count is not seen post-transfusion: autoantibodies (i.e. ITP), alloantibodies, consumption (bleeding, sepsis), or hypersplenism may be present

Table 38. Indications for Platelet Transfusion

Plt (/mm ³)	Indications
<10,000	Non-immune thrombocytopenia
<20,000	Procedures not associated with significant blood loss
<50,000	Procedures associated with blood loss or major surgery (>500 mL EBL)
<100,000	Pre-neurosurgery or head trauma
Any	Platelet dysfunction (or antiplatelet agents) and marked bleeding

Relative Contraindications of Platelet Transfusion

- TTP, HIT, post-transfusion purpura, HELLP

Coagulation Factors

Table 39. Coagulation Factor Products

Product	Indication
Frozen plasma (FP)	Depletion of multiple coagulation factors (e.g. sepsis, DIC, dilution, TTP/HUS, liver disease), emergency reversal of life-threatening bleeding secondary to warfarin overdose
Cryoprecipitate (enriched fibrinogen, vWF, VIII, XIII)	Factor VIII deficiency von Willebrand disease Hypofibrinogenemia
Humate P	von Willebrand disease
Factor VIII concentrate	Factor VIII deficiency (Hemophilia A)
Factor IX concentrate	Factor IX deficiency (Hemophilia B)
Recombinant VIIa	Factor VII deficiency with bleeding, Hemophilia A or B with inhibitors
Prothrombin complex (Octaplex®)	Reversal of warfarin therapy or vitamin K deficiency in bleeding patient or in patient requiring urgent (<6 h) surgical procedure

Acute Blood Transfusion Reactions

IMMUNE

Acute Hemolytic Transfusion Reactions

- ABO incompatibility resulting in intravascular hemolysis secondary to complement activation, occurs immediately after transfusion
- most commonly due to incorrect patient identification
- risk per unit of blood is <1 in 40,000
- presentation: fever, chills, hypotension, back or flank pain, dyspnea, hemoglobinuria
- acute renal failure (<24 h) and DIC
- treatment
 - stop transfusion
 - notify blood bank and check for clerical error
 - maintain BP with vigorous IV fluids ± inotropes
 - maintain urine output with diuretics, crystalloids, dopamine

Febrile Nonhemolytic Transfusion Reactions

- due to alloantibodies to WBC, platelets or other donor plasma antigens and release of cytokines from blood product cells
- occurs within 0-6 h of transfusion
- risk per unit of blood is 1 in 100 (minor), 1 in 10,000 to 40,000 (severe)
- presents with fever ± rigors, facial flushing, headache, myalgia, hypotension
- treatment
 - rule out hemolytic reaction or infection
 - if temperature <38°C, continue with transfusion but decrease rate and give antipyretics
 - if temperature >38°C, stop transfusion, give antipyretics and anti-histamine

Allergic Nonhemolytic Transfusion Reactions

- alloantibodies (IgE) to proteins in donor plasma result in mast cell activation and release of histamine
- occurs mainly in those with history of multiple transfusions or multiparous women
- risk per unit of blood is 1 in 100
- presents mainly as urticaria and occasionally with fever
- can present as anaphylactoid reaction with bronchospasm, laryngeal edema, and hypotension, but this occurs mainly in IgA deficient patients that have anti-IgA antibodies
- treatment
 - mild: slow transfusion rate and give diphenhydramine
 - moderate to severe: stop transfusion, give IV diphenhydramine, steroids, epinephrine, IV fluids, and bronchodilators

Transfusion-Related Acute Lung Injury

- new-onset acute lung injury that occurs during transfusion or within 6 h of transfusion completion
 - insidious, acute onset of pulmonary insufficiency
 - profound hypoxemia ($\text{PaO}_2/\text{FiO}_2 < 300$ mmHg)
 - bilateral pulmonary edema on CXR
 - pulmonary artery wedge pressure <18 mmHg
 - no clinical evidence of left atrial HTN
- pathogenesis uncertain; perhaps due to binding of donor antibodies to WBC of recipient and release of mediators that increase capillary permeability in the lungs
- typically occurs 2-4 h post transfusion and resolves in 24-72 h
- risk per unit of blood is 1:10,000
 - is currently the leading cause of transfusion-related morbidity and mortality
- treatment: supportive therapy (oxygen)
- inform blood bank; patient and donor testing will be arranged

DDx of Post-Transfusion Fever

- Acute hemolytic transfusion reaction
- Febrile non-hemolytic transfusion reaction
- Bacterial contamination
- Allergy

DDx of Post-Transfusion Dyspnea

- Transfusion-associated circulatory overload (TACO)
- Transfusion-related acute lung injury (TRALI)
- Allergy (bronchospasm/anaphylaxis)

NONIMMUNE**Transfusion-Associated Circulatory Overload**

- due to impaired cardiac function and/or excessive rapid transfusion
- presentation: dyspnea, orthopnea, hypotension, tachycardia, crackles at base of lung, and increased venous pressure
- incidence: 1 in 700 and is becoming more common
- treatment: transfuse at lower rate, give diuretics and oxygen

Bacterial Infection

- Gram positive: *S. aureus*, *S. epidermidis*, *Bacillus cereus*
- Gram negative: *Klebsiella*, *Serratia*, *Pseudomonas*, *Yersinia*
- overall risk is 1 in 100,000 for RBC and 1 in 10,000 for platelets
- never store blood >4 h after bag has left blood bank
- treatment: stop transfusion, blood cultures, IV antibiotics, fluids

Hyperkalemia

- due to K⁺ release from stored RBC
- risk increases with storage time and if blood is irradiated and risk decreases
- if given fresh blood
- occurs in 5% of massively transfused patients
- treatment: see [Nephrology](#), NP13

**Citrate Toxicity**

- occurs with massive transfusion in patients with liver disease – patients are unable to clear citrate from blood
- citrate binds to Ca²⁺ and causes signs and symptoms of hypocalcemia
- treatment: IV calcium gluconate (10 mL of 10%) for every 2 units of blood

Dilutional Coagulopathy

- occurs with massive transfusion (>10 units)
- pRBC contains no clotting factors, fibrinogen, cryoprecipitate, or platelets
- treatment: FP, platelets, and cryoprecipitate

Delayed Blood Transfusion Reactions

IMMUNE**Delayed Hemolytic**

- due to alloantibodies to minor antigens such as Rh, Kell, Duffy, Kidd, and MNS
- titre of antibody at time of transfusion is too low to cause hemolysis; later the level of antibody increases due to secondary stimulus and causes extravascular hemolysis
- occurs 5-7 d after transfusion
- presentation: anemia and mild jaundice
- treatment: no specific treatment required; important to note for future transfusion

Transfusion-Associated Graft Vs. Host Disease

- transfused T-lymphocytes recognize and react against “host” (recipient)
- occurs 4-30 d following transfusion
- most patients already have severely impaired immune systems (e.g. Hodgkin lymphoma or leukemia)
- may occur in immunocompetent individuals in setting of a designated transfusion from a related donor (decreased incidence with irradiated blood)
- presentation: fever, diarrhea, liver function abnormalities, and pancytopenia
- can be prevented by giving irradiated blood products

NONIMMUNE**Iron Overload**

- due to repeated transfusions over long period of time (e.g. β -thalassemia major)
- can cause secondary hemochromatosis
- treatment: iron chelators or phlebotomy if not longer requiring blood transfusion and not anemic

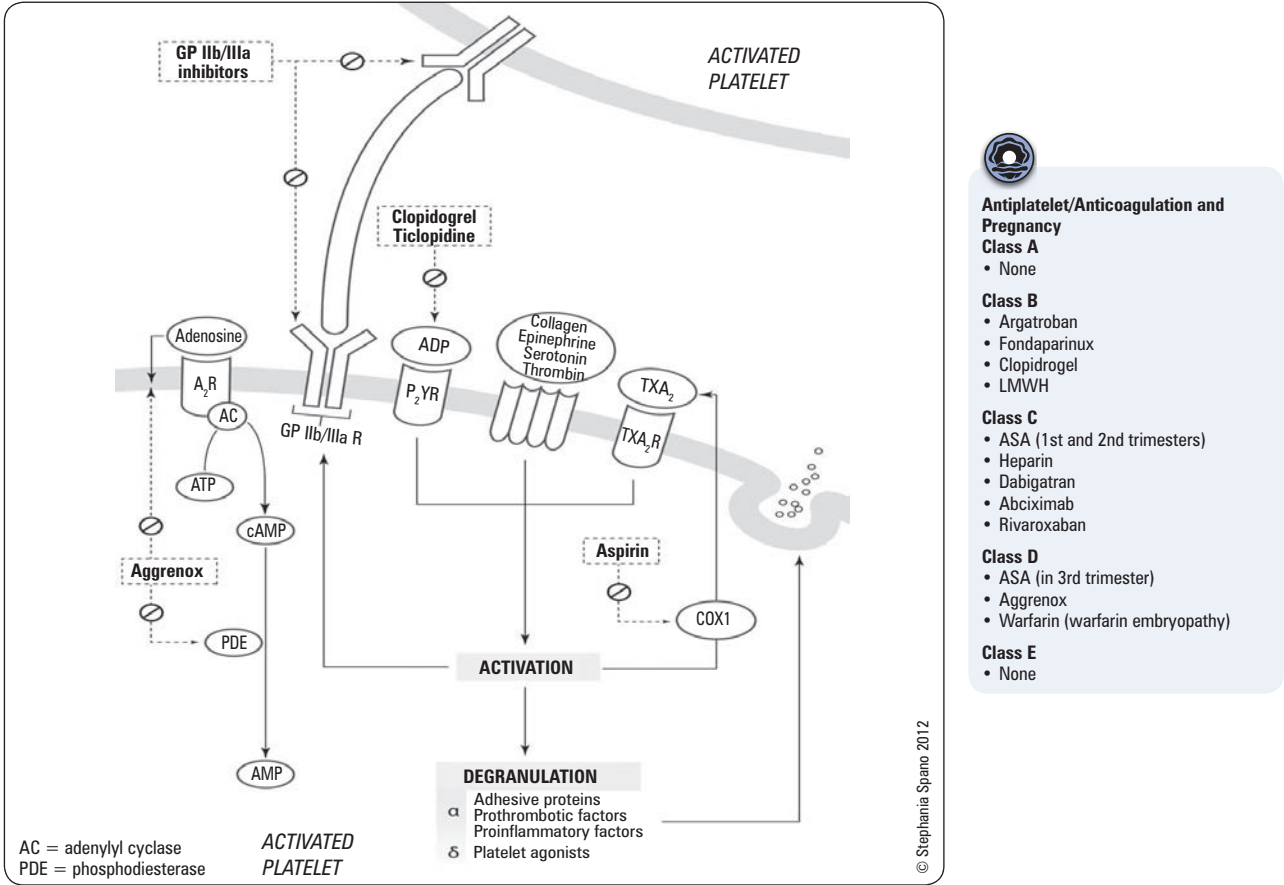

Viral Infection Risk

- HBV <1 in 153,000
- Human T-lymphotropic virus (HTLV) <1 in 4,300,000
- HCV <1 in 2,300,000
- HIV <1 in 7,000,000
- other infections include EBV, CMV, WNV (West Nile virus)

Common Medications

Antiplatelet Therapy

• see Figure 11a, Platelet Activation Cascade, H26

Antiplatelet/Anticoagulation and Pregnancy

Class A

- None

Class B

- Argatroban
- Fondaparinux
- Clopidogrel
- LMWH

Class C

- ASA (1st and 2nd trimesters)
- Heparin
- Dabigatran
- Abciximab
- Rivaroxaban

Class D

- ASA (in 3rd trimester)
- Aggrenox
- Warfarin (warfarin embryopathy)

Class E

- None

Figure 15. Mechanisms of action of antiplatelet therapy

Table 40. Antiplatelet Therapy

	Mechanism of Action	Dose/Route of Administration	Onset/Peak/Duration	Specific Side Effects	Remarks
Aspirin® (ASA)	Irreversibly acetylates COX, inhibiting TXA ₂ synthesis, thus inhibiting platelet aggregation	Single loading 200-300 mg PO, followed by dose of 75-100 mg PO daily	Onset: 5-30 min Peak: 0.25-3 h Duration: 3-6 h	GI ulcer/bleeding Tinnitus Bronchospasm Angioedema Reye's syndrome in pediatric patients	Indicated for stroke/MI prophylaxis Reduce incidence of recurrent MI Decrease mortality in post-MI patients Contraindicated in patients with GI ulcers
Aggrenox® (ASA + Dipyridamole)	Dipyridamole increases intracellular cAMP levels, which inhibits TXA ₂ synthesis, leading to decreased platelet aggregation	1 capsule PO bid	Peak: 75 min	Headache Dyspepsia N/V Abdominal pain Cardiac failure Hemorrhoids	More effective than ASA in secondary prevention of stroke Dipyridamole potentiates antiplatelet action of ASA
Clopidogrel (Plavix®)	Inhibit ADP binding to platelets, thus decreased platelet aggregation	75-300 mg PO daily	Onset: 2 h Peak: 1 h	URI Chest pain Headache Flu-like syndrome Depression UTI GI hemorrhage Pancytopenia May cause TTP	Prevention of cardiovascular events in high-risk patients CYP2C19 poor metabolizers have diminished response to clopidogrel Caution with hepatic/renal impairment
Glycoprotein IIb/IIIa Inhibitors (Reopro® [abciximab], Integrelin® [eptif])	Blocking GP II/IIIa receptor inhibits fibrinogen and vWF binding, leading to decreased platelet aggregation	Variable IV	Variable	Hypotension Back pain N/V Chest pain Abdominal pain Thrombocytopenia	Used most commonly in cardiac catheterization Contraindicated in PUD Monitoring aPTT/activated clotting time

Anticoagulant Therapy

Table 41. Anticoagulant Therapy

	Mechanism of Action	Dose/Route of Administration	Onset/Peak/ Duration	Reversing Agent	Monitoring	Specific Side Effects	Remarks
Heparin	Accelerates activity of antithrombin	As per hospital nomogram	Onset: 20-60 min Peak: 2-4 h	Protamine sulphate	aPTT (intrinsic pathway), UFH (anti-Xa) levels	Hemorrhage HIT Increased liver enzymes	Pregnancy: safe (does not cross placenta)
Warfarin	Vitamin K antagonist: inhibits production of II, VII, IX, X, proteins C and S	Individualized dosing by monitoring PT/INR PO	Onset: 36-48 h Peak: 1.5-3 d	IV vitamin K PCC FFP	PT/INR maintain 2-3 (2.5-3.5 for mechanical values)	Hemorrhage Cholesterol embolism syndrome Intraocular hemorrhage	Pregnancy: not used, can cross placenta (teratogenic)
LMWH (enoxaparin, dalteparin, tinzaparin)	Inhibits FXa	Variable SC/IV	Onset: 3-5 h Peak: 3-5 h Duration: 12 h	Partial reversibility with protamine sulphate	FXa in pediatrics, pregnancy and weight >150 kg	Hemorrhage Fever Increased liver enzymes <1% HIT	Increased bioavailability than heparin Can accumulate in patients low CrCl (<30)
Fondaparinux	Selective inhibitor of FXa	Variable SC daily	Onset: 2 h Peak: 2-3 h	Not reversible	None	Anemia Fever Nausea Rash	Heparin analogue Contraindicated in renal failure
Rivaroxaban	Anti-FXa	PO	Peak: 2-4 h	Not reversible	None	Syncope GI hemorrhage	Only indicated in treatment of acute VTE (not in cancer patients), and thromboprophylaxis in orthopedic patients
Argatroban	Direct thrombin inhibitor	Variable IV	Onset: 5-10 min Duration: 20-40 min	Not reversible	aPTT	Dyspnea Hypotension Fever	Indicated for HIT, renal failure, unstable patients
Dabigatran	Direct thrombin inhibitor	150 mg PO bid	Peak: 1 h	Not reversible	None (prolonged aPTT can suggest residual drug on board)	GI upset Dyspepsia	Contraindicated in renal failure, cancer patients, mechanical heart valves

Adverse Reactions of Heparin

- hemorrhage: depends on dose, age, and concomitant use of antiplatelet agents or thrombolytics
- heparin-induced thrombocytopenia: associated with venous or arterial thrombosis (see Table 23, H29)
- osteoporosis: with long-term use

Low Molecular Weight Heparin (enoxaparin, dalteparin, tinzaparin)

- increased bioavailability compared to normal heparin
- increased duration of action
- SC route of administration
- do not need to monitor aPTT
- adverse reactions less common than UFH
- patients with renal failure (CrCl <30) can accumulate LMWH, therefore must adjust dose
- only partially reversible with protamine sulphate

Table 42. Recommended Therapeutic INR Ranges of Common Indications for Oral Anticoagulant Therapy

Indication	INR Range
Prophylaxis of venous thrombosis (high-risk surgery)	2.0-3.0
Treatment of venous thrombosis	
Most cases of thrombosis with antiphospholipid antibody syndrome	
Treatment of pulmonary embolism	
Prevention of systemic embolism	
Tissue heart valves	
AMI (to prevent systemic embolism)	
Valvular heart disease	
Atrial fibrillation	
Bileaflet mechanical valve in aortic position	
Mechanical prosthetic mitral valves (high risk)	2.5-3.5
Prophylaxis of recurrent myocardial infarction	

AMI = acute myocardial infarction

Dabigatran vs. Warfarin in Patients with Atrial Fibrillation

NEJM 2009;361:1139-1151

Study: Non-inferiority trial with 2 yr follow-up.

Methods: Random assignment of 18,113 patients with atrial fibrillation and risk of stroke to fixed doses of dabigatran (blinded, 110 mg or 150 mg bid) or adjusted-dose warfarin (unblinded). Primary outcome was stroke or systemic embolism.

Results: The warfarin, dabigatran 110 mg, and dabigatran groups showed the following rates: 1) stroke or systemic embolism was 1.69%, 1.53%, and 1.11% per year respectively, 2) major bleeding was 3.36%, 2.71%, and 3.11% per year respectively, 3) hemorrhagic stroke was 0.38%, 0.12%, and 0.10% per year respectively ($p < 0.001$), 4) mortality was 4.13%, 3.75%, and 3.64% respectively.

Conclusions: In patients with atrial fibrillation, dabigatran 110 mg was similar to warfarin in rates of stroke and systemic embolism but had lower rates of major hemorrhage. Dabigatran 150 mg, as compared with warfarin, was associated with lower rates of stroke and systemic embolism but similar rates of major hemorrhage.

Table 43. Recommended Management of a Supratherapeutic INR

INR	Bleeding Present	Recommended Action
>Therapeutic to 4.5	No	Lower warfarin dose OR Omit a dose and resume warfarin at a lower dose when INR is in therapeutic range OR No dose reduction needed if INR is minimally prolonged
>4.5 to 10.0	No	Omit the next 1 to 2 doses of warfarin, monitor INR more frequently and resume treatment at a lower dose when INR is in therapeutic range OR Omit a dose and administer 1 to 2.5 mg oral vit K in patients with increased risk of bleeding
>10.0	No	Hold warfarin and administer 5 to 10 mg oral vit K; monitor INR more frequently and administer more vit K as needed; resume warfarin at a lower dose when INR is in therapeutic range
Any	Serious or life threatening	Hold warfarin and administer 10 mg vit K by slow IV infusion; supplement with four-factor prothrombin complex concentrate; monitor and repeat as needed

Chemotherapeutic and Biologic Agents Used in Oncology

Table 44. Selected Chemotherapeutic and Biologic Agents

Class	Example	Mechanism of Action or Target
Alkylating Agent	<ul style="list-style-type: none">• chlorambucil, cyclophosphamide, melphalan (nitrogen mustards)• carboplatin, cisplatin• dacarbazine, procarbazine• busulfan	Damage DNA via alkylation of base pairs Leads to cross-linking of bases, abnormal base-pairing, DNA breakage
Antimetabolites	<ul style="list-style-type: none">• methotrexate (folic acid antagonist)• 6-mercaptopurine, fludarabine (purine antagonist)• 5-fluorouracil (5-FU) (pyrimidine antagonist)• hydroxyurea• cytarabine	Inhibit DNA synthesis
Antibiotics	<ul style="list-style-type: none">• adriamycin (anthracycline)• bleomycin• mitomycin C• daunorubicin	Interfere with DNA and RNA synthesis
Taxanes	<ul style="list-style-type: none">• paclitaxel• docetaxel	Stabilize microtubules against breakdown once cell division complete
Vinca-alkaloids	<ul style="list-style-type: none">• vinblastine• vincristine• vinorelbine	Inhibit microtubule assembly (mitotic spindles), blocking cell division
Topoisomerase Inhibitors	<ul style="list-style-type: none">• irinotecan, topotecan (topo I)• etoposide (topo II)	Interfere with DNA unwinding necessary for normal replication and transcription
Steroids	<ul style="list-style-type: none">• prednisone• dexamethasone	Immunosuppression
Monoclonal Antibodies	<ul style="list-style-type: none">• trastuzumab (Herceptin®)• bevacizumab (Avastin®)• rituximab (Rituxan®)• cetuximab (Erbix®)	HER2 VEGF CD20 EGFR
Small Molecule Inhibitors	<ul style="list-style-type: none">• imatinib mesylate (Gleevec®)• dasatinib• nilotinib• erlotinib (Tarceva®)• gefitinib (Iressa®)• bortezomib (Velcade®)• sunitinib (Sutent®)	<i>Bcr-Abl</i> <i>Bcr-Abl</i> <i>Bcr-Abl</i> EGFR EGFR 26S proteasome VEGFR, PDGFR

Landmark Hematology Trials

Trial	Reference	Results
AZA-001	<i>Lancet Oncol</i> 2009; 10:223-32	Azacitidine increases overall survival in higher-risk myelodysplastic syndrome than conventional care
CHOP	<i>NEJM</i> 1993; 328:1002-6	In NHL, CHOP has lowest incidence of fatal toxic reactions and shows no significant difference from 3 other regimens in response or disease-free/overall survival; CHOP is the standard for advanced NHL
CLL8	<i>Lancet</i> 2010; 376:1164-74	Rituximab plus fludarabine and cyclophosphamide (FCR) improves progression-free and overall survival compared with fludarabine and cyclophosphamide alone (FC) in the treatment of CLL
CLOT	<i>NEJM</i> 2003; 349:146-53	In patients with cancer and acute venous thromboembolism, LWMH was more effective than warfarin in reducing the risk of recurrent thromboembolism without increasing the risk of bleeding
CML: Imatinib vs. IFN + Cytarabine	<i>NEJM</i> 2003; 348:994-1004	In patients with chronic-phase CML, imatinib was more effective than IFN α + cytarabine in inducing cytogenetic response and freedom from progression to accelerated phase/blast crisis
CYT0-PV	<i>NEJM</i> 2013; 368(1), 22-33	In patients with polycythemia vera, a hematocrit target of <0.45 for cytoreductive therapy is associated with prevention of thrombotic complications
Dabigatran vs. Warfarin in VTE	<i>NEJM</i> 2009; 361:2342-52	In the treatment of venous thromboembolism, dabigatran is as effective as warfarin and also has a similar safety profile; note: many problems in the trial, making it less pivotal in having drug approval
Dose of Platelet Transfusion	<i>NEJM</i> 2010; 362:600-13	Low dose prophylactic platelet transfusion decreases total number of platelets transfused but increases number of transfusions but not incidence of bleeding in patients with hypoproliferative thrombocytopenia
ESPIRIT	<i>Lancet</i> 2006; 367:1665-73	ASA plus dipyridamole is recommended over ASA alone as antithrombotic therapy after cerebral ischemia of arterial origin
Hodgkin Lymphoma: ABVD vs. MOPP	<i>NEJM</i> 1992; 327:1478-84	In Hodgkin lymphoma, ABVD regimen has equal failure-free and overall survival to MOPP + ABVD, but less myelotoxicity; ABVD is standard chemotherapy for Hodgkin lymphoma
ITP: Dexamethasone	<i>NEJM</i> 2003; 349:831-6	A four-day course of high-dose dexamethasone is effective initial therapy for adults with immune thrombocytopenic purpura
MInT Group	<i>Lancet</i> 2011; 12:1013-1022	Rituximab added to CHOP-like chemotherapy improved long-term outcomes for young patients with good-prognosis DLBCL
MSH	<i>NEJM</i> 1995; 332:1317-22	Hydroxyurea is effective in reduction of complications and clinical manifestations of sickle cell disease
Platelet Transfusion Threshold	<i>NEJM</i> 1997; 337:1870-5	The risk of major bleeding in patients with AML undergoing induction chemotherapy was similar whether the platelet-transfusion threshold was set at 20 or 10; use of the lower threshold reduced platelet usage by 21.5%
PT1	<i>NEJM</i> 2005; 353:85-6	Hydroxyurea plus low-dose ASA is superior to anagrelide plus low-dose ASA for patients with essential thrombocythemia at high risk for vascular events
R-CHOP	<i>NEJM</i> 2002; 346:235-42	Addition of rituximab to CHOP increases complete response rate and prolongs event-free survival and overall survival in elderly with DLBCL
StIL	<i>Lancet</i> 2013; 381(9873):1203-10	Bendamustine plus rituximab is superior to R-CHOP in terms of progression-free survival and fewer toxic effects in patients with previously untreated indolent lymphoma
Therapeutic Platelet Transfusion	<i>Lancet</i> 2012; 380:1309-16	Therapeutic platelet transfusions (when bleeding occurs) may be used if severe bleeding can be identified early in autologous stem-cell transplant patients; prophylactic transfusion (when platelets <10) should remain standard of care in AML patients
TRICC	<i>NEJM</i> 1999; 340:409-17	A restrictive strategy of red-cell transfusion (when Hb <70) is at least as effective as and possibly superior to a liberal transfusion strategy (when Hb <100) in ICU patients; one possible exception is patients with an acute MI or unstable angina
VISTA	<i>JCO</i> 2010; 28:2259-66	Bortezomib plus melphalan and prednisone (MPV) is superior to melphalan and prednisone (MP) in overall survival of non-transplant-eligible multiple myeloma patients

Principles of Microbiology

Bacteriology

Bacteria Basics

- bacteria are prokaryotic cells that divide asexually by binary fission
- Gram stain divides most bacteria into two groups based on their cell wall
 - Gram positive (GP): thick, rigid layer of peptidoglycan
 - Gram negative (GN): thin peptidoglycan layer + thicker outer membrane composed of lipoproteins and lipopolysaccharides
 - clinical significance: GN thick outer membrane makes it resistant to penicillin's mechanism of action
- AFB: high mycolic acid content in cell wall, "acid fast" as washout phase of gram stain is ineffective, e.g. *Mycobacteria*, *Nocardia*
- "atypical" bacteria: not seen on Gram stain and difficult to culture
 - obligate intracellular bacteria: e.g. *Chlamydia*
 - bacteria lacking a cell wall: e.g. *Mycoplasma*
 - spirochetes: e.g. *Treponema pallidum*
- O₂ can be either vital or detrimental to growth
 - obligate aerobes: require O₂
 - obligate anaerobes: require environment without O₂
 - facultative anaerobes: can survive in environments with or without O₂

Mechanisms of Bacterial Disease

- adherence to and colonization of skin or mucous membranes
 - e.g. fimbriae (pili): microfilaments extending through the cell wall – like burrs sticking to your clothes, they attach to epithelial cells e.g. *E. coli* in the urinary tract
- invasion or crossing normal epithelial barriers
- evasion of host defense system through inhibition of:
 - phagocytic uptake via polysaccharide capsule (*S. pneumoniae*, *N. meningitidis*, *H. influenzae*) or surface proteins (*Staphylococcus*, *Streptococcus*)
- toxin production
 - exotoxins are secreted by living pathogenic bacteria and cause disease even if the bacteria is not present (e.g. *Clostridium*)
 - endotoxins are structural components of GN bacterial cell wall, and may be shed by live cells or released during cell lysis
- intracellular growth
 - obligate intracellular: *Rickettsia* and *Chlamydia*
 - facultative intracellular: *Salmonella*, *Neisseria*, *Brucella*, *Mycobacteria*, *Listeria*, *Legionella*
- biofilm
 - an extracellular polysaccharide network forming mesh around the bacteria (e.g. *S. epidermidis*) which can coat prosthetic devices like IV catheters

Table 1. Common Bacteria

Gram-Positive Bacteria			Gram-Negative Bacteria		Not Seen on Gram Stain
	Cocci	Bacilli (rods)	Diplococci	Bacilli (rods)	Acid Fast Others
Aerobes	<i>Staphylococcus</i> <i>S. aureus</i> <i>S. saprophyticus</i> <i>S. epidermidis</i> <i>Streptococcus</i> <i>S. pneumoniae</i> <i>S. pyogenes</i> (GAS) <i>S. agalactiae</i> (GBS) <i>Enterococcus</i> <i>E. faecalis</i>	<i>Bacillus</i> <i>B. anthracis</i> <i>Listeria</i> <i>Nocardia</i> (modified acid fast positive)	<i>Neisseria</i> <i>N. meningitidis</i> <i>N. gonorrhoeae</i> <i>Moraxella</i> <i>M. catarrhalis</i>	<i>Enterobacteriaceae</i> <i>E. coli</i> , <i>Salmonella</i> , <i>Shigella</i> , <i>Campylobacter</i> , <i>Yersinia</i> <i>Klebsiella</i> <i>Legionella</i> <i>Pseudomonas</i> <i>Haemophilus</i> <i>H. influenzae</i>	<i>Mycobacteria</i> <i>M. tuberculosis</i> <i>M. leprae</i> <i>M. avium</i> complex <i>M. bovis</i> Obligate intracellular <i>Rickettsiae</i> <i>Chlamydia</i> <i>C. trachomatis</i> <i>Chlamydothila</i> <i>C. pneumoniae</i> No cell wall <i>Mycoplasma</i> Spirochaete (spiral) <i>Treponema pallidum</i>
Anaerobes	<i>Peptostreptococcus</i>	<i>Clostridium</i> <i>C. difficile</i> , <i>C. tetani</i> , <i>C. botulinum</i> , <i>C. perfringens</i>		<i>Bacteroides</i> <i>B. fragilis</i>	

Table 2. Commensal Flora

Site	Organisms
Skin	Coagulase-negative staphylococci, <i>Corynebacteria</i> , <i>Propionibacterium acnes</i> , <i>Bacillus</i> , <i>S. aureus</i>
Oropharynx	Viridans group streptococci, <i>Haemophilus</i> , <i>Neisseria</i> , anaerobes (<i>Peptostreptococcus</i> , <i>Bacteroides</i> , <i>Veillonella</i> , <i>Fusobacterium</i> , <i>Actinomyces</i> , <i>Prevotella</i>)
Small Bowel	<i>E. coli</i> , anaerobes (low numbers)
Colon	<i>E. coli</i> , <i>Klebsiella</i> , <i>Enterobacter</i> , <i>Enterococcus</i> , anaerobes (<i>Bacteroides</i> , <i>Peptostreptococcus</i> , <i>Clostridium</i>)
Vagina	<i>Lactobacillus acidophilus</i> , Viridans group streptococci, coagulase-negative staphylococci, facultative GN bacilli, anaerobes

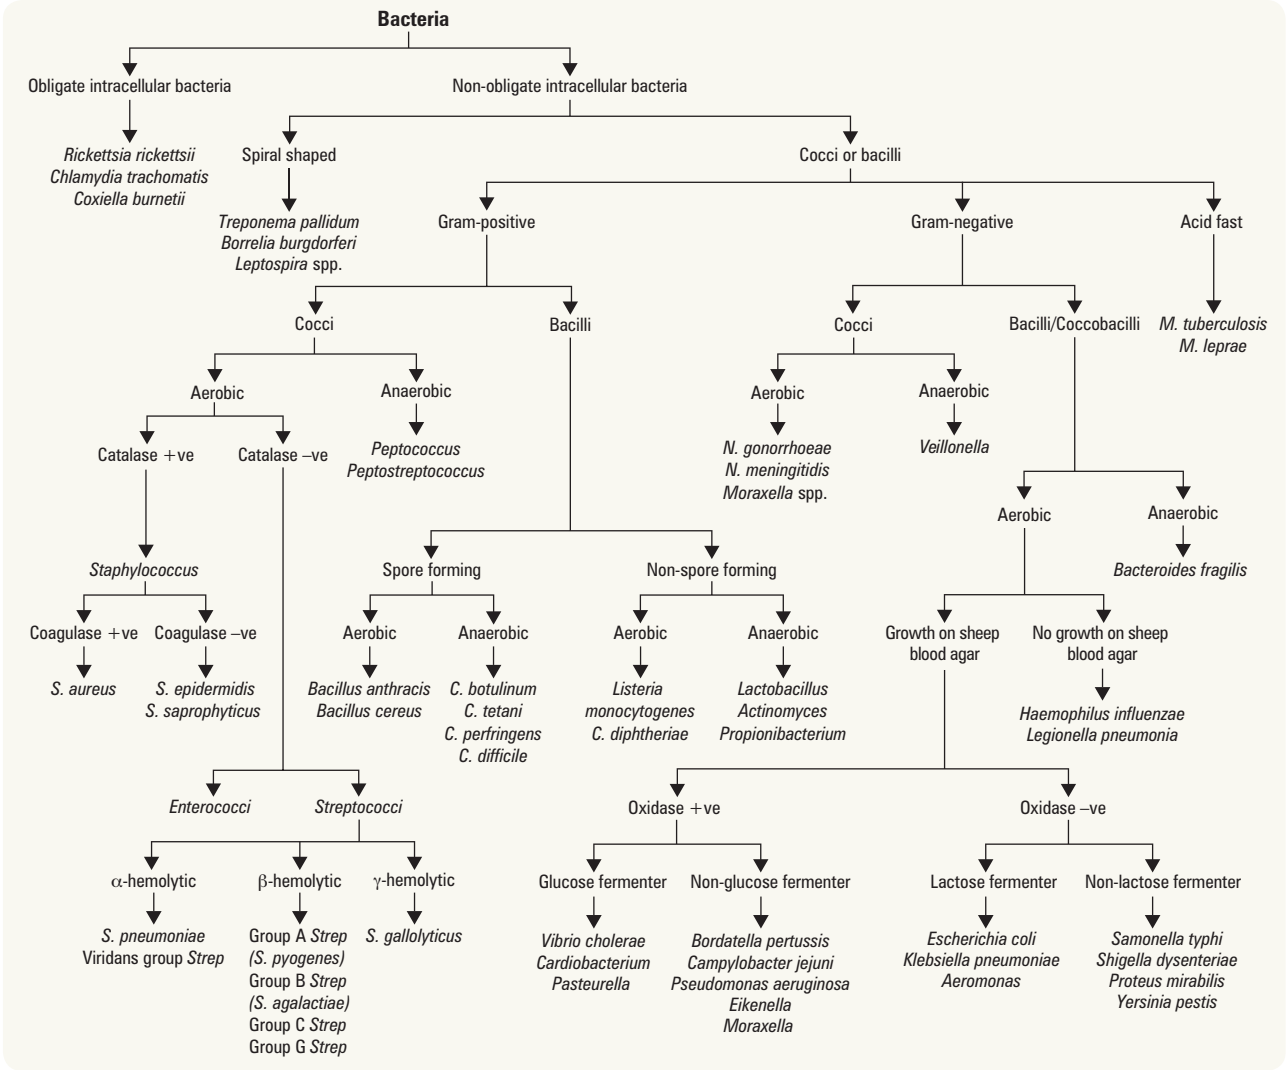

Figure 2. Laboratory identification of bacterial species

Virology

Viral Basics

- viruses are infectious particles consisting of RNA or DNA covered by a protein coat
 - infect cells and use host metabolic machinery to replicate
 - nucleic acid can be double stranded (ds) or single stranded (ss)
 - can be enveloped or naked
- virions are mature virus particles that can be released into the extracellular environment
- host susceptibility is governed by the host cell and virus surface proteins (viral tropism) and cellular immunity

Viral Disease Patterns

- acute infections (e.g. adenovirus)
 - host cells are lysed in the process of virion release
 - some produce acute infections with late sequelae (e.g. measles virus → subacute sclerosing panencephalitis)
- chronic infections (>6 mo): (e.g. HBV, HIV)
 - host cell machinery is used to produce and chronically release virions
- latent infections
 - viral genome remains latent in host cell nucleus
 - can reactivate (e.g. HSV, VZV)

Table 3. Common Viruses

Nucleic Acid	Enveloped	Virus Family	Major Viruses	Medical Importance
dsDNA	N	<i>Adenoviridae</i>	Adenovirus	URTI Conjunctivitis Gastroenteritis
	N	<i>Papillomaviridae</i>	HPV1,4 HPV6,11 HPV16,18, etc.	Plantar warts Genital warts Cervical/anal dysplasia and cancer
	Y	<i>Herpesviridae</i>	HHV1=HSV1 HHV2=HSV2 HHV3=VZV HHV4=EBV HHV5=CMV HHV6* HHV8=KSHV	Oral, ocular, and genital herpes; encephalitis Genital, oral, and ocular herpes; encephalitis Chicken pox, shingles Mononucleosis, viral hepatitis Retinitis, pneumonitis, hepatitis, encephalitis Roseola Kaposi's sarcoma, multicentric Castleman's disease, body cavity lymphoma
	N	<i>Polyomaviridae</i>	JC virus	Progressive multifocal leukoencephalopathy
	Y	<i>Hepadnaviridae</i> <i>Poxviridae</i>	Hepatitis B Variola	Hepatitis Smallpox
ssDNA	N	<i>Parvoviridae</i>	Parvovirus B19	Erythema infectiosum (Fifth disease)

Figure 3. Virus morphology

Mycology

Fungal Basics

- fungi are eukaryotic organisms, they can have the following morphologies
 - yeast (unicellular)
 - molds (also known as filamentous fungi) (multicellular with hyphae)
 - dimorphic fungi (found as mold at room temperature but grow as yeast-like forms at body temperature)

Table 4. Membrane and Cell Wall Compositions

	Membrane Sterol	Cell Wall
Bacteria	–	Peptidoglycan
Human Cell	Cholesterol	–
Fungi	Ergosterol	Chitin (complex glycopolysaccharide)

Mechanisms of Fungal Disease

- primary fungal infection by
 - overgrowth of normal flora (e.g. *Candida* species)
 - inhalation of fungal spores
 - traumatic inoculation into skin
- toxins produced by fungi (e.g. ingestion aflatoxins)
- allergic reactions to fungi (e.g. bronchopulmonary aspergillosis)

Figure 4. Common fungus morphology

Parasitology

Parasite Basics

- parasite:** an organism that lives in or on another organism (host) and damages the host in the process
- parasites with complex life cycles require more than one host to reproduce
 - reservoir host: maintains a parasite and may be the source for human infection
 - intermediate host: maintains the asexual stage of a parasite or allows development of the parasite to proceed to the larval stage
 - definitive host: allows the parasite to develop to the adult stage where reproduction occurs
- 2 major groups of parasites: protozoa and helminths
- see [Tables 26 and 27](#) for examples of clinically important parasites

Table 5. Differences Between Protozoa and Helminths

Protozoa	Helminths
Unicellular	Multicellular
Motile trophozoite → inactive cyst	Adult → egg → larva
Multiplication	No multiplication
± Eosinophilia	Eosinophilia (proportional to extent of tissue invasion)*
Indefinite life span	Definite life span

*Adult ascaris (roundworm) does not cause eosinophilia

Characteristics of Parasitic Disease

- symptoms are usually proportional to parasite burden
- tissue damage is due to the parasite and host immune response
- chronic infections may occur with or without overt disease
- immunocompromised hosts are more susceptible to manifestations of infection, reactivation of latent infections, and more severe disease
- eosinophilia may suggest a parasitic infection

Mechanisms of Parasitic Disease

- mechanical obstruction (e.g. ascariasis, clonorchiasis)
- competition with host for resources (e.g. anemia in hookworm disease, vitamin B₁₂ deficiency in diphyllorhynchiasis)
- cytotoxicity leading to abscesses and ulcers (e.g. amoebiasis, leishmaniasis)
- inflammatory
 - acute hypersensitivity (e.g. pneumonitis in Loeffler's syndrome)
 - delayed hypersensitivity (e.g. egg granulomas in schistosomiasis)
 - cytokine-mediated (systemic illness of malaria, disseminated strongyloidiasis)
- immune-mediated injury
 - autoimmune (e.g. myocarditis of Chagas disease, tissue destruction of mucocutaneous leishmaniasis)
 - immune complex (e.g. nephritis of malaria, schistosomiasis)

Figure 5. Classification of protozoa based on movement

Parasite sampling may need to be repeated on a number of occasions before infection can be ruled out

Transmission of Infectious Diseases

Table 6. Mechanism of Transmission

Mechanism	Mode of Transmission	Examples	Preventative Measure*
Contact	Direct physical contact, or indirect contact with a fomite	Person-to-person (MRSA) Sexual (<i>N. gonorrhoeae</i> , <i>C. trachomatis</i> , HSV, HIV) Blood-borne (HIV, HBV, HCV)	For patients in health care facilities: Contact precautions (see <i>Prevention of Infectious Diseases</i>) Barrier precautions Safe needlestick/sharp practices
Droplet/Contact	Respiratory droplets (>5 µm) can be projected short distances (≤2 m) and deposit on mucosal surfaces of the recipient (e.g. by coughing, sneezing, or talking); transmission can also occur by direct physical contact of respiratory fluids or indirect contact with a fomite contaminated with respiratory fluids	Influenza, mumps <i>N. meningitidis</i> , <i>Bordetella pertussis</i>	For patients in health care facilities: Contact/droplet precautions (see <i>Prevention of Infectious Diseases</i>)
Airborne	Airborne droplet nuclei (<5 µm) remain infectious over time and distance	<i>M. tuberculosis</i> , VZV, measles	For patients in health care facilities: Airborne precautions (see <i>Prevention of Infectious Diseases</i>)
Food/Waterborne	Ingestion of contaminated food or water	<i>V. cholerae</i> , <i>Salmonella</i> , HAV, HEV	Prophylactic vaccinations where available Ensure clean food/water supply For patients in health care facilities: Contact precautions used for admitted patients with fecal incontinence when stool is unable to be contained in diapers
Zoonotic	Disease transmission from animals to humans either directly or via an insect vector	Animals (rabies, Q fever) Arthropods (malaria, Lyme disease)	Prophylactic medications, vaccinations Protective clothing, insect repellent, mosquito nets, tick inspection
Vertical	Spread of disease from parent to offspring	Congenital syndromes (TORCH infections) Perinatal (HIV, HBV, GBS)	Prenatal screening Prophylactic treatment

*see *Prevention of Infectious Diseases* for further detail

Duodenal Infusion of Donor Feces for Recurrent *Clostridium difficile*

NEJM 2013;368:407-415

Study: RCT stopped after an interim analysis.

Population: 43 patients at least 18 yr of age, with a life expectancy of at least 3 mo, and a relapse of *C. difficile* after at least one course of adequate antibiotic therapy (≥10 d of vancomycin at a dose of ≥125 mg 4/d or ≥10 d of metronidazole at a dose of 500 mg 3/d).

Intervention: Initial vancomycin regimen (500 mg orally 4/d for 4 d) followed by a bowel lavage and infusion of a donor feces solution through a nasoduodenal tube, standard vancomycin regimen (500 mg orally 4/d for 14 d), or a standard vancomycin regimen with bowel lavage.

Primary Outcome: Resolution of diarrhea associated with *C. difficile* infection without relapse after 10 wk.

Results: 81% of patients in the group with duodenal infusion of donor feces had a resolution of *C. difficile*-associated diarrhea after the first infusion. 31% of patients receiving vancomycin alone and 23% of patients receiving vancomycin with bowel lavage had a resolution of *C. difficile*-associated diarrhea. After the infusion, patients showed greater fecal bacterial diversity similar to healthy donors.

Conclusions: Infusion of donor feces was more effective for the treatment of recurrent *C. difficile* infection than the use of vancomycin alone or vancomycin with bowel lavage.

Prevention of Infectious Diseases

Overview

- efforts to control the spread of infectious disease involves **infection control and prevention measures** in health care settings and **public health measures** outside of health care settings

Infection Control and Prevention Measures

- surveillance for important nosocomial infections or problem organisms (such as: surgical site infections, vascular access-related infections, *C. difficile* infections, colonization or infections due to antimicrobial resistant organisms e.g. methicillin-resistant *S. aureus*). (see [Population and Community Health, PH19](#) for a definition of active vs. passive surveillance)
- routine practices (also known as standard precautions) used for all patients
 - perform hand hygiene before and after seeing patient or patient environment contact, before aseptic procedures, and after body fluid exposure
 - use gloves for any encounter with body fluids
 - wear eye protection, mask, and gown for any procedures likely to generate splashes of body fluids
 - do not recap sharps by hand and dispose of sharps in puncture-resistant container near point-of-use
 - use mouthpieces for resuscitator bags instead of using mouth-to-mouth resuscitation
 - discard soiled waste properly
 - ensure routine cleaning and disinfection of patient environment and patient care equipment
- additional precautions used for various syndromes or known infectious diseases
 - contact precautions (private room, gown, gloves to be used routinely) (e.g. used for patients with *C. difficile*)
 - droplet/contact precautions (private room, gown, gloves, eye protection, fluid-resistant mask) (e.g. used for influenza, meningitis due to *Neisseria meningitidis*)
 - airborne precautions (negative-pressure private room with door closed, fit-tested N95 respirator) (e.g. used for TB, measles, VZV)

- decolonization (e.g. topical and oral antimicrobials be used in an attempt to decolonize methicillin-resistant *S. aureus* [MRSA])
- outbreak investigations (see [Population and Community Health, PH19](#))

Public Health Measures

- vaccination
- post-exposure prophylaxis (e.g. use of immunoglobulin or vaccination post-exposure to infectious disease agents in an attempt to reduce the likelihood or severity of disease)
- reportable diseases (e.g. list of reportable communicable diseases that physicians are legally required to report to local public health officials) (see [Population and Community Health, PH25](#))
- contact tracing (tracking of individuals who have been exposed to a person with a communicable disease during its period of communicability)
- quarantine (restriction of the activities of well persons who have been exposed to a person with a communicable disease during its period of communicability to prevent disease transmission during the incubation period if infection should occur)
- outbreak investigation (see [Population and Community Health, PH19](#))

Nosocomial Infections

- definition:** infections acquired >48 h after admission to a healthcare facility or within 30 d from discharge
- risk factors: prolonged hospital stay, antibiotic use, surgery, hemodialysis, intensive care, colonization with a resistant organism, immunodeficiency
- patients with nosocomial infections have higher mortality, longer hospital stays, and higher healthcare costs
- hand hygiene is an essential precaution

Table 7. Common Nosocomial Infectious Agents

Bacteria	Characteristics	Manifestation	Investigations	Management
Methicillin-Resistant <i>Staphylococcus aureus</i> (MRSA)	Gram-positive cocci	Skin and soft tissue infection Bacteremia Pneumonia Endocarditis Osteomyelitis	Admission screening culture from nares and peri-anal region identifies colonization Culture of infection site CXR	Contact precautions For infection: vancomycin or daptomycin or linezolid To decolonize: 2% chlorhexidine wash OD (+ rifampin + doxycycline + mupirocin cream bid to nares) x 7 d
Vancomycin-Resistant <i>Enterococcus</i> (VRE)	Majority are <i>E. faecium</i> Resistant if minimum inhibitory concentration of vancomycin is ≥ 32 $\mu\text{g/mL}$	Rarely causes disease in healthy people UTI Bacteremia Endocarditis Meningitis	Rectal or perirectal swab OR stool culture for colonization Culture of infected site	Contact precautions Ampicillin if susceptible Otherwise, linezolid, tigecycline, or daptomycin depending on site of infection No effective decolonization methods identified
<i>Clostridium difficile</i> (<i>C. difficile</i>)	Releases exotoxins A and B Hypervirulent strain has been responsible for increase in incidence and severity	Fever, nausea, abdominal pain Watery diarrhea \pm occult blood Pseudomembranous colitis Severe: toxic megacolon Risk of bowel perforation Associated with antibiotic use Leukocytosis	Stool PCR Stool immunoassay for toxins A and B AXR (may see colonic dilatation) Sigmoidoscopy for pseudomembranes; avoid if known colonic dilatation	Contact precautions Stop culprit antibiotic therapy Supportive therapy (IV fluids) Mild-moderate disease: metronidazole PO/IV x 10-14 d Severe disease: vancomycin PO x 10-14 d Toxic megacolon: metronidazole IV + vancomycin PO (as above) and general surgery consult
Extended Spectrum β-Lactam Producers (ESBL producing <i>E. coli</i>, <i>K. pneumoniae</i>)	Resistant to most β -lactam producing antibiotics e.g. penicillins, aztreonam, and cephalosporins	UTI Pulmonary infection Bacteremia Liver abscess in susceptible patients Meningitis	Blood, sputum, urine, or aspirated body fluid culture Imaging at infection site (CXR, CT, U/S)	Carbapenems or non- β -lactam antibiotics can be used for empiric therapy

Respiratory Infections

Pneumonia

- see [Pediatrics](#), P90
- see [Family Medicine](#), FM18

Definition

- infection of the lung parenchyma

Etiology and Risk Factors

- impaired lung defenses
 - poor cough/gag reflex (e.g. illness, drug-induced)
 - impaired mucociliary transport (e.g. smoking, cystic fibrosis)
 - immunosuppression (e.g. steroids, chemotherapy, AIDS/HIV, DM, transplant, cancer)
- increased risk of aspiration
 - impaired swallowing mechanism (e.g. impaired consciousness, neurologic illness causing dysphagia, mechanical obstruction)
- no organism identified in 75% of hospitalized cases, and >90% of ambulatory cases

When *Klebsiella* causes pneumonia; see red currant jelly sputum

3 As of *Klebsiella*

Aspiration pneumonia
Alcoholics and diabetics
Abscess in lungs

Aspiration pneumonias more commonly manifest as infiltrates in the right middle or lower lobes due to the larger caliber and more vertical orientation of the right bronchus

Table 8. Common Organisms in Pneumonia

Community Acquired	Nosocomial	Aspiration	HIV-associated	Alcoholic
Typical Bacteria <i>Streptococcus pneumoniae</i> <i>Moraxella catarrhalis</i> <i>Haemophilus influenzae</i> <i>Staphylococcus aureus</i> GAS Atypical Bacteria <i>Mycoplasma pneumoniae</i> <i>Chlamydia pneumoniae</i> <i>Legionella pneumophila</i> Viral Influenza virus Adenovirus	Enteric GNB (<i>E. coli</i>) <i>Pseudomonas aeruginosa</i> <i>S. aureus</i> (including MRSA)	Oral anerobes (<i>Bacteroides</i>) Enteric GNB (<i>E. coli</i>) <i>S. aureus</i> Gastric contents (chemical pneumonitis)	<i>Pneumocystis jiroveci</i> Fungi (<i>Cryptococcus</i>) <i>Nocardia</i> CMV HSV TB	<i>Klebsiella</i> Enteric GNB <i>S. aureus</i> Oral anaerobes (aspiration) TB

*See [Pediatrics](#) P90, Table 45 for Common Causes and Treatment of Pneumonia at Different Ages

Clinical Features

- cough (\pm sputum), fever, pleuritic chest pain, dyspnea, tachypnea, tachycardia
- elderly often present atypically; altered LOC is sometimes the only sign
- evidence of consolidation (dullness to percussion, bronchial breath sounds, crackles)
- features of parapneumonic effusion (decreased air entry, dullness to percussion) (see [Respirology](#), R21)
- complications: ARDS, lung abscess, parapneumonic effusion/empyema, pleuritis \pm hemorrhage

Investigations

- pulse oximetry to assess severity of respiratory distress
- CBC and differential, electrolytes, urea, Cr, ABG (if respiratory distress), troponin/CK, LFTs, urinalysis
- sputum Gram stain/C&S, blood C&S, \pm serology/viral detection, \pm pleural fluid C&S (if effusion >5 cm or respiratory distress)
- CXR \pm CT chest shows distribution (lobar consolidation or interstitial pattern), extent of infiltrate \pm cavitation
- bronchoscopy \pm washings for:
 - (1) severely ill patients refractory to treatment or (2) immunocompromised patients

Treatment

- ABC, O₂, IV fluids, consider salbutamol (nebulized or MDI)
- determine prognosis and need for hospitalization and antibiotics

Lobar Pneumonia

Bronchopneumonia

Interstitial Pneumonia

©Stuart Jantzen 2012

Figure 6. Lobar, broncho, and interstitial pneumonia

Criteria for Hospitalization

Table 9. CURB 65 Score – Pneumonia Clinical Prediction Tool

Component	Measurement(s)	Points	Total Score	Mortality	Disposition
Confusion	Altered mental status	1	0-1	<5%	Can treat as outpatient
Urea/BUN	Urea >7 mmol/L or BUN >20 mg/dL	1	2-3	5-15%	Consider hospitalization
Respiratory Rate	>30 breaths/min	1	4-5	15-30%	Consider ICU
Blood Pressure	Systolic <90 or diastolic <60 mmHg	1			
Age	65 or older	1			

Table 10. IDSA/ATS Community Acquired Pneumonia Treatment Guidelines 2007

Setting	Circumstances	Treatment
Outpatient	Previously well	Macrolide ¹
	No antibiotic use in last 3 mo	OR Doxycycline
Inpatient	Comorbidities ²	Respiratory fluoroquinolone ³
	Antibiotic use in last 3 mo (use different class)	OR β -lactam ⁴ + Macrolide ¹
ICU	Ward	Respiratory fluoroquinolone ³
	ICU	OR β -lactam ⁴ + Macrolide ¹

1. **Macrolide:** azithromycin, clarithromycin, erythromycin2. **Comorbidities:** chronic heart, lung, liver, or renal disease, DM, alcoholism, malignancy, asplenia, immunocompromised3. **Respiratory fluoroquinolone:** moxifloxacin, gemifloxacin, levofloxacin4. **β -lactam:** cefotaxime, ceftriaxone, ampicillin-sulbactam

IDSA: Infectious Diseases Society of America

ATS: American Thoracic Society

Table 11. IDSA/ATS Hospital/Ventilator/Healthcare-Associated Pneumonia Treatment Guidelines 2005

Setting	Treatment
No risk factors for multidrug resistance (MDR)	ceftriaxone
Early onset (<5 d)	OR levofloxacin, moxifloxacin, or ciprofloxacin
	OR ampicillin/sulbactam
	OR ertapenem
Late onset disease (≥ 5 d) or	antipseudomonal cephalosporin (cefepime or ceftazidime)
With risk factors for MDR:	OR
Antibiotic use in last 3 mo	antipseudomonal carbapenem (imipenem or meropenem)
High frequency of antibiotic resistance in the community	OR
or in the specific hospital unit	β -lactam/ β -lactamase inhibitor (piperacillin/tazobactam)
Hospitalization >1 d in past 3 mo	PLUS
Residence in a nursing home or extended care facility	antipseudomonal fluoroquinolone (ciprofloxacin or
Dialysis within 30 d	levofloxacin)
Home wound care	OR
Family member with multidrug-resistant pathogen	aminoglycoside (amikacin, gentamicin, or tobramycin)
Immunosuppressive disease and/or therapy	PLUS for MRSA
	linezolid or vancomycin
	PLUS for <i>Legionella</i>
	ensure regime includes either a macrolide or a fluoroquinolone

Note: Always use directed therapy against specific organism if one is found on culture (e.g. blood, sputum, etc.)

Prevention

- vaccine for influenza A and B recommended annually for all ages
- two pneumococcal polysaccharide vaccines available: 23 valent (indicated for all adults) and 13 valent (indicated for adults >50 yr)
- the CDC recommends giving Prevnar-13* to all adults at high risk for invasive pneumococcal disease (>65 yr, 19-64 with chronic disease, smokers, residents of long-term care facilities, Aboriginal peoples 50-64 yr)

Does This Adult Patient Have Pneumonia? From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3485708>

Study: Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for the diagnosis of adult community acquired pneumonia.

Results: The presence of fever or immunosuppression had a positive likelihood ratio (+LR) of 2, while a history of dementia had a +LR of 3; however, these traits are not confirmatory. The presence of an abnormality in any vital sign, including tachycardia, tachypnea, or fever had a +LR ranging from 2-4, which was not significantly affected by different cut-points. The absence of vital sign abnormality had a -LR ranging from 0.5-0.8. The combination of respiratory rate <30/min, heart rate <100/min, and temperature <37.8°C had a -LR of 0.18. Findings on chest exam raised the likelihood of diagnosis, but were uncommonly seen in studies. For example, presence of asymmetric respirations essentially confirmed the diagnosis, but was only present in 4% of patients. In patients with a clinical diagnosis, but normal radiograph, only ~10% will develop radiographic findings in 72 h.

Conclusions: Evidence suggests no single item on clinical history or physical exam is sufficient to rule in or out pneumonia without chest x-ray. Vital sign abnormalities were correlated with a diagnosis of pneumonia. Findings on chest exam significantly raised the likelihood of pneumonia, but were uncommonly seen in studies.

Does This Patient Have Ventilator-Associated Pneumonia?

JAMA 2007;297:1583-1593

Study: Systematic review of articles describing the precision and accuracy of clinical, radiographic, and laboratory data to diagnose bacterial ventilator-associated pneumonia, which is the most common and fatal nosocomial complication of intensive care.

Results: The presence of a new infiltrate on radiography with 2 or more of purulent sputum, fever, or increased white blood cell count increases the likelihood of ventilator-associated pneumonia (LR 2.8, 95% CI 0.97-7.9). Fewer than 50% neutrophils on the cell count of lower pulmonary secretions make ventilator-associated pneumonia unlikely (LR 0.05-0.10).

Conclusions: Routine bedside evaluation with radiographic information provides suggestive, but not definitive, evidence of ventilator-associated pneumonia. Clinicians need to consider additional tests to provide further evidence for ventilator-associated pneumonia.

Influenza

Definitions and Etiology

- influenza viruses A and B
- influenza A further divided into subtypes based on envelope glycoproteins:
 - hemagglutinin (H) and neuraminidase (N)
- seasonal (epidemic) influenza
 - main circulating influenza viruses: human-origin A (H1N1) and B (H3N2) subtypes
 - associated with antigenic drift (gradual, minor changes due to random point mutations)
 - may create a new viral subtype resulting in a seasonal epidemic (disease prevalence is greater than expected)
 - outbreaks occur mainly during winter months (late December to early March)
- pandemic influenza
 - associated with antigenic shift: abrupt, major changes due to mixing of two different viral strains from different hosts
 - may create a new viral strain resulting in a pandemic outbreak (worldwide)
 - antigenic shift occurs only in type A
- transmission: droplet, possibly airborne

Table 12. Difference Between Influenza Strains

	Influenza A	Influenza B
Host(s)	Humans, birds, mammals	Humans only
Antigenic drift	Yes, new strains	Yes, new strains
Antigenic shift	Yes, new subtypes	No
Epidemics	Yes	Yes
Pandemics	Yes	No

Clinical Features

- incubation period 1-4 d
- acute onset of systemic (fever, chills, myalgias, arthralgias, headache, fatigue) and respiratory symptoms (cough, dyspnea, pharyngitis)
- complications: respiratory (viral pneumonia, secondary bacterial pneumonia, otitis media, sinusitis), muscular (rhabdomyolysis, myositis), neurologic (encephalitis, meningitis, transverse myelitis, Guillain-Barré syndrome)

Investigations

- diagnosis is primarily clinical based on symptoms during the influenza season
- nasopharyngeal swabs for rapid antigen detection, DFA (Direct Fluorescent Antigen) detection, RT-PCR (gold standard)
- serology: rarely used for clinical management

Treatment and Prevention

- primarily supportive unless severe infection or high-risk of complications (e.g. elderly, pulmonary or cardiac disease)
- neuraminidase inhibitors: zanamivir (Relenza®) and oseltamivir (Tamiflu®) for treatment and prophylaxis against types A and B
 - decreases duration (by 1-2 d) and severity of symptoms if given within <48 h of onset
 - treatment beyond 48 h time window may be warranted in immunosuppressed and critically ill patients
- M2-inhibitors: amantidine/rimantidine for treatment and prophylaxis against type A only no longer recommended due to increased resistance
- vaccine for influenza A and B viruses is recommended annually for all ages
 - vaccine is reformulated each year to reflect circulating influenza A and B strains

Beware! Do Not Confuse *H. influenzae* with Influenza Virus

H. influenzae: a bacterium (Types A, B, C, D, E, F, refer to capsule)
Influenza: a virus (Types A and B refer to strain)

Vaccines for Preventing Influenza in Healthy Adults

Cochrane DB Syst Rev 2014;CD001269

Study: Meta-analysis of 90 RCTs and quasi-RCTs evaluating influenza vaccines compared to placebo in healthy individuals aged 16-65 yr.

Results: The preventative effect of inactivated influenza vaccine on healthy adults is small: 40 people would need a vaccination to avoid one influenza-like illness and 71 people would need a vaccination to prevent one case of influenza. 15.6% of unvaccinated vs. 9.9% of vaccinated people developed influenza-like symptoms: of these participants, only 2.4% and 1.1%, respectively, developed laboratory-confirmed influenza. Vaccination had a modest effect on working days lost, but no effects on hospitalization or complications. The effectiveness of live aerosol vaccinations on healthy adults is similar to that of inactivated influenza vaccines: 46 people would need a vaccination to avoid one influenza-like illness.

Conclusions: Influenza vaccines have a very modest effect in reducing influenza-like illness and working days lost in the general population.

Skin and Soft Tissue Infections

Cellulitis

Definition

- acute infection of the skin principally involving the dermis and subcutaneous tissue

Etiology

- common causative agents: *S. aureus*, β -hemolytic streptococci
- immunocompromised patients or water exposure: may also include GN rods and fungi
- risk factors:
 - trauma with direct inoculation, recent surgery
 - peripheral vascular disease, lymphedema diabetes, cracked skin in feet/toes (tinea pedis)

Clinical Features

- pain, edema, erythema with indistinct borders \pm regional lymphadenopathy, systemic symptoms (fevers, chills, malaise)
- can lead to ascending lymphangitis (visible red streaking in skin along lymphatics proximal to area of cellulitis)

Investigations

- CBC and differential, blood C&S if febrile
- skin swab ONLY if open wound with pus

Treatment

- antibiotics: cephalexin (broader coverage if risk factors for GN rods)
- if extensive erythema or systemic symptoms, consider cefazolin IV
- limb rest and elevation may help reduce swelling

Necrotizing Fasciitis

Definition

- life- and limb-threatening infection of the deep fascia characterized by rapid spread

Etiology

- Two main forms
 - Type I: polymicrobial infection – aerobes and anaerobes (e.g. *S. aureus*, *Bacteroides*, *Enterobacteriaceae*)
 - Type II: monomicrobial infection with GAS

Clinical Features

- pain out of proportion to clinical findings and beyond border of erythema
- edema, \pm crepitus (subcutaneous gas from anaerobes), \pm fever
- infection spreads rapidly
- patients may rapidly become very sick (tachycardia, hypotension, lightheadedness)
- late findings
 - skin turns dusky blue and black (secondary to thrombosis and necrosis)
 - induration, formation of hemorrhagic bullae

Investigations

- a clinical/surgical diagnosis – do NOT wait for results of investigations before beginning treatment
- blood and tissue C&S
- serum CK (elevated CK usually means myonecrosis – a late sign)
- plain film x-ray (soft tissue gas may be visualized)
- surgical exploration for debridement of infected tissue

Treatment

- resuscitation with IV fluids
- emergency surgical debridements to confirm diagnosis and remove necrotic tissue (may require amputation)
- IV antibiotics
 - unknown organism: meropenem or piperacillin/tazobactam + clindamycin IV \pm vancomycin if MRSA is considered
 - Type I (polymicrobial): piperacillin/tazobactam + clindamycin IV
 - Type II (monomicrobial): penicillin G + clindamycin IV
 - with Type II, evaluate for streptococcal toxic shock syndrome and the need for IVIg

Gastrointestinal Infections

Acute Diarrhea

- see [Gastroenterology](#), G15
- see [Pediatrics](#), P35
- see [Family Medicine](#), FM26

**Epidemiology**

- one of the top five leading causes of death worldwide, according to the World Health Organization
- significant morbidity in developed countries (over 900,000 hospitalizations in United States each year)

Definition

- passage of ≥ 3 loose or liquid stools/d OR >200 g stool/d for >2 d but ≤ 14 d

Approach to Acute Diarrhea

- rationale
 - the vast majority of acute diarrhea is caused by infection
 - in most cases, acute diarrheal illness is viral and/or self-limited, and lasts <3 d
 - investigations are costly and are necessary only in certain circumstances
- therefore, the evaluation of acute diarrhea involves:
 - identifying characteristics of the illness or patient that warrant further investigation
 - assessing volume status to determine appropriate method of rehydration
- see Figure 7

Physical Exam

- volume status: appearance, level of alertness, pulse, BP, orthostatic vitals, JVP, mucous membranes, skin turgor, capillary refill
- abdominal exam: pain, guarding, peritoneal signs

Treatment

- rehydration is mainstay of treatment
 - oral rehydration therapy
 - IV rehydration if oral intake insufficient to replace fluid loss
- antidiarrheal agents reduce duration of diarrhea: loperamide, bismuth salicylate
 - delays excretion of causative pathogens
 - contraindications: diarrhea with fever, bloody stool or diarrhea caused by *Clostridium difficile*
- antibiotic therapy is rarely indicated because:
 - most acute diarrheal illness is viral and self-limited
 - antibiotics can eradicate normal gut flora, predisposing patient to *C. difficile* infection
 - antibiotics prolong the shedding of *Salmonella* and other causes of bacterial diarrhea
 - in EHEC infection, antibiotics may increase the risk of HUS
 - indications for antibiotic therapy are shown in Figure 7

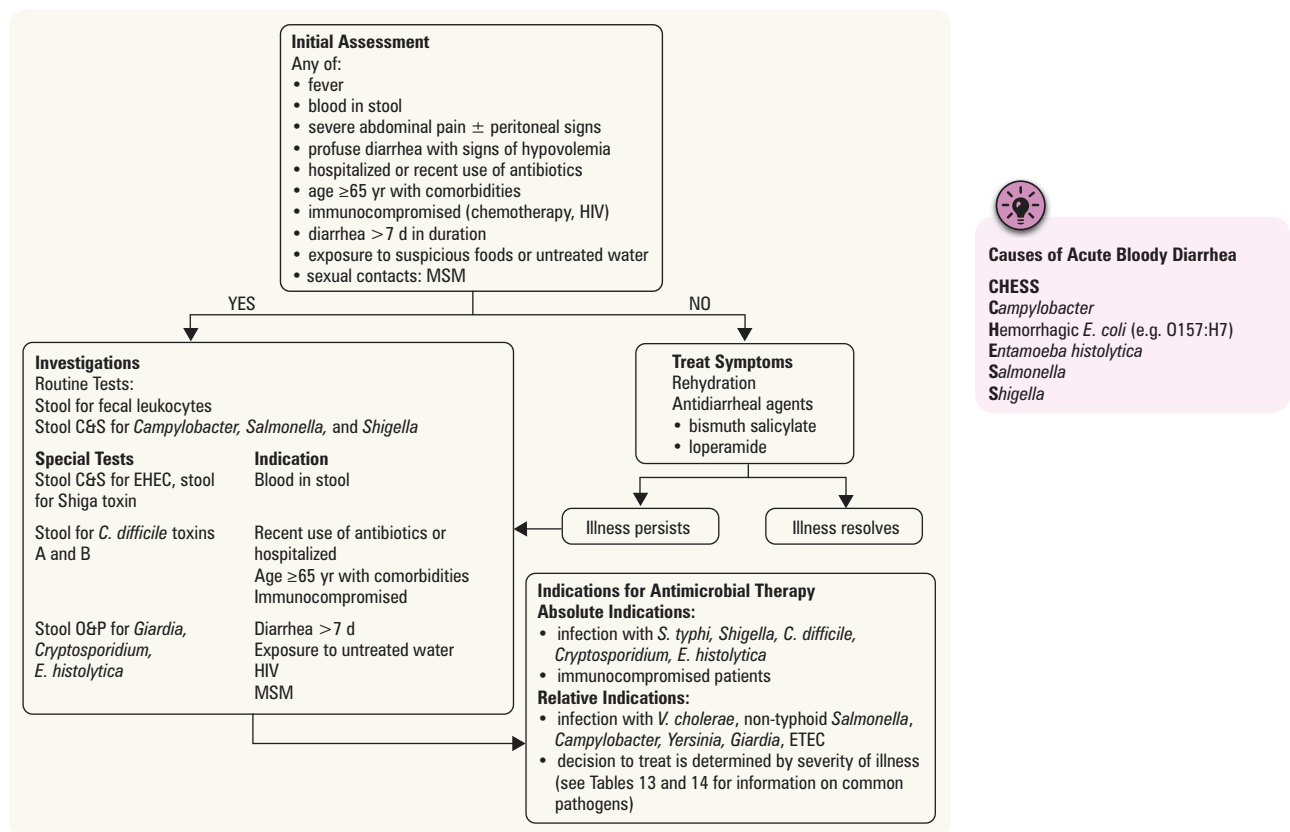

Figure 7. Approach to acute diarrhea

Table 13. Bacteria in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
<i>B. cereus</i> – Type A (emetic)	Rice dishes	1-6 h	–	–	–	+	<12 h	None	Preformed exotoxin
<i>B. cereus</i> – Type B (diarrheal)	Meats, vegetables, dried beans, cereals	8-16 h	–	–	–	–	<24 h	None	Secondary endotoxin
<i>Campylobacter jejuni</i>	Uncooked meat, especially poultry	2-10 d	+	±	+	±	<1 wk	Macrolide or fluoroquinolone if diarrhea > 1 wk, bloody diarrhea, or immunocompromised	Most common bacterial cause of diarrhea in U.S. Associated with Guillain-Barré syndrome
<i>Clostridium difficile</i>	Can be normally present in colon in small numbers (primary risk factor for disease is exposure to antimicrobials)	Unclear	±	±	±	–	Variable	Discontinue offending antimicrobial agent, if possible 1st line – metronidazole (PO/IV) or vancomycin PO in severe cases 2nd line – vancomycin PO	Usually follows antibiotic treatment (especially clindamycin, fluoroquinolones, penicillins, cephalosporins) Can develop pseudomembranous colitis
<i>Clostridium perfringens</i>	Contaminated food, especially meat and poultry	8-12 h	±	–	+	–	<24 h	None	<i>Clostridium</i> spores are heat resistant Secondary enterotoxin
Enteroinvasive <i>E. coli</i> (EIEC)	Contaminated food/water	1-3 d	+	±	+	–	7-10 d	None	Relatively uncommon
Enterotoxigenic <i>E. coli</i> (ETEC)	Contaminated food/water	1-3 d	–	–	+	–	3 d	Fluoroquinolone or azithromycin for moderate to severe symptoms	Most common cause of traveler's diarrhea Heat-labile and heat-stable toxins
Enterohemorrhagic <i>E. coli</i> (EHEC/STEC) i.e. O157:H7	Contamination of hamburger, raw milk, drinking and recreational water	3-8 d	–	+	+	±	5-10 d	None: antibiotics increase risk of HUS	Shiga toxin production Monitor renal function: 10% develop HUS Antidiarrheals increase risk of HUS
<i>Salmonella typhi</i> <i>S. paratyphi</i> (i.e. Enteric Fever, Typhoid)	Fecal-oral Contaminated food/water, travel to endemic area	10-14 d	+	±	+	±	<5-7 d	Empiric treatment with ceftriaxone or azithromycin Fluoroquinolone resistance is increasing	<i>Salmonella typhi</i> : "Rose spot" rash (on anterior thorax, upper abdomen), fever, and abdominal pain precedes diarrhea
Non-typhoidal Salmonellosis <i>S. typhimurium</i> , <i>S. enteritidis</i>	Contaminated animal food products, especially eggs, poultry, meat, milk	12-72 h	+	±	+	+	3-7 d	Ciprofloxacin only in severe illness, extremes of age, joint prostheses, valvular heart disease, severe atherosclerosis, cancer, uremia	
<i>Shigella dysenteriae</i>	Fecal-oral Contaminated food/water	1-4 d	+	±	+	+	<1 wk	Fluoroquinolone	Very small inoculum needed for infection Complications include toxic megacolon, HUS Antidiarrheals may increase risk of toxic megacolon
<i>Staphylococcus aureus</i>	Unrefrigerated meat and dairy products (custard, pudding, potato salad, mayo)	2-4 h	–	–	+	+	1-2 d	None	Heat-stable preformed exotoxin
<i>Vibrio cholerae</i>	Contaminated food/water, especially shellfish	1-3 d	–	–	–	–	3-7 d	Tetracycline or quinolones (ciprofloxacin)	Massive watery diarrhea (1-3 L/d) Mortality <1% with treatment
<i>Yersinia</i>	Contaminated food Unpasteurized milk	5 d	+	±	+	±	Up to 3 wk	Fluoroquinolone only for severe illness	Majority of cases in children 1-4 yr Mesenteric adenitis and terminal ileitis can occur without diarrhea, mimicking appendicitis

Table 14. Parasites in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
<i>Cryptosporidium</i>	Fecal-oral	7 d	±	–	–	+	1-20 d	Paromomycin + nitazoxanide	
<i>Entamoeba histolytica</i>	Worldwide endemic areas Fecal-oral	2-4 wk	±	+	–	+	Variable	Metronidazole + iodoquinol if symptomatic infection Only iodoquinol for asymptomatic cyst passage	If untreated, potential for liver abscess Sigmoidoscopy shows flat ulcers with yellow exudates
<i>Giardia lamblia</i>	Fecal-oral Contaminated food/water	1-4 wk	–	–	+	+	Variable	Metronidazole or nitazoxanide Treatment of asymptomatic carriers not recommended	Higher risk in: day care children, intake of untreated water ("beaver fever"), MSM, immunodeficiency (decreased IgA) May need duodenal biopsy

Table 15. Viruses in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
Norovirus	Fecal-oral	24 h	–	–	+	+	24 h	None	Noroviruses includes Norwalk virus
Rotavirus	Fecal-oral	2-4 d	±	–	–	±	3-8 d	None	Can cause severe dehydration Virtually all children are infected by 3 yr of age Oral vaccine given at 2 and 4 mo of age

Traveler's Diarrhea

- see *Acute Diarrhea*, ID11

Epidemiology

- the most common illness to affect travelers
- up to 50% of travelers to developing countries affected in first 2 wk and 10-20% after returning home

Etiology

- bacterial (80-90%): *E. coli* most common (ETEC), *Campylobacter*, *Shigella*, *Salmonella*, *Vibrio* (non-cholera); wide regional variation (e.g. *Campylobacter* more common in Southeast Asia)
- viral: norovirus, rotavirus, and astrovirus account for 5-8%
- protozoal (rarely): *Giardia*, *Entamoeba histolytica*, *Cryptosporidium*, *Cyclospora* for ~10% in long-term travelers
- pathogen-negative traveler's diarrhea common despite exhaustive microbiological workup

Treatment

- rehydration is the mainstay of therapy
 - rehydrate with sealed beverages
 - in severe fluid loss use oral rehydration solutions (1 package in 1 L boiled or treated water)
- treat symptoms: antidiarrheal agents (e.g. bismuth salicylate, loperamide)
- empiric antibiotics in moderate or severe illness: ciprofloxacin or azithromycin or rifaximin
 - note: there is increasing fluoroquinolone resistance in causative agents, especially in Southeast Asia

Bismuth salicylate (Pepto-Bismol®) can cause patients to have black stools, which may be mistaken for melena

Prevention

- proper hygiene practices
 - avoid consumption of: foods or beverages from establishments with unhygienic conditions (e.g. street vendors), raw fruits or vegetables without a peel, raw or undercooked meat and seafood
 - avoid untreated water
- bismuth salicylate (Pepto-Bismol®): 60% effective (2 tablets qid according to CDC website)
- CDC Guidelines: antibiotic prophylaxis not recommended
 - increased risk of infection with resistant organisms

- high risk groups (e.g. immunocompromised) likely to be infected with pathogen not covered by standard antimicrobial agents
- Dukoral®: oral vaccine that offers protection against *V. cholerae* (efficacy ~80%) and ETEC (efficacy ~50-67%); the CDC does not recommend it for routine use in travelers

Chronic Diarrhea

- see [Gastroenterology](#), G16

Peptic Ulcer Disease (*H. pylori*)

- see [Gastroenterology](#), G12

Bone and Joint Infections

Septic Arthritis

Routes of Infection

- hematogenous (adults)
- contiguous osteomyelitis (children)
- direct inoculation via skin/trauma
- iatrogenic (surgery, arthroscopy, arthrocentesis)

Etiology

- gonococcal
 - *N. gonorrhoeae*: previously accounted for 75% of septic arthritis in young sexually active adults
- non-gonococcal
 - *S. aureus*: affects all ages, rapidly destructive, accounts for most non-gonococcal cases of septic arthritis in adults (especially in those with rheumatoid arthritis)
 - *Streptococcus* species (Group A and B)
 - Gram-negatives: affects neonates, elderly, IV drug users, immunocompromised
 - *S. pneumoniae*: affects children
 - *Kingella kingae*: affects children aged <2 yr since Hib immunization (Hib possible cause in unvaccinated children)
 - *Salmonella* spp.: characteristic of sickle cell disease
 - coagulase-negative *Staphylococcus* species: prosthetic joints
- if culture negative: *Borrelia* spp. (Lyme disease) or *Tropheryma whipplei* (Whipple's disease)

Risk Factors

- gonococcal
 - age (<40 yr), multiple partners, unprotected intercourse, MSM
- non-gonococcal
 - bacteremia (extra-articular infection with hematogenous seeding, endocarditis)
 - prosthetic joints/recent joint surgery
 - underlying joint disease (rheumatoid arthritis, osteoarthritis)
 - immunocompromise (DM, chronic kidney disease, alcoholism, cirrhosis)
 - loss of skin integrity (cutaneous ulcer, skin infection)
 - age >80 yr

Clinical Features of Gonococcal Arthritis

- two forms (although overlap often)
 - bacteremic form
 - ♦ systemic symptoms: fever, malaise, chills
 - ♦ gonococcal triad: migratory polyarthralgias, tenosynovitis, dermatitis (pustular skin lesions)
 - septic arthritis form
 - ♦ local symptoms in involved joint: swelling, warmth, pain, inability to bear weight, marked decreased in range of motion (see [Rheumatology](#), RH3 for differential diagnosis)

Clinical Features of Non-Gonococcal Arthritis

- acute onset of pain, swelling, warmth, decreased range of motion ± fever, chills
- most often in large weight-bearing joints (knee, hip, ankle) and wrists
- usually monoarticular (polyarticular risk factors: rheumatoid arthritis, endocarditis, GBS)

Medical Emergency

Septic arthritis is a medical emergency! If untreated, rapid joint destruction will occur

Disseminated Gonococcal Infection Triad

- Migratory arthralgias
- Tenosynovitis next to inflamed joint
- Pustular skin lesions

Investigations

- consider rheumatologic causes for monoarthritis (see [Rheumatology, RH3](#))
- gonococcal: blood C&S, as well as endocervical, urethral, rectal, and oropharyngeal testing
- non-gonococcal: blood C&S
- arthrocentesis (synovial fluid analysis) is mandatory: CBC and differential, Gram stain, C&S, examine for crystals
 - infectious = opaque, increased WBCs ($>15,000/\text{mm}^3$: likelihood of infection increases with increasing WBCs), PMNs $>90\%$, culture positive
 - growth of *N. gonorrhoeae* from synovial fluid is successful in $<50\%$ of cases
- \pm plain x-ray: assess for osteomyelitis, provides baseline to monitor treatment

Treatment

- medical
 - empiric IV antibiotics (vancomycin + ceftriaxone) – delay may result in joint destruction
 - Gram stain guides subsequent treatment
 - gonococcal: ceftriaxone + azithromycin, for concurrent treatment of *C. trachomatis*
 - non-gonococcal: antibiotics against *Streptococcus* spp. (2 wk IV f/b PO), *S. aureus* (4 wk IV minimum), or GNB (4 wk)
- surgical drainage if: (see [Orthopedics, OR10](#))
 - persistent positive joint cultures on repeat arthrocentesis
 - hip joint involvement
 - prosthetic joint
- daily joint aspirations until culture sterile; no need to give intra-articular antibiotics
- physiotherapy

Prognosis

- gonococcal: responds well after 24-48 h of initiating antibiotics (usually complete recovery)
- non-gonococcal: up to 50% morbidity (decreased joint function/mobility)

Intra-articular steroids are contraindicated until septic arthritis has been excluded

Diabetic Foot Infections

Etiology

- neuropathy, peripheral vascular disease, and hyperglycemia contribute to foot ulcers that heal poorly and are predisposed to infection
- organisms in mild infection: *S. aureus*, *Streptococcus* spp.
- organisms in moderate/severe infection: polymicrobial with aerobes (*S. aureus*, *Streptococcus*, *Enterococcus*, GNB) and anaerobes (*Peptostreptococcus*, *Bacteroides*, *Clostridium*)

Clinical Features

- not all ulcers are infected
- consider infection if: probe to bone (see below), ulcer present >30 d, recurrent ulcers, trauma, PVD, prior amputation, loss of protective sensation, renal disease, history of walking barefoot
- diagnosis of infected ulcer: ≥ 2 of the cardinal signs of inflammation (redness, warmth, swelling, pain) or the presence of pus
- \pm crepitus, osteomyelitis, systemic toxicity
- visible bone or probe to bone \rightarrow osteomyelitis
- infection severity:
 - mild = superficial (no bone/joint involvement)
 - moderate = deep (beneath superficial fascia, involving bone/joint) or erythema >2 cm
 - severe = infection in a patient with systemic toxicity (fevers, tachypnea, leukocytosis, tachycardia, hypotension)

Investigations

- curettage specimen from ulcer base, aspirate from an abscess or bone biopsy (results from superficial swabs do not represent organisms responsible for deeper infection)
- blood C&S if febrile
- assess for osteomyelitis by x-ray (although not sensitive in early stages) or MRI if high clinical suspicion
 - if initial x-ray normal, repeat 2-4 wk after initiating treatment to increase test sensitivity

Treatment

- evaluate for early surgical debridement \pm revascularization or amputation
- eliminate/reduce pressure and provide regular local wound care
- mild: cephalexin or clindamycin
- moderate: clindamycin + ciprofloxacin or moxifloxacin PO, ceftriaxone or ertapenem IV \pm MRSA coverage
- severe: piperacillin/tazobactam or meropenem IV \pm vancomycin if MRSA known or suspected
- encourage glycemic control

Does This Patient with Diabetes Have Osteomyelitis of the Lower Extremity?
JAMA 2008;299:806-813

Study: Systematic literature review, 21 studies.
Population: 1,027 adult patients with DM being investigated for osteomyelitis.

Intervention: Various aspects of history, physical exam, laboratory tests, and diagnostic imaging studies vs. bone biopsy.

Primary Outcome: Diagnostic utility.

Results: No studies examined any part of history taking. Temperature, ulcer characteristics (erythema, swelling, purulence), elevated WBC, skin swabs, and soft tissue cultures were not useful. Nuclear imaging has poor specificity for osteomyelitis (62-88.5%), and MRIs have greater accuracy in detecting osteomyelitis.

Finding	(+) LR	(-) LR
Visualization of bone	9.2	0.70
Ulcer area >2 cm ²	7.2	0.48
Probe-to-bone	6.4	0.39
Clinical judgment	5.5	0.54
ESR >70 mm/h	11	NS*
Plain radiographs	2.3	0.63
MRI	3.8	0.14

*NS = not significant

Osteomyelitis

- see [Orthopedics](#), OR10

Cardiac Infections

Infective Endocarditis

Definition

- infection of cardiac endothelium, most commonly the valves
- classifications: acute vs. subacute, native valve vs. prosthetic valve, right-sided vs. left-sided
- leaflet vegetations that are comprised of platelet-fibrin thrombi, WBCs, and bacteria

Risk Factors and Etiology

- predisposing conditions
 - **high risk:** prosthetic cardiac valve, previous IE, congenital heart disease (unrepaired, repaired within 6 mo, repaired with defects), cardiac transplant with valve disease (surgically constructed systemic-to-pulmonary shunts or conduits)
 - moderate risk: other congenital cardiac defects, acquired valvular dysfunction, hypertrophic cardiomyopathy
 - low/no risk: secundum ASD or surgically repaired ASD < VSD, PDA, MV prolapse, ischemic heart disease, previous CABG
 - opportunity for bacteremia: IVDU, indwelling venous catheter, hemodialysis, poor dentition, DM, HIV
- frequency of valve involvement MV >> AV > TV > PV
 - but in 50% of IVDU-related IE the tricuspid valve is involved

MV mitral valve
AV aortic valve
TV tricuspid valve
PV pulmonic valve

Etiology of Culture-Negative Endocarditis

- **HACEK (fastidious Gram-Negative bacilli)**

Haemophilus parainfluenzae
Aggregatibacter aphrophilus/
Aggregatibacter
actinomycetemcomitans
Cardiobacterium hominis
Eikenella corrodens
Kingella kingae

- *Coxiella burnetii*
- *Bartonella* species
- *Tropheryma whippelii*
- Fungi
- Mycobacteria

Table 16. Microbial Etiology of Infective Endocarditis Based on Risk Factors

Native Valve	IVDU	Prosthetic Valve (recent surgery <2 mo)	Prosthetic Valve (remote surgery >2 mo)
<i>Streptococcus</i>¹ (36%)	<i>S. aureus</i> (68%)	<i>S. aureus</i> (36%)	<i>Streptococcus</i> (20%)
<i>S. aureus</i>⁴ (28%)	<i>Streptococcus</i> (13%)	<i>S. epidermidis</i> (17%)	<i>S. aureus</i> (20%)
<i>Enterococcus</i> (11%)	<i>Enterococcus</i>	Other	<i>S. epidermidis</i> (20%)
<i>S. epidermidis</i>	GNB	<i>Enterococcus</i>	<i>Enterococcus</i> (13%)
GNB	<i>Candida</i>	GNB	Other ²
Other ²	Other ³	Other ²	

Organisms in bold are the most common isolates.

1. *Streptococcus* includes mainly Viridans group *streptococci*

2. Other includes less common organisms such as:

- *Streptococcus bovis* (usually associated with underlying GI malignancy, cirrhosis)
- Culture-negative organisms including nutritionally-deficient *streptococci*, HACEK, *Bartonella*, *Coxiella*, *Chlamydia*, *Legionella*, *Brucella*
- *Candida*

3. IVDU endocarditis pathogens depend on substance used to dilute the drugs (i.e. tap water = *Pseudomonas*, saliva = oral flora, toilet water = GI flora)

Clinical Features

- systemic
 - fever (80-90%), chills, weakness, rigors, night sweats, weight loss, anorexia
- cardiac
 - dyspnea, chest pain, clubbing (subacute)
 - regurgitant murmur (new onset or increased intensity)
 - signs of CHF (secondary to acute MR, AR)
- embolic/vascular
 - petechiae over legs, splinter hemorrhages (linear, reddish-brown lesion within nail bed)
 - Janeway lesions (painless, 5 mm, erythematous, hemorrhagic pustular lesions on soles/palms)
 - focal neurological signs (CNS emboli), headache (mycotic aneurysm)
 - splenomegaly (subacute)
 - microscopic hematuria, flank pain (renal emboli) ± active sediment
- immune complex
 - Osler's nodes (painful, raised, red/brown, 3-15 mm on digits)
 - glomerulonephritis
 - arthritis
 - Roth's spots (retinal hemorrhage with pale center)

Diagnosis

- Modified Duke Criteria, see [Table 17](#)
 - definitive diagnosis if: 2 major, OR 1 major + 3 minor, OR 5 minor
 - possible diagnosis if: 1 major + 1 minor, OR 3 minor

Clinical Features of Infective Endocarditis

FROM JANE

Fever
Roth's spots
Osler's nodes
Murmur
Janeway lesions
Anemia
Nail-bed hemorrhages (i.e. splinter hemorrhages)
Emboli

Table 17. Modified Duke Criteria

Major Criteria (2)
<ol style="list-style-type: none"> Positive blood cultures for IE <ul style="list-style-type: none"> Typical microorganisms for IE from 2 separate blood cultures (<i>Streptococcus viridans</i>, HACEK group (see ID17), <i>Streptococcus bovis</i>, <i>Staphylococcus aureus</i>, community-acquired enterococci) OR Persistently positive blood culture, defined as recovery of a microorganism consistent with IE from blood drawn >12 h apart or all of 3 or a majority of 4 or more separate blood cultures, with first and last drawn >1 h apart OR Single positive blood culture for <i>Coxiella burnetii</i> or antiphase I IgG antibody titer >1:800 Evidence of endocardial involvement <ul style="list-style-type: none"> Positive echocardiogram for IE (oscillating intracardiac mass on valve or supporting structures, or in the path of regurgitant jets, or on implanted material in the absence of an alternative anatomic explanation OR abscess OR new partial dehiscence of prosthetic valve) OR New valvular regurgitation (insufficient if increase or change in preexisting murmur)
Minor Criteria (5)
<ol style="list-style-type: none"> Predisposing condition (abnormal heart valve, IVDU) Fever (100.4°F/38.0°C) Vascular phenomena: major arterial emboli, septic pulmonary infarcts, mycotic aneurysms, ICH, conjunctival hemorrhages, Janeway lesions Immunologic phenomena: glomerulonephritis, rheumatoid factor, Osler's nodes, Roth's spots Positive blood culture but not meeting major criteria OR serologic evidence of active infection with organism consistent with IE

Investigations

- serial blood cultures: 3 sets (each containing one aerobic and one anaerobic sample) collected from different sites >1 h apart
 - persistent bacteremia is the hallmark of endovascular infection (such as IE)
- repeat blood cultures (at least 2 sets) after 48 to 72 h of appropriate antibiotics to confirm clearance
- blood work: CBC and differential (normochromic, normocytic anemia), ESR (increased), RF (+), BUN/Cr
- urinalysis (proteinuria, hematuria, red cell casts) and urine C&S
- ECG: prolonged PR interval may indicate perivalvular abscess
- Echo findings: vegetations, regurgitation, abscess
 - TTE (poor sensitivity) inadequate in 20% (obesity, COPD, chest wall deformities)
 - TEE indicated if TTE is non-diagnostic in patients with at least possible endocarditis or if suspect prosthetic valve endocarditis or complicated endocarditis (e.g. paravalvular abscess/perforation) (~90% sensitivity)

TEE
TTE

transesophageal echo
transthoracic echo

Treatment

- medical
 - usually non-urgent and can wait for confirmation of etiology before initiating treatment
 - empiric antibiotic therapy if patient is unstable; administer ONLY after blood cultures have been taken
 - first-line empiric treatment for native valve: vancomycin
 - first line empiric treatment for prosthetic valve: vancomycin + gentamicin + cefepime OR a carbapenem
 - targeted antibiotic therapy: antibiotic and duration (usually 4-6 wk) adjusted based on valve, organism, and sensitivities
 - monitor for complications of IE (e.g. CHF, conduction block, new emboli) and complications of antibiotics (e.g. interstitial nephritis)
 - prophylaxis only for high risk individuals listed above with dental procedures that may lead to bleeding OR invasive procedure of the respiratory tract that involves incision or biopsy of the respiratory mucosa, such as tonsillectomy and adenoidectomy OR procedures on infected skin, skin structure, or musculoskeletal tissue
 - dental/respiratory: amoxicillin single dose 30-60 min prior; clindamycin if penicillin-allergic
 - skin/soft tissue: cephalexin single dose 30-60 min prior; clindamycin if penicillin-allergic (modify based on etiology of skin/soft tissue infection)
- surgical
 - most common indication is refractory CHF
 - other indications include: valve ring abscess, fungal etiology, valve perforation, unstable prosthesis, ≥2 major emboli, antimicrobial failure (persistently positive blood cultures), mycotic aneurysm, staphylococci on a prosthetic valve

Prognosis

- adverse prognostic factors: CHF, prosthetic valve infection, valvular/myocardial abscess, embolization, persistent bacteremia, altered mental status prognostic factors: CHF, prosthetic valve infection, valvular/myocardial abscess
- mortality: prosthetic valve IE (25-50%), non-IVDU *S. aureus* IE (30-45%), IVDU *S. aureus* or streptococcal IE (10-15%)

Neurological Infections

Meningitis

- see [Pediatrics](#), P61

Definition

- inflammation of the meninges

Etiology

Table 18. Common Organisms in Meningitis

Bacterial			Viral	Fungal	Other
Age 0-4 wk	Age 1-23 mo	Age >2 yr			
<i>GBS</i>	<i>GBS</i>	<i>S. pneumoniae</i>	HSV-1, 2	<i>Cryptococcus</i>	Lyme disease
<i>E. coli</i>	<i>E. coli</i>	<i>N. meningitidis</i>	VZV	<i>Coccidioides</i>	Neurosyphilis
<i>L. monocytogenes</i>	<i>S. pneumoniae</i>	<i>L. monocytogenes</i>	Enteroviruses		TB
<i>Klebsiella</i>	<i>N. meningitidis</i>	(age >50 and comorbidities)	West Nile		
	<i>H. influenzae</i>				

Risk Factors

- lack of immunization against *S. pneumoniae*, *H. influenzae type b* in children
- hematogenous spread after invasion from a mucosal surface (nasopharynx)
- parameningeal focus (otitis media, infection, sinusitis)
- penetrating head trauma
- anatomical meningeal defects – CSF leaks
- previous neurosurgical procedures, shunts
- immunocompromise (corticosteroids, HIV, asplenia, hypogammaglobulinemia, complement deficiency)
- contact with colonized or infected persons

Clinical Features

- neonates and children: fever, vomiting, lethargy, irritability, poor feeding
- older children and adults: fever, H/A, neck stiffness, confusion, N/V, lethargy, photophobia, altered level of consciousness, seizures, focal neurological signs, papilledema
- petechial rash in meningococcal meningitis, seen more frequently on trunk or lower extremities

Investigations

- blood work: CBC and differential, electrolytes (for SIADH), blood C&S
 - CSF: opening pressure, cell count + differential, glucose, protein, Gram stain, bacterial C&S
 - AFB, fungal C&S, cryptococcal antigen in immunocompromised patients, subacute illness, suggestive travel history or TB exposure
 - PCR for HSV, VZV, enteroviruses, WNV if viral cause suspected
- imaging/neurologic studies: CT, MRI, EEG if focal neurological signs present

Table 19. Typical CSF Profiles for Meningitis

CSF Analysis	Bacterial	Viral
Glucose (mg/dL)	Decreased	Normal
Protein (mg/mL)	Markedly Increased	Increased
WBC	500-10,000/ μ L	10-500/ μ L
Predominant WBC	Neutrophils	Lymphocytes

Treatment

- bacterial meningitis is a medical emergency: **do not delay antibiotics for CT or LP**
- empiric antibiotic therapy
 - age <1 mo: ampicillin + cefotaxime IV OR ampicillin + an aminoglycoside IV
 - age >1 mo: vancomycin + cefotaxime OR ceftriaxone IV
 - ♦ add ampicillin IV if risk factors for infection with *L. monocytogenes* present: age >50, alcoholism, immunocompromised
- steroids in acute bacterial meningitis: dexamethasone IV within 20 min prior to or with first dose of antibiotics
 - continue in those patients with proven pneumococcal meningitis
 - not recommended for patients with suspected bacterial meningitis in some resource-limited countries

Brudzinski's Sign

Passive neck flexion causes involuntary flexion of hips and knees

Kernig's Sign

Resistance to knee extension when hip is flexed to 90°

Jolt Accentuation of H/A

Headache worsens when head turned horizontally at 2-3 rotations/s; more sensitive than Brudzinski's and Kernig's

CSF Gram Stain Findings

- *S. pneumoniae* – GP diplococci
- *N. meningitidis* – GN diplococci
- *H. influenzae* – Pleiomorphic GN coccobacilli
- *L. monocytogenes* – GP rods

Does this Adult Patient Have Acute Meningitis? From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3482857>

Study: Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for the diagnosis of adult meningitis.

Results: In retrospective studies, sensitivity for headache was 68%, and 52% for nausea and vomiting. Sensitivity for physical exam findings is similarly low (fever: 87%, neck stiffness: 80%, altered mental status: 69%). Sensitivity for the combination of the classic triad of fever, neck stiffness, and altered mental status was 46%. In prospective studies, sensitivity of H/A was 92%, while sensitivity of N/V could not be pooled, and ranged from 32-70%. Brudzinski's and Kernig's signs had a sensitivity of 5% and Kernig's sign only 5-9%. Jolt accentuation had a sensitivity of 97%.

Conclusions: Data were heterogeneous, and lacked standardization of clinical exams. No single item on clinical history or physical exam was sufficient to rule out meningitis, including Kernig's and Brudzinski's signs, or the absence of the classic triad of fever, neck stiffness, and altered mental status essentially rules out meningitis.

Jolt accentuation has high sensitivity, but further research is needed. LP may be performed safely without CT head in patients without altered LOC, no recent seizure, no history of CNS disease, not immunocompromised, and <60 yr.

Prevention

- see [Pediatrics](#), P3
- immunization
 - children: immunization against *H. influenzae* (Pentacel®), *S. pneumoniae* (Synflorix®, Prevnar-13®), *N. meningitidis* (Menjugate®, Menactra®)
 - adults: immunization against *N. meningitidis* in selected circumstances (outbreaks, travel, epidemics) and *S. pneumoniae* (Pneumovax®) for high-risk groups
- prophylaxis: close contacts of patients infected with *H. influenzae* should be treated with rifampin if they live with an inadequately immunized (<4 yr) or immunocompromised child (<18 yr); ciprofloxacin, rifampin, or ceftriaxone if close or household contact of a patient with *N. meningitidis*

Meningococcal Quadrivalent Vaccine (Menactra® or Menomune®)

- Healthy young adults (not immunized in childhood)
- Asplenia
- Travelers to high-risk areas
- Military recruits or laboratory personnel
- Complement, factor D, or properdin deficiency or acquired terminal complement deficiency through receipt of eculizumab

Prognosis

- complications
 - H/A, seizures, cerebral edema, hydrocephalus, SIADH, residual neurological deficit (especially CN VIII), deafness, death
- mortality
 - *S. pneumoniae* 25%; *N. meningitidis* 5-10%; *H. influenzae* 5%
 - worse prognosis if: extremes of age, delays in diagnosis and treatment, stupor or coma, seizures, focal neurological signs, septic shock at presentation

Encephalitis

Definition

- inflammation of the brain parenchyma

Etiology

- identified in only 40-70% of cases
 - when cause is identified, the most common etiology is viral
 - e.g. HSV, VZV, EBV, enteroviruses, CMV, West Nile, HIV, mumps, measles, rabies, polio
 - bacteria: *L. monocytogenes*, *Mycobacteria*, spirochetes (Lyme, syphilis)
 - parasites: protozoa (e.g. *Toxoplasma*) and helminths (rare)
 - fungi: e.g. *Cryptococcus*
 - post-infectious (e.g. acute disseminated encephalomyelitis [ADEM])

Pathophysiology

- acute inflammatory disease of the brain due to direct invasion or pathogen-initiated immune response
- viruses may reach the CNS via peripheral nerves (e.g. rabies, HSV)
- herpes simplex encephalitis
 - acute, necrotizing, asymmetrical hemorrhagic process with lymphocytic and plasma cell reaction which usually involves the medial temporal and inferior frontal lobes
 - associated with HSV-1, but can also be caused by HSV-2

Clinical Features

- constitutional: fever, chills, malaise, N/V
- meningeal involvement (meningoencephalitis): H/A, nuchal rigidity
- parenchymal involvement: seizures, altered mental status, focal neurological signs
- herpes simplex encephalitis
 - acute onset (<1 wk) of focal neurological signs: hemiparesis, ataxia, aphasia, focal or generalized seizures
 - temporal lobe involvement: behavioral disturbance
 - usually rapidly progressive over several days and may result in coma or death
 - common sequelae: memory and behavior disturbances

Investigations

- CSF: opening pressure, cell count + differential, glucose, protein, Gram stain, bacterial C&S, PCR for HSV, VZV, EBV, enteroviruses, and other less common viral etiologies
- serology: may aid diagnosis of certain causes of encephalitis (e.g. West Nile virus)
- imaging/neurologic studies: CT, MRI, EEG to define anatomical sites affected
- invasive testing: brain tissue biopsy may be required for culture, histological examination, and immunocytochemistry (if diagnosis not clear via non-invasive means)
- findings in herpes simplex encephalitis (must rule out due to high mortality)
 - CT/MRI: medial temporal lobe necrosis
 - EEG: early focal slowing, periodic discharges

Treatment

- general supportive care
- monitor vital signs carefully
- IV acyclovir empirically until HSV encephalitis ruled out

Meningitis and encephalitis patients can be distinguished based on their cerebral function. Cerebral function is abnormal in encephalitis patients (e.g. altered mental status, motor or sensory deficits, altered behavior, speech or movement disorders), but may be normal in patients with meningitis. Note however, that there is considerable overlap between the two syndromes ("meningoencephalitis")

Generalized Tetanus

- see [Family Medicine, FM3](#)
- see [Pediatrics, P3](#)

Etiology and Pathophysiology

- caused by *Clostridium tetani*: motile, spore forming, anaerobic GP bacillus
- found in soil, splinters, rusty nails, GI tract (humans and animals)
- traumatic implantation of spores into tissues with low oxygenation (e.g. puncture wound, burns, nonsterile surgeries or deliveries)
- upon inoculation, spores transform into *C. tetani* bacilli that produce tetanus toxin
 - toxin travels via retrograde axonal transport to the CNS where it irreversibly binds presynaptic neurons to prevent the release of inhibitory neurotransmitters (e.g. GABA)
 - net effect is the disinhibition of spinal motor reflexes which results in tetany and autonomic hyperactivity

Clinical Features

- generalized tetanus
 - initially present with painful spasms of masseters (trismus or "lockjaw")
 - sustained contraction of skeletal muscle with periodic painful muscle spasms (triggered by sensory stimuli, e.g. loud noises)
 - paralysis descends to involve large muscle groups (neck, abdomen)
 - apnea, respiratory failure, and death secondary to tonic contraction of pharyngeal and respiratory muscles
- autonomic hyperactivity
 - diaphoresis, tachycardia, HTN, fever as illness progresses

Investigations

- primarily a clinical diagnosis, often although not always with a history of a traumatic wound and lack of immunization
- culture wounds, CK may be elevated

Treatment

- stop toxin production
 - wound debridement to clear necrotic tissue and spores
 - antimicrobial therapy: IV metronidazole, penicillin G IV is an effective alternative
- neutralize unbound toxin with tetanus immune globulin (TIG)
- supportive therapy: intubation, spasmolytic medications (benzodiazepines), quiet environment, cooling blanket
- control autonomic dysfunction: α - and β -blockade (e.g. labetalol), magnesium sulfate

Antimicrobial therapy (e.g. metronidazole) may fail to treat *C. tetani* unless adequate wound debridement is performed

Prevention

- infection with *C. tetani* does not produce immunity – vaccinate patients on diagnosis
- tetanus toxoid vaccination (see [Pediatrics, P3](#)/[Emergency Medicine, ER17](#))

Rabies

Definition

- acute progressive encephalitis caused by RNA virus (family: *Rhabdoviridae*, genus *Lyssavirus*)

Etiology and Pathophysiology

- any mammal can transmit the rabies virus
 - most commonly transmitted by raccoon, skunk, bat, fox, cat, and dog; monkeys also a risk in the developing world
- transmission: breaching of skin by teeth or direct contact of infectious tissue (saliva, neural tissue) with skin or mucous membranes
 - almost all cases due to bites
- virus travels via retrograde axonal transport from PNS to CNS
- virus multiplies rapidly in brain, then spreads to other organs, including salivary glands
- development of clinical signs occurs simultaneously with excretion of rabies virus in saliva
 - infected animal can transmit rabies virus as soon as it shows signs of disease

Clinical Features

- five stages of disease
 1. incubation period
 - 1-3 mo on average (can range from days to years)
 2. prodrome (<1 wk)
 - influenza-like illness: low-grade fever, malaise, anorexia, N/V, H/A, sore throat
 - pain, pruritus, paresthesia may occur at wound site

- once prodromal symptoms develop, there is rapid, irreversible progression to death
 - ♦ progression from prodrome to coma and death may occur without an intervening acute neurologic syndrome
- 3. acute neurologic syndrome: 3 types (<1 wk)
 - a. encephalitic (most common): hyperactivity, fluctuating LOC, hydrophobia, aerophobia, hypersalivation, fever, seizures
 - ♦ painful pharyngeal spasms on encountering gust of air or swallowing water cause aerophobia and hydrophobia, respectively
 - b. paralytic: quadriplegia, loss of anal sphincter tone, fever
 - c. atypical: rare
- 4. coma
 - complete flaccid paralysis, respiratory and cardiovascular failure
- 5. death (within days to weeks of initial symptoms)

Investigations

- purpose of diagnosis by investigations is to limit patient contact with others and to identify others exposed to the infectious source
- ante-mortem: direct immunofluorescence or PCR on multiple specimens: saliva, skin biopsy, serum, CSF
- post-mortem: direct immunofluorescence in nerve tissue, presence of Negri bodies (inclusion bodies in neurons)

Treatment

- post-exposure prophylaxis depends on regional prevalence (contact Public Health) and circumstances surrounding injury
- three general principles
 - wound care: clean wound promptly and thoroughly with soap and running water
 - passive immunization: HRIG infiltrated into wound site, with any remaining volume administered IM in anatomical site distant from vaccine administration
 - active immunization: inactivated rabies virus vaccine (series of shots post-exposure)
- treatment is supportive once victim manifests signs and symptoms of disease

Prevention

- pre-exposure vaccination
 - recommended for high risk persons: laboratory staff working with rabies, veterinarians, animal and wildlife control workers, long-term travelers to endemic areas

Systemic Infections

Sepsis and Septic Shock

- see [Respirology](#), R33

Definitions

- systemic inflammatory response syndrome (SIRS): two or more of
 1. temperature $<96.8^{\circ}\text{F}/36^{\circ}\text{C}$ or $>100.4^{\circ}\text{F}/38^{\circ}\text{C}$
 2. heart rate >90 beats per minute
 3. respiratory rate >20 breaths per minute or $\text{PaCO}_2 <32$ mmHg
 4. $\text{WBC} <4 \times 10^9/\text{L}$ or $>12 \times 10^9/\text{L}$ or $>10\%$ bands
- sepsis: SIRS + proven or provable infection
- severe sepsis: sepsis + signs of end-organ dysfunction and hypoperfusion
- septic shock: severe sepsis + hypotension (<90 mmHg sBP), despite adequate fluid resuscitation

Pathophysiology

- causative agents are identified in only 50-70% of cases
- when organisms are identified, GP and GN organisms are the cause in 90% of cases
- primary bloodstream infection or secondary bacteremia \rightarrow local immune response \rightarrow immune cells release pro-inflammatory cytokines \rightarrow immune response spreads beyond local environment \rightarrow unregulated, exaggerated systemic immune response \rightarrow vasodilation and hypotension \rightarrow involvement of tissues remote from the site of injury/infection resulting in multiple major organ dysfunction \rightarrow periodic immunoparalysis

Clinical Features

- history: fever, chills, dyspnea, cool extremities, fatigue, malaise, anxiety, confusion
- physical: abnormal vitals (fever, tachypnea, tachycardia, hypotension), local signs of infection

Investigations

- CBC and differential, electrolytes, BUN, creatinine, liver enzymes, ABG, lactate, INR, PTT, FDP, blood C&S x3, urinalysis, urine C&S and cultures of any wounds or lines
- CXR (other imaging depends on suspicion of focus of infection)

Treatment (also see [Respirology, R33](#))

- respiratory support: O₂ ± intubation
- cardiovascular support: IV fluids, ± norepinephrine + ICU
- IV antibiotics (empirical, depends on suspected source)
 - start with broad spectrum antibiotics (piperacillin/tazobactam or meropenem) ± additional agents depending on patient risk factors, suspected etiology of infection, and local microbial susceptibilities (± aminoglycoside for drug-resistant GNs or vancomycin for MRSA)
 - narrow once susceptibilities are known
- hydrocortisone IV in patients with septic shock unresponsive to fluid resuscitation and vasopressors

Leprosy (Hansen's Disease)

Etiology

- *Mycobacterium leprae*: obligate intracellular bacteria, slow-growing (doubling time 12.5 d), survives in macrophages
- bacteria transmitted from nasal secretions, potentially via skin lesions
- invades skin and peripheral nerves leading to chronic granulomatous disease

Clinical Features

- lesions involve cooler body tissues (e.g. skin, superficial nerves, nose, eyes, larynx)
- spectrum of disease determined by host immune response to infection
 - i. paucibacillary “tuberculoid” leprosy (intact cell-mediated immune response)
 - ≤5 hypoesthetic lesions, usually hypopigmented, well-defined, dry
 - early nerve involvement, enlarged peripheral nerves, neuropathic pain
 - may be self-limited, stable, or progress over time to multibacillary “lepromatous” form
 - ii. multibacillary “lepromatous” leprosy (weak cell-mediated immune response)
 - ≥6 lesions, symmetrical distribution
 - leonine facies (nodular facial lesions, loss of eyebrows, thickened ear lobes)
 - extensive cutaneous involvement, late and insidious nerve involvement causing sensory loss at the face and extremities
 - iii. borderline leprosy
 - lesions and progression lies between tuberculoid and lepromatous forms

Investigations

- skin biopsy down to fat or slit skin smears for AFB, PCR
- histologic appearance: intracellular bacilli in spherical masses (lepra cells), granulomas involving cutaneous nerves

Treatment (WHO Treatment Regimens)

- paucibacillary: dapsone + rifampin monthly x 6 mo
- single skin lesion paucibacillary: single dose of rifampicin, ofloxacin, and minocycline
- multibacillary and borderline: dapsone + rifampin monthly + clofazimine monthly x 12 mo AND low dose clofazimine once daily x 12 mo
- treatment of leprosy can cause an immune reaction to killed bacteria (e.g. erythema nodosum leprosum and reversal reaction): symptomatic management with NSAIDs if mild, prednisone with 6-12 wk taper if severe; thalidomide for erythema nodosum leprosum

Prognosis

- curable with WHO-approved treatment regimens
- complications: muscle atrophy, contractures, trauma/superinfection of lesions, crippling/loss of limbs, erythema nodosum leprosum
- long post-treatment follow-up warranted to monitor for relapse and immune reactions

Lyme Disease

**Etiology/Epidemiology**

- spirochete bacteria: *Borrelia burgdorferi* (N. America), *B. garinii*, *B. afzelii* (Europe and Asia)
- transmitted by Ixodes tick
- reported in 49 of the 50 U.S. states, but most cases occur in the Northeast, the Midwest, and Northern California
- small rodents (mice) serve as primary reservoir, while larger animals (white tailed deer) serve as hosts for ticks
- human contact usually May-August in fields with low brush near wooded areas
- infection usually requires >36 h tick attachment

Clinical Features

- stage 1 (early localized stage: 7-14 d post-bite)
 - malaise, fatigue, H/A, myalgias
 - erythema migrans: expanding, non-pruritic bulls-eye (target) lesions (red with clear center) on thigh/groin/axilla
- stage 2 (early disseminated stage): weeks post-infection
 - CNS: aseptic meningitis, CN palsies (CN VII palsy), peripheral neuritis
 - cardiac: transient heart block or myocarditis
- stage 3 (late persistent stage: months to years post-infection)
 - may not have preceding history of early stage infection
 - MSK: chronic monoarticular or oligoarticular arthritis
 - acrodermatitis chronica atrophicans (due to *B. afzelii*)
 - neurologic: encephalopathy, meningitis, neuropathy

**BAKE a Key Lyme Pie**

Bell's palsy
Arthritis
Kardiac block
Lyme
Erythema chronicum migrans

Investigations

- serology: ELISA, Western blot

Prevention

- use of protective clothing (tuck pants into socks), insect repellent, inspection for ticks and prompt removal of tick
- doxycycline prophylaxis within 72 h of removal of an engorged, *Ixodes scapularis* tick in hyperendemic area (local rate of infection of ticks $\geq 20\%$) for patients >8 yr who are not pregnant or lactating

Treatment

- stage 1: doxycycline/amoxicillin/cefuroxime
- stage 2-3: ceftriaxone

Toxic Shock Syndrome

Etiology

- superantigens produced by some strains of *S. aureus* or GAS cause widespread T-cell activation and pro-inflammatory cytokine release (IL-1, IL-6, TNF)
- course of disease is precipitous and leads to acute fever, shock, multiorgan failure
- Staphylococcal TSS involves the production of superantigen TSST-1 (toxic shock syndrome toxin 1)
- Streptococcal TSS involves the production of superantigens SPEA, SPEB, SPEC

Risk Factors

- Staphylococcal: tampon use, nasal packing, wound infections (e.g. postpartum vaginal or Cesarean or other surgical infections)
- Streptococcal: minor trauma, surgical procedures, preceding viral illness (chickenpox), use of NSAIDs

Clinical Features and Investigations

- acute onset
- Staphylococcal TSS
 - $T > 102^{\circ}\text{F}$
 - sBP < 90 mmHg
 - diffuse erythroderma with subsequent desquamation, especially on palms and soles
 - involvement of 3 or more organ systems: GI (vomiting, diarrhea), muscular (myalgia, increased CK), mucous membranes (hyperemia), renal, hepatic, hematologic (thrombocytopenia), CNS (disorientation)
 - isolation of *S. aureus* is not required for diagnosis (*S. aureus* is rarely recovered from blood in TSS)
- Streptococcal TSS
 - sBP < 90 mmHg
 - isolation of GAS from a normally sterile site (e.g. blood, pleural, tissue biopsy, or surgical wound)
 - ≥ 2 of coagulopathy, liver involvement, ARDS, soft tissue necrosis (necrotizing fasciitis, myositis, gangrene), renal impairment, erythematous macular rash that may desquamate

Treatment

- supportive: fluid resuscitation
- Staphylococcal: IV clindamycin + (cloxacillin or vancomycin depending on susceptibilities)
- Streptococcal: IV penicillin and clindamycin and IVIg

Cat Scratch Disease

Etiology

- *Bartonella henselae*: intracellular bacteria
- cat-to-human transmission via cat scratch/bite

Clinical Features

- skin lesion appears 3-10 d post-inoculation
- may be followed by fever, tender regional lymphadenopathy
- in some patients, organism may disseminate causing hepatosplenomegaly, neurologic symptoms
- usually self-limited

Investigations

- serology, lymph node biopsy

Treatment

- supportive in most cases
- azithromycin x 10-14 d in patients with moderate-severe disease or immunocompromise

Rocky Mountain Spotted Fever

Etiology

- *Rickettsia rickettsii*: obligate intracellular GN organism
- reservoir hosts: rodents, dogs
- vectors: *Dermacentor* ticks
- organisms cause inflammation of endothelial lining of small blood vessels, causing small hemorrhages and thrombi
- can cause widespread vasculitis leading to H/A, CNS changes and can progress to death if treatment is delayed

Clinical Features

- usually occurs in summer following tick bite
- influenza-like prodrome: acute onset fever, H/A, myalgia, N/V, anorexia
- macular rash appearing on day 2-4 of fever
 - begins on wrists and ankles, then spreads centrally to arms/legs/trunk/palms/soles
 - occasionally "spotless" (10% of patients)

Investigations

- skin biopsy and serology (indirect fluorescent antibody test)

Treatment

- doxycycline, usually 5-7 d (3 days after afebrile)

West Nile Virus

Epidemiology

- virus has been detected throughout the United States and much of southern Canada
- overall case-fatality rates in severe cases are ~10%

Transmission

- primarily from mosquitoes that have fed on infected birds (crows, blue jays)
- transplacental, blood products (rare), organ transplantation

Clinical Features

- most are asymptomatic
- most symptomatic cases are mild (West Nile fever): acute onset of H/A, back pain, myalgia, anorexia, maculopapular non-pruritic rash involving chest, back, arms
- severe complications: encephalitis, meningoencephalitis and acute flaccid paralysis (especially in those >60 yr)

Investigations

- IgM antibody in serum or CSF (cross reactivity with yellow fever and Japanese encephalitis vaccines, and with dengue fever and St. Louis virus infection); may not reflect current illness as IgM antibody can last for >6 mo
- viral isolation by PCR from CSF, tissue, blood and fluids (all have low sensitivity)
- CSF: elevated lymphocytes and protein if CNS involvement

Treatment and Prevention

- treatment: supportive
- prevention: mosquito repellent (DEET), drain stagnant water, community mosquito control programs

Syphilis

Etiology

- *Treponema pallidum*: thick motile spirochetes historically detectable by dark-field microscopy
- transmitted sexually, vertically, or parenterally (rare)

Clinical Features

- see [Dermatology, D30](#) and [Gynecology, GY27](#)
- multi-stage disease
 - primary syphilis (3-90 d post-infection)
 - painless chancre at inoculation site (any mucosal surface)
 - regional lymphadenopathy
 - acute disease lasts 3-6 wk, 25% progress to secondary syphilis without treatment
 - secondary syphilis = systemic infection (2-8 wk following chancre)
 - maculo-papular non-pruritic rash including palms and soles
 - generalized lymphadenopathy, low grade fever, malaise, H/A, aseptic meningitis, ocular/otic syphilis
 - condylomata lata: painless, wart-like lesion on palate, vulva, or scrotum (highly infectious)
 - latent syphilis
 - asymptomatic infection that follows untreated primary/secondary syphilis
 - early latent (<1 yr post-infection) or late latent/unknown duration (>1 yr post-infection)
 - increased transmission risk with early latent; longer treatment duration required for late latent
 - tertiary syphilis (1-30 yr post-infection)
 - gummatous syphilis: nodular granulomas of skin, bone, liver, testes, brain
 - aortic aneurysm and aortic insufficiency
 - neurosyphilis: dementia, personality changes, Argyll-Robertson pupils, tabes dorsalis
 - congenital syphilis
 - causes spontaneous abortions, stillbirths, congenital malformations, developmental delay, deafness
 - infants may be asymptomatic until age 2-5 yr then present with rhinitis, lymphadenopathy, hepatosplenomegaly, bone and cartilage degeneration (including saddle nose, saber shins), CN VIII deafness

Investigations

- screening tests: VDRL or RPR (non-treponemal), EIA (treponemal)
- confirmatory tests: FTA-ABS, MHA-TP, TPPA, TPI, dark field microscopy with silver stain (rarely)
- LP for neurosyphilis if: seropositive and symptoms of neurosyphilis or treatment failure/other tertiary symptoms, or with HIV and late latent/unknown duration syphilis; consider in others

Treatment

- for 1°, 2°, early latent: benzathine penicillin G 2.4 million units IM x 1
- for 3°, late latent: benzathine penicillin G 2.4 million units IM weekly x 3
- if allergic to penicillin: doxycycline 100 mg PO bid x 14 d
- neurosyphilis: aqueous Penicillin G 18-24 million units/d IV x 14 d
- see [Family Medicine, FM45](#) for generalized STD workup

Argyll Robertson Pupil

Accommodates but does not react to light

Those with Untreated 1° or 2° Syphilis

1/3 cure
1/3 latent indefinitely
1/3 3° syphilis

Causes of False Positive VDRL and RPR Tests:

Viruses (mononucleosis, hepatitis)
Drugs and substance abuse
Rheumatic fever
Lupus and leprosy

Patients with 2° or 3° syphilis treated with penicillin may experience a Jarisch-Herxheimer reaction. Lysis of organisms release pyrogens thought to cause fever, chills, myalgia, flu-like symptoms may last up to 24 h

VDRL	Venereal Disease Research Laboratory
RPR	Rapid Plasma Reagin
EIA	Enzyme Immunoassay
FTA-ABS	Fluorescent <i>Treponema</i> Antibody-Absorption
MHA-TP	Microhemagglutination Assay <i>T. pallidum</i>
TPPA	<i>T. pallidum</i> Particle Agglutination Assay

Tuberculosis

Etiology, Epidemiology, and Natural History

- 1/3 of the world's population is infected with TB
- contracted by aerosolized inhalation of *Mycobacterium tuberculosis*, a slow growing aerobe (doubling time = 18 h) that can evade innate host defenses, survive, and replicate in macrophages
- inhalation and deposition in the lung can lead to one of the following outcomes:
 1. immediate clearance of the pathogen
 2. latent TB: asymptomatic infection contained by host immune defenses (represents 95% of infected people)
 3. primary TB: symptomatic, active disease (represents 5% of infected people)
 4. secondary TB: symptomatic reactivation of previously dormant TB (represents 5-10% of those with latent TB, most often within the first 2-3 yr of initial infection) at a pulmonary or extra-pulmonary site

Tuberculous Polyserositis

Pleural + pericardial + peritoneal effusions (usually from granuloma breakdown that spills TB into pleural cavity – very rare)

Figure 8. Tuberculosis statistics

Canadian Tuberculosis Standards, 7th ed.

Risk Factors

- social and environmental factors
 - travel or birth in country with high TB prevalence (e.g. Asia, Latin America, Sub-Saharan Africa, Eastern Europe)
 - Aboriginal, crowded living conditions, low SES/homeless, IVDU
 - personal or occupational contact
- host factors
 - immunocompromised/immunosuppressed (especially HIV, including extremes of age)
 - silicosis
 - chronic renal failure requiring dialysis
 - malignancy and chemotherapy
 - substance abuse (e.g. drug use, alcoholism, smoking)

Clinical Features

- primary infection usually asymptomatic, although progressive primary disease may occur, especially in children and immunosuppressed patients
- secondary infection/reactivation usually produces constitutional symptoms (fatigue, anorexia, night sweats, weight loss) and site-dependent symptoms
 - i. pulmonary TB
 - chronic productive cough ± hemoptysis
 - CXR consolidation or cavitation, lymphadenopathy
 - non-resolving pneumonia despite standard antimicrobial therapy
 - ii. miliary TB
 - widely disseminated spread especially to lungs, abdominal organs, marrow, CNS
 - CXR: multiple small 2-4 mm millet seed-like lesions throughout lung
 - iii. extrapulmonary TB
 - lymphadenitis, pleurisy, pericarditis, hepatitis, peritonitis, meningitis, osteomyelitis (vertebral = Pott's disease), adrenal (causing Addison's disease), renal, ovary

Investigations

- screening for latent TB
 - PPD/Mantoux skin tests
 - ♦ both tests diagnose prior TB exposure; neither can diagnose or exclude active disease
 - IFN- γ release assay (IGRA):
 - ♦ in patients previously infected with TB, T-cells produce increased amounts of IFN- γ when re-exposed to TB antigen
 - ♦ detects antigen not present in the BCG vaccine or in most types of non-tuberculous-mycobacteria (NTM), therefore fewer false positives
 - American guidelines treat IGRAs as equivalent to the TB skin test and preferable in patients with a history of BCG vaccination or who may not return for skin test reading
- diagnostic tests/investigations for active pulmonary TB
 - morning sputum on 3 consecutive days for acid-fast bacilli smear and culture
 - BAL
 - CXR
 - ♦ nodular or alveolar infiltrates with cavitation (middle/lower lobe if primary, apical if secondary)
 - ♦ pleural effusion (usually unilateral and exudative) may occur independently of other radiograph abnormalities
 - ♦ hilar/mediastinal adenopathy (especially in children)
 - ♦ tuberculoma (semi-calcified well-defined solitary coin lesion 0.5-4 cm that may be mistaken for lung CA)
 - ♦ miliary TB
 - ♦ evidence of past disease: calcified hilar and mediastinal nodes, calcified pulmonary focus, pleural thickening with calcification, apical scarring

Prevention

- primary prevention
 - airborne isolation for active pulmonary disease
 - BCG vaccine
 - ♦ ~80% effective against pediatric miliary and meningeal TB
 - ♦ effectiveness in adults debated (anywhere from 0-80%)
 - ♦ routine use rarely recommended in American population, however widely used in other countries
- secondary prevention (defer in pregnancy unless mother is high risk)
 - likely INH-sensitive: isoniazid (INH) + pyridoxine (vit B₆ to help prevent INH-associated neuropathy) x 9 mo
 - likely INH-resistant: rifampin x 4 mo

Treatment of Active Infection

- empiric therapy: INH + rifampin + pyrazinamide + ethambutol + pyridoxine
- pulmonary TB: INH + rifampin + pyrazinamide + ethambutol + pyridoxine x 2 mo (initiation phase), then INH + rifampin + pyridoxine x 4 mo in fully susceptible TB (continuation phase), total 6 mo
- extrapulmonary TB: same regimen as pulmonary TB but increase to 12 mo in bone/joint, CNS, and miliary/disseminated TB + corticosteroids for meningitis, pericarditis
- empiric treatment of suspected MDR (multidrug resistant) or XDR (extensively drug-resistant) TB requires referral to a specialist
 - MDR = resistance to INH and rifampin \pm others
 - XDR = resistance to INH + rifampin + fluoroquinolone + ≥ 1 of injectable, second-line agents
 - ♦ very difficult to treat, global public health threat
 - suspect MDR TB if previous treatment, exposure to known MDR index case, or immigration from a high-risk area
- note: TB is a reportable disease to Public Health (please see Center for Disease Control website <http://www.cdc.gov/tb/> for more information)

Positive PPD Test

If induration at 48-72 h
 >5 mm if immunocompromised, close contact with active TB

>10 mm all others; positive PPD \rightarrow CXR; decision to treat depends on individual risk factors

False(-): poor technique, anergy, immunosuppression, infection <10 wk or remotely

False(+): BCG after 12 mo of age in a low-risk individual, NTM

Booster effect: initially false(-) result boost to a true(+) result by the testing procedure itself (usually if patient was infected long ago so had diminished delayed type hypersensitivity reaction or if history of BCG)

HIV and AIDS

Epidemiology

American Situation (Center for Disease Control, 2012)

- at the end of 2009, an estimated 1,148,200 persons aged 13 and older were living with HIV infection in the United States, including 207,600 (18.1%) persons whose infections had not been diagnosed
- approximately 50,000 people in the United States are newly infected with HIV each year; in 2010 (the most recent year that data are available), there were an estimated 47,500 new HIV infections

Global Situation (WHO and UNAIDS Core Epidemiology Slides, December 2013)

- estimated 35.5 million people living with HIV/AIDS in 2012
- estimated 2.3 million newly infected in 2012
- estimated 1.6 million AIDS-related deaths in 2012

Definition and Pathophysiology

- HIV is a retrovirus that causes progressive immune system dysfunction which predisposes patients to various opportunistic infections and malignancies
- HIV virion includes an envelope (gp41 and gp120 glycoproteins), matrix (p17) and capsid (p24) enclosing 2 single-stranded copies of RNA + enzymes in its core
- virion glycoproteins bind CD4 and CXCR4/CCR5 on CD4+ T lymphocytes (T-helper cells) to fuse and enter the cells
- RNA converted to dsDNA by reverse transcriptase; dsDNA is integrated into host genome
- virus DNA transcribed and translated using host cell machinery, post-translational modifications include proteolytic activity of virally encoded protease enzymes
- newly produced virions bud out of host cell, incorporating host cell membrane; additional maturation steps are required before virion is considered infectious
- exact mechanisms of CD4 depletion incompletely characterized but likely include direct viral cytopathic effects, apoptosis, increased cell turnover

Modes of Transmission

Table 20. Modes of Transmission by Site and Medium

HIV Invasion Site	Sub-Location	Transmission Medium	Transmission Probability per Exposure Event
Female genital tract	Vagina, ectocervix, endocervix	Semen	1 in 200 to 1 in 2,000
Male genital tract	Inner foreskin, penile urethra	Cervicovaginal and rectal secretions and desquamations	1 in 700 to 1 in 3,000
Intestinal tract	Rectum Upper GI tract	Semen	1 in 20 to 1 in 300
		Semen	1 in 2,500
		Maternal blood/genital secretions (intrapartum)	1 in 5 to 1 in 10
		Breastmilk	1 in 5 to 1 in 10
Placenta	Chorionic villi	Maternal blood (intrauterine)	1 in 10 to 1 in 20
Blood stream		Contaminated blood products	95 in 100
		Sharp/needlestick injuries	1 in 150

Adapted with permission from Macmillan Publishers Ltd. *Nat Rev Immunology* 2008;8:447-457

NOTE: these estimates are for "all comers" i.e. they estimate transmission risk for anyone with HIV infection and do not take into account treatment status of the HIV+ person (in contrast to results of PARTNER study)

HIV-1 is the predominant type in North America and most of the world

HIV-2 is found mainly in West Africa

Both lead to AIDS but HIV-2 is generally less virulent

p24 = capsid protein
gp41 = fusion and entry
gp120 = attachment to host T-cell

Homozygosity for A32 mutation in CCR5 gene confers relative resistance to HIV infection

Heterozygosity for A32 mutation in CCR5 gene associated with slower disease course

Infection is NOT transmitted by casual contact, kissing, mosquitoes, toilet seats, or shared utensils

©Stuart Jantzen 2012

Figure 9. HIV viral particle

Natural History

Figure 10. Relationships between CD4 T-cell count, viral load, and anti-HIV antibodies

Acute (Infection) Retroviral Syndrome

- 40-90% experience an acute "flu-like" illness (may include fever, pharyngitis, lymphadenopathy, rash, arthralgias, myalgias, H/A, GI symptoms, oral ulcers, weight loss) 2-6 wk post-exposure lasting 10-15 d
- hematologic disturbances (lymphopenia, thrombocytopenia)
- 10-20% present with aseptic meningitis; HIV RNA and/or p24 may be detected in CSF
- associated with a high level of plasma viremia and therefore high risk of transmission

Asymptomatic (Latent) Stage

- during latent phase, HIV infects and replicates in CD4+ T lymphocytes (lymph nodes)
- normal CD4 count: 500-1,100 cells/mm³
- CD4 count drops 60-100 cells/mm³ per year
- by 10 yr post-infection, 50% have AIDS, 30% demonstrate milder symptoms, and <20% are asymptomatic if left untreated

AIDS Definition in United States

- CD4+ T-lymphocyte count of <200 cells/μL OR
- CD4+ T-lymphocyte percentage of total lymphocytes of <14% OR
- documentation of an AIDS-defining condition

Table 21. Symptomatic Stage (CD4 count thresholds for classic clinical manifestations)

CD4 Counts	Possible Manifestations
<500 cells/mm ³	Often asymptomatic Constitutional symptoms: fever, night sweats, fatigue, weight loss Mucocutaneous lesions: seborrheic dermatitis, HSV, VZV (shingles), oral hairy leukoplakia (EBV), candidiasis (oral, esophageal, vaginal), Kaposi's sarcoma (KS) Recurrent bacterial infections, especially pneumonia Pulmonary and extrapulmonary tuberculosis Lymphoma
<200 cells/mm ³	<i>Pneumocystis jiroveci</i> pneumonia (formerly PCP) KS Oral thrush Local and/or disseminated fungal infections: <i>Cryptococcus neoformans</i> , <i>Coccidioides immitis</i> , <i>Histoplasma capsulatum</i>
<100 cells/mm ³	Progressive multifocal leukoencephalopathy (PML) – JC virus CNS toxoplasmosis
<50 cells/mm ³	CMV infection: retinitis, colitis, cholangiopathy, CNS disease Mycobacterium avium complex (MAC) Bacillary angiomatosis (disseminated <i>Bartonella</i>) Primary central nervous system lymphoma (PCNSL)

PARTNER Study: Risk of HIV Transmission Between Serodiscordant Couples with HIV+ Partner on ART

Preliminary results presented at Conference on Retroviruses and Opportunistic Infections 2014 (CROI 2014); final results due 2017

Participants: 740 serodiscordant heterosexual (60% of couples) and homosexual couples (40% of couples) that engage in sex without using condoms. The HIV- partner cannot be using pre- or post-exposure prophylaxis and the HIV+ partner must be on ART with an undetectable viral load.

Methods: Partners enrolled in the study are asked to independently complete a questionnaire on sexual behavior with their partner every 3-6 mo. Additionally, if the HIV- partner seroconverts, a blood sample will be taken from each partner and the viruses genotyped for comparison. To remain in the study, the requirements for participation must be maintained.

Results: No HIV transmissions within couples from a partner with an undetectable viral load in an estimated 16,400 occasions of sex in MSM and 28,000 occasions of sex in the heterosexual couples. If the HIV+ partners had not been on treatment in this group, 50-100 (median: 86) transmissions would have been expected in the MSM group and 15 transmissions in heterosexual couples. In a couple whose sexual activity is considered as average for the group studied, there was a 95% chance that the greatest-possible risk of transmission from a partner was 0.45% per year as well as 1% per year from anal sex.

HIV should always be considered in the differential diagnosis of acute flu-like or mononucleosis-like illness!

Laboratory Diagnosis

- anti-HIV antibodies detectable after a median of 3 wk, virtually all by 3 mo (therefore 3 mo window period)
- initial screening test (3rd generation antibody test): enzyme linked immunosorbent assay (ELISA) detects serum antibody to HIV; sensitivity >99.5%

- increasingly, combination p24 antigen/HIV antibody tests (4th generation) used for screening; improved sensitivity in early or acute infection and sensitivity/specificity approach 100% for chronic infection
- confirmatory test: in positive screen, Western blot confirmation by detection of antibodies to at least two different HIV protein bands (p24, gp41, gp120/160); specificity >99.99%
- rapid (point of care) antibody tests: higher false positives, therefore need to confirm positive results with traditional serology
- p24 antigen: detection by ELISA may be positive during "window period"

Management of the HIV-Positive Patient

- verify positive HIV test
- complete baseline history and physical exam, then follow-up every 3-6 mo
- laboratory evaluation
 - routine CD4 count to measure status of the immune system
 - routine HIV-RNA levels (viral load)
 - ♦ also important indicator of effect of ART
 - baseline HIV resistance testing to guide ARV therapy
 - HLA-B*5701 genetic test to screen for abacavir hypersensitivity
 - baseline tuberculin skin test (PPD): induration greater than 5 mm is positive
 - baseline serologies (hepatitis A, B, and C, syphilis, toxoplasma, CMV, VZV)
 - routine biochemistry and hematology, CXR
 - annual fasting lipid profile and fasting glucose (due to HAART side effects)
- education
 - regular follow-up on CD4 counts and viral loads (q3-6 mo) as well as strict adherence to ART improves prognosis
 - prevention of further transmission through safer sex and clean needles for injection drug use
 - HIV superinfection (transmission of different HIV strains from another HIV+ person) does rarely occur so barrier protection during sex is still recommended
 - discuss importance of disclosing HIV status to partners including risk of criminal prosecution of non-disclosure in jurisdictions where applicable
 - connect to relevant community groups and resources
- health care maintenance
 - assessment of psychosocial concerns and referral to psychiatry or social work if appropriate
 - vaccines: influenza annually, 23-valent pneumococcal every 5 yr, HBV (if not immune), HAV (if seronegative)
 - annual screening (PAP smear, STDs)
 - management of comorbid conditions and provision of general primary care

Table 22. Prophylaxis Against Opportunistic Infections in HIV-Infected Patients

Pathogen	Indication for Prophylaxis	Prophylactic Regimen
<i>Pneumocystis jiroveci</i>	CD4 count <200 cells/mm ³ or history of oral candidiasis	TMP-SMX 1 SS or DS OD
<i>Toxoplasma gondii</i>	IgG antibody to <i>Toxoplasma</i> and CD4 count <100 cells/mm ³	As per prophylaxis for pneumocystis
<i>Mycobacterium tuberculosis</i>	PPD reaction >5 mm or contact with case of active TB	INH + pyridoxine daily x 9 mo
<i>Mycobacterium avium</i> complex	CD4 count <50 cells/mm ³	Azithromycin 1,200 mg q1wk

SS = single strength; DS = double strength

See 2002 USPHS/IDSA guidelines for preventing opportunistic infections among HIV-infected persons. Available from: <http://aidsinfo.nih.gov/>

Anti-Retroviral Treatment

Overall Treatment Principles

- recommended that all HIV+ patients initiate HAART to prevent disease progression and transmission; strength of evidence supporting that recommendation changes depending on CD4 count and sexual practices (AI evidence that CD4 <350 should be on HAART)
- patients starting HAART should be committed to treatment and understand the importance of adherence; poor compliance can lead to viral resistance; may defer treatment on the basis of clinical and psychosocial factors on case by case basis
- initiate ART if opportunistic infection/malignancy, pregnancy, HIV-associated nephropathy, HIV-associated thrombocytopenia, need for hepatitis B therapy in HBV co-infected patients
- consider starting treatment early if HCV co-infection, high HIV viral load, comorbid conditions (e.g. cardiovascular disease)
- consider results of baseline resistance testing and complete ART history before (re-)initiating HAART
- goal: keep viral load below limit of detection i.e. <40 copies/mL (undetectable); viral load should decrease 10-fold within 4-8 wk, be undetectable by 6 mo and restore immunological function
- strong evidence against intermittent HAART or 'drug holidays'
- ART leads to 96% reduction in risk of transmitting HIV to sexual partners

Seroconversion: Development of detectable anti-HIV antibodies

Window Period: Time between infection and development of anti-HIV antibodies; when serologic tests (ELISA, Western blot) are negative

All infants born to HIV infected mothers have positive ELISA tests because of circulating maternal anti-HIV antibodies which disappear by 18 mo; early diagnosis is made by detection of HIV RNA in plasma

HIV Status

- CD4 count: progress and stage of disease
- Viral load: rate of progression

1° and 2° prophylaxis may be discontinued if CD4 count is above threshold for ≥6 mo while on ART

HLA-B*5701 Testing

Abacavir hypersensitivity reactions usually only occur in individuals carrying this HLA allele (~5-7% of Caucasians, lower prevalence in other ethnic groups). Routine screening for HLA-B*5701 at baseline and definitely prior to abacavir use

Reasons for Deterioration of a Patient with HIV/AIDS

- Opportunistic infections
- Neoplasms
- Medication-related toxicities
- Co-infections (e.g. HBV, HCV, STDs)
- Non-AIDS-related comorbidities (e.g. cardiovascular, renal, hepatic, neurocognitive, bone disease)

HAART Recommendations for Treatment of Naïve Patients

- 2 NRTIs + 1 NNRTI/PI (boosted with ritonavir)/INSTI

Treatment Failure

- defined clinically (HIV progression), immunologically (failure to increase CD4 count by 25-50 over first year of treatment or CD4 decrease >100 over 1 yr), or virologically (failure to achieve viral load <40 copies/mL after 6 mo)
- ensure that viral load >40 is not just a transient viremia or 'blip'; confirm medication adherence, assess drug interactions, resistance testing

Table 23. Anti-Retroviral Drugs

Class	Drugs	Mechanism	Adverse Effects
Nucleoside reverse transcriptase inhibitors (NRTIs)	zidovudine (AZT) lamivudine (3TC) stavudine (d4T) didanosine (ddI) abacavir (ABC) emtricitabine (FTC) tenofovir disoproxil fumarate (TDF) Combination Tablets: AZT/3TC (Combivir®) AZT/3TC/ABC (Trizivir®) ABC/3TC (Kivexa®) TDF/FTC (Truvada®)	Incorporated into the growing viral DNA chain, thereby competitively inhibiting reverse transcriptase and terminating viral DNA growth	Lactic acidosis Lipodystrophy Rash N/V/diarrhea Bone marrow suppression (AZT) Peripheral neuropathy (ddI, d4T) Drug-induced hypersensitivity (ABC) Pancreatitis (ddI/d4T) Myopathy (AZT)
Non-nucleoside reverse transcriptase inhibitors (NNRTIs)	efavirenz (EFZ) nevirapine (NVP) delavirdine (DLV) etravirine (ETR) rilpivirine (RPV)	Non-competitively inhibit function of reverse transcriptase, thereby preventing viral RNA replication	Rash, Stevens-Johnson syndrome CNS: dizziness, insomnia, somnolence, abnormal dreams (efavirenz) Hepatotoxicity (nevirapine – avoid in females with CD4 >250, men with CD4 >400) CYP3A4 interactions
Protease inhibitors (PIs)*	ritonavir (RTV) saquinavir (SQV) amprenavir (APV) nelfinavir (NFV) indinavir (IDV) atazanavir (ATV) fosamprenavir (FPV) lopinavir/ritonavir (Kaletra®) tipranavir (TPV) darunavir (DRV)	Prevent maturation of infectious virions by inhibiting the cleavage of polyproteins	Lipodystrophy, metabolic syndrome N/V/diarrhea Nephrolithiasis (indinavir) Rash (APV) Hyperbilirubinemia (atazanavir, indinavir) CYP3A4 interactions Hyperlipidemia
Fusion inhibitor	enfuvirtide (T-20)	Inhibit viral fusion with T-cells by inhibiting gp41, preventing cell infection	Injection site reactions, rash, infection, diarrhea, nausea, fatigue
CCR5 antagonist	maraviroc	Inhibit viral entry by blocking host CCR5 co-receptor	Fever, cough, dizziness
Integrase strand transfer inhibitors (INSTIs)	raltegravir elvitegravir dolutegravir	Inhibits integration of HIV DNA into the human genome thus preventing HIV replication	

*Standard of care is to pharmacologically boost most PIs with ritonavir to increase concentrations

Single Tablet ART Regimens

- reduces pill burden and increases adherence
- generally better tolerated

Table 24. Single Tablet HAART Regimens

Name	Contents	Common Side Effects
Atripla®	efavirenz/tenofovir/emtricitabine	psychiatric events, vivid dreams
Complera®	rilpivirine/emtricitabine/tenofovir	good side effect profile
Stribild®	elvitegravir/cobicistat/emtricitabine/tenofovir	good side effect profile

Treatment Failure

- Assess adherence
- Assess drug interactions
- Resistance testing
- Rule out opportunistic infections
- Rule out marrow suppression
- Construct new 3-drug regimen

Lactic Acidosis

- Occurs secondary to mitochondrial toxicity
- Symptoms include abdominal pain, fatigue, N/V, muscle weakness

Lipodystrophy

Body fat redistribution (mainly with old ARVs):

- Lipohypertrophy (e.g. dorsal fat pad, breast enlargement, increased abdominal girth) thought to be caused primarily by protease inhibitors
- Lipodystrophy (e.g. facial thinning, decreased adipose tissue in the extremities) is thought to be caused by thymidine analogue NRTIs such as ddI and AZT
- Metabolic abnormalities: lipids (increased LDL, increased TGs), glucose (insulin resistance, type 2 DM), increased risk of CVD

Pharmacologic Boosting

- The goal of pharmacologic boosting is to increase the plasma exposure to the boosted drug
- PI boosting traditionally achieved by administering low-dose ritonavir along with the PI
- Ritonavir inhibits the metabolism of other PIs primarily by inhibiting cytochrome P450 3A4, the enzyme systems responsible for metabolism of the PIs
- Cobicistat is a new non-ARV pharmacologic booster, presently co-formulated with the INSTI elvitegravir

Tropism Testing

- In addition to CD4, HIV requires a co-receptor (either CCR5 or CXCR4) to enter cells
- CCR5 antagonists (e.g. Maraviroc) only work if virus is CCR5-tropic
- Tropism test required prior to initiating CCR5 antagonists

Figure 11. Mechanism of HIV replications

Prevention of HIV Infection

- education, including harm-reduction
 - safer sexual practices: condoms for vaginal and anal sex, barriers for oral sex
 - harm reduction for injection drug users: avoid sharing needles
- treatment of HIV+ women with HAART during the 2nd and 3rd trimester of pregnancy and AZT during delivery followed by treatment of the infant for 6 wk (decreases maternal-fetal transmission from 25% to <3%)
- universal blood and body precautions for health care workers
 - post-exposure prophylaxis (PEP) after occupational (e.g. needle-stick injury) and non-occupational (e.g. consensual sex, sexual assault) exposure to HIV: 2- or 3-drug regimen initiated immediately (<72 h) after exposure and continuing for 4 wk
- recent data has demonstrated efficacy of pre-exposure prophylaxis (oral PrEP or topical microbicides) in preventing HIV although additional data needed
- ART associated with 96% reduction in risk of transmitting HIV to sexual partners
- screening of blood and organ donation

Types of Testing

1. Nominal/Name-Based HIV Testing

- the person ordering the test knows the identity of the person being tested for HIV
- the HIV test is ordered using the name of the person being tested
- person ordering the test is legally obligated to notify Public Health officials if test results are positive for HIV
- the test result is recorded in the health care record of the person being tested

2. Non-Nominal/Non-Identifying HIV Testing

- similar to nominal/name-based testing on all points except:
 - the HIV test is ordered using a code or the initials of the person being tested

3. Anonymous Testing

- available at specialized clinics
- the person ordering the HIV test does not know the identity of the person being tested
- the HIV test is carried out using a unique non-identifying code that only the person being tested for HIV knows
- test results are not recorded on the health care record of the person being tested
- patient identification and notification of Public Health required to gain access to ART

Early identification of HIV is essential for patients to receive the maximal benefit from ART

HIV Pre- and Post-Test Counseling

- a diagnosis of HIV can be overwhelming and is often associated with stigma and discrimination
- consider pre- and post-test counseling, regardless of the results
- goals include: assessing risk, making informed decision to be tested, education to protect themselves and others from virus exposure, where to go for more information and support
- HIV+ patients should be connected with local support services

Fungal Infections

Skin and Subcutaneous Infections

Superficial Fungal Infections

- see [Dermatology](#), D23

Dermatophytes

- see [Dermatology](#), D25

Subcutaneous Fungal Infection

Pathophysiology

- fungi that naturally reside in soil and enter skin via traumatic break
- *Sporothrix schenckii*: most commonly affects gardeners injured by a rose thorn or splinter
 - causes subcutaneous nodule at point of entry
 - fungi may migrate up lymphatic vessels creating nodules along the way – “nodular lymphangitis”

Treatment

- oral azole (e.g. itraconazole)
- IV amphotericin B for severe or disseminated infection

Endemic Mycoses

Basics

- three major endemic mycoses in North America
 - histoplasmosis
 - blastomycosis
 - coccidioidomycosis

- thermally dimorphic organisms: mold in cold temperature (e.g. soil) and yeast at higher temperature (e.g. tissue)
- infection occurs through inhalation of spores (soil, bird droppings, vegetation) or inoculation injury
- all can cause pneumonia and may disseminate hematogenously
- may reactivate or disseminate during immunocompromise

Treatment

- common to all endemic mycoses
 - oral azole (e.g. itraconazole for mild-moderate local infection)
 - IV amphotericin B for systemic infection

Table 25. Endemic Mycoses

Disease	Endemic Region	Clinical Features	Investigations
<i>Histoplasma capsulatum</i>	Ohio and Mississippi River valleys in central USA, Ontario, Quebec; widespread	Asymptomatic (in most people) Primary pulmonary <ul style="list-style-type: none"> • Fever, cough, chest pain, headache, myalgia, anorexia • CXR (acute): pulmonary infiltrates ± hilar lymphadenopathy • CXR (chronic): pulmonary infiltrates, cavitory disease Disseminated (rare) <ul style="list-style-type: none"> • Occurs primarily in immunocompromised patients • Spread to bone marrow (pancytopenia), GI tract (ulcers), lymph nodes (lymphadenitis), skin, liver, adrenals, CNS 	Fungal culture, fungal stain Antigen detection (urine and serum) Serology
<i>Blastomyces dermatitidis</i>	States east of Mississippi River, Northern Ontario and along the Great Lakes	May be asymptomatic Primary: acute or chronic pneumonia <ul style="list-style-type: none"> • Fever, cough, chest pain, chills, night sweats, weight loss • CXR (acute): lobar or segmental pneumonia • CXR (chronic): lobar infiltrates, fibronodular interstitial disease Disseminated <ul style="list-style-type: none"> • Spread to skin (verrucous lesions that mimic skin cancer, ulcers, subcutaneous nodules), bones (osteomyelitis, osteolytic lesions), GU tract (prostatitis, epididymitis) 	Sputum smear and culture Direct examination of clinical specimens for characteristic broad-based budding yeast (sputum, tissue, purulent material)
<i>Coccidioides immitis</i>	Deserts in southwest USA, northwest Mexico	Primary <ul style="list-style-type: none"> • "Valley fever": subacute fever, chills, cough, chest pain, sore throat, fatigue that lasts for weeks to months • Can develop hypersensitivity with arthralgias, erythema nodosum Disseminated <ul style="list-style-type: none"> • Rare spread to skin (ulcers), joints (synovitis), bones (lytic lesions), meninges (meningitis) • Common opportunistic infection in patients with HIV 	Sputum culture Direct examination of clinical specimens for characteristic yeast (sputum, tissue, purulent material)

Histoplasmosis is commonly associated with exposure to chicken coops, bird roosts, and bat caves

High Risk for Dissemination

- Immunocompromised (e.g. HIV, steroids, TNF- α inhibitors, transplantation)
- Pregnancy (3rd trimester)
- DM

Opportunistic Fungi

Pneumocystis jiroveci (formerly *P. carinii*)

Microbiology

- unicellular fungi
- previously classified as a protozoa

Transmission

- rarely person-to-person transmission
- most disease is due to reactivation of latent infection acquired by the respiratory route or reinfection by a different genotype
 - causes clinical disease in immunocompromised patients (steroid use, HIV)
 - 80% lifetime risk without prophylaxis (TMP/SMX) in HIV patients with CD4 count <200 cells/mm³

Clinical Features

- symptoms of pneumonia: fever, nonproductive cough, progressive dyspnea
- classic CXR

Investigations

- demonstration of organism in induced sputum, bronchoalveolar lavage, or endotracheal aspirate (if intubated)

CXR in *P. jiroveci*

- Bilateral, diffuse opacities
- CXR may be normal (20-30% cases)
- CT or CXR may show cysts if advanced (hence the name Pneumo"cystis")
- Almost never pleural effusions

Treatment and Prevention

- oxygen to keep $\text{SaO}_2 > 90\%$
- antimicrobial options
 - TMP/SMX (PO or IV) *First line
 - dapsone and TMP
 - clindamycin and primaquine
 - pentamidine (IV)
 - atovaquone
- corticosteroids used as adjuvant therapy in those with severe hypoxia ($\text{pO}_2 < 70$ mmHg or A-a gradient $\text{O}_2 > 35$ mmHg)
- prophylactic TMP/SMX for those at high risk of infection (HIV patients when $\text{CD4} < 200$ cells/mm³ or non-HIV immunocompromised patients under specific conditions)

Cryptococcus spp.**Microbiology**

- encapsulated yeast found worldwide
- 2 human pathogenic species: *C. gattii*, *C. neoformans*

Transmission

- inhalation of airborne yeast from soil contaminated with pigeon droppings (*C. neoformans*) or certain tree species such as Eucalyptus or Douglas fir (*C. gattii*) → may cause local infection in lung → asymptomatic or pneumonia
- may also spread hematogenously to the CNS, skin, bones, and other organs
- *C. neoformans* tends to affect immunocompromised hosts
- *C. gattii* tends to affect immunocompetent hosts

Clinical Features

- pulmonary
 - usually asymptomatic or self-limited pneumonitis
 - only 2% of HIV+ patients present with pulmonary symptoms including productive cough, chest tightness, and fever
- disseminated
 - frequently disseminates in HIV+ population
 - CNS: meningitis (leading cause of meningitis in patients with HIV)
 - skin: umbilicated papules that resemble large lesions of *Molluscum contagiosum*

Investigations

- serum cryptococcal antigen
- CSF for meningitis: India-ink stain, cryptococcal antigen test, culture to confirm

Treatment

- in patients with HIV who have cryptococcal meningitis or severe pulmonary disease:
 - amphotericin B (+ flucytosine) is used in the first 2 wk for induction therapy; limited duration due to side effects
 - switch to fluconazole for at least 8 wk as consolidation therapy, then continue at lower dose for prolonged maintenance

C. gattii sees limited geographical distribution including Vancouver Island, Northern Australia, and Papua New Guinea

India-ink sensitivity for cryptococcus is only 50% (higher in HIV patients)

Candida albicans**Microbiology**

- yeast forms with pseudohyphae at 68°F/20°C and germ tube formation at 86°F/37°C

Transmission

- normal flora of skin, mouth, vagina, and GI tract
- risk factors for overgrowth
 - immunocompromised state (DM, corticosteroids)
 - ICU patients (broad-spectrum antibiotic use, central venous catheters, TPN)
 - obesity → maceration and moisture in intertriginous areas, pannus, under breasts

Clinical Features

- mucocutaneous
 - oral thrush, esophagitis (chest pain, odynophagia), vulvovaginitis (see [Gynecology, GY24](#)), balanitis, cutaneous (diaper rash, skin folds, folliculitis), chronic mucocutaneous
 - small satellite lesions beyond the margin of the rash
- invasive
 - candidemia, endophthalmitis, endocarditis, UTI (upper tract), hepatosplenic disease

Treatment

- thrush: nystatin suspension or pastilles for mild disease, fluconazole for severe disease
- vulvovaginal candidiasis: topical agents (imidazole or nystatin), oral fluconazole for recurrent disease
- cutaneous infection: topical imidazole
- opportunistic infections in HIV, other systemic infections: fluconazole or echinocandin
- chronic mucocutaneous: azoles

Aspergillus* spp.*Microbiology**

- branching septate hyphae
- common species causing disease include *A. fumigatus*, *A. flavus*

Transmission

- ubiquitous in the air and the environment
- *Aspergillus* produces a toxin called aflatoxin that contaminates nuts, grains, and rice

Clinical Features

- allergic bronchopulmonary aspergillosis (ABPA)
 - IgE-mediated asthma-type reaction with dyspnea, high fever, and transient pulmonary infiltrates
 - occurs more frequently in patients with asthma and allergies
- aspergilloma (fungus ball)
 - ball of hyphae in a preexisting lung cavity
 - symptoms range from asymptomatic to massive hemoptysis
 - CXR: round opacity surrounded by a thin lucent rim of air, often in upper lobes ("air crescent" sign)
- invasive aspergillosis
 - associated with prolonged and persistent neutropenia or transplantation
 - pneumonia – most common
 - may disseminate to other organs: brain, skin
 - severe symptoms with fever, cough, dyspnea, cavitation; fatal if not treated early and aggressively
 - CXR: local or diffuse infiltrates ± pulmonary infarction, pulmonary nodules with surrounding ground glass ("halo" sign)
- mycotoxicosis
 - aflatoxin produced by *A. flavus* (nuts, grains, rice)
 - results in liver necrosis and hepatocellular carcinoma

Treatment Options

- for invasive aspergillosis: voriconazole or amphotericin B
- surgical resection for aspergilloma
- corticosteroids ± itraconazole for ABPA

Parasitic Infections**Protozoa – Intestinal/Genitourinal Infections*****Entamoeba histolytica* (Amoebas)****Transmission**

- reservoir: infected humans
- cysts by fecal-oral and food/waterborne transmission in areas of poor sanitation
- seen in immigrants, travelers, institutionalized individuals, Aborigines, MSM

Clinical Features

- asymptomatic carriers
- amoebic dysentery
 - abdominal pain, cramping, colitis, dysentery, low grade fever with bloody diarrhea secondary to local tissue destruction and ulceration of large intestine
- amoebic abscesses
 - most common in liver (hematologic spread); presents with RUQ pain, weight loss, fever, hepatomegaly
 - can also occur in lungs and brain

**Figure 12. Entamoeba life cycle**

Investigations

- serology, fecal/serum antigen testing, stool exam (for cysts and trophozoites), colon biopsy
- *E. histolytica* indistinguishable microscopically from the non-pathogen *E. dispar* (distinguish by specific stool antigen detection)

Treatment and Prevention

- metronidazole
- for invasive disease or cyst elimination: follow with iodoquinol or paromomycin
- aspiration of hepatic abscess if risk of cyst rupture, poor response to medical therapy, or diagnostic uncertainty
- asymptomatic cyst: iodoquinol or paromomycin alone
- good personal hygiene, purification of water supply by boiling, filtration (not chlorination)

Giardia lamblia

Transmission

- reservoir: infected humans and other mammals
- food/waterborne (especially in the Rockies) and fecal-oral transmission of infectious cysts
- risk factors: travel, camping, institutions, day care centers, MSM

Clinical Features

- giardiasis ("beaver fever")
 - symptoms vary from asymptomatic to self-limited mild watery diarrhea to malabsorption syndrome (chronic giardiasis where the parasite coats small intestine and thus prevents fat absorption)
 - nausea, malaise, abdominal cramps, bloating, flatulence, fatigue, weight loss, steatorrhea
 - no hematochezia (no invasion into intestinal wall), no mucus in stool

Investigations

- multiple stool samples (daily x 3 d) for microscopy, stool antigen used occasionally
- occasionally small bowel aspirate or biopsy

Treatment and Prevention

- metronidazole, nitazoxanide if symptomatic
- good personal hygiene and sanitation, water purification (iodine better than chlorination), outbreak investigation

Trichomonas vaginalis

Transmission

- sexual contact

Clinical Features

- often asymptomatic (10-50%), especially males (occasionally urethritis, prostatitis)
- trichomonas vaginitis (see [Gynecology, GY25](#))
 - vaginal discharge (profuse, malodorous, yellow-green or gray, frothy), pruritus, dysuria, dyspareunia

Investigations

- wet mount (motile parasites), antigen detection, culture
- urine PCR to detect in males

Treatment

- metronidazole for patient and partner(s)

Trichomonas causes 25% of vaginitis

***Cryptosporidium* spp.**

Transmission

- reservoir: infected humans and a wide variety of young animals
- fecal-oral transmission by ingestion of cysts, waterborne
- risk factors: summer and fall, young children (day care), MSM, contact with farm animals, immunocompromise, immune reconstitution

Clinical Features

- range from self-limited watery diarrhea (immunocompetent) to chronic, severe, non-bloody diarrhea with N/V, abdominal pain, and anorexia resulting in weight loss and death (immunocompromised)

Investigations

- modified acid-fast stain of stool specimen, microscopic identification of oocysts in stool or tissue, stool antigen detection by direct fluorescent antibody

Treatment and Prevention

- supportive care
- in HIV, try HAART to restore immunity; if fails, try nitazoxanide
- good personal hygiene, water filtration

Malaria is the most common fatal infectious disease worldwide

Blood and Tissue Infections

Plasmodium spp. (Malaria)

Microbiology

- species include: *P. falciparum* (most common and most lethal), *P. vivax*, *P. ovale*, *P. malariae*, *P. knowlesi* (new species isolated from primates in Malaysia, potentially fatal)
- complex life cycle: human host for asexual reproduction and mosquito for sexual reproduction
- sporozoite from mosquitoes infect liver cells in which parasites multiply and are released as merozoites which infect RBCs causing disease
- P. ovale* and *P. vivax* can produce dormant hypnozoites in the liver that may cause relapsing malarial attacks by reactivating (entering the erythrocytic cycle) after many months

Transmission

- reservoir: infected human
- transmission by the night-biting female *Anopheles* mosquito, vertical transmission, and blood transfusion
- occurs in tropical/subtropical regions (sub-Saharan Africa, Oceania, South Asia, Central America, Southeast Asia, South America)

Clinical Features

- flu-like prodrome
- paroxysms of high spiking fever and shaking chills (due to synchronous systemic lysis of RBCs) (lasts several hours)
 - P. vivax* and *P. ovale*: chills and fever q48h but can be variable
 - P. malariae*: chills and fever q72h but can be variable
 - P. falciparum*: less predictable fever interval, can be highly variable (>90% ill within 30 d)
- abdominal pain, diarrhea, myalgia, H/A, and cough
- hepatosplenomegaly and thrombocytopenia without leukocytosis

Complications

- P. falciparum*: CNS involvement (cerebral malaria = seizures and coma), severe anemia, acute renal failure, ARDS, primarily responsible for fatal disease
- P. knowlesi*, and rarely *P. vivax* can be fatal

Investigations

- microscopy: blood smear q12-24h (x3) to rule out infection
 - thick smear (Giemsa stain) for presence of organisms
 - thin smear (Giemsa stain) for species identification and quantification of parasites
- rapid antigen detection tests

Treatment and Prevention

- P. vivax*, *P. ovale*: chloroquine (and primaquine to eradicate liver forms)
- P. vivax*, chloroquine resistant: primaquine with quinine and doxycycline or tetracycline or mefloquine
- P. malariae*, *P. knowlesi*: chloroquine
- P. falciparum*: most areas of the world show chloroquine resistance – check local resistance patterns
 - artemisinin combination therapy (e.g. artesunate + doxycycline or clindamycin or atovaquone/proguanil)
 - atovaquone/proguanil combination (Malarone®)
 - quinine plus doxycycline, tetracycline, or clindamycin
 - mefloquine and artemisinin resistance increasing in southeast Asia (check local resistance)
- prevention with antimalarial prophylaxis, covering exposed skin, bed nets, insect repellent

Figure 13. Life cycle of *Plasmodium* spp.

Drugs for Preventing Malaria in Travelers

Cochrane DB Syst Rev 2009;CD006491

Study: Cochrane Systematic Review. 8 RCTs.

Population: 4,240 non-immune adults and children traveling to regions with *P. falciparum* resistance to chloroquine.

Intervention: Atovaquone-proguanil, doxycycline, mefloquine, chloroquine-proguanil, or primaquine used for malaria prophylaxis.

Outcome: Efficacy, safety, and tolerability.

Results: Atovaquone-proguanil and doxycycline had similar adverse events. Atovaquone-proguanil had fewer overall (RR 0.72), GI (RR 0.54), and neuropsychiatric events (RR 0.49) than mefloquine. Doxycycline also had fewer neuropsychiatric events than mefloquine (RR 0.84).

Conclusion: Atovaquone-proguanil or doxycycline as prophylaxis against malaria is best tolerated in terms of adverse effects and mefloquine is associated with adverse neuropsychiatric outcomes.

Trypanosoma cruzi

Transmission

- found in Mexico, South America, and Central America
- transmission by Reduviid insect vector ("Kissing Bug"), which defecates on skin and trypomastigotes in the stool are rubbed into bite site by host

- also transmitted via placental transfer, organ donation, blood transfusion, and ingestion of contaminated food containing Reduviid insects (especially cane juice)

Clinical Features

- American trypanosomiasis (Chagas disease)
 - acute: usually asymptomatic, local swelling at site of inoculation ("Romana's sign"; usually around one eye) with variable fever, lymphadenopathy, cardiomegaly, and hepatosplenomegaly
 - intermediate phase: asymptomatic but increasing levels of parasite and antibody in blood; most infected persons remain in this phase
 - chronic: can lead to chronic dilated cardiomyopathy, esophagomegaly, and megacolon 10-25 yr after acute infection in 30-40% of infected individuals

Investigations

- wet prep and Giemsa stain of thick and thin blood smear, serology, PCR

Treatment and Prevention

- acute: nifurtimox or benznidazole
- intermediate: increasing trend to treat as acute infection
- chronic: symptomatic therapy, surgery including heart transplant, or esophagectomy, colectomy, as necessary, may be a benefit to antiparasitic treatment
- insect control, bed nets

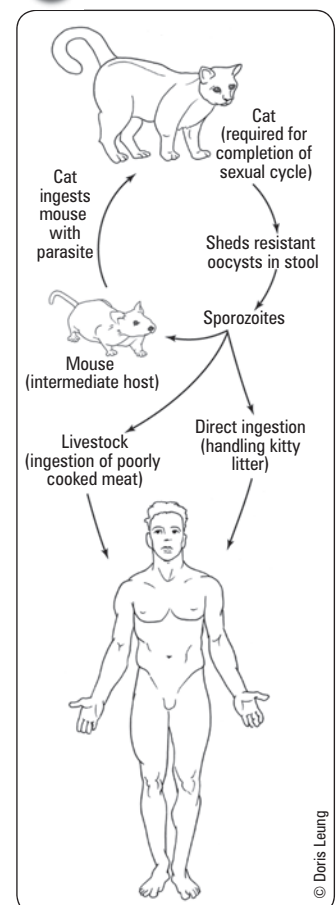

1/3 of Ontario's population is infected with *Toxoplasma gondii*

Classic Triad of Congenital Toxoplasmosis:

- Chorioretinitis
- Hydrocephalus
- Intracranial calcifications

© Doris Leung

Figure 14. Life cycle of *Toxoplasma gondii*

Toxoplasma gondii

Transmission

- acquired through exposure to cat feces (oocysts), ingestion of undercooked meat (tissue cysts), vertical transmission, organ transplantation, gardening without gloves, or whole blood transfusions

Clinical Features

- congenital
 - result of acute primary infection of mother during pregnancy (TORCH infection – see [Obstetrics, OB19](#))
 - stillbirth (rare), chorioretinitis, blindness, seizures, severe developmental delay, microcephaly
 - initially asymptomatic infant may develop reactivation of chorioretinitis as adolescent or adult → blurred vision, scotoma, ocular pain, photophobia, epiphora, hearing loss, developmental delay
- acquired
 - usually asymptomatic or mononucleosis-like syndrome in immunocompetent patient
 - infection remains latent for life unless reactivation due to immunosuppression
- immunocompromised (most commonly AIDS with CD4 <200)
 - encephalitis with focal CNS lesions seen as single or multiple ring-enhancing masses on CT (H/A and focal neurological signs)
 - lymph node, liver, and spleen enlargement and pneumonitis
 - chorioretinitis

Investigations

- serology, CSF Wright-Giemsa stain, antigen or DNA detection (PCR); pathology provides definitive diagnosis
- immunocompromised patients: consider CT scan (ring-enhancing lesion in cortex or deep nuclei) and ophthalmologic examination
- negative serology in many AIDS patients (false negative due to decreased lymphocyte population)

Treatment and Prevention

- no treatment if: immunocompetent, not pregnant, no severe organ damage
- pregnancy: spiramycin to prevent transplacental transmission or pyrimethamine + sulfadiazine (add folinic acid), avoid undercooked meat and refrain from emptying cat litter boxes
- HIV: pyrimethamine + sulfadiazine (see [Prophylaxis, ID29](#))
- eye disease, meningitis: corticosteroids
- proper hand hygiene, cook meat thoroughly to proper temperature

Helminths

Roundworms – Nematodes

Table 26. Nematodes (Roundworms)

Nematode	Epidemiology	Transmission	Medical Importance	Treatment
<i>Ascaris lumbricoides</i>	Tropics	Human feces, ingestion of contaminated food or water	Abdominal pain and intestinal obstruction from high worm burden Cough, dyspnea, pulmonary infiltrates from larval migration through lungs (Löffler's syndrome)	Mebendazole OR albendazole OR pyrantel pamoate
<i>Trichuris trichiura</i> (whipworm)	Tropics	Ingestion of eggs in soil	Diarrhea (± mucus, blood), abdominal pain, rectal prolapse, stunted growth	Mebendazole OR albendazole
<i>Onchocerca volvulus</i>	Africa, Latin America	Black fly bite	River blindness (onchocerciasis), dermatitis	Ivermectin + doxycycline
<i>Wuchereria bancrofti</i>	Tropics	Mosquito bite	Damage to lymphatics resulting in lymphadenopathy, lymphedema, and elephantiasis Tropical pulmonary eosinophilia	Diethylcarbamazine + doxycycline
<i>Loa Loa</i>	Central Africa	Deer fly bite	Subcutaneous migration of worm, hyperresponsiveness in travelers	Diethylcarbamazine, removal of adult
<i>Enterobius vermicularis</i> (Pinworm)	Worldwide	Human host: fecal-oral self-inoculation and fomite person-to-person transfer Adult worms live in cecum and deposit eggs in perianal skin	Asymptomatic carriers or severe nocturnal perianal itching (pruritus ani) Occasional vaginitis Abdominal pain, N/V with high worm burden	Sticky tape test: eggs adhere to tape applied to perianal skin (need 5-7 tests to rule out) Examination of perianal skin at night may reveal adult worms Usually no eosinophilia as no tissue invasion Mebendazole, albendazole; pyrantel in pregnancy Change underwear, bathe in morning, pajamas to bed, wash hands, trim fingernails Treat all family members simultaneously Reinfection common
<i>Strongyloides stercoralis</i> (Threadworm)	Subtropical, tropical, and temperate (including southern US)	Fecal contamination of soil: transmission via unbroken skin, walking barefoot Autoinfection: penetration of larvae through GI mucosa or perianal skin Adult worms live in mucosa of small intestine	One of few worms able to multiply in human host Mostly asymptomatic infection or can have pruritic dermatitis at site of larval penetration Transient pulmonary symptoms during pulmonary migration of larvae (eosinophilic pneumonitis = Löffler's syndrome) Abdominal pain, diarrhea, pruritis ani, larva currens (itchy rash) Hyperinfection: occasional fatal cases caused by massive auto-infection in immunocompromised host; immunoablative therapy, including high-dose corticosteroids, is the most common risk factor for disseminated infection	Ivermectin, 200 µg/kg/d PO x 2 doses (albendazole 40 mg PO bid x 7 d, less effective)

Figure 15. Life cycle of Enterobius

Figure 16. Life cycle of Strongyloides

Flatworms

Cestodes/Trematodes

Table 27. Cestodes/Trematodes (Flatworms)

	Epidemiology	Transmission	Medical Importance	Treatment
CESTODES				
<i>Taenia solium</i>	Developing countries	Undercooked pork (larvae), human feces (eggs)	Taeniasis: mild abdominal symptoms Cysticercosis: mass lesions in CNS, eyes, skin, seizures	Corticosteroids + albendazole for cysticercosis Antiepileptics if seizures Praziquantel for adult tapeworm in gut (taeniasis)
<i>Taenia saginata</i>	Developing countries	Undercooked beef (larvae)	Mild GI symptoms	Praziquantel
<i>Diphyllobothrium latum</i>	Europe, North America, Asia	Raw fish	B ₁₂ deficiency leading to macrocytic anemia and posterior column deficits	Praziquantel
<i>Echinococcus granulosus</i>	Rural areas Sheep-raising countries	Dog feces (eggs)	Liver/lung cysts (enlarge between 1-20 yr; may cause mass effect or rupture) Risk of anaphylaxis if cystic fluid released during surgical evacuation	Albendazole alone Surgery + perioperative albendazole Percutaneous aspiration + perioperative albendazole
TREMATODES				
<i>Clonorchis sinensis</i>	Japan, Taiwan, China, SE Asia	Raw fish	Exists in bile ducts, causes inflammation and sometimes cholangiocarcinoma	Praziquantel
<i>Schistosoma</i> spp.	Africa, SE Asia, focal in Western Hemisphere	Fresh water exposure	Chronic sequelae secondary to long-term infection (e.g. chronic liver disease, SCC of the bladder)	Praziquantel

Trematodes/Flukes

Schistosoma spp.

Species

- *S. mansoni*, *S. hematobium*, *S. japonicum*

Transmission

- larvae (cercariae), released from snails, penetrate unbroken skin in infested fresh water
- adult worms live in terminal venules of bladder/bowel passing eggs into urine/stool
- eggs must reach fresh water to hatch; schistosomes cannot multiply in or pass between humans
 - more common in individuals from sub-Saharan Africa, South America, Asia, Caribbean, Eastern Mediterranean/North Africa

Clinical Features

- most asymptomatic; symptoms seen in travelers (nonimmune)
- Swimmer's itch: pruritic skin rash at site of penetration (cercarial dermatitis)
- acute schistosomiasis (Katayama fever): hypersensitivity to migrating parasites (4-8 wk after infection)
 - fever, hives, H/A, weight loss, cough, abdominal pain, chronic diarrhea, eosinophilia

Complications of Chronic Infection

- *S. mansoni*, *S. japonicum*
 - worms in mesenteric vein, eggs in portal tracts of liver and bowel
 - heavy infections: intestinal polyps, portal and pulmonary HTN, splenomegaly (2° to portal HTN), hepatomegaly
- *S. hematobium*
 - worms in vesical plexus, eggs in distal ureter and bladder induce granulomas and fibrosis
 - hematuria and obstructive uropathy; associated with squamous cell bladder cancer
- neurologic complications: spinal cord neuroschistosomiasis (transverse myelitis), cerebral or cerebellar neuroschistosomiasis (increased ICP, focal CNS signs, seizures)
- pulmonary complications: granulomatous pulmonary endarteritis, pulmonary HTN, cor pulmonale; especially in patients with hepatosplenic involvement

Figure 17. Life cycle of *Schistosoma*

Investigations

- serology (high sensitivity and specificity), CBC (eosinophilia, anemia, thrombocytopenia)
- S. mansoni*, *S. japonicum*: eggs in stool, liver U/S shows fibrosis, rectal biopsy
- S. hematobium*: bladder biopsy, eggs in urine and occasionally stool, kidney and bladder U/S

Treatment and Prevention

- praziquantel
- add glucocorticoid if acute schistosomiasis or neurologic complications develop
- proper disposal of human fecal waste, molluscicide, avoidance of infested water
- do not swim in Lake Malawi

For up to date information on geographic and seasonal patterns of disease and travel advisories, check the website for the United States Centers for Disease Control and Prevention (wwwnc.cdc.gov/travel) or Foreign Affairs Canada (travel.gc.ca)

Ectoparasites

- scabies, lice
- see [Dermatology](#), D26

Travel Medicine

General Travel Precautions

- vector-borne: long-sleeves, long pants, hats, repellents (containing permethrin) applied to clothes, belongings and bed nets, exposed skin
- food/water: avoid eating raw meats/seafood, uncooked vegetables, and milk/dairy products; drink only bottled beverages, chlorinated water, boiled water
- recreation: caution when swimming in schistosomiasis-endemic regions (Lake Malawi), fresh water rafting/kayaking, beaches that may contain human/animal waste products, near storm drains, after heavy rainfalls
- prophylaxis: malaria (chloroquine, mefloquine, atovaquone + proguanil, doxycycline), traveler's diarrhea (bismuth salicylate)
- standard vaccines up to date (hepatitis B, MMR, tetanus/diphtheria, varicella, pertussis, polio)
- travel vaccines: hepatitis A/B, Japanese encephalitis, typhoid fever, yellow fever, rabies, ETEC, cholera
- sexually transmitted and blood-borne infections: safe sex practices, avoidance of percutaneous injury through razors, tattoos, piercings

Infectious Diseases to Consider

- vector borne: malaria, dengue fever, Chikungunya fever, yellow fever, *Rickettsia*, West Nile virus, trypanosomiasis, Japanese encephalitis, tick-borne encephalitis, spotted fever, leishmaniasis
- sexually transmitted: HIV, HBV, syphilis, usual STDs
- zoonotic: rabies, hantavirus, tularemia, Q fever, anthrax, brucellosis
- airborne: TB
- food/water: HAV, HEV, brucellosis, typhoid, paratyphoid, amoebiasis, dysentery, traveler's diarrhea, cholera, *Campylobacter* spp.
- soil/water: schistosomiasis, strongyloidiasis, leptospirosis, cutaneous larva migrans, histoplasmosis, paracoccidioidomycosis

Fever in traveler from malaria endemic area is malaria until proven otherwise

Important Exposures

Insect Bites	
Mosquito	<ul style="list-style-type: none"> <i>Plasmodium</i> spp. (Malaria) Dengue Lymphatic filariasis (Elephantiasis) West Nile Encephalitis Yellow Fever Japanese Encephalitis
Tick	<ul style="list-style-type: none"> <i>Borrelia burgdorferi</i> (Lyme Disease) <i>Rickettsia rickettsii</i> (Rocky Mountain Spotted Fever)
Fly	<ul style="list-style-type: none"> <i>Trypanosoma brucei</i> spp. (African sleeping sickness) <i>Leishmania</i> spp. (Leishmaniasis) <i>Bartonella bacilliformis</i> (Bartonellosis)
Flea	<ul style="list-style-type: none"> <i>Yersinia</i> (Plague) <i>Tunga penetrans</i> (Tungiasis)
Mammal Bites	
Dog/Cat	<ul style="list-style-type: none"> Rabies, <i>Pasteurella</i>, anaerobes, <i>Streptococcus</i>, <i>S. aureus</i>
Human	<ul style="list-style-type: none"> <i>Streptococcus</i>, <i>S. aureus</i>, oral anaerobes, <i>Eikenella</i>

Oral Exposures	
Unpasteurized Milk	<ul style="list-style-type: none"> <i>Brucella</i> spp., non-tuberculous mycobacteria, <i>Salmonella</i>, <i>E. coli</i>, <i>Listeria</i>
Undercooked Meat/Fish	<ul style="list-style-type: none"> Enteric bacteria, helminths, protozoa
Water	<ul style="list-style-type: none"> Hepatitis A/E, Norwalk, cholera, <i>Salmonella</i>, <i>Shigella</i>, <i>Giardia</i>, poliovirus, <i>Cryptosporidium</i>, <i>Cyclospora</i>

Environmental Exposures	
Freshwater	<ul style="list-style-type: none"> <i>Leptospira</i> spp., schistosomes, <i>Acanthamoeba</i>, <i>Naegleria fowleri</i>
Soil	<ul style="list-style-type: none"> Hookworms, <i>Toxocara</i> spp. (visceral larva migrans), <i>Leptospira interrogans</i> (leptospirosis)

Fever in the Returned Traveler

Etiology

- commonly identified causes of fever in returning traveler
 - parasitic: malaria (20-30%)
 - viral: non-specific mononucleosis-like syndrome (4-25%), dengue (5%), viral hepatitis (3%)
 - bacterial: typhoid from *Salmonella* (2-7%), rickettsioses (3%)
 - diverse group of causative pathogens: traveler's diarrhea (10-20%), RTI (10-15%), UTI/STD (2-3%)
- febrile illness in travelers can be caused by routine infections that are common in non-travelers (e.g. URTI, UTI)
- less commonly, fever can be due to non-infectious causes: e.g. DVT, PE

History

- pre-travel preparation
- travel itinerary: when, where, why, what, who, how?
 - dates of travel (determine incubation period)
 - season of travel: wet or dry
 - destination: country, region (urban or rural), environment (jungle, desert, etc.)
 - purpose of trip

- persons visiting friends and family more likely to be exposed to local population and pathogens
 - style of travel: lodgings, camping, adventure traveling
 - local population: sick contacts
 - transportation: use of animals
- exposure history
 - street foods, untreated water: increased risk of traveler's diarrhea, enteric fever
 - uncooked meat/unpasteurized dairy: increased risk of parasitic infection
 - body fluids (sexual contacts, tattoos, piercings, IVDU, other injections)
 - increased risk of HBV, HCV, HIV, GC, *C. trachomatis*, syphilis
 - animal/insect bites: increased risk of malaria, dengue, rickettsioses, rabies
- fever pattern
- incubation period: use the earliest and latest possible dates of exposure to narrow the differential diagnosis and exclude serious infections
 - <21 d: consider malaria, typhoid fever, dengue fever, rickettsioses; exclude HBV, TB
 - >21 d: consider malaria, TB; exclude dengue fever, travelers' diarrhea, rickettsioses
- body systems affected: GI, respiratory, CNS, skin

Investigations

- all travelers with fever should undergo the following tests
 - blood work: CBC and differential, liver enzymes, electrolytes, creatinine, thick and thin blood smears x3 (for malaria), blood C&S
 - urine: urinalysis, urine C&S
- special tests based on symptoms, exposure history, and geography
 - stool: C&S, O&P
 - CXR
 - dengue serology for IgM

Table 28. Fever in the Returned Traveler

Illness	Geography/ Timing	Pathogen	Incubation Period	Clinical Manifestations	Diagnosis	Treatment
Malaria	Africa India C. and S. America SE Asia Usually rural, night-biting mosquitoes	<i>Plasmodium falciparum</i> <i>Plasmodium vivax</i> <i>P. malariae</i> <i>P. ovale</i> <i>P. knowlesi</i>	10 d to 40 yr	Fever and flu-like illness, (shaking chills, H/A, muscle aches, and fatigue) N/V and diarrhea Anemia and jaundice <i>Plasmodium falciparum</i> : (severe) kidney failure, seizures, mental confusion, prostration, coma, death, respiratory failure	Blood smear (thick and thin) x3 Antigen detection PCR (mostly a research tool)	Artesunate (for severe disease) + malarone, doxycycline, or clindamycin Quinine sulfate + doxycycline or clindamycin Chloroquine + primaquine
Dengue	South East Asia Caribbean Usually urban, day-biting mosquitoes	Dengue viruses	3 d to 2 wk	Sudden onset of fever, H/A, retro-orbital pain, myalgias, and arthralgias Leukopenia Thrombocytopenia Hemorrhagic manifestations (rare in travelers)	Anti-dengue IgM positivity	Symptom relief: Acetaminophen (avoid using NSAIDs because of anticoagulant properties)
Typhoid (enteric fever)	Global but mostly Indian subcontinent	<i>Salmonella typhi</i> <i>Salmonella paratyphi</i>	3 to 60 d	Sustained fever 103°-104°F (39°-40°C) Abdominal pain, H/A, loss of appetite, cough, constipation	Stool, urine, or blood sample positive for <i>S. typhi</i> or <i>S. paratyphi</i>	Quinolone antibiotic (e.g. ciprofloxacin), ceftriaxone, or macrolide
Tick Typhus	Mediterranean South Africa India	<i>Rickettsia</i>	1 to 2 wk	Fever, H/A, fatigue, muscle aches, occasionally rash Eschar at site of tick bite Thrombocytopenia Elevated liver enzymes	Serology Presence of classic tick eschar	Doxycycline
TB	Global	<i>M. tuberculosis</i>	Variable	Fever, cough, hemoptysis	CXR Sputum culture and acid-fast stain	Ethambutol, isoniazid, pyrazinamide, rifampin
Mononucleosis	Caribbean, C. and S. America	EBV or CMV	30 to 50 d	Malaise, fatigue, pharyngitis, lymphadenopathy, splenomegaly	Atypical lymphocytes on blood smear and positive heterophilic antibody (monospot) test	Acetaminophen or NSAIDs, fluids

Fever of Unknown Origin

Table 29. Classification of Fever of Unknown Origin (FUO) – Temp > 101°F on several occasions

Classical FUO	Nosocomial FUO	Neutropenic FUO	HIV-associated FUO
Duration >3 wk	Hospitalized patient Infection not present/ incubating on admission	Neutrophil count <500/mL or is expected to fall to that level in 1-2 d	HIV infections Duration >4 wk for outpatients, >3 d for hospitalized patients
Diagnosis uncertain after 3 outpatient visits or 3 d in hospital or 1 wk of intensive ambulatory investigation	Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures	Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures	Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures

Etiology of Classic FUO

- infectious causes (~30%)
 - TB: extra-pulmonary (most common), miliary, pulmonary (if pre-existing disease)
 - abscess: subphrenic, liver, splenic, pancreatic, perinephric, diverticular, pelvis, psoas
 - osteomyelitis
 - bacterial endocarditis (culture negative)
 - uncommon: viral (CMV, EBV), fungal (histoplasmosis, cryptococcosis), parasitic (toxoplasmosis, leishmaniasis, amoebiasis, malaria)
- neoplastic causes (~20%)
 - most commonly lymphomas (especially non-Hodgkin's) and leukemias, also multiple myeloma, myelodysplastic syndrome
 - solid tumors: RCC (most common), also breast, liver (hepatoma), colon, pancreas, or liver metastases
- collagen vascular diseases (~30%)
 - SLE, RA, rheumatic fever, vasculitis (temporal arteritis, PAN), JRA, Still's disease
- miscellaneous (~20%)
 - drugs, factitious fever
 - sarcoidosis, granulomatous hepatitis, IBD
 - hereditary periodic fever syndromes (such as familial Mediterranean fever)
 - venous thromboembolic disease: PE, DVT
 - endocrine: thyroiditis, thyroid storm, adrenal insufficiency, pheochromocytoma
- unknown in 30-50% despite detailed workup

Approach to Classic FUO

- careful history: travel, environmental/occupational exposures, infectious contacts, medication history, immunizations, TB history, sexual history, past medical history, comprehensive review of systems (including symptoms that resolved before interview)
- thorough physical exam: fever pattern, rashes (skin, mucous membranes), murmurs, arthritis, lymphadenopathy, organomegaly
- initial investigations as appropriate
 - blood work: CBC and differential, electrolytes, BUN, Cr, calcium profile, LFTs, ESR, CRP, muscle enzymes, RF, ANA, serum protein electrophoresis (SPEP), blood smear
 - cultures: blood (x2 sets), urine, sputum, stool C&S, O&P, other fluids as appropriate
 - serology: HIV, monospot, CMV IgM
 - imaging: CXR, abdominal imaging
- if there are diagnostic clues from any of the above steps, proceed with directed exam, biopsies or invasive testing as required, followed by directed treatment once a diagnosis is established
- if no diagnosis with the above, consider empiric therapy vs. watchful waiting
 - without intervention: patients that remain undiagnosed despite extensive workup have good prognosis

Anti- Drugs that may Cause Fever:

- Anti-microbials (sulfonamides, penicillins, nitrofurantoin, antimalarials)
- Anti-hypertensives (hydralazine, methyldopa)
- Anti-epileptics (barbiturate, phenytoin)
- Anti-arrhythmics (quinine, procainamide)
- Anti-inflammatories (NSAIDs)
- Anti-thrombotic (ASA)
- Anti-histamines
- Anti-thyroid

Causes of Nosocomial FUO

B, C, D, E

Bacterial and fungal infections of respiratory tract and surgical sites
Catheters (intravascular and urinary)
Drugs
Emboli

Infections in the Immunocompromised Host

- immunocompromised hosts have increased susceptibility to infections from pathogens that are typically low virulence, commensal, or latent
- type of immunosuppression predicts probable spectrum of agents

Factors that Compromise the Immune System

- general: age (very young or elderly), malnutrition
- immune disease: HIV/AIDS, malignancies, asplenia (functional or anatomic), hypogammaglobulinemia, neutropenia
- DM
- iatrogenic: corticosteroids, chemotherapy, radiation treatment, anti-TNF therapy, other immunosuppressive drugs (e.g. in transplant patients)

Table 30. Types of Immunocompromise

Type	Conditions	Vulnerable To
Cell-Mediated Immunity	HIV, Hodgkin's, hairy cell leukemia, cytotoxic drugs, SCID, DiGeorge syndrome	Latent viruses Fungi Parasites
Humoral Immunity	CLL, lymphosarcoma, multiple myeloma, nephrotic syndrome, protein-losing enteropathy, burns, sickle cell anemia, asplenia, splenectomy, selective Ig deficiencies, Wiskott-Aldrich syndrome	Encapsulated organisms (<i>S. pneumoniae</i> , <i>H. influenzae</i> , <i>N. meningitidis</i> , <i>Salmonella typhi</i> , GBS)
Neutrophil Function	Myelodysplasia, paroxysmal nocturnal hemoglobinuria, radiation, cytotoxic drug therapy, C3 or C5 deficiencies, chronic granulomatous disease	Catalase-producing organisms (<i>Staphylococcus</i> , <i>Serratia</i> , <i>Nocardia</i> , <i>Aspergillus</i>)

Infections Associated with Asplenia

- Haemophilus influenzae* type b
- Streptococcus pneumoniae*
- Neisseria meningitidis*
- Salmonella*
- Babesiosis*
- Malaria*
- Capnocytophaga canimorsus* (dog bite)

Febrile Neutropenia

Definition

- fever ($\geq 101^\circ\text{F}/38.3^\circ\text{C}$ or $\geq 100.4^\circ\text{F}/38.0^\circ\text{C}$ for ≥ 1 h) and one of:
 - ANC < 0.5 OR
 - ANC < 1.0 but trending down to 0.5

Pathophysiology

- decreased neutrophil production
 - marrow: infection, aplastic/myelophthitic anemia, leukemia, lymphoma, myelodysplastic syndromes
 - iatrogenic: cancer chemotherapy, radiation, drugs
 - deficiencies: vitamin B₁₂, folate
- increased peripheral neutrophil destruction
 - autoimmune: Felty's syndrome, SLE, antineutrophil antibodies
 - splenic sequestration

Epidemiology/Etiology

- most common life-threatening complication of cancer therapy
- 8 cases per 1,000 cancer patients per year in the U.S.
- causative organism identified only 1/3 of the time
- GN (especially *Pseudomonas*) historically most common
- GP more common now
- fungal superinfection if neutropenia prolonged or if concurrent antibiotic use (especially *Candida*, *Aspergillus*)

Investigations

- examine for potential sites of infection: mucositis and line infections are most common
- do NOT perform DRE; examine perianal region
- blood C&S (x2 sets), urine C&S, culture all indwelling catheter ports, \pm sputum C&S and NP swab for respiratory viruses
- CBC and differential, Cr, BUN, electrolytes, AST/ALT, total bilirubin

Treatment

- most hospitals have their own specific protocol; one example is presented below

ANC (absolute neutrophil count) =
WBC \times (%neutrophils + %bands)

Usual signs and symptoms of infection may be diminished because neutrophils are required for a robust inflammatory response; exam and x-ray findings may be more subtle

WBC is lowest between 5-10 d after last chemotherapy cycle

Prophylaxis against FN with G-CSF (granulocyte colony-stimulating factor) and GM-CSF (granulocyte-macrophage colony-stimulating factor) decreases hospitalization without affecting mortality (indicated if risk of FN 20% or if FN has occurred in a previous chemotherapy cycle)

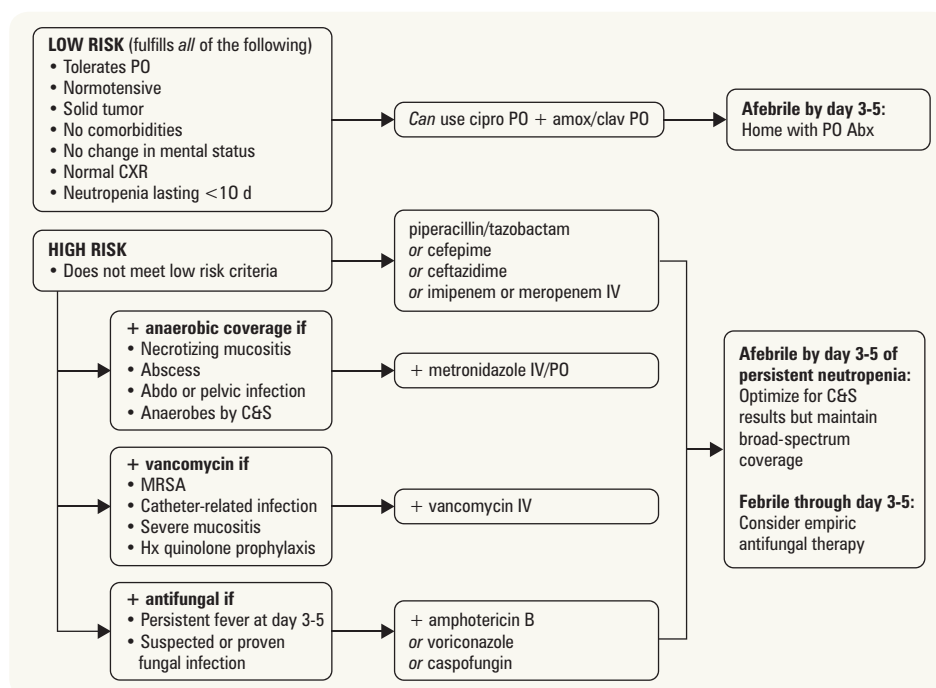

Figure 18. Example of treatment protocol for febrile neutropenia

Infections in Solid Organ Transplant Recipients

- infection is a leading cause of early morbidity/mortality in transplant recipients
- infection depends on degree of immunosuppression
- common infections <1 mo post-transplant
 - bacterial infection of wound/lines/lungs, herpetic stomatitis
- common infections >1 mo post-transplant
 - viral (especially CMV, EBV, VZV)
 - fungal (especially *Aspergillus*, *Cryptococcus*, *P. jirovecii*)
 - protozoan (especially *Toxoplasma*)
 - unusual bacterial/mycobacterial infections (especially TB, *Nocardia*, *Listeria*)

Prophylactic Vaccinations Given Before Transplant

- to all transplant patients: DTaP, pneumococcal, influenza, hepatitis A and B vaccines
- if low titer or poor documentation: MMR, polio, varicella vaccination (with booster 4-8 wk later)

Immune Reconstitution Syndrome

Definition

- a harmful inflammatory response directed against a previously acquired infection following a recovery of the immune system

Etiology

- paradoxical worsening of a successfully or partially treated opportunistic infection
- new onset response to a previously unidentified opportunistic infection
- the majority of cases are in HIV/AIDS or immunosuppressed patients starting anti-retroviral therapy or discontinuing immunosuppressive therapy; sudden recovery from an immunosuppressive state towards a pro-inflammatory state directed towards subclinical infection results in fever and inflammation
- can occur in response to multiple infections
 - *Mycobacteria* (tuberculosis, *avium* complex)
 - *Cryptococcus*
 - *Pneumocystis*
 - *Toxoplasma*
 - HBV and HCV
 - Herpes viruses (VZV reactivation, HSV, CMV)
 - JC virus (progressive multifocal leukoencephalopathy)
 - *Molluscum contagiosum*

- clinical features are dependent on the type and location of the pre-existing infection
- thought to be worse with quick increase in CD4 count and with lower pre-treatment CD4 count
- non-HIV conditions with documented IRS: solid organ transplant recipients, post-partum women, neutropenic patients, anti-TNF therapy

Epidemiology

- in HIV patients starting HAART, IRS reported to affect ~10%

Investigations

- diagnosis of exclusion
- rule out drug reaction, patient non-adherence, drug resistance

Treatment

- continue HAART therapy in HIV patients with mild-moderate symptoms, but consider discontinuation if symptoms are life-threatening or potentially irreversible
- treat underlying infection; initiate treatment for some infections prior to HAART initiation
- consider starting corticosteroids/NSAIDs to decrease inflammatory response

A Simplified Look at Antibiotics

- general overview, see Table 31 for more details

1. Penicillins (most *Streptococcus*, *N. meningitidis*, many oral anaerobes except *B. fragilis*)

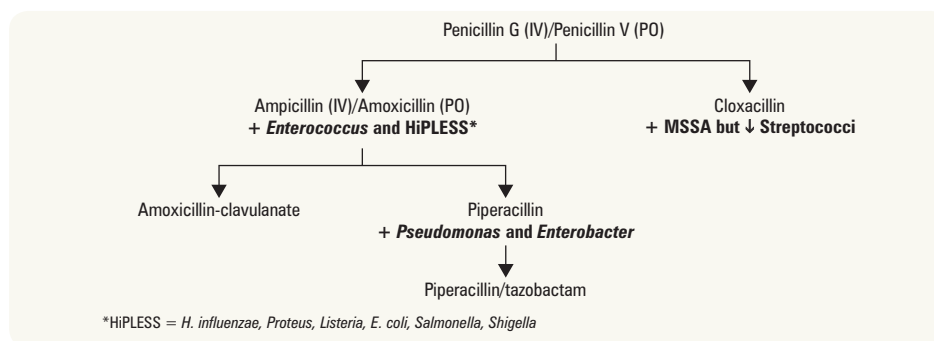

Figure 19. Penicillins

2. Cephalosporins (PO/IV)

- 1st generation: cephalexin/cefazolin (mostly GP, some GN)
- 2nd generation: cefuroxime/cefprozil (some GP and some GN, *anaerobes)
- 3rd generation: cefixime/cefotaxime, ceftriaxone (good *Streptococcal* coverage, mostly GN) and ceftazidime (no GP, mostly GN, *Pseudomonas*)
- 4th generation: --/cefepime (most GP, most GN, *Pseudomonas*)

3. Aminoglycosides (GN aerobic bacilli)

- gentamicin
- tobramycin
- amikacin

4. Macrolides (GP, *Haemophilus*, and atypical bacteria [*Legionella*, *Chlamydomphila*, *Mycoplasma*])

- erythromycin
- clarithromycin
- azithromycin

5. Fluoroquinolones (GN – although resistance becoming a huge problem)

- ciprofloxacin (+ *Pseudomonas*)
- norfloxacin (for UTI only)
- respiratory fluoroquinolones (some GP, GN, "atypicals", *Legionella*, *Mycoplasma*, *Chlamydomphila*)
 - levofloxacin
 - moxifloxacin (+ anaerobes)

6. Carbapenems (broad coverage: GP, GN, and anaerobes)

- imipenem (+ *Pseudomonas*)
- meropenem (+ *Pseudomonas*)
- ertapenem

7. Others
- doxycycline/tetracycline (GP, syphilis, *Chlamydomphila*, *Rickettsia*, *Mycoplasma*)
 - vancomycin (all GP and *C. difficile* – the oral form)
 - linezolid (for resistant GP infections)
 - clindamycin (most GP, GN anaerobes)
 - TMP/SMX (most *S. aureus* including: MRSA, GN aerobes, *Pneumocystis*)
 - nitrofurantoin (GN bacilli, *S. saprophyticus*, *Enterococcus*)
 - metronidazole (anaerobes including: *C. difficile*; *Trichomonas*, *Entamoeba*)
 - treatment for *C. difficile*: metronidazole OR oral vancomycin; consider both in serious infection

Antimicrobials

Antibiotics

- empiric antibiotic therapy
 - choose antibiotic(s) to cover for most likely and lethal organisms for the type of infection prior to obtaining laboratory results (usually reserved for serious infections)
 - adjust antibiotic(s) based on C&S
 - ♦ if causative organism identified, use antibiotic to which organism is sensitive
 - ♦ if causative organism not identified, re-evaluate need for ongoing antimicrobial therapy (and continue with empiric antibiotic(s) if indicated)

Figure 20. Mechanism of action of antibiotics

Reasons for Combination Therapy

- Polymicrobial infection
- Empiric therapy pending culture results
- Synergy for difficult to treat pathogens (e.g. *Enterococcus* spp. causing endocarditis)
- To prevent emergence of resistance

Bactericidal Antibiotics	Bacteriostatic Antibiotics
"Very Finely Proficient At CCell Murder"	"ECSTaTiC"
Vancomycin	Erythromycin (and other macrolides)
Fluoroquinolones	Clindamycin
Penicillin	Sulfamethoxazole
Aminoglycosides	Trimethoprim
Cephalosporins	Tetracyclines
Carbapenems	Chloramphenicol
Metronidazole	

Table 31. Antibiotics

Class and Drugs		Coverage	Mechanism of Action		Adverse Effects	Indications	Contraindications
CELL WALL INHIBITORS							
Penicillins							
Benzyl penicillin - penicillin G IV/IM - penicillin V PO		GP <u>except</u> <i>Staphylococcus</i> , <i>Enterococcus</i> Oral anaerobes	Bactericidal: β-lactam inhibits cell wall synthesis by binding penicillin binding protein (PBP) preventing cross-linking of peptidoglycan		Immediate allergy (IgE): anaphylaxis, urticaria Late-onset allergy (IgG): urticaria, rash, serum sickness Interstitial nephritis Dose related toxicity: seizures Diarrhea	Mild to moderately severe infections caused by susceptible organisms including actinomycosis, streptococcal pharyngitis, streptococcal skin and soft tissue infections, pneumococcal pneumonia, syphilis	Hypersensitivity to penicillin
Aminopenicillin - ampicillin IV - amoxicillin PO (Moxatag®)		Same as penicillin AND <i>Enterococcus</i> <i>Listeria</i>	See above		See above	Bacterial meningitis and endocarditis (IV ampicillin), acute otitis media (AOM), streptococcal pharyngitis, sinusitis, acute exacerbations of COPD, part of multidrug therapy for <i>H. pylori</i> treatment, Lyme disease, pneumococcal pneumonia; UTI (amoxicillin and ampicillin) for most enterococci and susceptible gram-negative pathogens	Hypersensitivity to penicillin or β-lactam antibiotics
Isoxazyolyl penicillin - cloxacillin - methicillin - nafcillin - oxacillin		Methicillin-sensitive <i>Staphylococcus aureus</i> ; streptococci	See above		See above	Bacterial infections caused by staphylococci and streptococci including skin soft-tissue infections	Hypersensitivity to cloxacillin or any penicillin
β-lactam/β-lactamase inhibitor combinations - amoxicillin-clavulanate (Amoclan®, Augmentin®) - piperacillin/tazobactam (Zosyn®)		Same as penicillin AND <i>Staphylococcus</i> <i>H. influenzae</i> <i>Enterococcus</i> Anaerobes (oral and gut)	β-lactamases prduced by certain bacteria inactivate β-lactams Lactamase inhibitors prevent this process, preserving antibacterial effect of β-lactams		See above	Various β-lactamase producing bacteria, Clavulin® sensitive bacteria including RTI, sinusitis, AOM, skin and soft tissue infections, UTI, and severe intra-abdominal and pelvic infections	Hypersensitivity to penicillin or cephalosporin History of Clavulin®-associated jaundice or hepatic dysfunction
Cephalosporins							
PO 1° cephalexin (Keflex®)	IV cefazolin	GP Good with the exception of <i>Enterococcus</i> and MRSA	GN <i>E. coli</i> , <i>Klebsiella</i> , <i>Proteus</i> , <i>H. influenzae</i> (not all isolates)	Bactericidal: β-lactam inhibits PBP, prevents cross-linking of peptidoglycan, less susceptible to penicillinases	10% penicillin allergy cross-reactivity Nephrotoxicity	Skin and soft tissue infections, prevention of surgical site infections (cefazolin); infections caused by susceptible organisms (especially <i>Staph</i> and <i>Strep</i> infections)	Hypersensitivity to cephalosporins or other β-lactam antibiotics
2° cefuroxime (Ceftin®) cefprozil	cefuroxime (Zinacef®) cefoxitin ^A	Weaker activity than 1°	More coverage than 1° (^A includes anaerobes)	See above	See above	Upper and lower respiratory tract infections; pneumococcal pneumonia; soft tissue infections	See above
3° cefixime (Suprax®)	ceftriaxone (Rocephin®) cefotaxime (Claforan®) ceftazidime ^B (Fortaz®)	<i>S. aureus</i> + <i>streptococcal</i> coverage (cefotaxime and ceftriaxone) especially <i>S. pneumoniae</i>	Broad coverage (^B includes <i>Pseudomonas</i> for ceftazidime only)	See above	~1% penicillin allergy cross-reactivity	Community-acquired pneumonia (cefotaxime, ceftriaxone), gonorrhea (use ceftriaxone), community-acquired bacterial meningitis (ceftriaxone, cefotaxime); abdominal and pelvic infections (cefotaxime or ceftriaxone in combination with metronidazole); once-daily administration makes ceftriaxone convenient for outpatient IV therapy	Severe hypersensitivity (Type I) to other β-lactam antibiotics
4°	cefepime (Maxipine®)	Broad spectrum	Broad coverage including <i>Pseudomonas</i>	See above	See above	Empiric therapy for febrile neutropenia	See above

Table 31. Antibiotics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
CELL WALL INHIBITORS					
Carbapenems					
imipenem (Primaxin®)	GP except MRSA GN including <i>Pseudomonas</i> + <i>Enterobacter</i> , ESBLs, anaerobes	β -lactam inhibits PBP and prevents cross-linking of peptidoglycan	Penicillin allergy cross-reactivity Seizures	Treatment of infections caused by GNB producing extended-spectrum β -lactamases, serious infections caused by susceptible organisms	Hypersensitivity to imipenem
meropenem (Merrem®)	See above; does not cover <i>Enterococcus</i>	See above	See above	See above	Hypersensitivity to β -lactams
ertapenem (INVanz®)	GP except <i>Enterococcus</i> , MRSA GN including <i>Enterobacter</i> (but not <i>Pseudomonas</i>), anaerobes	See above	See above	See above; once-daily administration makes it convenient for outpatient IV therapy	Hypersensitivity to β -lactams
Glycopeptides					
Vancomycin (Vancocin®)	GP including MRSA, not VRE <i>C. difficile</i> if PO	Glycopeptide sterically inhibits cell wall synthesis	Red Man Syndrome Nephrotoxicity Ototoxicity Thrombocytopenia	Severe or life-threatening GP infections, patients with β -lactam allergy May only be taken orally for severe <i>C. difficile</i> infection	Hypersensitivity to vancomycin
PROTEIN SYNTHESIS INHIBITORS (50S RIBOSOME)					
Macrolides					
erythromycin (EryPed®)	GP <u>except</u> <i>Enterococcus</i> GN: <i>Legionella</i> , <i>B. pertussis</i> "Atypicals": <i>Chlamydia</i> , <i>Mycoplasma</i>	Binds to 50S ribosomal subunit inhibiting protein synthesis	GI upset Acute cholestatic hepatitis Prolonged QT	Susceptible RTI, pertussis, diphtheria, Legionnaires' disease, skin and soft tissue infections	Hypersensitivity to erythromycin Concurrent therapy with astemizole, terfenadine
*This agent is rarely used due to GI upset					
clarithromycin (Biaxin®)	See above	See above	See above	Susceptible RTI, skin infections, non-tuberculous mycobacterial infections, part of multidrug therapy for <i>H. pylori</i> treatment	Hypersensitivity to macrolides
azithromycin (Zithromax®)	See above	See above	See above	Susceptible RTI, acute exacerbations of COPD, community-acquired pneumonia, skin infections, <i>Campylobacter</i> infections if treatment indicated, chlamydia	Hypersensitivity to macrolides
Lincosamides					
clindamycin (Cleocin®)	GP <u>except</u> <i>Enterococcus</i> , most community-acquired MRSA Anaerobes	Inhibits peptide bond formation at 50S ribosome	Pseudomembranous colitis GI upset	Treatment of suspected or proven infections caused by GP, anaerobes including skin and skin structure infections, oropharyngeal infections, in combination with GN coverage for intra-abdominal and pelvic infections	Hypersensitivity to clindamycin Infants <30 d
chloramphenicol	GP GN Anaerobes	Inhibits peptidyl transferase action of tRNA at 50S ribosome	Aplastic anemia Gray Baby Syndrome	Serious infections by susceptible organisms when suitable alternatives are not available including meningococcal disease in patients with anaphylaxis to β -lactams	Hypersensitivity to chloramphenicol
linezolid (Zyvoxam®)	GP including VRE + MRSA	Binds 50S ribosome and prevents functional 70S initiation complex	HTN (acts as MAOI) Risks with prolonged use: myelosuppression optic neuropathy, peripheral neuropathy	Vancomycin-resistant <i>Enterococcus faecium</i> infections including intra-abdominal, skin and skin-structure, and urinary tract infections, MRSA infections as outpatient therapy	Hypersensitivity to linezolid

Table 31. Antibiotics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
PROTEIN SYNTHESIS INHIBITORS (30S RIBOSOME)					
Aminoglycosides					
gentamicin tobramycin amikacin (Amikin®)	GN (<u>includes</u> <i>Pseudomonas</i>)	Binds 30S subunit of ribosome inhibiting protein synthesis	Nephrotoxicity (reversible) Vestibular and ototoxicity (irreversible) Vestibular toxicity is the most important aminoglycoside toxicity	GN infections when alternatives do not exist, UTIs, used in low doses for synergy with β-lactams or with vancomycin for the treatment of serious enterococcal infections	Pre-existing hearing loss and renal dysfunction
Tetracyclines					
tetracycline minocycline (Minocin®) doxycycline (Adoxa®)	GP Anaerobes "Atypicals": <i>Chlamydomphila</i> , <i>Mycoplasma</i> , <i>Rickettsia</i> , <i>Borrelia burgdorferi</i> <i>Treponema</i> Malaria prophylaxis (doxycycline)	Binds 30S subunit of ribosome inhibiting protein synthesis	GI upset Hepatotoxicity Fanconi's syndrome Photosensitivity Teratogenic Yellow teeth and stunted bone growth in children	Rickettsial infections, <i>Chlamydomphila</i> , acne (tetracycline, minocycline), PID (step-down), malaria prophylaxis (doxycycline)	Severe renal or hepatic dysfunction Pregnancy or lactation Children under 8 yr
TOPOISOMERASE INHIBITORS					
Fluoroquinolones (FQs)					
ciprofloxacin (Cipro®) norfloxacin (Noroxin®) ofloxacin Respiratory FQs: levofloxacin (Levaquin®) moxifloxacin (Avelox®)	Poor GP activity GN (<u>includes</u> <i>Pseudomonas</i>) Atypicals Moxifloxacin also covers many anaerobes	Inhibits DNA gyrase	H/A, dizziness Allergy Seizures Prolonged QT Dysglycemia (levofloxacin, moxifloxacin)	Upper and lower RTI (not ciprofloxacin unless susceptible organism isolated), UTI, prostatitis (not moxifloxacin), bone and joint infections for susceptible organisms, skin and soft tissue infections (levofloxacin, moxifloxacin), infectious diarrhea, meningococcal prophylaxis, intra-abdominal infections (moxifloxacin, ciprofloxacin in combination with metronidazole or clindamycin), febrile neutropenia prophylaxis (ciprofloxacin, levofloxacin) or ciprofloxacin in combination with amoxicillin-clavulanate low management of "low-risk" febrile neutropenia	
Rifampin	GP cocci <i>N. meningitidis</i> <i>H. influenzae</i> <i>Mycobacteria</i>	Inhibits RNA polymerase	Hepatic dysfunction, P450 enzyme induction Orange tears/saliva/ urine	Part of multidrug treatment for active TB, alone for treatment of latent TB, part of multidrug treatment of other mycobacterial infections, endocarditis involving prosthetic valve or other prosthetic device infections in combination with other antibiotic agents, prophylaxis for those exposed to people with <i>N.</i> <i>meningitidis</i> or HiB meningitis	Jaundice Not to be used as monotherapy (except for prophylaxis)
Metronidazole (Flagyl®)	Anaerobes Protozoa	Forms toxic metabolites in bacterial cell which damage microbial DNA	Disulfiram-type reaction with EtOH Seizures Peripheral neuropathy	Protozoal infections (trichomoniasis, amoebiasis, giardiasis), bacterial vaginosis, anaerobic bacterial infections	
ANTI-METABOLITE					
Trimethoprim- Sulfamethoxazole (TMP/SMX) (Septra®, Bactrim®)	GP, especially <i>S. aureus</i> (including most MRSA) GN: enteric <i>Nocardia</i> Other: <i>Pneumocystis</i> , <i>Toxoplasmosis</i>	Inhibits folic acid pathway (TMP inhibits DHFR and SMX competes with PABA)	Hepatitis Stevens-Johnson syndrome Bone marrow suppression Hyperkalemia Drug toxicity (increases free levels of many drugs, including glyburide, warfarin)	Susceptible UTI, RTI, GI infections, skin and soft tissue infections caused by staphylococcal species, treatment and prophylaxis of <i>P.</i> <i>jiroveci</i> pneumonia	Hypersensitivity to TMP-SMX, sulfa drugs

Table 31. Antibiotics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
ANTI-METABOLITE					
nitrofurantoin (MacroBID [®] , (Macrochant [®]))	<i>Enterococcus</i> , <i>S. saprophyticus</i> GN (coliforms)	Reactive metabolites inhibit ribosomal protein synthesis	Cholestasis, hepatitis Hemolysis if G6PD deficiency Interstitial lung disease with chronic use	Lower UTI; not pyelonephritis or bacteremia	Hypersensitivity to nitrofurantoin Anuria, oliguria, or significant renal impairment Pregnant patients during labor and delivery or when labor imminent Infants <1 mo of age
ANTI-MYCOBACTERIALS					
isoniazid (INH)	<i>Mycobacteria</i>	Inhibits mycolic acid synthesis	Hepatotoxicity Hepatitis Drug-induced SLE Peripheral neuropathy	Part of multidrug treatment for active TB, alone for treatment of latent TB	Drug-induced hepatitis or acute liver disease
rifampin (RIF)	<i>Mycobacteria</i>	Inhibits RNA polymerase	Hepatotoxicity P450 enzyme inducer Orange tears, saliva, urine	Part of multidrug treatment for active TB, alone for treatment of latent TB, part of multidrug treatment of other mycobacterial infections	Jaundice Not to be used monotherapy (except for prophylaxis)
ethambutol	<i>Mycobacteria</i>	Inhibits mycolic acid synthesis	Loss of central and color vision	Part of multidrug treatment for active TB and other mycobacterial infections	Renal failure
pyrazinamide (PZA)	<i>Mycobacteria</i>	Unknown	Hepatotoxicity Gout Gastric irritation	Part of multidrug treatment for active TB	Severe hepatic damage or acute liver disease Patients with acute gout
SULFONES					
dapsone sulfoxone	<i>M. leprae</i> , <i>P. jiroveci</i> , <i>Toxoplasma</i>	Inhibit folic acid synthesis by competition with PABA	Rash Drug fever Agranulocytosis	Part of multidrug treatment for <i>M. leprae</i> , part of treatment for <i>P. jiroveci</i> pneumonia (with TMP), <i>P. jiroveci</i> pneumonia prophylaxis, toxoplasmosis prophylaxis with pyrimethamine	

Table 32. Antibiotics for Selected Bacteria

<i>Pseudomonas</i>	<i>S. aureus</i>	<i>Enterococcus</i>	<i>H. influenzae</i>	Anaerobes
ciprofloxacin	cloxacillin (MSSA)	ampicillin	amoxicillin-clavulanate	metronidazole
gentamicin, tobramycin	1° cephalosporin (MSSA)	amoxicillin	2°/3° cephalosporin	clindamycin
piperacillin/tazobactam	clindamycin	vancomycin	macrolides (clarithromycin, azithromycin)	amoxicillin-clavulanate
ceftazidime	vancomycin (including MRSA)	nitrofurantoin (lower UTI)	levofloxacin	cefoxitin
cefepime	linezolid (including MRSA)	linezolid for VRE	moxifloxacin	piperacillin/tazobactam
meropenem	daptomycin (including MRSA)	daptomycin for VRE		moxifloxacin
imipenem		tigecycline for VRE		ertapenem, imipenem, meropenem

**Rifampin**

- Good adjunct for treating prosthetic device infection (bacterial biofilm)
- Always used in combination with other antibiotics to reduce emergence of resistance

Antivirals

Table 33. Antivirals

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
ANTI-HERPESVIRUS				
acyclovir valacyclovir (Valtrex [®]) (prodrug of acyclovir)	HSV-1,2 VZV	Guanosine analog inhibits viral DNA polymerase	PO well-tolerated IV: nephrotoxicity, CNS	Hypersensitivity to acyclovir or valacyclovir
famciclovir (Famvir [®]) penciclovir	HSV-1,2 VZV	See above	H/A, nausea	Hypersensitivity to famciclovir or penciclovir
ganciclovir (Cytovene [®]) valganciclovir (prodrug of ganciclovir)	CMV HSV-1,2, VZV	See above	Heme: neutropenia, thrombocytopenia, anemia Renal insufficiency	Hypersensitivity to ganciclovir or valganciclovir Possible cross-hypersensitivity between acyclovir and valacyclovir
foscarnet	CMV Acyclovir-resistant HSV, VZV	Pyrophosphate analog inhibits viral DNA polymerase	Nephrotoxicity Anemia, Electrolyte disturbances	Hypersensitivity to foscarnet

Table 33. Antivirals (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
OTHER ANTIVIRALS				
(pegylated) interferon- α -2a or -2b	Chronic hepatitis B or C HPV	Inhibits viral protein synthesis	"Flu-like" syndrome Depression Bone marrow suppression	Hypersensitivity to any interferon Cannot use in combination with ribavirin if renal impairment
ribavirin (Virazole®)	Chronic hepatitis C RSV Lassa fever	Guanosine analog with multiple postulated mechanisms of action	Hemolytic anemia Rash, conjunctivitis Highly teratogenic	Pregnancy, women who may become pregnant or their partners Renal impairment
lamivudine (Epivir®)	Chronic hepatitis B HIV	See <i>HIV and AIDS</i> , ID29		Hypersensitivity to lamivudine
Neuraminidase inhibitors: zanamivir (Relenza®) oseltamivir (Tamiflu®)	Influenza A and B: treatment and prophylaxis	Inhibits neuraminidase, an enzyme required for release of virus from infected cells and prevention of viral aggregation	GI: N/V, diarrhea Bronchospasm in zanamivir	Hypersensitivity to the neuraminidase inhibitors

Antifungals

Table 34. Antifungals

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
POLYENES				
amphotericin B	Endemic mycoses: Histoplasmosis Blastomycosis Coccidioidomycosis Pulmonary: Aspergillosis CNS: Cryptococcus	A polyene antimicrobial: inserts into fungal cytoplasmic membrane causing altered membrane permeability and cell death	Nephrotoxicity Hypo/hyperkalemia Infusion reactions: chills, fevers, H/A Peripheral phlebitis	Renal impairment
nystatin (oral, topical)	Candidiasis: mucocutaneous, GI, oral (thrush), vaginal	See above Not absorbed from the GI tract	GI: N/V, diarrhea Highly toxic if given IV	
IMIDAZOLES				
clotrimazole (Alevazol®, Lotrimin®)	Oral and vulvovaginal candidiasis Dermatomycoses	All azoles: inhibit ergosterol synthesis and thereby alter fungal cell membrane permeability	Pruritis, skin irritation	
miconazole (Vagistat-3®, Desenex®)	Vulvovaginal candidiasis Dermatomycoses		Vaginal burning N/V	
ketoconazole (Nizoral®)	Dermatomycoses Seborrheic dermatitis		Pruritis, skin irritation GI nonspecific Results in decreased androgen and testosterone synthesis	Cross-sensitivity with other azoles possible Hepatic dysfunction Pregnant women or those that may become pregnant

Table 34. Antifungals (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
TRIAZOLES				
fluconazole (Diflucan®)	Candida infections (mucosal and invasive) Cryptococcal meningitis (step-down therapy)	All azoles: inhibit ergosterol synthesis and thereby alter fungal cell membrane permeability	Elevated liver enzymes GI nonspecific	Cross-sensitivity with other azoles unknown
itraconazole (Sporanox®)	Sporotrichosis Onychomycoses Endemic mycoses: Histoplasmosis Blastomycosis Coccidioidomycosis		Elevated liver enzymes Rash GI nonspecific HTN Hyperkalemia Peripheral edema	Cross-sensitivity with other azoles unknown Severe ventricular dysfunction
voriconazole (Vfend®)	Aspergillosis Candidiasis		Visual disturbance (30%) Hepatotoxicity Cutaneous photosensitivity Cutaneous squamous cell carcinoma with long-term use in immunosuppressed patients Prolonged QT Periostitis Neurologic toxicity	Cross-sensitivity with other azoles unknown May avoid or alter doses if co-administered with other CYP3A4 substrates, rifampin, carbamazepine, long-acting barbiturates, ritonavir, efavirenz, sirolimus, rifabutin, ergot alkaloids
posaconazole (Posanol®, Noxafil®)	Candidiasis Aspergillosis Mucormycosis		Elevated liver enzymes H/A Prolonged QT	Coadministration of cisapride, ergot alkaloids, pimozide, quinidine, or sirolimus
ALLYLAMINES				
terbinafine (Lamisil®)	Dermatomycoses Onychomycoses	Inhibits enzyme needed for ergosterol synthesis	Rash, local irritation GI nonspecific, transaminitis	Active liver disease
ECHINOCANDINS				
caspofungin micafungin anidulafungin	Refractory aspergillosis, candidemia (azole- resistant)	Inhibits 1-3 β -D-glucan synthesis (needed for fungal cell wall)	Hepatotoxicity Infusion and injection site reactions	

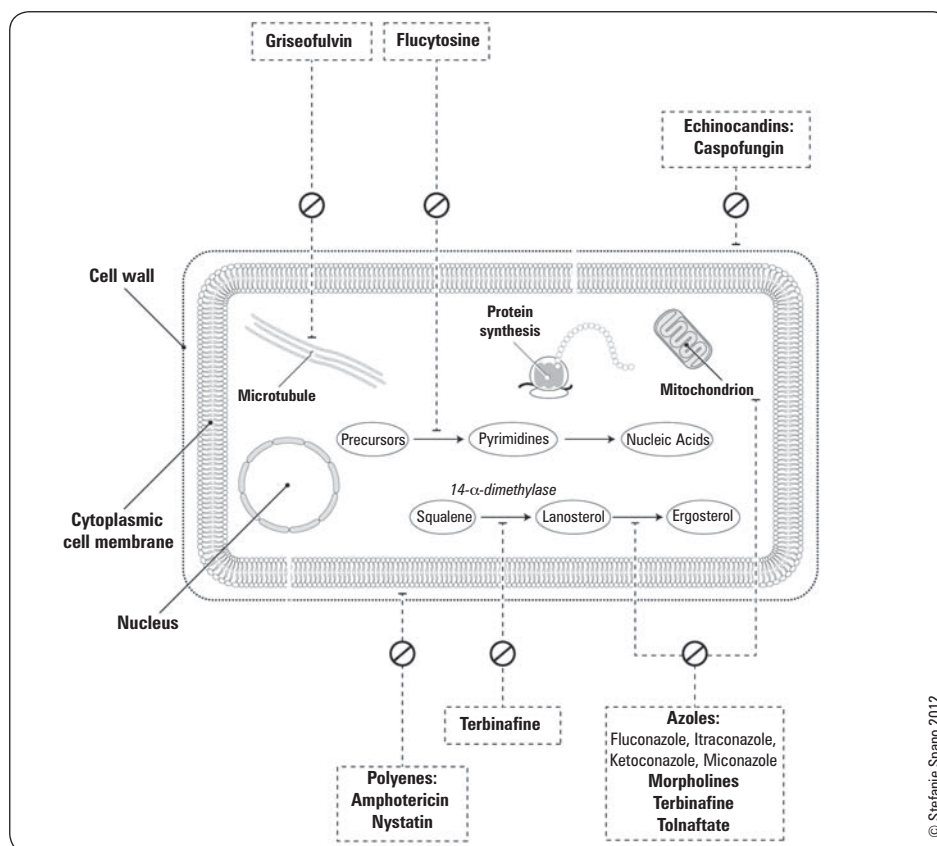

Figure 21. Mechanism of action of antifungals

Antiparasitics

Table 35. Antiparasitics

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
ANTIMALARIALS				
chloroquine	Malaria: treatment of erythrocytic phase of all five species of <i>Plasmodium</i> that infect humans Note: High resistance of <i>P. falciparum</i> and <i>P. vivax</i> in certain geographic areas	Inhibits parasite heme polymerase	CNS: blurred vision, retinopathy, dizziness Nonspecific GI (rare with prophylaxis)	Hypersensitivity to chloroquine or other 4-aminoquinoline Retinal or visual field changes due to 4-aminoquinoline
quinine	Malaria: treatment of all five species of <i>Plasmodium</i> that infect humans, including chloroquine-resistant <i>P. falciparum</i>		Cinchonism: ears (tinnitus, vertigo), eyes (visual disturbance), GI (N/V, diarrhea), CNS (H/A, fever) Hypoglycemia	Hypersensitivity to quinine, may have cross-sensitivity with quinidine Patients with G6PD deficiency, tinnitus, optic neuritis, hypoglycemia, history of blackwater fever or thrombocytopenic purpura due to quinine use
mefloquine (Lariam®)	Malaria: treatment and prophylaxis of all four species of <i>Plasmodium</i> that infect humans		CNS/Psych: irritability, nightmares, psychoses, suicide, depression, seizures, H/A	History of seizures, psychosis, severe anxiety or depression
primaquine	Malaria: treatment of liver hypnozoites of <i>P. vivax</i> and <i>P. ovale</i> ; prophylaxis of all <i>Plasmodium</i> spp. <i>Pneumocystis jiroveci</i> (with clindamycin)	Interferes with mitochondrial function	Hemolytic anemia in G6PD deficient GI upset (take with food)	GI nonspecific G6PD deficiency Concurrent or recent use of quinacrine Pregnancy
atovaquone/proguanil (Malarone®)	Malaria: treatment and prophylaxis of <i>P. falciparum</i>	Inhibits mitochondrial electron transport and dihydrofolate reductase	N/V, anorexia, diarrhea, abdominal pain (take with food)	Hypersensitivity to atovaquone or proguanil Severe renal impairment
artemisinin derivatives (artemeter, artesunate, etc.) Note: marketed primarily in endemic countries	Malaria: treatment of all <i>Plasmodium</i> species Severe malaria (IV artesunate) Typically used in combination with a longer-acting agent from above	Binds iron, leading to formation of free radicals that damage parasite proteins	Transient neurologic deficits (nystagmus, balance disturbance) Transient neutropenia (at high doses of oral artesunate)	Hypersensitivity to artemisinins

Table 35. Antiparasitics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
OTHER ANTI-PROTOZOAL				
iodoquinol (Yodoxin®)	Amoebiasis: <i>E. histolytica</i> , <i>Dientamoeba fragilis</i> , <i>Balantidium coli</i> , <i>Blastocystis hominis</i>	Contact amoebicide that acts in intestinal lumen by uncertain mechanism	GI: N/V, diarrhea, abdominal pain CNS: H/A, seizures, encephalitis	Hypersensitivity to any 8-hydroxy-quinoline or iodine Patients with hepatic damage or optic neuropathy Pregnancy
metronidazole	Amoebiasis, <i>T. vaginalis</i> , giardiasis	See Antibiotics		
nitazoxanide	<i>Cryptosporidium</i> , giardiasis	Interferes with parasite anaerobic metabolism	N/V, diarrhea, abdominal pain, H/A	Hypersensitivity to nitazoxanide
ANTI-HELMINTHICS				
praziquantel	<i>Schistosomiasis</i> and other flukes Tapeworms	Increases Ca ²⁺ permeability of helminth cell membrane, causing paralysis and detachment	N/V, fever, dizziness	Ocular cysticercosis
albendazole	Intestinal roundworms <i>Neurocysticercosis</i> <i>Microsporidiosis</i> <i>Echinococcus</i> → Hydatid disease	Inhibits glucose uptake into susceptible parasites	Elevated liver enzymes Alopecia GI nonspecific Agranulocytosis	Pregnancy Ocular cysticercosis or intraventricular cysticercosis
ivermectin	<i>Strongyloidiasis</i> <i>Onchocerciasis</i> Scabies	Interferes with polarization of nerve and muscles cells in susceptible parasites leading to paralysis	Nausea, bloating, diarrhea, myalgias, lightheadedness, H/A	Hypersensitivity to ivermectin Pregnancy
diethylcarbamazine	<i>Wuchereria bancrofti</i> <i>Loa loa</i>		Anorexia, N/V, H/A, drowsiness, encephalitis, retinal hemorrhage Mazzotti reaction if coinfectd with onchocerciasis	Pregnancy

Quick Reference: Common Infections and Their Antibiotic Management

Table 36. Common Infections and Their Empiric Antibiotic Management

Infection	Bacteria	Antibiotic
RESPIRATORY		
Pneumonia • Community-acquired	<i>S. pneumoniae</i> , <i>H. influenzae</i> , <i>M. catarrhalis</i> , <i>Mycoplasma</i> , <i>Chlamydia</i> , <i>Legionella</i> , <i>S. aureus</i>	Outpatient: amoxicillin-clavulanate OR doxycycline Hospitalized: antipseudomonal respiratory fluoroquinolone OR 3rd generation cephalosporin ± macrolide
	GNB (including <i>Pseudomonas</i> in special settings such as ICU)	ceftriaxone (if not at risk for <i>Pseudomonas</i>) OR piperacillin/tazobactam OR meropenem
Tuberculosis	<i>Mycobacterium tuberculosis</i>	isoniazid + rifampin + pyrazinamide + ethambutol + pyridoxine (for initial empiric therapy)
UTI		
Cystitis	KEEP ² S	fluoroquinolone OR TMP/SMX OR nitrofurantoin
Pyelonephritis	KEEP ² S	ciprofloxacin OR 3rd generation cephalosporin
Urethritis	<i>Neisseria gonorrhoeae</i> <i>Chlamydia</i>	ceftriaxone azithromycin OR doxycycline
SOFT TISSUE		
Cellulitis	β-hemolytic streptococci, MSSA	cephalexin OR cefazolin
Necrotizing Fasciitis	Type I: polymicrobial (GNB and anaerobes)	piperacillin/tazobactam + clindamycin
	Type II: β-hemolytic streptococci Unknown organism(s)	penicillin G + clindamycin

KEEP²S= *K*lebsiella, *E. coli*, *Enterococci*, *Proteus mirabilis*, *Pseudomonas*, *S. saprophyticus*

Table 36. Common Infections and Their Empiric Antibiotic Management (continued)

Infection	Bacteria	Antibiotic
BONE		
Osteomyelitis	MSSA	cloxacillin OR cefazolin
Diabetic Foot		
• Mild	MSSA, <i>Streptococcus</i> spp.	cephalexin OR clindamycin
• Moderate or severe	Polymicrobial	clindamycin + ciprofloxacin OR piperacillin/tazobactam ± vancomycin if MRSA suspected
Septic Arthritis	<i>N. gonorrhoeae</i> (sexually active adults) <i>S. aureus</i> , <i>S. pyogenes</i>	vancomycin + ceftriaxone
OTHER		
Meningitis	<i>S. pneumoniae</i> , <i>N. meningitidis</i> , <i>H. influenzae</i>	ceftriaxone + vancomycin (+ ampicillin for <i>Listeria</i> in very young, old, immunocompromised)
Bacterial Endocarditis		
• Native valve	<i>S. viridans</i> , <i>S. aureus</i> , <i>Enterococcus</i>	Usually non-urgent and can wait for confirmation of etiology Empiric therapy if patient unstable, vancomycin + gentamicin OR ceftriaxone; take multiple blood cultures prior to initiating therapy

		MS	multiple sclerosis	V/Q	ventilation/perfusion

Imaging Modalities

X-Ray Imaging

- x-rays, or Röntgen rays, are a form of electromagnetic energy of short wavelength
- as x-ray photons traverse matter, they can be absorbed (a process known as “attenuation”) and/or scattered
- the density of a structure determines its ability to attenuate or “weaken” the x-ray beam
 - air < fat < water < bone < metal
- structures that have high attenuation (e.g. bone) appear white on the resulting images

Plain Films

- x-rays pass through the patient and interact with a detection device to produce a 2-dimensional projection image
- structures closer to the film appear sharper and less magnified
- contraindications: pregnancy (relative)
- advantages: inexpensive, non-invasive, readily available
- disadvantages: radiation exposure, generally poor at distinguishing soft tissues

Fluoroscopy

- used for guiding angiographic and interventional procedures, in contrast examinations of the GI tract, and in the OR for certain surgical procedures (e.g. orthopedic, urological)
- on the fluoroscopic image, black and white are reversed so that bone and contrast agents appear dark and radiolucent structures appear light
- advantages: continuous x-rays allow real-time visualization
- disadvantages: increased radiation dose; however, the use of pulsed fluoroscopy has reduced fluoroscopy time by 76% and radiation dose by 64% as compared with continuous fluoroscopy

Computed Tomography

- x-ray beam opposite a detector moves in a continuous 360 degree arc as patient is advanced through the imaging system
 - subsequent computer assisted reconstruction of anatomical structures from the axial plane
- attenuation is quantified in Hounsfield units
 - subsequent computer assisted reconstruction of anatomical structures from the axial plane
 - adjusting the “window width” (range of Hounsfield units displayed) and “window level” (midpoint value of the window width) can maximally visualize certain anatomical structures (e.g. CT chest can be viewed using “lung”, “soft tissue”, and “bone” settings)
- contraindications: pregnancy (relative), contraindications to contrast agents (e.g. allergy, renal failure)
- advantages: delineates surrounding soft tissues, excellent at delineating bones and identifying lung/liver masses, may be used to guide biopsies, spiral CT has fast data acquisition, helical CT allows 3D reconstruction, CTA is less invasive than conventional angiography
- disadvantages: high radiation exposure, IV contrast injection, anxiety of patient when going through scanner, higher cost, and less available than plain film

Ultrasound

- high frequency sound waves are transmitted from a transducer and passed through tissues; reflections of the sound waves are picked up by the transducer and transformed into images
- reflection (or “echo”) occurs when the sound waves pass through tissue interfaces of different acoustic densities
- structures are described based on their echogenicity; hyperechoic structures appear bright (ultrasound reflected) whereas hypoechoic structures appear dark (U/S waves not reflected back but pass through)
- higher U/S frequencies result in greater resolution but greater attenuation (i.e. deeper structures more difficult to visualize)
- artifacts: acoustic shadowing refers to the echo-free area located behind an interface that strongly reflects (e.g. tissue/air) or absorbs (e.g. tissue/bone) sound waves; enhancement refers to the increase in reflection amplitude (i.e. increased brightness) from objects that lie below a weakly attenuating structure (e.g. cyst)
- Doppler: determines the velocity of blood flowing past the transducer based on the Doppler effect
- Duplex scan: Doppler + visual images
- advantages: relatively low cost, non-invasive, no radiation, real time imaging, may be used for guided biopsies, many different imaging planes (axial, sagittal), determines cystic vs. solid
- disadvantages: highly operator-dependent, air in bowel may prevent imaging of midline structures in the abdomen, may be limited by patient habitus

Typical Effective Doses from Diagnostic Medical Exposures (in adults)*

Diagnostic Procedure Type	Equivalent Number of Chest X-Rays	Approximate Equivalent Period of Natural Background Radiation** (~3 mSv/yr)
X-Ray:		
Skull	5	12 d
Cervical spine	10	3 wk
Thoracic spine	50	4 mo
Lumbar spine	75	6 mo
Chest (single PA film)	1	2 d
Shoulder	0.5	1 d
Mammography	20	7 wk
Abdomen	35	3 mo
Hip	35	3 mo
Pelvis	30	10 wk
Knee	0.25	<1 d
IVU	150	1 yr
CT:		
Dual-energy x-ray absorptiometry (without/with CT)	0.5/2	<1 d/4 d
Upper GI series	300	2 yr
Small bowel series	250	20 mo
Barium enema	400	2.7 yr
Radionuclide:		
Brain (¹⁸ FDG)	705	4.7 yr
Bone (^{99m} Tc)	315	2.1 yr
Thyroid (^{99m} Tc)	240	1.6 yr
Thyroid (¹²³ I)	95	8 mo
Cardiac rest-stress test		
(^{99m} Tc 1-d)	470	3 yr
(^{99m} Tc 2-d)	640	4 yr
Lung ventilation (¹³³ Xe)	25	2 mo
Lung perfusion (^{99m} Tc)	100	8 mo
Renal (^{99m} Tc)	90-165	7-13 mo
Liver-spleen (^{99m} Tc)	105	8.4 yr
Biliary tract (^{99m} Tc)	155	1 yr

*Source: Radiology 2008;248:254-263

**Calculated using average natural background exposure in the USA (ionizing radiation exposure of the population of the United States. Bethesda, Md.: National Council on Radiation Protection and Measurements. 2009. NCRP No. 160)

Substance	Hounsfield Unit
Air	-1000
Fat	-120
Water	0
Blood	+30 to +45
Muscle	+40
Contrast	+130
Bone	+400 or more

Attenuation

Bone (= bright) > gray matter > white matter (“fatty” myelin) > CSF > air (= dark)

Magnetic Resonance Imaging

- non-invasive technique that does not use ionizing radiation
- able to produce images in virtually any plane
- patient is placed in a magnetic field; protons (H^+) align themselves along the plane of magnetization due to intrinsic polarity. A pulsed radiofrequency beam is subsequently turned on which deflects all the protons off their aligned axes due to absorption of energy from the radiofrequency beam. When the radiofrequency beam is turned off, the protons return to their pre-excitation axis, giving off the energy they absorbed. This energy is measured with a detector and interpreted by a computer to generate MR images
- the MR image reflects the signal intensity picked up by the receiver. This signal intensity is dependent on:
 1. hydrogen density: tissues with low hydrogen density (e.g. cortical bone, lung) generate little to no MR signal compared to tissues with high hydrogen density (e.g. water)
 2. magnetic relaxation times (T1 and T2): reflect quantitative alterations in MR signal strength due to intrinsic properties of the tissue and its surrounding chemical and physical environment

Table 1. Differences Between Diffusion, T1- and T2-Weighted MR Imaging

Imaging Techniques	Contrast Enhancements	Main Application	Advantages
Diffusion Weighted Imaging	Contrast dependent on the molecular motion of water Decreased diffusion is hyperintense (bright), whereas increased diffusion is hypointense (dark)	Neuroradiology	Sensitive for detection of acute ischemic stroke and differentiating an acute stroke from other neurologic pathologies Acute infarction appears hyperintense Abscess collections also show restricted diffusion
T1-Weighted	Fluid is hypointense (dark) and fat is hyperintense (bright)	Body soft tissues	Often considered an anatomic scan since they provide a reference for functional imaging
T2-Weighted	Fluid is hyperintense (bright) and fat is hypointense (dark)	Body soft tissues	Often considered a pathologic scan since they will highlight edematous areas associated with certain pathologies

Remember that water is "white" on T2 as "World War II"

Recommended Premedication Protocol to Reduce the Frequency and/or Severity of Reactions to Contrast Media

- Non-emergent situations: prednisone 50 mg PO at 13 h, 7 h, and 1 h before contrast media injection plus diphenhydramine (Benadryl®) 50 mg IV/IM by 1 h before contrast medium
- Emergent situations (e.g. bowel ischemia, aortic dissection): patient signs consent form, risks explained and diphenhydramine (Benadryl®) 50 mg may be administered 15-30 min prior to injection of IV contrast (after discussion with radiologist)

Contraindications to IV Contrast

MADD Failure
Multiple myeloma
Adverse reaction previously
DM
Dehydration
Failure (renal, severe heart)

Acute Reactions to IV Contrast

Hot BUNS
Hypotension
Bradycardia
Urticaria
Nausea/vomiting
Seizures

Positron Emission Tomography Scans

- non-invasive technique that involves exposure to ionizing radiation (~7 mSv)
- nuclear medicine imaging technique that produces images of functional processes in the body
- current generation models integrate PET and CT technologies into a single imaging device (PET-CT) that collects both anatomic and functional information during a single acquisition
- positron-producing radioisotope, such as ^{18}F FDG is chemically incorporated into a metabolically active molecule (e.g. glucose), injected into patient, which travels to target organ, accumulates in tissues of interest, and as radioactive substance begins to decay, gamma rays are produced which are detected by PET scanner
- contraindications: pregnancy
- advantages: shows metabolism and physiology of tissues (not only anatomic), in oncology allows diagnosis, staging, restaging, has predictive and prognostic value, can evaluate cardiac viability
- disadvantages: cost, ionizing radiation

Contrast Enhancement

Table 2. Contrast Agents

Imaging Modality	Types	Advantages	Disadvantages	Contraindications
X-Ray/CT	1. Barium (oral or rectal)	Radioopaque substance which helps to delineate intraluminal anatomy, may demonstrate patency, lumen integrity, or large filling defects		Previous adverse reaction to contrast; barium enema is contraindicated in toxic megacolon, acute colitis, and suspected perforation
	2. Iodine (IV injection)	Delineates intraluminal anatomy, may demonstrate patency, lumen integrity, or large filling defects; under fluoroscopy, may also give information on function of an organ	Risk of nephrogenic systemic fibrosis in patients with end-stage renal disease	Previous adverse reaction to contrast, renal failure, DM, pregnancy, multiple myeloma, severe heart failure and dehydration eGFR <60 may require preventative measures and follow up
MRI	Gadolinium-Chelates (IV injection)	Shortens T1 relaxation time, thereby increasing signal intensity in T1-weighted sequences; gadolinium has some effect on T2-relaxation time; highlights highly vascular structures (e.g. tumors)	Risk of nephrogenic systemic fibrosis in patients with end-stage renal disease	Previous adverse reaction to contrast or if end-stage renal disease (relative contraindication)
U/S	Microbubbles (IV injection)	Since gas is highly echogenic, the microbubbles allow for echo-enhancement of a tissue		Contraindicated in individuals with right-to-left cardiac shunts or people with known hypersensitivity reactions

Chest Imaging

Chest X-Ray

Standard Views

- PA: anterior chest against film plate to minimize magnification of the heart size
- lateral: better visualization of retrocardiac space and thoracic spine (more sensitive at picking up pleural effusions)
 - helps localize lesions when combined with PA view
- AP: for bedridden patients (generally a lower quality film than PA because of enlarged cardiac silhouette)
- lateral decubitus: to assess for pleural effusion and pneumothorax in bedridden patients; however, POCUS can also be utilized for both these purposes
- lordotic: angled beam allowing better visualization of apices normally obscured by the clavicles and anterior ribs

Figure 1. CXR views

Approach to CXR

Basics

- ID: patient name, MRN, sex, age
- date of exam
- markers: right and/or left
- technique: view (e.g. PA, AP, lateral), supine or erect
- indications for the study
- comparison: date of previous study for comparison (if available)
- quality of film: inspiration (6th anterior and 10th posterior ribs should be visible), penetration (thoracic spine should be visible) and rotation (clavicles vs. spinous process)

Analysis

- tubes and lines: check position and be alert for pneumothorax or pneumomediastinum
- soft tissues: neck, axillae, pectoral muscles, breasts/nipples, chest wall
 - nipple markers can help identify nipples (may mimic lung nodules)
 - amount of soft tissue, presence of masses and air (subcutaneous emphysema)
- abdomen (see *Abdominal Imaging*, MI10)
 - free air under the diaphragm, air-fluid levels, distention in small and large bowels
 - herniation of abdominal contents (i.e. diaphragmatic hernia)
- bones: C-spine, thoracic spine, shoulders, ribs, sternum, clavicles
 - lytic and blastic lesions and fractures
- mediastinum: trachea, heart, great vessels
 - cardiomegaly (cardiothoracic ratio >0.5), tracheal shift, tortuous aorta, widened mediastinum
- hila: pulmonary vessels, mainstem and segmental bronchi, lymph nodes
- lungs: lung parenchyma, pleura, diaphragm
 - comment on abnormal lung opacity, pleural effusions or thickening
 - right hemidiaphragm usually higher than left due to liver
 - right vs. left hemidiaphragm can be discerned on lateral CXR due to heart resting directly on left hemidiaphragm

Sodium Bicarbonate Plus N-Acetylcysteine Prophylaxis: A Meta-Analysis

J Am Coll Cardiol Intv 2009;2:1116-1124

Study: A meta-analysis of 10 RCTs.

Objective: To compare N-acetylcysteine (NAC) + sodium bicarbonate (NaHCO_3) to NAC + normal saline hydration in prevention of acute kidney injury (AKI) from IV contrast.

Patients: Those receiving IV contrast for various indications (PCI, angiography, catheterization)

Results: Combination treatment of NAC with intravenous NaHCO_3 reduced contrast-induced AKI by 35% (relative risk: 0.65; 95% confidence interval: 0.40-1.05). However, the combination of N-acetylcysteine plus NaHCO_3 did not significantly reduce renal failure requiring dialysis.

Conclusion: Combination prophylaxis should be considered for all high-risk patients (emergent cases or patients with chronic kidney disease).

Anatomy

Localizing Lesions for Parenchymal Lung Disease

- **silhouette sign:** loss of normal interfaces due to lung pathology (consolidation, atelectasis, mass), which can be used to localize disease in specific lung segments; note that pleural or mediastinal disease can also produce the silhouette sign)
- **spine sign:** on lateral films, vertebral bodies should appear progressively radiolucent as one moves down the thoracic vertebral column; if they appear more radioopaque, it is an indication of pathology (e.g. consolidation in overlying left lower lobe)
- **air bronchogram:** branching pattern of air filled bronchi on a background of fluid filled airspaces

Table 3. Localization Using the Silhouette Sign

Interface Lost	Location of Lung Pathology
SVC/right superior mediastinum	RUL
Right heart border	RML
Right hemidiaphragm	RLL
Aortic knob/left superior mediastinum	LUL
Left heart border	Lingula
Left hemidiaphragm	LLL

Computed Tomography Chest

Approach to CT Chest

- soft tissue window
 - thyroid, chest wall, pleura
 - heart: chambers, coronary artery calcifications, pericardium
 - vessels: aorta, pulmonary artery, smaller vasculature
 - lymph nodes: mediastinal, axillary
- bone window
 - vertebrae, sternum, manubrium, ribs: fractures, lytic lesions, sclerosis
- lung window
 - trachea: patency, secretions
 - bronchial trees: anatomic variants, mucus plugs, airway collapse
 - lung parenchyma: fissures, nodules, fibrosis/interstitial changes
 - pleural space: effusions

Table 4. Types of CT Chest

	Advantage	Disadvantage	Contrast	Indication
Standard	Scans full lung very quickly (<1 min)	Poor at evaluating diffuse disease	±	CXR abnormality Pleural and mediastinal abnormality Lung cancer staging Follow up metastases Empyema vs. abscess
High Resolution	Thinner slices provide high definition of lung parenchyma	Only 5-10% lung is sampled	No	Hemoptysis Diffuse lung disease (e.g. sarcoidosis, hypersensitivity pneumonitis, pneumoconiosis) Pulmonary fibrosis Normal CXR but abnormal PFTs Characterize solitary pulmonary nodule
Low Dose	1/5th the radiation	Decreased detail	No	Screening Follow up infections, lung transplant, metastases
CTA	Iodinated contrast highlights vasculature	Contrast can cause severe allergic reaction and is nephrotoxic	Yes	PE Aortic aneurysms Aortic dissection

Figure 4. CT thorax windows

DDx of Airspace Disease

- Pus (e.g. infections such as pneumonia, non-infectious inflammatory process)
- Fluid (e.g. pulmonary edema)
- Blood (e.g. pulmonary hemorrhage)
- Cells (e.g. bronchioalveolar carcinoma, lymphoma)
- Protein (e.g. alveolar proteinosis)

Figure 5. Atelectasis: RML collapse

Figure 6. Air bronchograms in right lung

Lung Abnormalities

Atelectasis

- pathogenesis: collapse of alveoli due to restricted breathing, blockage of bronchi, external compression, or poor surfactant
- findings
 - increased opacity of involved segment/lobe, vascular crowding, silhouette sign, air bronchograms
 - volume loss: fissure deviation, hilar/mediastinal displacement, diaphragm elevation
 - compensatory hyperinflation of remaining normal lung
- differential diagnosis
 - obstructive (most common): air distal to obstruction is reabsorbed causing alveolar collapse
 - ♦ post-surgical, endobronchial lesion, foreign body, inflammation (granulomatous infections, pneumoconiosis, sarcoidosis, radiation injury) or mucous plug (cystic fibrosis)
 - compressive
 - ♦ tumor, bulla, effusion, enlarged heart, lymphadenopathy
 - traction (cicatization): due to scarring, which distorts alveoli and contracts the lung
 - adhesive: due to lack of surfactant
 - ♦ hyaline membrane disease, prematurity
 - passive (relaxation): a result of air or fluid in the pleural space
 - ♦ pleural effusion, pneumothorax
- management: in the absence of a known etiology, persisting atelectasis must be investigated (i.e. CT thorax) to rule out a bronchogenic carcinoma

Consolidation

- pathogenesis: fluid (water, blood), inflammatory exudates, protein, or tumor in alveoli
- findings
 - air bronchograms: lucent branching bronchi visible through opacification
 - airspace nodules: fluffy, patchy, poorly defined margins with later tendency to coalesce, may take on lobar or segmental distribution
 - silhouette sign

- differential diagnosis
 - fluid: pulmonary edema, blood (trauma, vasculitis, bleeding disorder, pulmonary infarct)
 - inflammatory exudates: bacterial infections, TB, allergic hypersensitivity alveolitis, BOOP, allergic bronchopulmonary aspergillosis, aspiration, sarcoidosis
 - protein: pulmonary alveolar proteinosis
 - tumor: bronchoalveolar carcinoma, lymphoma
- management: varies depending on the pattern of consolidation, which can suggest different etiologies; should also be done in the context of clinical picture

Interstitial Disease

- pathogenesis: pathological process involving the interlobular connective tissue (i.e. “scaffolding of the lung”)
- findings
 - linear: fine lines caused by thickened connective tissue septae
 - ♦ Kerley A: long thin lines in upper lobes
 - ♦ Kerley B: short horizontal lines extending from lateral lung margin
 - ♦ Kerley C: diffuse linear pattern throughout lung
 - ♦ seen in pulmonary edema, lymphangietic carcinomatosis, and atypical interstitial pneumonias
 - nodular: 1-5 mm well-defined nodules distributed evenly throughout lung
 - ♦ seen in malignancy, pneumoconiosis and granulomatous disease (e.g. sarcoidosis, miliary TB)
 - reticular (honeycomb): parenchyma replaced by thin-walled cysts suggesting extensive destruction of pulmonary tissue and fibrosis
 - ♦ seen in IPF, asbestosis, and CVD
 - ♦ watch for pneumothorax as a complication
 - reticulonodular: combination of reticular and nodular patterns
 - may also see signs of airspace disease (atelectasis, consolidation)
- differential diagnosis
 - occupational/environmental exposure
 - ♦ inorganic: asbestosis, coal miner's pneumoconiosis, silicosis, berylliosis, talc pneumoconiosis
 - ♦ organic: hypersensitivity pneumonitis, bird fancier's lung, farmer's lung (moldy hay), and other organic dust
 - autoimmune: CVD (e.g. rheumatoid arthritis, scleroderma, SLE, polymyositis, mixed connective tissue disease), IBD, celiac disease, vasculitis
 - drug-related: antibiotics (cephalosporins, nitrofurantoin), NSAIDs, phenytoin, carbamazepine, fluoxetine, amiodarone, chemotherapy (e.g. methotrexate), heroin, cocaine, methadone
 - infections: non-tuberculous mycobacteria, certain fungal infections
 - idiopathic: hypersensitivity pneumonitis, IPF, BOOP
 - for *Causes of Interstitial Lung Disease Classified by Distribution*, see [Respirology, R13](#)
- management: high resolution CT thorax and biopsy

Pulmonary Nodule

- findings: round opacity ± silhouette sign
 - note: do not mistake nipple shadows for nodules; if in doubt, repeat CXR with nipple markers
- differential diagnosis
 - extrapulmonary density: nipple, skin lesion, electrode, pleural mass, bony lesion
 - solitary nodule
 - ♦ tumor: carcinoma, hamartoma, metastasis, bronchial adenoma
 - ♦ inflammation: histoplasmosis, tuberculoma, coccidioidomycosis
 - ♦ vascular: AV fistula, pulmonary varix (dilated pulmonary vein), infarct, embolism
 - multiple nodules: metastases, abscess, granulomatous lung disease (TB, fungal, sarcoid, rheumatoid nodules, silicosis, GPA)
- management: clinical information and CT appearance determine level of suspicion of malignancy
 - if high probability of malignancy, invasive testing (fine needle aspiration, transbronchial/trans-thoracic biopsy) is indicated
 - if low probability of malignancy, repeat CXR or CT in 1-3 mo and then every 6 mo for 2 yr; if no change, then >99% chance benign

Figure 7. Consolidation: bacterial pneumonia

Figure 8. Interstitial disease: fine reticular pattern

Figure 9. Interstitial disease: medium reticular pattern

DDx of Interstitial Lung Disease

FASSTEN (upper lung disease)
 Farmer's lung (hypersensitivity pneumonitis)
 Ankylosing spondylitis
 Sarcoidosis
 Silicosis
 TB
 Eosinophilic granuloma (Langerhans cell histiocytosis)
 Neurofibromatosis
BAD RASH (lower lung disease)
 BOOP
 Asbestos
 Drugs (nitrofurantoin, hydralazine, isoniazid, amiodarone, many chemotherapy drugs)
 Rheumatological disease
 Aspiration
 Scleroderma
 Hamman Rich (IPF) and idiopathic pulmonary fibrosis

Pulmonary Nodule Follow-Up

Always check for previous CXR if available (lesion such as granuloma could be stable for many yr)
 Reliable predictors of benign disease on CXR: 1) benign calcifications 2) absence of growth over 2 yr

DDx for Cavitating Lung Nodule

WEIRD HOLES
 GPA (Wegener's)
 Embolic (pulmonary, septic)
 Infection (anaerobes, pneumocystis, TB)
 Rheumatoid (necrobiotic nodules)
 Developmental cysts (sequestration)
 Histiocytosis
 Oncological
 Lymphangioleiomyomatosis
 Environmental, occupational
 Sarcoidosis

Table 5. Characteristics of Benign and Malignant Pulmonary Nodules

	Malignant	Benign
Margin	Ill-defined/spiculated ("corona radiata")	Well-defined
Contour	Lobulated	Smooth
Calcification	Eccentric or stippled	Diffuse, central, popcorn, concentric
Doubling Time	20-460 d	<20 d or >460 d
Other Features	Cavitation, collapse, adenopathy, pleural effusion, lytic bone lesions, smoking history	
Size	>3 cm	<3 cm
Cavitation	Yes, especially with wall thickness >15 mm, eccentric cavity and shaggy internal margins	No
Satellite Lesions	No	Yes

**Figure 10. Pulmonary nodule: bronchogenic carcinoma****Figure 11. Peribronchial cuffing****Figure 12. Pleural effusion in lateral view****Figure 13. Pneumothorax**

Pulmonary Vascular Abnormalities

Pulmonary Edema

- pathogenesis: fluid accumulation in the airspaces of the lungs
- findings
 - vascular redistribution/enlargement, cephalization, pleural effusion, cardiomegaly (may be present in cardiogenic edema and fluid overloaded states)
 - fluid initially collects in interstitium
 - ♦ loss of definition of pulmonary vasculature
 - ♦ peribronchovascular cuffing
 - ♦ Kerley B lines
 - ♦ reticulonodular pattern
 - ♦ thickening of interlobar fissures
 - as pulmonary edema progresses, fluid begins to collect in alveoli causing diffuse air space disease often in a "bat wing" or "butterfly" pattern in perihilar regions with tendency to spare the outermost lung fields
- differential diagnosis: cardiogenic (e.g. CHF), renal failure, volume overload, non-cardiogenic (e.g. ARDS)

Pulmonary Embolism

- pathogenesis: arterial blockage in the lungs due to emboli from pelvic or leg veins, rarely from PICC lines, ports, or air, fat, or amniotic fluid (difficult to diagnose on imaging except by combination of clinical history and CXR and CT findings of ARDS)
- findings
 - CXR: Westermark sign (localized pulmonary oligemia), Hampton's hump (triangular peripheral infarct), enlarged right ventricle and right atrium, atelectasis, pleural effusion, and rarely pulmonary edema
 - definitive imaging study: CT pulmonary angiography to look for filling defect in contrast-filled pulmonary arteries (emboli can be seen up to 4th order arterial branching)
 - V/Q scan: not a diagnostic study

Pleural Abnormalities

Pleural Effusion

Table 6. Sensitivity of Plain Film Views for Pleural Effusion

X-Ray Projection	Minimum Volume to Visualize
Lateral decubitus	25 mL: most sensitive
Upright lateral	50 mL: meniscus seen in the posterior costophrenic sulcus
PA	200 mL
Supine	Diffuse haziness

- a horizontal fluid level is seen only in a hydropneumothorax (i.e. both fluid and air within pleural cavity)
- effusion may exert mass effect, shift trachea and mediastinum to opposite side, or cause atelectasis of adjacent lung
- U/S is superior to plain film for detection of small effusions and may also aid in thoracentesis, and POCUS is now standard of care in acute situations
- fluid level >1 cm on lateral decubitus film is indication to perform thoracentesis

Pneumothorax

- pathogenesis: gas/air accumulation within the pleural space resulting in separation of the lung from the chest wall

- findings
 - upright chest film allows visualization of visceral pleura as curvilinear line paralleling chest wall, separating partially collapsed lung from pleural air
 - more obvious on expiratory (increased contrast between lung and air) or lateral decubitus films (air collects superiorly)
 - more difficult to detect on supine film; look for the “deep (costophrenic) sulcus” sign, “double diaphragm” sign (dome and anterior portions of diaphragm outlined by lung and pleural air, respectively), hyperlucent hemithorax, sharpening of adjacent mediastinal structures
 - mediastinal shift may occur if tension pneumothorax
- differential diagnosis: spontaneous (tall and thin males, smokers), iatrogenic (lung biopsy, ventilation, CVP line insertion), trauma (associated with rib fractures), emphysema, malignancy, honeycomb lung
- management: needle decompression or chest tube insertion, repeat CXR to ensure resolution

Asbestos

- asbestos exposure may cause various pleural abnormalities including benign plaques (most common) that may calcify, diffuse pleural fibrosis, effusion, and malignant mesothelioma

Elevated Hemidiaphragm Suggests:

PAL DIP

Pregnancy
Atelectasis
Lung resection
Diaphragmatic paralysis
Intra-abdominal process
Pneumonectomy

Pleural effusion also may result in apparent elevation

Depressed Hemidiaphragm Suggests

TALC

Tumor
Asthma
Large pleural effusion
COPD

DDx Anterior Mediastinal Mass

4 Ts

Thyroid
Thymic neoplasm
Teratoma
Terrible lymphoma

Mediastinal Masses

Approximately 60% of anterior, 30% of middle, and 15% of posterior mediastinal masses are malignant

Mediastinal Abnormalities

Mediastinal Mass

- the mediastinum is divided into four compartments; this provides an approach to the differential diagnosis of a mediastinal mass
- anterior (anterior border formed by the sternum and posterior border by the heart and great vessels)
 - 4 Ts: see sidebar
 - cardiophrenic angle mass differential: thymic cyst, epicardial fat pad, foramen of Morgagni hernia
- middle (extending behind anterior mediastinum to a line 1 cm posterior to the anterior border of the thoracic vertebral bodies)
 - esophageal carcinoma, esophageal duplication cyst, metastatic disease, lymphadenopathy (all causes), hiatus hernia, bronchogenic cyst
- posterior (posterior to the middle line described above)
 - neurogenic tumor (e.g. neurofibroma, schwannoma), multiple myeloma, pheochromocytoma, neuroenteric cyst, thoracic duct cyst, lateral meningocele, Bochdalek hernia, extramedullary hematopoiesis
- superior boundaries (superiorly by thoracic inlet, inferiorly by plane of the sternal angle, anteriorly by manubrium, posteriorly by T1-T4, laterally by pleura)
- in addition, any compartment may give rise to lymphoma, lung cancer, aortic aneurysm or other vascular abnormalities, abscess, and hematoma

Enlarged Cardiac Silhouette

- heart borders
 - on PA view, right heart border is formed by right atrium; left heart border is formed by left atrium and left ventricle
 - on lateral view, anterior heart border is formed by right ventricle; posterior border is formed by left atrium (superior to left ventricle) and left ventricle
- cardiothoracic ratio = greatest transverse dimension of the central shadow relative to the greatest transverse dimension of the thoracic cavity
 - using a good quality erect PA chest film in adults, cardiothoracic ratio of >0.5 is abnormal
 - differential of ratio >0.5
 - cardiomegaly (myocardial dilatation or hypertrophy)
 - pericardial effusion
 - poor inspiratory effort/low lung volumes
 - pectus excavatum
 - ratio <0.5 does not exclude enlargement (e.g. cardiomegaly + concomitant hyperinflation)
- pericardial effusion: globular heart with loss of indentations on left mediastinal border
- RA enlargement: increase in curvature of right heart border and enlargement of SVC
- LA enlargement: straightening of left heart border; increased opacity of lower right side of cardiovascular shadow (double heart border); elevation of left main bronchus (specifically, the upper lobe bronchus on the lateral film), distance between left main bronchus and “double” heart border >7 cm, splayed carina (late sign)
- RV enlargement: elevation of cardiac apex from diaphragm; anterior enlargement leading to loss of retrosternal air space on lateral; increased contact of right ventricle against sternum
- LV enlargement: displacement of cardiac apex inferiorly and posteriorly – “boot-shaped” heart

Figure 14. Lateral CXR showing 4 mediastinal compartments

Tubes, Lines, and Catheters

- ensure appropriate placement and assess potential complications of lines and tubes
- avoid mistaking a line/tube for pathology (e.g. oxygen rebreather mask for pneumothoraces)

Central Venous Catheter

- used for fluid and medication administration, vascular access for hemodialysis, and CVP monitoring
- tip must be located proximal to right atrium to prevent inducing arrhythmias or perforating wall of atrium
 - if monitoring CVP, catheter tip must be proximal to venous valves
- tip of well positioned central venous catheter projects over silhouette of SVC in a zone demarcated superiorly by the anterior first rib end and clavicle, and inferiorly by top of RA
- course should parallel course of SVC – if appears to bend as it approaches wall of SVC or appears perpendicular, catheter may damage and ultimately perforate wall of SVC
- complications: pneumothorax, bleeding (mediastinal, pleural), air embolism

Endotracheal Tube

- frontal chest film: tube projects over trachea and shallow oblique or lateral chest radiograph will help determine position in 3 dimensions
- progressive gaseous distention of stomach on repeat imaging is concerning for esophageal intubation
- tip should be located 4 cm above tracheal carina – avoids bronchus intubation and vocal cord irritation
- maximum inflation diameter <3 cm to avoid necrosis of tracheal mucosa and rupture – ensure diameter of balloon is less than tracheal diameter above and below balloon
- complications: aspiration (parenchymal opacities), pharyngeal perforation (subcutaneous emphysema, pneumomediastinum, mediastinitis)

Nasogastric Tube

- tip and sideport should be positioned distal to esophagogastric junction and proximal to gastric pylorus
- radiographic confirmation of tube is mandatory because clinical techniques for assessing tip position may be unreliable
- complications: aspiration (parenchymal opacities), intracranial perforation (trauma patients), pneumothorax

Swan-Ganz Catheter

- to monitor pulmonary capillary wedge pressure and to measure cardiac output for suspected LV dysfunction
- tip should be positioned within right or left main pulmonary arteries or in one of their large, lobar branches
- if tip is located more distally, increased risk of prolonged pulmonary artery occlusion resulting in pulmonary infarction or, rarely, pulmonary artery rupture
- complications: pneumothorax, bleeding (mediastinal, pleural), air embolism

Chest Tube

- in dorsal and caudal portion of pleural space to evacuate fluid
- in ventral and cephalad portions of pleural space to evacuate pneumothoraces
- tube may lie in fissure as long as functioning
- complications: lung perforation (mediastinal opacities)

Figure 15. Well-positioned central venous catheter (CXR)

Abdominal Imaging

Abdominal X-Ray

- indications
 - acute abdomen: bowel perforation, toxic megacolon, bowel ischemia, small bowel obstruction, large bowel obstruction
 - chronic symptoms: constipation, calcifications (gallstones, renal stones, urinary bladder stones, etc.)
 - not useful in: GI bleeds, chronic anemia, vague GI symptoms
- AXR 3 most common views: left lateral decubitus, supine, erect upright (see Figure 16, MI12)

3 Views of AXR

- Left lateral decubitus
- Supine
- Erect/Upright

Anatomy

- abdomen divided into 2 cavities
 - peritoneal cavity: lined by peritoneum that wraps around most of the bowel, the spleen, and most of the liver; forms a recess lateral to both the ascending and descending colon (paracolic gutters)
 - retroperitoneal cavity: contains several organs situated posterior to the peritoneal cavity; the contour of these can often be seen on radiographs

Table 7. Differentiating Small and Large Bowel

Property	Small Bowel	Large Bowel
Mucosal Folds	Uninterrupted valvulae conniventes (or plicae circularis)	Interrupted haustra extend only partway across lumen
Location	Central	Peripheral (picture frame)
Maximum Diameter	3 cm	6 cm (9 cm at cecum)
Maximum Fold Thickness	3 mm	5 mm
Other	Rarely contains solid fecal material	Commonly contains solid fecal material

What's in the Retroperitoneum?

- Duodenum (2nd, 3rd, 4th part)
- Ascending and descending colon
- Rectum
- Kidneys, ureters, bladder, adrenals
- Psoas, quadratus lumborum
- Aorta, inferior vena cava
- Pancreas

Approach to Abdominal X-Ray

- mnemonic: "Free ABDO"
- Free = free air and fluid
 - free fluid
 - ♦ small amounts of fluid: increased distance between lateral fat stripes and adjacent colon may indicate free peritoneal fluid in the paracolic gutters
 - ♦ large amounts of fluid: diffuse increased opacification on supine film; bowel floats to center of anterior abdominal wall
 - ♦ ascites and blood (hemoperitoneum) are the same density on the radiograph and therefore cannot be differentiated
 - ♦ free intraperitoneal air suggests rupture of a hollow viscus (anterior duodenum, transverse colon), penetrating trauma, or recent (<7 d) surgery
- A = air in the bowel (can be normal, ileus, or obstruction)
 - volvulus – twisting of the bowel upon itself; from most to least common:
 - ♦ sigmoid: "coffee bean" sign (massively dilated sigmoid projects to right or mid-upper abdomen) with proximal dilation
 - ♦ cecal: massively dilated bowel loop projecting to left or mid-upper abdomen with small bowel dilation
 - ♦ gastric: rare
 - ♦ transverse colon: rare (usually young individuals)
 - ♦ small bowel: "corkscrew sign" (rarely diagnosed on plain films, seen best on CT)
 - toxic megacolon
 - ♦ manifestation of fulminant colitis
 - ♦ extreme dilatation of colon (>6.5 cm) with mucosal changes (e.g. foci of edema, ulceration, pseudopolyps), loss of normal haustral pattern
- B = bowel wall thickening
 - increased soft tissue density in bowel wall, thumb-like indentations in bowel wall ("thumb-printing"), or a picket-fence appearance of the valvulae conniventes ("stacked coin" appearance)
 - may be seen in IBD, infection, ischemia, hypoproteinemic states, and submucosal hemorrhage
- D = densities
 - bones: look for gross abnormalities of lower ribs, vertebral column, and bony pelvis
 - abnormal calcifications: approach by location
 - ♦ RUQ: renal stone, adrenal calcification, gallstone, porcelain gallbladder
 - ♦ RLQ: ureteral stone, appendicolith, gallstone ileus
 - ♦ LUQ: renal stone, adrenal calcification, tail of pancreas
 - ♦ LLQ: ureteral stone
 - ♦ central: aorta/aortic aneurysm, pancreas, lymph nodes
 - ♦ pelvis: phleboliths (i.e. calcified veins), uterine fibroids, bladder stones
- O = organs
 - kidney, liver, gallbladder, spleen, pancreas, urinary bladder, psoas shadow
 - outlines can occasionally be identified because they are surrounded by more lucent fat, but all are best visualized with other imaging modalities (CT, MRI)

Approach to AXR

Free ABDO

Free fluid or air (outside bowel)
 Air in the bowel
 Bowel wall thickening
 Densities (bones, calcifications)
 Organs

Figure 16. Normal AXRs: (left) supine anteroposterior AXR, (middle) upright anteroposterior AXR, and (right) left lateral decubitus AXR

Table 8. Abnormal Air on Abdominal X-Ray

Air	Appearance	Common Etiologies
Extraluminal		
Intraperitoneal (pneumoperitoneum)	Upright film: air under diaphragm Left lateral decubitus film: air between liver and abdominal wall Supine film: gas outlines of structures not normally seen: • Inner and outer bowel wall (Rigler's sign) • Falciform ligament • Peritoneal cavity ("football" sign)	Perforated viscus Post-operative (up to 10 d to be resorbed)
Retroperitoneal	Gas outlining retroperitoneal structures allowing increased visualization: • Psoas shadows • Renal shadows	Perforation of retroperitoneal segments of bowel: duodenal ulcer, post-colonoscopy
Intramural (pneumatosis intestinalis)	Lucent air streaks in bowel wall, 2 types: 1. Linear 2. Rounded (cystoides type)	1. Linear: ischemia, necrotizing enterocolitis 2. Rounded/cystoides (generally benign): primary (idiopathic), secondary to COPD
Intraluminal	Dilated loops of bowel, air-fluid levels	Adynamic (paralytic) ileus, mechanical bowel obstruction
Loculated	Mottled, localized in abnormal position without normal bowel features	Abscess (evaluate with CT)
Biliary	Air centrally over liver	Sphincterotomy, gallstone ileus, erosive peptic ulcer, cholangitis, emphysematous cholecystitis
Portal Venous	Air peripherally over liver in branching pattern	Bowel ischemia/infarction

Biliary vs. Portal Venous Air

"Go with the flow": air follows the flow of bile or portal venous blood
Biliary air is most prominent centrally over the liver
Portal venous air is most prominent peripherally

Table 9. Adynamic Ileus vs. Mechanical Obstruction

Feature	Adynamic Ileus	Mechanical Obstruction
Calibre of Bowel Loops	Normal or dilated	Usually dilated
Air-Fluid Levels (erect and left lateral decubitus films only)	Same level in the same single loop	Multiple air fluid levels giving "step ladder" appearance, dynamic (indicating peristalsis present), "string of pearls" (row of small gas accumulations in the dilated valvulae conniventes)
Distribution of Bowel Gas	Air throughout GI tract is generalized or localized • In a localized ileus (e.g. pancreatitis, appendicitis), dilated "sentinel loop" remains in the same location on serial films, usually adjacent to the area of inflammation	Dilated bowel up to the point of obstruction (i.e. transition point) No air distal to obstructed segment "Hairpin" (180°) turns in bowel

ICV Function in Large Bowel Obstruction

Competent ICV

Distention of large bowel between obstruction and ICV; small bowel unaffected
Higher risk of perforation, especially with cecal distention > 10 cm

Incompetent ICV

Distention of large and small bowel

Abdominal CT

- indications for plain CT: renal colic, hemorrhage
- indications for CT with contrast
 - IV contrast given immediately before or during CT to allow identification of arteries and veins
 - ♦ portal venous phase: indicated for majority of cases
 - ♦ biphasic (arterial and portal venous phases): liver, pancreas, bile duct tumors
 - oral contrast: barium or water soluble (water soluble if suspected perforation) given in most cases to demarcate GI tract
 - rectal contrast: given for investigation of colonic lesions
 - caution: contrast allergy (may premedicate with steroids and antihistamine)
 - contraindication: impaired renal function, based on eGFR

Approach to Abdominal Computed Tomography

- look through all images in gestalt fashion to identify any obvious abnormalities
- look at each organ/structure individually, from top to bottom evaluating size and shape of each area of increased or decreased density
- evaluate the following
 - soft tissue window
 - ♦ liver, gallbladder, spleen, and pancreas
 - ♦ adrenals, kidneys, ureters, and bladder
 - ♦ stomach, duodenum, small bowel mesentery, and colon/appendix
 - ♦ retroperitoneum: aorta, vena cava, and mesenteric vessels; look for adenopathy in vicinity of vessels
 - ♦ peritoneal cavity for fluid or masses
 - ♦ abdominal wall and adjacent soft tissue
 - lung window
 - ♦ visible lung (bases)
 - bone window
 - ♦ vertebrae, spinal cord, and bony pelvis

CT and Bowel Obstruction

- cause of bowel obstruction rarely found on plain films – CT is best choice for imaging
- the “3,6,9” rule is a very useful guide to determining when the bowel is dilated; the maximum diameter of the bowel is 3 cm for small bowel, 6 cm for large bowel, and 9 cm for cecum; this can also be useful to distinguish small and large bowel, and to assess for ‘impending’ cecal perforation (e.g. post-untreated Ogilvie’s syndrome)
- closed-loop obstruction: an obstruction in two locations (usually small bowel) creating a loop of bowel segment obstructed both proximally and distally; complications (e.g. ischemia, perforation, necrosis) may occur quickly

CT Colonography (virtual colonoscopy)

- emerging imaging technique for evaluation of intraluminal colonic masses (i.e. polyps, tumors)
- two CT scans of the abdomen (prone and supine) after the instillation of carbon dioxide into a prepped colon
- computer reconstruction of 2D CT images into a 3D intraluminal view of the colon in order to look for masses
- lesions seen on 3D images correlated with 2D axial images
- indications: surveillance in low-risk patients, incomplete colonoscopy, staging of obstructing colonic lesions

Colorectal Cancer: CT Colonography and Colonoscopy for Detection-Systematic Review and Meta-Analysis

Radiology 2011;259:393-405

Study: Systematic review and meta-analysis.

Population: 49 studies on 11,151 patients undergoing diagnostic study for detection of colorectal cancer (CRC).

Intervention: CT colonography (CTC) and optical colonoscopy (OC).

Main Outcome Measure: Sensitivity of CTC and OC for CRC.

Results: CTC has a sensitivity of 96.1% (95% CI 93.8%, 97.7%) and OC has a sensitivity of 94.7% (95% CI 90.4%, 97.2%) for the detection of CRC.

Conclusion: CTC is highly sensitive for the detection of CRC and may be a better modality for the initial investigation of suspected CRC, assuming reasonable specificity.

Figure 17. Barium enema

Contrast Studies

Table 10. Types of Contrast Studies

Study	Organ	Procedure Description	Assessment	Findings
Cine Esophagogram	Cervical esophagus	Contrast agent swallowed Recorded for later playback and analysis	Dysphagia, swallowing incoordination, recurrent aspiration, post-operative cleft palate repair	Aspiration, webs (partial occlusion), Zenker's diverticulum, cricopharyngeal bar, laryngeal tumor
Barium Swallow	Thoracic esophagus	Contrast agent swallowed under fluoroscopy, selective images captured	Dysphagia, rule out GERD, post esophageal surgery	Achalasia, hiatus hernia, esophagitis, cancer, esophageal tear
Upper GI Series	Thoracic esophagus, stomach, or duodenum	Double contrast study: 1. Barium to coat mucosa, then 2. Gas pills for distention Patient NPO after midnight	Dyspepsia, investigate possible upper GI bleed, weight loss/anemia, post gastric surgery	Ulcers, neoplasms, filling defects
Barium Enema	Large bowel Rectum may be obscured by tube – therefore must do sigmoidoscopy to exclude rectal lesions	Colon filled retrograde with barium and air or CO ₂ Bowel prep the night before procedure	Altered bowel habits, suspected lower GI bleed, weight loss/anemia, rule out large bowel obstruction, suspected perforation, check surgical anastomosis, history of polyps	Diverticulosis, neoplasms, IBD, intussusception (can be reduced with barium or air enema), volvulus
Small Bowel Follow Through	Entire small bowel	Single contrast images following upper GI series	GI bleed with nondiagnostic upper GI series/barium enema, weight	Neoplasms, IBD, malabsorption, infection
Small Bowel Enema (enteroclysis)	Entire small bowel	Duodenal intubation: 1. Barium/methyl cellulose infusion and fluoroscopic evaluation 2. CT enteroclysis with water infusion	IBD, malabsorption, weight loss/anemia, Meckel's diverticulum	Neoplasms, IBD, malabsorption, infection

Specific Visceral Organ Imaging

Liver

- U/S: assessment of cysts, abscesses, tumors, biliary tree
- CT ± IV: most popular procedure for imaging the liver parenchyma (primary liver tumors, metastases, cysts, abscesses, trauma, cirrhosis)
- MR: also excellent in evaluation of primary liver tumors, liver metastases, and other parenchymal conditions, and is particularly helpful in differentiating common benign hepatic hemangiomas from primary liver tumors and metastases
- findings
 - advanced cirrhosis: liver small and irregular (fibrous scarring, segmental atrophy, regenerating nodules)
 - portal HTN: increased portal vein diameter, collateral veins, splenomegaly (≥ 12 cm), portal vein thrombosis, recanalization of the umbilical vein
 - porto-systemic shunts: caput medusa, esophageal varices, spontaneous spleno-renal shunt
 - U/S: cirrhosis appears nodular and hyperechoic with irregular areas of atrophy of the right lobe and hypertrophy of the caudate or left lobes
 - CT: fatty infiltration appears hypodense
- in order to be visualized, some masses require contrast

Table 11. Triphasic/Quadruphasic Liver Protocol

Phase	Time Frame	Uses
Non-Contrast CT	0	<ul style="list-style-type: none"> • For all initial investigations of liver lesions • Post radiofrequency ablation of liver tumors • Not usually indicated for surveillance imaging
Arterial Phase	20-30 s	<ul style="list-style-type: none"> • Early and late arterial phase on multidetector CT • Late arterial phase best for discriminating hypervascular HCC
Portal Venous Phase	60-70 s	<ul style="list-style-type: none"> • Provides maximum enhancement of hepatic tissue • Most tumors supplied by hepatic artery are relatively hypovascular, therefore appear as low-attenuation masses in portal venous phase • Hypervascular tumors wash out (HCC)
Equilibrium (Delayed) Phase	120-180 s	<ul style="list-style-type: none"> • Hemangioma: persistent enhancement suggests blood <ul style="list-style-type: none"> ▪ Enhancement of fibrous/scar tissue (HCC capsule, focal nodular hyperplasia, cholangiocarcinoma)

Table 12. Imaging of Liver Masses

Mass	U/S	CT
Metastases	Multiple masses of variable echotexture	Usually low attenuation on contrast enhanced scan
HCC	Single/multiple masses, or diffuse infiltration	Hypervascular enhances in arterial and washes out in venous phase with portal venous tumor thrombus
Abscess	Poorly defined, irregular margin, hypoechoic contents	Low-attenuation lesion with an irregular enhancing wall
Hydatid Cyst	Simple/multiloculated cyst	Low-attenuation simple or multiloculated cyst; calcification
Hemangioma	Homogeneous hyperechoic mass	Peripheral globular enhancement in arterial phase scans; central-filling and persistent enhancement on delayed scans
Focal Nodular Hyperplasia	Well-defined mass, central scar seen in 50%	Hypervascular mass in arterial phase and isoattenuation to liver in portal venous phase
Hepatic Adenoma	Most common in young women taking oral contraceptives. Well-defined mass with hyperechoic areas due to hemorrhage	Well-defined hypervascular lesion with enlarged central vessel becoming slightly isoattenuating in venous phase

Spleen

- U/S, CT, nuclear medicine scan (nuclear medicine only to distinguish ectopic splenic tissue from enhancing tumors)
- CT for splenic trauma (hemorrhage)

Biliary Tree

- U/S: bile ducts usually visualized only if dilated, secondary to obstruction (e.g. choledocholithiasis, benign stricture, mass)
- CT: dilated intrahepatic ductules seen as branching, tubular structures following pathway of portal venous system
- MRCP, ERCP, PTC: further evaluation of obstruction and possible intervention

Normal liver appears denser than spleen on CT. If less dense, suspect fatty infiltration

Liver Mass DDx

5 Hs
HCC
 Hydatid cyst
 Hemangioma
 Hepatic adenoma
 Hyperplasia (focal nodular)

Revised Estimates of Diagnostic Test Sensitivity and Specificity in Suspected Biliary Tract Disease

Arch Intern Med 1998;154:2573-2581

Purpose: To assess the sensitivity and specificity of tests used to diagnose cholelithiasis and acute cholecystitis, including ultrasonography, oral cholecystography, radionuclide scanning with Technetium, MRI, CT.

Study Characteristics: Meta-analysis of 30 studies evaluating the use of different imaging modalities in the diagnosis of biliary tract disease.

Participants: No limits.

Main Outcomes: Sensitivity and specificity of the different imaging modalities, using the gold standard of surgery, autopsy, or 3 mo clinical follow-up for cholelithiasis. For acute cholecystitis, pathologic findings, confirmation of an alternate disease, or clinical resolution during hospitalization for cholecystitis were used as the standard.

Results: For evaluating cholelithiasis, U/S had the best unadjusted sensitivity (0.97; 95% CI 0.95-0.99) and specificity (0.95, 95% CI 0.88-1.00) and adjusted (for verification bias) sensitivity (0.84; 95% CI 0.76-0.92) and specificity (0.99; 95% CI 0.97-1.00). For evaluating acute cholecystitis, radionuclide scanning has the best sensitivity (0.97; 95% CI 0.96-0.98) and specificity (0.90; 95% CI 0.86-0.95).

Conclusions: U/S is the test of choice for diagnosing cholelithiasis and radionuclide scanning is the superior test for diagnosing acute cholecystitis.

Figure 18. ERCP: biliary tree

Pancreas

- tumors
 - U/S: mass is more echogenic than normal pancreatic tissue
 - CT: preferred modality for diagnosis/staging
- ductal dilation secondary to stone/tumor
 - MRCP: imaging of ductal system using MRI cholangiography; no therapeutic potential
 - ERCP: endoscope to inject dye into the biliary tree and x-ray imaging to assess pancreatic and biliary ducts; therapeutic potential (stent placement, stone retrieval); acute pancreatitis is a complication in 5% of diagnostic procedures and 10% of therapeutic procedures

"itis" Imaging

Acute Cholecystitis

- pathogenesis: inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or, in the case of acalculous cholecystitis, due to gallbladder ischemia or cholestasis (see [General Surgery, GS46](#))
- best imaging modality: U/S (best sensitivity and specificity); nuclear medicine (HIDA scan) can help diagnose cases of acalculous or chronic cholecystitis
- findings: thick wall, pericholecystic fluid, gallstones, dilated gallbladder, positive sonographic Murphy's sign
- management: cholecystectomy

Figure 19. Ultrasound: inflamed gallbladder

Acute Appendicitis

- pathogenesis: luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess or peritonitis (see [General Surgery, GS28](#))
- best imaging modality: U/S or CT
- findings
 - U/S: thick-walled appendix, appendicolith, dilated fluid-filled appendix, non-compressible; may also demonstrate other causes of RLQ pain (e.g. ovarian abscess, IBD, ectopic pregnancy)
 - CT: enlargement of appendix (>6 mm in outer diameter), enhancement of appendiceal wall, adjacent inflammatory stranding, appendicolith; also facilitates percutaneous abscess drainage
- management: appendectomy

Figure 20. Ultrasound: inflamed appendix

Acute Diverticulitis

- pathogenesis: erosion of the intestinal wall (most commonly rectosigmoid) by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro- or macroscopic perforation (see [General Surgery, GS31](#))
- best imaging modality: CT is modality of choice, although U/S is sometimes used
- contrast: oral and rectal contrast given before CT to opacify bowel
- findings
 - cardinal signs: thickened wall, mesenteric infiltration, gas-filled diverticula, abscess
 - CT can be used for percutaneous abscess drainage before or in lieu of surgical intervention
 - sometimes difficult to distinguish from perforated cancer (therefore send abscess fluid for cytology and follow up with colonoscopy)
 - if chronic, may see fistula (most common to bladder) or sinus tract (linear or branching structures)
- management: ranges from antibiotic treatment to surgical intervention; can use imaging to follow progression

Computed Tomography and Ultrasonography to Detect Acute Appendicitis in Adults and Adolescents

Ann Intern Med 2004;141:537-546

Purpose: To review the diagnostic accuracy of CT and ultrasonography in the diagnosis of acute appendicitis.

Study Characteristics: Meta-analysis of 22 prospective studies evaluating the use of CT or ultrasonography, followed by surgical or clinical follow-up in patients with suspected appendicitis.

Participants: Age 14 and older with a clinical suspicion of appendicitis.

Main Outcomes: Sensitivity and specificity using surgery or clinical follow-up as the gold standard.

Results: CT (12 studies) had an overall sensitivity of 0.94 (95% CI 0.91-0.95) and a specificity of 0.95 (95% CI 0.93-0.96). Ultrasonography (14 studies) had an overall sensitivity of 0.86 (95% CI 0.83-0.88) and a specificity of 0.81 (95% CI 0.78-0.84).

Conclusions: CT is more accurate for diagnosing appendicitis in adults and adolescents, although verification bias and inappropriate blinding of reference standards were noted in the included studies.

Acute Pancreatitis

- pathogenesis: activation of proteolytic enzymes within pancreatic cells leading to local and systemic inflammatory response (see [Gastroenterology, G50](#)); a clinical/biochemical diagnosis
- best imaging modality: imaging used to support diagnosis and evaluate for complications (diagnosis cannot be excluded by imaging alone)
 - U/S good for screening and follow-up
 - CT is useful in advanced stages and in assessing for complications (1st line imaging test)
- findings
 - U/S: hypoechoic enlarged pancreas (if ileus present, gas obscures pancreas)
 - CT: enlarged pancreas, edema, stranding changes in surrounding fat with indistinct fat planes, mesenteric and Gerota's fascia thickening, pseudocyst in lesser sac, abscess (gas or thick-walled fluid collection), pancreatic necrosis (low attenuation gas-containing non-enhancing pancreatic tissue), hemorrhage
- management: supportive therapy
 - CT-guided needle aspiration and/or drainage done for abscess when clinically indicated
 - pseudocyst may be followed by CT and drained if symptomatic

Angiography requires active blood loss 1-1.5 mL/min under optimal conditions for a bleeding site to be visualized in cases of lower GI bleeding

Chronic Pancreatitis

- pathogenesis: (see [Gastroenterology, G51](#))
- best imaging modality: MRCP (can show calcification and duct obstruction)
- findings: U/S, CT scan, and MRI may show calcifications, ductal dilatation, enlargement of the pancreas and fluid collections (e.g. pseudocysts) adjacent to the gland

Imaging Modality Based on Presentation

- Acute testicular pain = Doppler, U/S
- Amenorrhea = U/S, MRI (brain)
- Bloating = U/S, CT
- Flank pain = U/S, CT
- Hematuria = U/S, Cystoscopy, CT
- Infertility = HSG, MRI
- Lower abdominal mass = U/S, CT
- Lower abdominal pain = U/S, CT
- Renal colic = U/S, KUB, CT
- Testicular mass = U/S
- Urethral stricture = Urethrogram

Angiography of GI Tract

- anatomy of the GI tract arterial blood supply branches
 - celiac artery: hepatic, splenic, gastroduodenal, left/right gastric
 - superior mesenteric artery: jejunal, ileal, ileo-colic, right colic, middle colic
 - inferior mesenteric artery: left colic, superior rectal
- imaging modalities
 - conventional angiogram: invasive (usual approach via femoral puncture), catheter used
 - ♦ flush aortography: catheter injection into abdominal aorta, followed by selective arteriography of individual vessels
 - CT angiogram: modality of choice, non-invasive using IV contrast (no catheterization required)

Genitourinary System and Adrenal

Urological Imaging

KUB

- a frontal supine radiograph of the abdomen
- **indication:** useful in evaluation of radio-opaque renal stones (all stones but uric acid and indinavir), as well as indwelling ureteric stents or catheters
- **findings:** addition of IV contrast excreted by the kidney (intravenous urogram) allows greater visualization of the urinary tract, but has been largely replaced by CT urography

Abdominal CT

Renal Masses

- Boznik classification for cystic renal masses
- class I-II: benign and can be disregarded
- class IIF: should be followed
- class III-IV: suspicious for malignancy, requiring additional workup

Table 13. Boznik Classification for Cystic Renal Masses

Classes	Definition
Simple Renal Cysts	
Class I	Fluid-attenuating well-defined lesion, no septation, no calcification, no solid components, hair thin wall
Class II	Same as class I + fine calcification or moderately thickened calcification in septae or walls; also includes hyperdense cysts (<3 cm) that do not enhance with contrast
Complex Renal Cysts	
Class III	Thick irregular walls ± calcifications ± septated, enhancing walls or septa with contrast
Renal Cell Carcinoma	
Class IV	Same as class III + soft tissue enhancement with contrast (defined as >10 Hounsfield unit increase, characterizing vascularity) with de-enhancement in venous phase ± areas of necrosis

- **plain CT KUB**
 - indications: general imaging of renal anatomy, renal colic symptoms, assessment of renal calculi (size and location), and hydronephrosis prior to urological treatment
- **CT urography**
 - indications: investigation of cause of microscopic/gross hematuria, detailed assessment of urinary tracts (excretory phase), high sensitivity (95%) for uroepithelial malignancies of the upper urinary tracts, assessment of renal calculi
 - phases: unenhanced, excretory
- **renal triphasic CT**
 - indications: standard imaging for renal masses, allows accurate assessment of renal arteries and veins, better characterization of suspicious renal masses, especially in differentiating renal cell carcinoma from more benign masses, and pre-operative staging
 - phases: unenhanced, arterial and venous (nephrographic)

Figure 21. Triphasic CT of an angiomyolipoma: showing fat density with non-contrast scan, mildly enhancing with contrast

Figure 22. Triphasic CT of a renal cell carcinoma: showing arterial enhancing right renal lesion with venous washout (shunting)

Ultrasound

- indications: initial study for evaluation of kidney size and nature of renal masses (solid vs. cystic renal masses vs. complicated cysts); technique of choice for screening patients with suspected hydronephrosis (no IV contrast injection, no radiation to patient, and can be used in patients with renal failure); TRUS useful to evaluate prostate gland and guide biopsies; Doppler U/S to assess renal vasculature
- findings: solid renal masses are echogenic (bright on U/S), cystic renal masses have smooth well-defined walls with anechoic interior (dark on U/S), and complicated cysts have internal echoes within a thickened, irregular wall

Retrograde Pyelography

- indications: visualize the urinary collecting system via a cystoscope, ureteral catheterization, and retrograde injection of contrast medium, ordered when the intrarenal collecting system and ureters cannot be opacified using intravenous techniques (patient with impaired renal function, high grade obstruction)
- findings: only yields information about the collecting systems (renal pelvis and associated structures), no information regarding the parenchyma of the kidney

Voiding Cystourethrogram

- bladder filled with contrast to the point where voiding is triggered
- fluoroscopy (continuous, real-time) to visualize bladder
- indications: children with recurrent UTIs, hydronephrosis, hydroureter, suspected lower urinary tract obstruction or vesicoureteral reflux
- findings: contractility and evidence of vesicoureteric reflux

Retrograde Urethrogram

- a small Foley catheter placed into penile urethral opening
- indications: used mainly to study strictures or trauma to the male urethra; first-line study if trauma with blood present at urethral meatus

MRI

- advantages: high spatial and tissue resolution, lack of exposure to ionizing radiation and nephrotoxic contrast agents
- indications: indicated over CT for depiction of renal masses in patients with previous nephron sparing surgery; patients requiring serial follow-up (less radiation dosage), patients with reduced renal function, and patients with solitary kidneys

Renal Nuclear Scan

Table 14. Renal Scan Tests

Type of Test	Uses	Radionuclide
Renogram	To assess renal function and collecting system: evaluation of renal failure, workup of urinary tract obstruction and HTN, investigation of renal transplant	IV ^{99m}Tc -pentetate (DTPA) or mertiatide (MAG3), and imaged at 1-3 s intervals with a gamma camera over the first 60 s to assess perfusion
Morphological	Assess renal anatomy: investigation of pyelonephritis and cortical scars	^{99m}Tc -DMSA ^{99m}Tc -glucoheptonate

Figure 23. Retrograde urethrogram: demonstrating stricture in the membranous urethra

Figure 24. Transabdominal ultrasound: pregnancy, 18 wk fetus

Figure 25. HSG: left hydrosalpinx

Pregnancy should always be ruled out by β -hCG before CT of a female pelvis (or any organ system) is performed

Gynecological Imaging

Ultrasound

- transabdominal and transvaginal are the primary modalities, and are indicated for different scenarios
- transabdominal requires a full bladder to push out air containing loops of bowel
 - indication: good initial investigation for suspected pelvic pathology
- TVUS provides enhanced detail of deeper/smaller structures by allowing use of higher frequency sound waves at reduced distances
 - indication: improved assessment of ovaries, first trimester development, and ectopic pregnancies

Hysterosalpingogram

- indications: useful for assessing pathology of the uterine cavity and fallopian tubes, evaluating uterine abnormalities (e.g. bicornuate uterus), or evaluation of fertility (absence of flow from tubes to peritoneal cavity indicates obstruction)
- performed by x-ray images of the pelvis after cannulation of the cervix and subsequent injection of opacifying agent

CT/MRI

- indications: evaluating pelvic structures, especially those adjacent to the adnexa and uterus
- invaluable for staging gynecological malignancies

Sonohysterogram

- saline infusion sonohysterogram involves instilling fluid into the uterine cavity transcervically to provide enhanced endometrial visualization during transvaginal U/S examination
- indications: abnormal uterine bleeding, uterine cavity abnormalities that are suspected or noted on transvaginal U/S (e.g. leiomyomas, polyps, synechiae), congenital abnormalities of the uterine cavity, infertility, recurrent pregnancy loss
- contraindications: pregnancy, pelvic infection

Table 15. Typical and Atypical Findings on a Sonohysterogram

Finding	Typical	Atypical
Polyps	A well-defined, homogeneous, polypoid lesion isoechoic to the endometrium with preservation of the endometrial-myometrial interface	Atypical features include cystic components, multiple polyps, broad base, hypoechogenicity or heterogeneity
Leiomyoma	Well-defined, broad-based, hypoechoic, solid masses with shadowing. Overlying layer of endometrium is echogenic and distorts the endometrial-myometrial interface	Pedunculation or multilobulated surface
Hyperplasia and Cancer	Diffuse echogenic endometrial thickening without focal abnormality, although focal lesions can occur. Endometrial cancer is typically a diffuse process, but early cases can be focal and appear as a polypoid mass	
Adhesions	Mobile, thin, echogenic bands that cut across the endometrial cavity	Thick, broad-based bands that can completely obliterate the endometrial cavity, as in Asherman's syndrome

Adrenal Mass

- imaging modality: most often identified on CT scan as 'incidentaloma', can also use CT/MRI to distinguish benign from malignant masses

Table 16. Adrenal Mass Findings on CT and MRI

Factors	Adrenocortical Adenoma	Adrenocortical Carcinoma	Pheochromocytoma	Metastasis
Diameter (CT)	Usually ≤ 3 cm	Usually ≥ 4 cm	Usually > 3 cm	Variable around < 3 cm
Shape (CT)	Smooth margins and round/oval	Irregular with unclear margins	Round/oval with clear margins	Oval/irregular with unclear margins
Texture (CT)	Homogeneous	Heterogeneous with mixed densities	Heterogeneous with cystic areas	Heterogeneous with mixed densities
Vascularity (CT)	Not highly vascular	Usually vascular	Usually vascular	Usually vascular
Washout of Contrast Medium on CT	$\geq 50\%$ at 10 min	$< 50\%$ at 10 min	$< 50\%$ at 10 min	$< 50\%$ at 10 min
Growth	Stable or very slow (< 1 cm/yr)	Usually rapid (> 2 cm/yr)	Slow (0.5-1 cm/yr)	Variable
Other Findings	Usually low density due to intracellular fat	Necrosis, calcifications, and hemorrhage	Hemorrhage	Occasionally hemorrhage
MRI on T2 Weighted Imaging	Isointense in relation to liver	Hyperintense in relation to liver	Markedly hyperintense in relation to liver	Hyperintense in relation to liver

Modality Based on Neuropathology Presentation

- Cognitive decline = CT
- Cord compression = MRI
- Decreased level of consciousness = CT
- Fish bone/other swallowed foreign body = CT
- Low back pain, radiculopathy = MRI
- Multiple sclerosis = MRI
- Neck infection = CT
- Orbital infection = CT
- Rule out bleed = CT
- Rule out aneurysm = CTA, MRA
- Seizure = CT
- Sinusitis = CT
- Stroke = CT, MRI
- Trauma = CT
- Weakness, systemically unwell = CT

Neuroradiology

Modalities

- CT is the modality of choice for most neuropathology; even under circumstances when MRI is preferred, CT is frequently the initial study because of its speed, availability, and lower cost
 - acute head trauma: CT is best for visualizing "bone and blood"; MRI is used only when CT fails to detect an abnormality despite strong clinical suspicion
 - acute stroke: MRI ideal, CT most frequently used
 - suspected subarachnoid or intracranial hemorrhage
 - meningitis: rule out mass effect (e.g. cerebral herniation, shift) prior to lumbar puncture
 - tinnitus and vertigo: CT and MRI are used in combination to detect bony abnormalities and CN VIII tumors, respectively

Figure 26. Epidural hematoma

Skull Films

- rarely performed, generally not indicated for non-penetrating head trauma
- indications: screening for destructive bony lesions (e.g. metastases), metabolic disease, skull anomalies, post-operative changes and confirmation of hardware placement, skeletal surveys

CT

- excellent study for evaluation of bony abnormalities
- often done first without and then with IV contrast to show vascular structures or anomalies
- vascular structures and areas of blood-brain barrier impairment are opaque (e.g. hyperattenuating or white/show enhancement) with contrast injection
 - when in doubt, look for circle of Willis or confluence of sinuses to determine presence of contrast enhancement
- posterior fossa can be obscured by extensive bony artifact
- rule out skull fracture, epidural hematoma (lenticular shape), subdural hematoma (crescentic shape), subarachnoid hemorrhage, space occupying lesion, hydrocephalus, and cerebral edema
- multiplanar imaging can be performed with newer generation of multidetector CT scanners

Myelography

- introduction of water-soluble, low-osmotic contrast media into subarachnoid space using lumbar puncture followed by x-ray or CT scan
- indications: excellent study for disc herniations, traumatic nerve root avulsions, patients with contraindication to MRI

MRI

- indications: shows brain and spinal soft tissue anatomy in fine detail, clearly distinguishes white from gray matter (especially T1-weighted series), multiplanar reconstruction helpful in pre-operative assessment

Cerebral Angiography/CTA/MRA

- indications: evaluation of vascular lesions such as atherosclerotic disease, aneurysms, vascular malformations, arterial dissection
- conventional DSA remains the gold standard for the assessment of neck and intracranial vessels; however, it is an invasive procedure requiring arterial (femoral) puncture; catheter manipulation has risk of vessel injury (e.g. dissection, occlusion, vasospasm, emboli)
- MRA methods (phase contrast, time of flight, gadolinium-enhanced) and CTA are much less invasive without actual risk to intracranial or neck vessels
- MRA and CTA are often used first as ‘screening tests’ for the assessment of subarachnoid hemorrhage, vasospasm, aneurysms

Figure 31. **Hydrocephalus:** ventricular dilatation (may see periventricular low attenuation due to transependymal CSF flow)

Table 17. Two Types of Hydrocephalus

Type	Cause
Communicating/Extra-Ventricular	Obstruction distal to the ventricles (e.g. at the level of the arachnoid granulations); imaging shows all ventricles dilated
Non-Communicating	Obstruction within the ventricular system (e.g. mass obstructing the aqueduct or foramen of Monro); imaging shows dilatation of ventricles proximal to the obstruction

Nuclear Medicine

- SPECT using ^{99m}Tc-exametazime (HMPAO) and ^{99m}Tc-bicisate (ECD) imaging assesses cerebral blood flow by diffusing rapidly across the blood brain barrier and becoming trapped within cells
- ¹⁸FDG PET imaging assesses cerebral metabolic activity

Figure 27. Subdural hematoma

Figure 28. Subarachnoid hemorrhage

Figure 29. Intraparenchymal hemorrhage

Figure 30. Verteobasilar circulation

Approach to CT Head

- think anatomically, work from superficial to deep
- scan: confirm that the imaging is of the correct patient, whether contrast was used, if the patient is aligned properly, if there is artifact present
- skin/soft tissue: examine the soft tissue superficial to the skull, looking for thickening suggestive of hematoma or edema; also investigate ear, orbital contents (globe, fat, muscles), parotid, muscles of mastication (masseter, temporalis, pterygoids), visualized pharynx
- bone and airspace (use the bone window): check calvarium, visualize mandible, visualize C-spine (usually C1 and maybe part of C2) for fractures, absent bone, lytic/sclerotic lesions; inspect sinuses and mastoid air cells for opacity that may suggest fluid, pus, blood, tumor, or fracture; status of the orbital floor in cases of facial trauma (coronal series best)
- dura and subdural space: crescent-shaped hyperdensity in the subdural space suggests subdural hematoma; lentiform hyperdensity in the epidural space suggests epidural hematoma; check symmetry of dural thickness, where increased thickness may suggest the presence of blood
- parenchyma: asymmetry of the parenchyma suggests midline shift; poor contrast between gray and white matter suggests possible infarction, tumor, edema, infection, or contusion; hyperdensity in the parenchyma suggests enhancing lesions, intracerebral hemorrhage, or calcification; central gray matter nuclei (e.g. globus pallidus, putamen, internal capsule) should be visible, otherwise, suspect infarct, tumor, or infection
- ventricles/sulci/cisterns: examine position of ventricles for evidence of midline compression/shift; hyperdensities in the ventricles suggest ventricular/subdural hemorrhage; enlarged ventricles suggest hydrocephalus; obliteration of sulci may suggest presence of edema causing effacement, possible blood filling in the sulci, or tumor; cistern hyperdensities may suggest blood, pus, or tumor

Approach to the CT Head

Some = Scan

Sore = Skin/Soft Tissue

Brains = Bone/Airspace

Demonstrate = Dura/Subdural space

Pushed = Parenchyma

Ventricles = Ventricles/Sulci/Cisterns

Transient ischemic attacks are not associated with radiological findings

Selected Pathology

- see [Neurosurgery](#), NS4-22 for intracranial mass lesions
- see [Neurosurgery](#), NS29 and [Plastic Surgery](#), PL28 for head trauma
- see [Emergency Medicine](#), ER9 for vertebral trauma
- see [Neurosurgery](#), NS23-27 and [Orthopedics](#), OR21 for degenerative spinal abnormalities

Cerebrovascular Disease (see [Neurology](#), N43 and [Neurosurgery](#), NS17)

- pathogenesis of stroke: see [Neurology](#), N47
- best imaging modality: infarcts best detected by either CT or MRI
- findings of infarction
 - early changes
 - ♦ CT
 - usually normal within 6 h of infarction
 - edema (loss of gray-white matter differentiation – “insular ribbon” sign, effacement of sulci, mass effect)
 - within 24 h, development of low-density, wedge-shaped area of infarction extending to periphery (correlating to vascular territory distal to affected artery)
 - in case of ischemic stroke, may see hyperattenuating (bright) artery (hyperdense MCA sign) representing intravascular thrombus or embolus
 - in case of hemorrhagic stroke or transformation (common in basal ganglia and cortex), may see bright acute blood surrounded by edema
 - ♦ MRI
 - edema with high signal on T2-weighted images and FLAIR image (loss of gray-white matter differentiation, effacement of sulci, mass effect)
 - DWI shows acute high signal changes demonstrating restricted movement of water indicative of cytotoxic edema; usually indicates stroke damage before CT
 - apparent diffusion coefficient image shows low signal intensity in acute ischemia (nadir 3-5 d, returns to baseline 1-4 wk)
 - subacute changes on CT and MRI
 - ♦ edema and mass effect more prominent
 - ♦ gyral enhancement with contrast indicative of blood-brain barrier breakdown
 - chronic changes on CT and MRI
 - ♦ encephalomalacia (parenchymal volume loss) with dilatation of adjacent ventricles
- carotid artery disease
 - best imaging modality: Duplex Doppler U/S
 - other modalities: MRA or CTA if carotid angioplasty or endarterectomy is under consideration (conventional angiography reserved for inadequate MRA or CTA)

Figure 32. Insular Ribbon

Multiple Sclerosis (refer to [Neurology](#), N52)

- best imaging modality: MRI has high sensitivity in diagnosing MS (>90%) but low specificity (71-74%)
- findings
 - characteristic lesion on MRI is cerebral or spinal plaque
 - plaques typically found in periventricular region, corpus callosum (arranged at right angles to the corpus callosum), centrum semiovale, and to a lesser extent in deep white matter structures and basal ganglia
 - "Dawson's fingers" refers to perivenular regions of demyelination that are seen to radiate outwards into the deep periventricular region
 - plaques usually have ovoid appearance, hyperintense on T2 and hypointense on T1
 - conventional T2 may underestimate plaque size and overall plaque burden – advanced techniques (diffusion tensor imaging and MR spectroscopy) can be of use
 - perivascular and interstitial edema may be prominent
 - spinal cord lesions typical of MS
 - ♦ little or no cord swelling
 - ♦ unequivocal hyperintensity on T2-weighted sequences
 - ♦ size at least 3 mm but less than 2 vertebral segments in length
 - ♦ occupy only part of the cord in cross-section
 - ♦ focal (i.e. clearly delineated and circumscribed on T2-weighted sequences)

CNS Infections

- **leptomeningitis**
 - pathogenesis: inflammation of the pia or arachnoid mater, most often secondary to hematogenous spread from infection or via organisms gaining access across areas not protected by the blood-brain barrier (choroid plexus or circumventricular organs)
 - ♦ pathogens include: *S. pneumoniae*, *H. influenzae*, *N. meningitidis*, *L. monocytogenes*
 - best imaging modality: MRI (T2-weighted/FLAIR) superior to CT
 - findings
 - ♦ meningeal enhancement (following the gyri/sulci, and/or basal cisterns), hydrocephalus (communicating), cerebral swelling, subdural effusion
 - ♦ a normal MRI does not rule out leptomeningitis
- **herpes simplex encephalitis** (see [Infectious Diseases](#), ID20)
 - pathogenesis: inflammation of the brain parenchyma secondary to infection with herpes simplex virus, asymmetrically affects the limbic regions of the brain (i.e. temporal lobes, orbitofrontal region, insula, and cingulate gyrus)
 - best imaging modality: MRI (T1- and T2-weighted)
 - findings
 - ♦ acute (within 4-5 d): asymmetric high intensity lesions on T2 MRI in temporal and inferior frontal lobes strongly suggestive
 - ♦ DDX: infarct, tumor, status epilepticus, limbic encephalitis
 - ♦ CT may show low density in temporal lobe and insula; rarely basal ganglia involvement
 - ♦ long-term may show parenchymal loss to affected areas
- **cerebritis/cerebral abscess**
 - pathogenesis: an infection of the brain parenchyma (cerebritis) which can progress to a collection of pus (abscess), most frequently due to hematogenous spread of infectious organisms, commonly located in the distribution of the MCA
 - ♦ pathogens include: *S. aureus* (often in IV drug users, nosocomial), *Streptococcus*, Gram negative bacteria, *Bacteroides*
 - best imaging modality: MRI including DWI imaging series (abscess will be DWI positive); CT still used as a viable alternative
 - findings according to one of four stages of abscess formation:
 - ♦ early cerebritis (1-3 d): inflammatory infiltrate with necrotic center, low intensity on T1, high intensity on T2
 - ♦ late cerebritis (4-9 d): ring enhancement may be present
 - ♦ early capsule (10-13 d): ring enhancement
 - ♦ late capsule (14 d or greater): well demarcated ring-enhancing lesion, low intensity core, with mass effect; considerable edema around the lesion, seen as hyperintensity on T2

Figure 33. CT images of early infarct: (A) absence of left insular ribbon (B) hyperdense artery

Figure 34. DWI of patient with right frontotemporal infarct

Figure 35. T2-weighted FLAIR: (A) sagittal (B) axial images of multiple sclerosis with periventricular "Dawson's Fingers"

Figure 36. T2-weighted (FLAIR) coronal image of herpes simplex virus encephalitis affecting temporal lobes

Musculoskeletal System

Modalities

Plain Film/X-Ray

- usually initial study used in evaluation of bone and joint disorders
- indications: fractures and dislocations, arthritis, assessment of malalignment, orthopedic hardware, and bone tumors (initial)
- minimum of two films orthogonal to each other (usually AP and lateral) to rule out a fracture
- image proximal and distal joints (particularly important with paired bones (e.g. radius/ulna))
- minimally effective in evaluating soft tissue injury
- advantages: fast, inexpensive, readily available, reproducible

CT

- evaluation of fine bony detail
- indications: assessment of complex, comminuted, intra-articular or occult fractures including distal radius, scaphoid, skull, spine, acetabulum, calcaneus, and sacrum
- evaluation of soft tissue calcification/ossification
- advantages: fast, reproducible, excellent bone evaluation, and spatial resolution
- disadvantages: radiation dose, relatively poor soft tissue characterization in comparison with U/S and MRI

MRI

- indications: evaluation of internal derangement of joints (e.g. ligaments, joint capsule, menisci, labrum, cartilage), assessment of tendons and muscle injuries, characterization and staging of soft tissue and bony masses
- advantages: excellent soft tissue contrast, multiplanar imaging, no radiation
- disadvantages: long imaging times, expensive, claustrophobia, contraindications (e.g. pacemakers, orbital metallic bodies), artifact around metal hardware

U/S

- indications: tendon injury (e.g. rotator cuff, Achilles tendon), detection of soft tissue masses and to determine whether cystic or solid, detection of foreign bodies, U/S guided biopsy and injections
- Doppler determines vascularity of structures
- advantages: good soft tissue evaluation, easy contralateral comparison, dynamic imaging
- disadvantages: operator dependent, poor for bone evaluation

Nuclear Medicine (Bone Scintigraphy)

- determine the location and extent of bony lesions
- ^{99m}Tc -methylene diphosphonate localizes to areas of increased bone turnover or calcification – growth plate in children, tumors, infections, fractures, metabolic bone disease (e.g. Paget's), sites of reactive bone formation, and periostitis
- advantages: very sensitive, capable of imaging entire body with relatively low dose radiation
- disadvantages: low specificity, not widely available due to special requirements (e.g. gamma camera, radiopharmaceuticals)

Approach to Interpretation of Bone X-Rays

- identification: name, MRN, age of patient, type of study, region of investigation
- soft tissues: swelling, calcification/ossification
- joints: alignment, joint space, presence of effusion, osteophytes, erosions, bone density, overall pattern, and symmetry of affected joint
- bone: periosteum, cortex, medulla, trabeculae, density, articular surfaces, bone destruction, bone production, appearance of the edges or borders of any lesions

Trauma

Fracture/Dislocation

- description of fractures
- site of fracture (bone, region of bone, intra-articular vs. extra-articular)
- pattern of fracture line (simple vs. comminuted)
- displacement (distal fragment with reference to the proximal fragment)

- soft tissue involvement (calcification, gas, foreign bodies)
- type of fracture (stress vs. pathologic)
- for specific fracture descriptions and characteristics of fractures, see [Orthopedics, OR5](#)

Figure 37. X-ray of first carpometacarpal joint: normal image (left) and osteoarthritis (right) with joint space narrowing and subchondral sclerosis

Arthritis

Radiographic Hallmarks of Osteoarthritis

- joint space narrowing – typically non-uniform
- subchondral sclerosis
- subchondral cyst formation
- osteophytes

Radiographic Hallmarks of Rheumatoid Arthritis

- joint space narrowing – typically uniform
- soft tissue swelling
- erosions
- periarticular osteopenia

Bone Tumor

Approach

- metastatic tumors to bone are much more common than primary bone tumors, particularly if age >40 yr
 - diagnosis usually requires a biopsy if primary not located
 - few benign tumors/lesions have potential for malignant transformation
 - MRI is good for tissue delineation and pre-operative assessment of surrounding soft tissues, neurovascular structures, and medullary/marrow involvement
 - plain film is less sensitive than other modalities but useful for assessing aggressiveness and constructing differential diagnosis

Considerations and Tumor Characteristics

- for specific bone tumors, see [Orthopedics, OR43](#)
- age – most common tumors by age group
 - <1 yr of age: metastatic neuroblastoma
 - 1-20 yr of age: Ewing's sarcoma in tubular bones
 - 10-30 yr of age: osteosarcoma and Ewing's sarcoma in flat bones
 - >40 yr of age: metastases, multiple myeloma, and chondrosarcoma
- multiplicity: metastases, myeloma, lymphoma, fibrous dysplasia, enchondromatosis
- location within bone
 - epiphysis: giant cell tumor, chondroblastoma, geode, eosinophilic granuloma, infection
 - metaphysis: simple bone cyst, aneurysmal bone cyst, enchondroma, chondromyxoid fibroma, nonossifying fibroma, osteosarcoma, chondrosarcoma
 - diaphysis: fibrous dysplasia, aneurysmal bone cyst, brown tumors, eosinophilic granuloma, Ewing's sarcoma
- expansile
 - aneurysmal bone cyst, giant cell tumor, enchondromas, brown tumors, metastases (especially renal and thyroid), plasmacytoma
- matrix mineralization
 - chondroid (popcorn calcification) or osseous
- margin/zone of transition: area between lesion and normal bone
- cortex: intact, disturbed
- periosteal reaction
- soft tissue mass

Figure 38. Rheumatoid arthritis (A) compared with osteoarthritis (B) changes on X-ray

Benign Lesions which may have Aggressive Features

- Osteomyelitis
- Osteoblastoma
- Aneurysmal bone cyst
- Langerhans cell histiocytosis
- Myositis ossificans

Periosteal Reaction

- "Onion skinning" = Ewing's sarcoma
- "Sunburst", "hair on end" = osteosarcoma
- "Codman's triangle" = osteosarcoma, Ewing's sarcoma, subperiosteal abscess

Figure 39. Radiographic appearance of bone remodelling and destruction processes

Table 18. Characteristics of Benign and Malignant Bone Lesions

Benign	Malignant
Thin sclerotic margin/sharp delineation of lesion	Poor delineation of lesion – wide zone of transition
Overlying cortex intact	Loss of overlying cortex/bony destruction
No or simple periosteal reaction	Periosteal reaction
No soft tissue mass	Soft tissue mass

Metastatic Bone Tumors

- all malignancies have potential to metastasize to bone
- metastases are 20-30x more common than primary bone tumors
- metastasis can cause a lytic or a sclerotic reaction when seeding to bone
- when a primary malignancy is first detected, a bone scan is often part of the initial workup
- may present with pathological fractures or pain
- biopsy or determination of primary is the only way to confirm the diagnosis
- most common metastatic bone tumors: breast, prostate, lung, see [Orthopedics, OR46](#)

Lytic = decreased density
Sclerotic = increased density

**Table 19. Characteristic Bone Metastases of Common Cancers**

Lytic	Sclerotic	Expansile	Peripheral
Breast	Prostate	Thyroid	Kidney
Lung	Breast	Renal	Lung
Thyroid	Lymphoma		Melanoma
Kidney	Lung		(KLM: flies to the periphery)
Multiple myeloma	Bowel		
	Medulloblastoma		
	Treated tumors		

Infection

Osteomyelitis

- MRI is the imaging modality of choice for demonstrating bone, bone marrow, and soft tissue abnormalities
- ^{99m}Tc , followed by ^{111}In labeled white cell scan or gallium radioisotope scan
- plain film
 - visible 8-10 d after process has begun
 - osteomyelitic changes on plain film
 - ♦ soft tissue swelling
 - ♦ local periosteal reaction
 - ♦ pockets of air (from anaerobes) may be seen in the tissues, may also suggest necrotizing fasciitis
 - ♦ mottled and nonhomogeneous with a classic “moth-eaten” appearance
 - ♦ cortical destruction

Bone Abscess

- overlying cortex has periosteal new bone formation
- sharply outlined radiolucent area with variable thickness in zone of transition
- variable thickness periosteal sclerosis
- sequestrum: a piece of dead bone within a Brodie's abscess
- a sinus tract or cloaca may communicate between the abscess through the cortex to the surface of the bone
- best modality: MRI for bone, bone marrow, and soft tissue abnormalities; CT for sequestra and cortical erosions

Metabolic Bone Disease

Osteoporosis

- reduction in amount of normal bone mass; fewer and thinner trabeculae; diffuse process affecting all bones
- DEXA: gold standard for measuring bone mineral density
 - T-score: the number of standard deviations from the young adult mean, most clinically valuable
 - ♦ osteopenia: $-2.5 < \text{T-score} < -1$
 - ♦ osteoporosis: $\text{T-score} \leq -2.5$
 - Z-score: the number of standard deviations from the age-matched mean
 - risk of fracture: related to bone mineral density, age, history of previous fractures, steroid therapy

Diagnostic sensitivity of DEXA highest when bone mineral density measured at lumbar spine and proximal femur

- appearance on plain film
 - osteopenia: reduced bone density on plain films
 - ♦ may also be seen with osteomalacia, hyperparathyroidism, and disuse
 - compression of vertebral bodies
 - biconcave vertebral bodies ("codfish" vertebrae)
 - long bones have appearance of thinned cortex and increased medullary cavity
 - ♦ look for complications of osteoporosis (e.g. insufficiency fractures: hip, vertebrae, sacrum, pubic rami)
- see [Endocrinology, E42](#)

Osteomalacia/Rickets

- reduction in bone mineral density, usually due to vitamin D deficiency, resulting in softening and bowing of long bones
- similar to osteoporosis, initial radiological appearance of osteopenia (coarse and poorly defined bone texture)
- "fuzzy", ill-defined trabeculae
- Looser's zones (pseudofracture)
 - characteristic radiologic feature
 - fissures or clefts at right angles to long bones and extending through cortex
 - DDx: chronic renal disease, fibrous dysplasia, hyperthyroidism, Paget's, osteodystrophy, X-linked hypophosphatemia

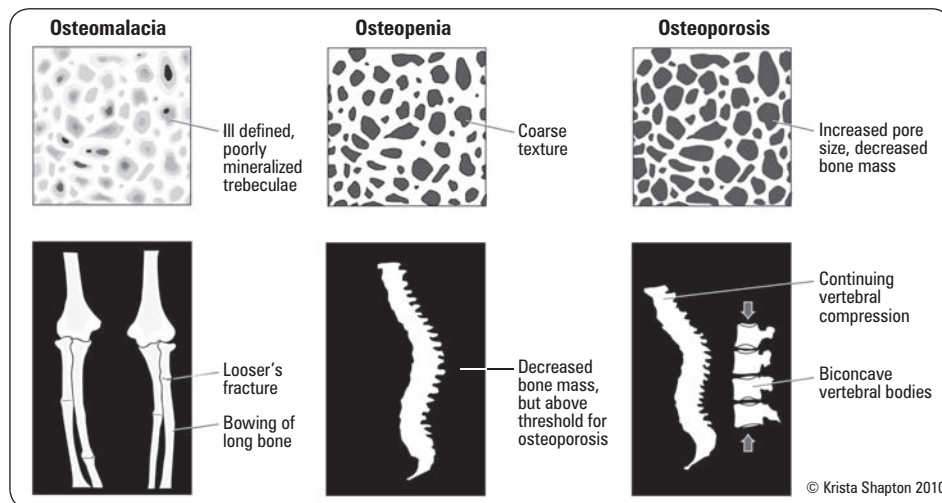

Figure 40. Osteomalacia, osteopenia, and osteoporosis

Hyperparathyroidism

- most common cause is renal failure (secondary hyperparathyroidism)
- chondrocalcinosis
 - calcium crystal deposition in hyaline cartilage or fibrocartilage (including arteries and peri-articular soft tissue)
 - resorption of bone typically in hands (subperiosteal and at tufts), sacroiliac joints (subchondral), skull ("salt and pepper" appearance), osteoclastoma (brown tumors)
 - "rugger jersey spine": band-like osteosclerosis at superior/inferior margins of vertebral bodies
- see [Endocrinology, E45](#)

Paget's Disease

- abnormal remodeling involving single or multiple bones – especially skull, spine, pelvis
- 3 phases: 1st phase = lytic, 2nd phase = mixed (lytic/sclerotic), 3rd phase = sclerotic
- features
 - coarsening of the trabeculae with bone expansion
 - bone softening/bowing
 - bone scan will reveal high activity, especially at bone ends
 - thickened cortex
- see [Endocrinology, E46](#)

Osteoporosis

Reduced amount of bone

OsteoMalacia

Normal amount of bone, but reduced Mineralization of normal osteoid

Nuclear Medicine

Brain

- ^{99m}Tc -HMPAO and ^{99m}Tc -ECD imaging to assess cerebral blood flow, taken up in cortical and subcortical gray matter; used for dementia, traumatic brain injury and to a lesser extent vasculitis, neuropsychiatric disorders and stroke
- PET imaging assesses metabolic activity by using ^{18}F FDG
- CSF imaging, intrathecal administration of ^{111}In DTPA to evaluate CSF leak or to differentiate normal pressure hydrocephalus from other causes of hydrocephalus
- ventricular shunt evaluation for obstruction (most commonly ventriculoperitoneal) with ^{99m}Tc or ^{111}In -DTPA

Thyroid

Radioactive Iodine Uptake (see [Endocrinology, E21](#))

- index of thyroid function (trapping and organification of iodine)
- radioactive ^{131}I or ^{123}I given PO to fasting patient
- measure percentage of administered iodine taken up by thyroid
- increased RAIU: toxic multinodular goitre, toxic adenoma, Graves' disease
- decreased RAIU: subacute thyroiditis, late Hashimoto's disease, hormone suppression
- falsely decreased in patient with recent radiographic contrast studies, high dietary iodine (e.g. seaweed)

Thyroid Imaging (Scintiscan)

- ^{99m}Tc /pertechnetate IV or radioactive iodine (^{123}I)
- provides functional anatomic detail
- hot (hyperfunctioning) lesions: usually benign (e.g. adenoma, toxic multinodular goitre), cancer very unlikely (less than 1%)
- cold (hypofunctioning) lesions: cancer must be considered until biopsy negative even though only 6-10% are cancerous
- isointense lesions: cancer must be considered as an isointense lesion may represent cold nodules superimposed on normal tissue; if cyst suspected, correlate with U/S
- serum thyroglobulin to detect recurrent thyroid cancer post-treatment

Radioiodine Ablation

- ^{123}I for Graves' disease, multinodular goitre, thyroid cancer

Figure 41. Radioiodine ablation

V/Q Scan

For PE investigation: normal scan makes PE unlikely
Probability of PE: high 80-100%, intermediate 20-80%, low <20%, very low <10%

Ventilation Scan Defects indicate:
Airway obstruction, chronic lung disease, bronchospasm, tumor mass obstruction

Perfusion Scan Defects indicate:
Reduced blood flow due to PE, COPD, asthma, bronchogenic carcinoma, inflammatory lung diseases (pneumonia, sarcoidosis), mediastinitis, mucous plug, vasculitis

Respiratory

V/Q Scan

- examine areas of lung in which ventilation and perfusion do not match
- ventilation scan
 - patient breathes radioactive gas (^{99m}Tc -DTPA, ^{133}Xe , Technegas) through a closed system, filling alveoli proportionally to ventilation
 - ventilation scan defects indicate: airway obstruction, chronic lung disease, bronchospasm, tumor mass obstruction
- perfusion scan
 - radiotracer injected IV (^{99m}Tc -MAA) → trapped in pulmonary capillaries (1 in 1500 arterioles occluded) according to blood flow
 - gives a map of pulmonary circulation
 - relatively contraindicated in severe pulmonary HTN and right-to-left shunt
- with PE
 - areas of lung are well ventilated but not perfused (unmatched defect)
 - defects are wedge-shaped, extend to periphery, usually bilateral and multiple
 - reported as high probability, intermediate, low, very low, or normal
 - V/Q scans for PE have been largely replaced by CT scan with contrast (see [Respirology, R19](#))
- not valid for assessment of PE when patients have intrinsic lung diseases and ventilatory problems
- modified V/Q scan (perfusion only, lower dose contrast) may be used for pregnant patients if CXR is normal

Cardiac

Myocardial Perfusion Scanning

- for investigation of angina, atypical chest pain, CAD, and follow-up post-bypass
- thallium-201 (a radioactive analogue of potassium), ^{99m}Tc -sestamibi, or ^{99m}Tc -tetrofosmin
- injected at peak exercise (physical stress) or after persantine challenge (vasodilator) and again later at rest
- persistent defect (at rest and stress) suggests infarction; reversible defect (only during stress) suggests ischemia
- used to discriminate between reversible (ischemia) vs. irreversible (infarction) changes when other investigations are equivocal
- see [Cardiology and Cardiac Surgery, C13](#)

Radionuclide Ventriculography

- ^{99m}Tc tagged to red blood cells
- first pass through RV → pulmonary circulation → LV; provides information about RV function
- cardiac MUGA scan sums multiple cardiac cycles
 - evaluation of LV function
 - images are obtained by gating (synchronizing) the count acquisitions to the ECG signal
 - MUGA scan can be used to study the function of the heart at a particular stage of contraction
- provides information on ejection fraction (normal = 50-65%), ventricular volume, and wall motion

Active uptake of radiolabel by myocardium is proportional to regional blood flow

Persistent defect (at rest and stress) suggests infarction; reversible defect (only during stress) suggests ischemia

MUGA Scan can be used to study the function of the heart at a particular stage of contraction; superior to echo only in its reproducibility in ejection fraction measurement (precise)

Abdomen and Genitourinary System

HIDA Scan

- IV injection of ^{99m}Tc -disofenin (DISIDA) or ^{99m}Tc -mebrofenin which is bound to protein, taken up, and excreted by hepatocytes into biliary system
- can be performed in non-fasting state but prefer NPO after midnight
- gallbladder visualized when cystic duct is patent (rules out cholecystitis with >99% certainty), usually seen by 30 min to 1 h
- acute cholecystitis: no visualization of gallbladder at 4 h or after administration of morphine at 30 min
- chronic cholecystitis: no visualization of gallbladder at 1 h but seen at 4 h or after morphine administration
- differential diagnosis of obstructed cystic duct: acute/chronic cholecystitis, decreased hepatobiliary function (commonly due to alcoholism), bile duct obstruction, parenteral nutrition, fasting less than 4 h or more than 24 h
- assess bile leaks post-operatively

RBC Scan

- IV injection of radiotracer with sequential images of the abdomen (^{99m}Tc RBCs)
- GI bleed
 - if bleeding acutely at <0.5 mL/min, the focus of activity in the images generally indicates the site of the acute bleed, look for a change in shape and location on sequential image
 - if bleeding acutely at >0.5 mL/min, use angiography (more specific)
- liver lesion evaluation
 - hemangioma has characteristic appearance: cold early, fills in later

Bone

Bone Scan

- isotopes
 - ^{99m}Tc -diphosphonate
 - ♦ triphasic bone scan: flow → blood pool → delayed bone images
 - ♦ uptake can distinguish bone vs. soft tissue infection and septic arthritis vs. osteomyelitis vs. peripheral cellulitis
 - ♦ acute osteomyelitis: increased activity in flow, blood pool, and delayed bone images; usually does not cross joint
 - ♦ septic arthritis and cellulitis: increased activity in blood pool and normal or slightly increased activity in delayed images; may cross joint
 - ^{111}In WBC: tracks the active migration of the WBC, more specific for infection
 - ^{67}Ga citrate: may see uptake in some tumors, also more specific for infection
- radioactive tracer binds to hydroxyapatite of bone matrix

- increased binding when increased blood supply to bone and/or high bone turnover (active osteoblasts)
- indications: bone pain of unknown origin, avascular necrosis, suspected malignancy, staging malignancy (breast, prostate, kidney or lung), follow up after treatment, detection and follow up of primary bone disease, assessment of skeletal trauma, detection of soft tissue calcification renal failure
- differential diagnosis of positive bone scan: bone metastases (breast, prostate, lung, thyroid), primary bone tumor, arthritis, fracture, infection, anemia, Paget's disease
- multiple myeloma: typically normal or cold (false negative); need a skeletal survey
- "superscan": increased bone uptake and poor renal uptake due to diffuse metastases or metabolic causes (renal osteodystrophy)

Interventional Radiology

Vascular Procedures

Angiography

- injection of contrast material through a catheter placed directly into an artery or vein to delineate vascular anatomy
- catheter can be placed into a large vessel (e.g. aorta, vena cava) for a "flush" or selectively placed into a branch vessel for more detailed examination of smaller vessels and specific organs
- indications: diagnosis of primary occlusive or stenotic vascular disease, aneurysms, coronary, carotid and cerebral vascular disease, PE, trauma, bleeding (GI, hemoptysis, hematuria), vascular malformations, as part of endovascular procedures (endovascular aneurysm repair, thrombolysis, stenting, and angioplasties)
- complications (<5% of patients): puncture site hematoma, infection, pseudoaneurysm, AV fistula, dissection, thrombosis, embolic occlusion of a distal vessel
- due to improved technology, non-invasive evaluation of vascular structures is being performed more frequently (color Doppler U/S, CTA, and MRA)
- see *Neuroradiology*, MI18

Percutaneous Transluminal Angioplasty and Stents

- introduction and inflation of a balloon into a stenosed vessel to restore distal blood supply
- common alternative to surgical bypass grafting with 5 yr patency rates similar to surgery, depending on site
- renal, iliac, femoral, mesenteric, subclavian, coronary, and carotid artery stenoses are amenable to treatment
- vascular stents may help improve long-term results by keeping the vessel wall patent after PTA
- stents are also used for angioplasty failure or complications
- stent grafts (metal mesh covered with durable fabric) may provide an alternative treatment option for aneurysms and AV fistulas
- complications: similar to angiography, but also includes vessel rupture

Thrombolytic Therapy

- may be systemic (IV) or catheter directed
- infusion of a fibrinolytic agent (urokinase, streptokinase, TNK, tPA – used most commonly) via a catheter inserted directly into a thrombus
- can restore blood flow in a vessel obstructed with a thrombus or embolus
- indications: treatment of ischemic limb (most common indication), early treatment of MI or stroke to reduce organ damage, treatment of venous thrombosis (DVT or PE)
- complications: bleeding, stroke, distal embolus, reperfusion injury with myoglobinuria and renal failure if advanced ischemia present

Embolization

- injection of occluding material into vessels
- permanent agents: amplatzer plugs, coils, glue, and onyx
- temporary: gel foam, autologous blood clots
- indications: management of hemorrhage (epistaxis, trauma, GI bleed, GU bleed), treatment of arteriovenous malformation, pre-operative treatment of vascular tumors (bone metastases, renal cell carcinoma), varicocele embolization for infertility, symptomatic uterine fibroids
- complications: post-embolization syndrome (pain, fever, leukocytosis), unintentional embolization of a non-target organ with resultant ischemia

On U/S, veins are compressible, arteries are not

Thrombolytic Therapy for Pulmonary Embolism

Cochrane DB Syst Rev 2009;3:CD004437

Study: Systematic review of RCTs comparing thrombolytic therapy with placebo, heparin, or surgical intervention.

Patients: 679 patients with acute PE.

Intervention: Thrombolytics vs. heparin or placebo.

Outcome: Death rate, recurrence of PE, major and minor hemorrhagic events.

Results: Non-significant difference between thrombolytics and heparin or placebo in all measured outcomes. Rt-PA and heparin together reduced need for treatment for in-hospital events. Thrombolytics improved hemodynamic outcome, lung VQ scans, pulmonary angiography assessment, and echocardiograms greater than heparin. Need for further double-blinded RCTs.

Conclusion: We cannot conclude whether thrombolytic therapy is better than heparin for pulmonary embolism based on limited evidence found.

Advanced ischemia patients should receive surgery rather than thrombolysis

Chemoembolization delivers chemotherapy directly into the tumor through its feeding blood supply and traps the drug in place by embolization

Inferior Vena Cava Filter

- insertion of metallic “umbrellas” to mechanically trap emboli and prevent PE
- may be temporary (retrievable) or permanent
- inserted via femoral vein, jugular vein, or antecubital vein
- usually placed infrarenally to avoid renal vein thrombosis
- indications: contraindication to anticoagulation, failure of adequate anticoagulation (e.g. recurrent PE despite therapeutic anticoagulant levels), complication of anticoagulation

Central Venous Access

- variety of devices available
- PICC, external tunneled catheter (Hickman or dialysis catheters), subcutaneous port (Portacath®)
- indications: chemotherapy, TPN, long-term antibiotics, administration of fluids and blood products, blood sampling
- complications: venous thrombosis and central venous stenosis, infection including sepsis, pneumothorax

Figure 42. Retrievable IVC filter

Indications for Central Venous Access

FAT CAB

- Fluids
- Antibiotics
- TPN
- Chemotherapy
- Administration of blood
- Blood sampling

Nonvascular Interventions

Percutaneous Biopsy

- replaces open surgical procedure
- many sites are amenable to biopsy using U/S, fluoroscopy or CT guidance
- complications: false negative (sampling error or tissue necrosis), pneumothorax in 30% of lung biopsies (chest tube required in approximately 5%), acute pancreatitis (pancreatic biopsies), bleeding from liver biopsies in patients with uncorrectable coagulopathies or ascites (can be minimized with transjugular approach)

Abscess Drainage

- placement of a drainage catheter into an infected fluid collection
- administer broad spectrum IV antibiotics prior to procedure
- routes: percutaneous (most common), transgluteal, transvaginal, transrectal
- complications: hemorrhage, injury to intervening structures (e.g. bowel), bacteremia, sepsis

Percutaneous Biliary Drainage/Cholecystostomy

- placement of drainage catheter ± metallic stent into obstructed biliary system (PBD) or gallbladder (cholecystostomy) for relief of jaundice or infection
- percutaneous gallbladder access can be used to crush or remove stones
- indications
 - cholecystostomy: acute cholecystitis
 - PBD: biliary obstruction secondary to stone or tumor, cholangitis
- complications
 - acute: sepsis, hemorrhage
 - long-term: tumor overgrowth and stent occlusion

Percutaneous Nephrostomy

- placement of catheter into renal collecting system
- indications: hydronephrosis, pyonephrosis, ureteric injury with or without urinary peritonitis (traumatic or iatrogenic)
- complications: bacteria and septic shock, hematuria due to pseudoaneurysm or AV fistulas, injury to adjacent organs

Gastrostomy/Gastrojejunostomy

- percutaneous placement of catheter directly into either stomach (gastrostomy) or through stomach into small bowel (transgastric jejunostomy)
- indications: inability to eat (most commonly CNS lesion) or esophageal obstruction, decompression in gastric outlet obstruction
- complications: gastroesophageal reflux with aspiration, peritonitis, hemorrhage, bowel or solid organ injury

Radiofrequency Ablation

- U/S or CT guided probe is inserted into tumor, radiofrequency energy delivered through probe causes heat deposition and tissue destruction
- indications: hepatic tumors (HCC and metastases), renal tumors
- complications: destruction of neighbouring tissues and structures, bleeding

Figure 43. Femoral arteriogram: distal occlusion of superficial femoral artery

Breast Imaging

Modalities

Mammography

Description

- x-ray imaging of the breasts for screening in asymptomatic patients, or diagnosis of clinically-detected or screening-detected abnormalities (see [General Surgery, GS54](#))

Indications

- screening
 - begin screening from age 50 q1-2 yr
 - if over the age of 70, continue screening mammography if in good general health
 - not routinely recommended if under the age of 50 unless strong family history
 - if positive family history, begin screening 5-10 yr younger than the first degree relative who developed breast cancer
- diagnostic
 - signs and symptoms suggestive of breast cancer include a lump or thickening, localized nodularity, dimpling or contour deformity, a persistent focal area of pain, and spontaneous serous or sanguinous nipple discharge from a single duct
 - women with abnormal screening mammograms
 - follow-up of women with previous breast cancer
 - suspected complications of breast implants

Table 20. Breast Imaging Reporting and Data System (BI-RADS®) Mammography Categories

Assessment Categories	Imaging Findings	Follow-up Recommendations
BI-RADS 0	Incomplete	Additional imaging Comparison to prior films
BI-RADS 1	Negative	Routine screening
BI-RADS 2	Benign	Routine screening
BI-RADS 3	Probably benign Likelihood of malignancy is <2%	Unilateral mammogram at 6 mo
BI-RADS 4	Suspicious abnormality	Biopsy
BI-RADS 5	Highly suspicious of malignancy Likelihood of malignancy is 95%	Biopsy
BI-RADS 6	Malignancy confirmed by biopsy	Definitive therapy

Breast MRI

Description

- should be used only after mammography and U/S investigation
- sensitive for detecting invasive breast cancer (95-100%) but specificity variable (37-97%)
- use as a screening modality has been limited to high risk patients

Indications

- evaluation of previously diagnosed breast cancer: positive margins, recurrence, response to chemotherapy
- post-surgical resection of breast cancer
- known BRCA1 or BRCA2 mutation, or other gene predisposing to breast cancer
- untested first-degree relative of a carrier of such a gene mutation
- family history consistent with a hereditary breast cancer syndrome and estimated personal lifetime cancer risk >25%
- high-risk marker on prior biopsy (atypical ductal hyperplasia, atypical lobular hyperplasia, lobular carcinoma *in situ*)
- radiation therapy to chest (before age 30)
- MRI should not be used to screen the general population or to differentiate between benign and malignant lesions

U/S

Definition

- U/S can determine if a mass is cystic or solid and is commonly used during biopsy

Indications

- identification and characterization of palpable abnormalities
- evaluation of ambiguous mammographic findings in the determination of cystic vs. solid characteristics
- evaluation of patients with suspected silicone implant rupture and problems associated with breast implants
- guidance for interventional procedures
- breast U/S is the initial imaging technique to evaluate palpable masses in women under 30 and in lactating and pregnant women

Breast Interventional Procedures

Description

- includes fine needle aspirate biopsy, core needle biopsy, abscess drainage, and cyst aspiration (see [General Surgery, GS54](#))

Indications

- cystic mass: complex cyst, symptomatic, suspected abscess
- solid mass: confirm diagnosis of a lesion suspicious for malignancy (BI-RADS® Category 4 or 5) or confirm diagnosis of a probable benign mass (BI-RADS® Category 3)
- initial percutaneous biopsy procedure that was insufficient or discordant with imaging
- presurgical U/S-guided localization of a lesion

Breast Findings

Breast Masses

- definition: a space occupying lesion seen in two different projections; if seen in only a single projection it should be called a “density” until its three-dimensionality is confirmed

Table 21. Mammographic Features of Benign and Malignant Breast Masses

	Benign	Malignant
Shape	Oval, round, lobular	Irregular
Margin	Circumscribed, well-defined	Indistinct, microlobulated, spiculated
Density	Radiolucent (oil cyst, lipoma, fibrolipoma, galactoceles, hamartoma)	Radiodense
Calcifications (± mass)	Popcorn (hyalinizing fibroadenoma), lucent center (oil cyst/fat necrosis), layering (milk of calcium), vascular, round, scattered	Pleomorphic (vary in size and shape), amorphous (indistinct), fine linear, coarse heterogeneous, regional, segmental, clustered

Other Findings

- tubular density/dilated duct: branching tubular structures usually represent enlarged ducts (milk ducts); if they are clearly identified as such, these densities are of little concern
- intramammary lymph node: typical lymph nodes are circumscribed, reniform and often have a fatty notch and center; usually less than 1 cm, and usually seen in the outer, often upper part of the breast; when these characteristics (particularly fatty center or notch) are well seen, the lesion is almost always benign and insignificant
- focal asymmetric density: area of breast density with similar shape on two views, but completely lacking borders and conspicuity of a true mass; must be carefully evaluated with focal compression to exclude findings of a true mass or architectural distortion
 - if focal compression shows mass-like character, or if the area can be palpated, biopsy must be considered

Basic Anatomy Review

Anatomy of the Kidney

- see [Urology, U4](#)

Renal Structure and Function

The Nephron

- basic structural and functional unit of the kidney, approximately 1 million per kidney
- 2 main components: glomerulus and attached renal tubule
- direction of blood flow: afferent arteriole → glomerular capillaries → efferent arteriole → vasa recta (the capillaries surrounding the tubules) → renal venules

Table 1. Major Functions of the Kidneys

Function	Mechanism	Affected Elements
1. Waste Excretion	Glomerular filtration	Excretion of nitrogenous products of protein metabolism (urea, Cr)
	Tubular secretion	Excretion of organic acids (urate) and organic bases (Cr)
	Tubular catabolism	Breakdown and excretion of drugs (antibiotics, diuretics) and peptide hormones (most pituitary hormones, insulin, glucagon)
2. Electrolyte Balance	Tubular NaCl and water reabsorption	Controls volume status and osmolar balance
	Tubular K ⁺ secretion	Controls potassium concentration
	Tubular H ⁺ secretion	Acid-base balance
	HCO ₃ ⁻ synthesis and reabsorption	Acid-base balance
	Tubular Ca ²⁺ , Mg ²⁺ , PO ₄ ³⁻ transport	Alters Ca ²⁺ , Mg ²⁺ , PO ₄ ³⁻ homeostasis
3. Hormonal Synthesis	Erythropoietin production (cortex)	RBC production
	Vitamin D activation: 25(OH)D converted to 1,25(OH) ₂ D	Calcium homeostasis
	Renin production (juxtaglomerular apparatus)	Alters vascular resistance and aldosterone secretion
4. Blood Pressure Regulation	Na ⁺ excretion	Alters ECF volume
	Renin production	Alters vascular resistance
5. Glucose Homeostasis	Gluconeogenesis (from lactate, pyruvate, and amino acids)	Glucose supply maintained in prolonged starvation

The Glomerulus

- site where blood constituents are filtered through to the kidney tubules for excretion or reabsorption
- filtration occurs across the glomerular filtration barrier (endothelium, GBM, podocytes) into Bowman's space
- particles are selectively filtered by size (<60 kDa) and charge (negative charge repelled)
- consists of following cell types
 1. Mesangial cells
 - structural cells that support the vascular tree; they are also contractile and produce vasoactive substances to help control blood flow
 2. Capillary endothelial cells
 - one of the cells of the glomerular filtration barrier and help form the plasma filtration apparatus due to their sinusoidal nature and glycocalyx; contribute to the production of the GBM
 3. Visceral epithelium (podocytes)
 - one of the cells of the glomerular filtration barrier and help form the plasma filtration apparatus due to their interdigitated foot process that form slit diaphragms; contribute to the production of the GBM
 4. Parietal epithelium
 - lines the interior of Bowman's capsule and contains a podocyte progenitor population
 5. Juxtaglomerular cells
 - smooth muscle cell in lining of afferent arteriole; produce, store, and secrete renin as part of renal autoregulation

Acronyms

ACEI	angiotensin converting enzyme inhibitor
ACR	albumin to creatinine ratio
ADH	antidiuretic hormone
AG	anion gap
AIN	acute interstitial nephritis
AKI	acute kidney injury
ANA	antinuclear antibody
ARB	angiotensin receptor blocker
ASA	acetylsalicylic acid
ASOT	anti-streptolysin-O titer
ATN	acute tubular necrosis
AVM	arteriovenous malformation
c-ANCA	cytoplasmic antineutrophil cytoplasmic antibody
C&S	culture and sensitivity
CHF	congestive heart failure
CKD	chronic kidney disease
Cr	creatinine
CrCl	creatinine clearance
D5W	5% dextrose in water
DCT	distal convoluted tubule
DDAVP	1-desamino-8-d-arginine vasopressin
DI	diabetes insipidus
DIC	disseminated intravascular coagulation
DKA	diabetic ketoacidosis
DM	diabetes mellitus
eGFR	estimated glomerular filtration rate
ESR	erythrocyte sedimentation rate
ESRD	end-stage renal disease
FF	filtration fraction
FGS	focal segmental glomerulosclerosis
GBM	glomerular basement membrane
GFR	glomerular filtration rate
GN	glomerulonephritis
HCTZ	hydrochlorothiazide
HPF	high power field
HSP	Henoch-Schönlein purpura
HTN	hypertension
HUS	hemolytic uremic syndrome
IVP	intravenous pyelogram
LOC	level of consciousness
MDRD	modification of diet in renal disease
NS	normal saline
NSAIDs	nonsteroidal anti-inflammatory drugs
p-ANCA	perinuclear anti-neutrophil cytoplasmic antibody
PCKD	polycystic kidney disease
PTH	parathyroid hormone
R&M	routine and microscopy
RAAS	renin-angiotensin-aldosterone system
RBF	renal blood flow
RPF	renal plasma flow
RCC	renal cell carcinoma
RPGN	rapidly progressive glomerulonephritis
RRT	renal replacement therapy
RTA	renal tubular acidosis
SIADH	syndrome of inappropriate antidiuretic hormone
SLE	systemic lupus erythematosus
TBW	total body water
TIN	tubulointerstitial nephritis
TTP	thrombotic thrombocytopenic purpura
UAG	urine anion gap
UTI	urinary tract infection

Figure 1. The glomerulus

The Renal Tubules

- reabsorption and secretion occur between the renal tubules and vasa recta forming urine for excretion
- each segment of the tubule selectively transports various solutes and water and is targeted by specific diuretics

Figure 2. Tubular segments of the nephron

Renal Hemodynamics

- GFR
 - the rate of fluid transfer between glomerular capillaries and Bowman's space
 - 180 L/d, of which 99% is reabsorbed, giving a daily urine output of 1.0-1.5 L
 - normal urine output is >0.5 ml/kg/h in adults
 - GFR is highest in early adulthood, and decreases thereafter
- renal autoregulation maintains constant GFR over mean arterial pressures of 70-180 mmHg
- 2 mechanisms of autoregulation:
 - myogenic mechanism: release of vasoactive factors in response to changes in perfusion pressure (e.g. ↑ perfusion pressure → afferent arteriolar constriction → ↓ GFR)
 - tubuloglomerular feedback: changes in Na⁺ delivery to macula densa lead to changes in afferent arteriolar tone (e.g. increased delivery causes afferent constriction)
- FF
 - percentage of RPF filtered across the glomeruli
 - expressed as a ratio: FF = GFR/RPF; normal = 0.2 or 20%
 - angiotensin II constricts renal efferent arterioles, which increases FF thereby maintaining GFR
- renin is released from juxtaglomerular apparatus in response to decreased RPF

Glomerular Filtration Rate

$$GFR = K_f (\Delta P - \Delta \Pi)$$

K_f = ultrafiltration coefficient

ΔP = hydrostatic pressure difference between glomerular capillaries and Bowman's space

$\Delta \Pi$ = osmotic pressure difference between glomerular capillaries and Bowman's space

$\Delta P - \Delta \Pi$ = net outward pressure

Figure 3. Stimuli for renin release

Assessment of Renal Function

Measurement of Renal Function

- GFR = rate of filtration of plasma by the glomeruli
- most renal functions decline in parallel with a decrease in GFR
- inulin clearance is the gold standard for measuring GFR, but very rarely used clinically
- clinically, GFR is estimated using serum creatinine concentration, [Cr]
- Cr is a metabolite of creatine (intermediate in muscle energy metabolism)
- Cr is freely filtered at the glomerulus with no tubular reabsorption
- tubular secretion varies based on level of renal function (10% to >50%)
- rate of production determined by muscle mass
- Cr filtered ≈ Cr excreted (at steady state)

Ways to Estimate GFR Using Serum Creatinine Concentration

1. Measure CrCl

- calculation provides reasonable estimate of GFR
- measure plasma [Cr], 24 h urine volume, and urine [Cr]
 - $GFR/d = (\text{urine [Cr]} \times \text{urine volume}/d) / (\text{plasma [Cr]})$
 - must use same units for urine [Cr], and plasma [Cr]

2. Estimate CrCl using Cockcroft-Gault formula

- serum Cr used along with age, gender, and weight (kg) to estimate GFR
- normal range is >90 mL/min (>1.5 mL/s)

$$Cr_{\text{filtered}} = Cr_{\text{excreted}}$$

$$[Cr]_{\text{plasma}} \times GFR = [Cr]_{\text{urine}} \times \text{urine flow rate (mL/min)}$$

$$GFR = \frac{[Cr]_{\text{urine}} \times \text{urine flow rate}}{[Cr]_{\text{plasma}}}$$

At steady state $[Cr]_{\text{serum}} \propto 1/CrCl$

Cockcroft-Gault Formula

$$CrCl \text{ (mL/min)} = \frac{(\text{weight in kg}) (140 - \text{age}) \times 1.23}{\text{serum creatinine (}\mu\text{mol/L)}}$$

Multiply above by 0.85 for females

3. Estimate GFR using MDRD formula

- most common way in which GFR is estimated (MDRD 7 equation)
- complex formula incorporating age, gender, serum Cr, and African descent, but does not include weight
- GFR is reported as mL/min/1.73 m² body surface area

4. Estimate GFR using CKD-EPI equation

- the best current equation
- calculated using serum Cr, age, sex, and race

Limitations of Using Serum Cr Measurements**1. must be in steady state**

- constant GFR and rate of production of Cr from muscles
- sudden injury may reduce GFR substantially, but it takes time for Cr to accumulate and then re-establish steady state
- clinical correlation: in AKI, the rise in Cr is often delayed

2. GFR must fall substantially before plasma [Cr] rises above normal laboratory range

- with progressive renal failure, remaining nephrons compensate with hyperfiltration
- GFR is relatively preserved despite significant structural damage

3. plasma [Cr] is influenced by the rate of Cr production

- lower production with smaller muscle mass (e.g. female, elderly, low weight)
 - for example, consider plasma [Cr] of 100 µmol/L (1.13 mg/dL) in both of these patients
 - 20 yr old man who weighs 100 kg, GFR = 144 mL/min
 - 80 yr old woman who weighs 50 kg, GFR = 30.6 mL/min
- clinical correlation: GFR decreases with age but would not be reflected as a rise in serum Cr due to the age-associated decline in muscle mass

4. tubular secretion of Cr increases as GFR decreases

- serum Cr and CrCl overestimate low GFR
- certain drugs (cimetidine, trimethoprim) interfere with Cr secretion

5. errors in Cr measurement

- very high bilirubin level causes [Cr] to be falsely low
- acetoacetate (a ketone body) and certain drugs (cefexitin) create falsely high [Cr]

Measurement of Urea Concentration

- urea is the major end-product of protein metabolism
- plasma urea concentration reflects renal function but should not be used alone as it is modified by a variety of other factors
- urea production reflects dietary intake of protein and catabolic rate; increased protein intake or catabolism (sepsis, trauma, GI bleed) causes urea level to rise
- ECF volume depletion causes a rise in urea independent of GFR or plasma [Cr]
- in addition to filtration, a significant amount of urea is reabsorbed along the tubule
- reabsorption is increased in hypernatremic states such as ECF volume depletion
- typical ratio of urea to [Cr] in serum is 1:12 in SI units (using mEq/L for urea and µmol/L for Cr)

**Cystatin C**

Cystatin C is a protease which is completely filtered by the glomerulus and is not affected by muscle mass; it is not currently used in clinical practice, but may be a more accurate way to measure renal function in the future, particularly in DM

**Clinical Settings in which Urea Level is Affected Independent of Renal Function****Disproportionate Increase in Urea**

- Volume depletion (prerenal azotemia)
- GI hemorrhage
- High protein diet
- Sepsis
- Catabolic state with tissue breakdown
- Corticosteroid or cytotoxic agents

Disproportionate Decrease in Urea

- Low protein diet
- Liver disease

Urinalysis

- use dipstick in freshly voided urine specimen to assess the following:

1. Specific Gravity

- ratio of the mass of equal volumes of urine/H₂O
- range is 1.001 to 1.030
- values <1.010 reflect dilute urine, values >1.020 reflect concentrated urine
- value usually 1.010 in ESRD (isosthenuria)

2. pH

- urine pH is normally between 4.5-7.0; if persistently alkaline, consider:
 - RTA
 - UTI with urease-producing bacteria (e.g. *Proteus*)

3. Glucose

- freely filtered at glomerulus and reabsorbed in proximal tubule
- causes of glucosuria include
 1. hyperglycemia >160-200 mg/dL (>9-11 mEq/L) leads to filtration that exceeds tubular resorption capacity
 2. increased GFR (e.g. pregnancy)
 3. proximal tubule dysfunction (e.g. Fanconi's syndrome)

4. Protein

- dipstick only detects albumin; other proteins (e.g. Bence-Jones, Ig, Tamm-Horsfall) may be missed
- microalbuminuria (defined as ≥2.0 mg/mEq Cr in males and ≥2.8 mg/mEq Cr in females) is not detected by standard dipstick (see *Diabetes*, NP28)
- sulfosalicylic acid detects all protein in urine by precipitation
- gold standard: 24 h timed urine collection for total protein

**24 h Urine Collection**

- Discard first morning specimen
- Collect all subsequent urine for the next 24 h
- Refrigerate between voids
- Collect second morning specimen

Clarity: Cloudiness may indicate infection

Color: usually pale yellow or amber, but may be colorless (diabetes insipidus, excess water intake), bright yellow (due to riboflavin ingestion or vitamin tablets), or dark yellow (concentrated urine in intravascular volume depletion)

**Estimating Urine Osmolality**

Last 2 digits of the specific gravity x 30
= urine osmolality approximately
(e.g. specific gravity of 1.020
= 600 mOsm)

5. Leukocyte Esterase

- enzyme found in WBC and detected by dipstick
- presence of WBCs indicates infection (e.g. UTI) or inflammation (e.g. AIN)

6. Nitrites

- nitrates in urine are converted by some bacteria to nitrites
- high specificity, low sensitivity for UTI

7. Ketones

- positive in alcoholic/diabetic ketoacidosis, prolonged starvation, fasting

8. Hemoglobin

- positive in hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis), and true hematuria (RBCs seen on microscopy)

Nitrite Negative Bacteria

- *Enterococci*
- *Staphylococci*

Urine Microscopy

- centrifuge urine specimen for 3-5 min, discard supernatant, resuspend sediment and plate on slide
- shaking tube vigorously may disrupt casts

Table 2. Comparison of Urinary Sediment Findings

	Active Sediment = Suggestive of Parenchymal Kidney Disease	Bland Sediment = Less Likely Parenchymal Kidney Disease
Any one or more of the following seen on microscopy	Red cell casts White cell casts Muddy-brown granular or epithelial cell casts >2 red cells per HPF >4 white cells per HPF	Only hyaline casts <2 red cells per HPF <4 white cells per HPF Small quantities of crystals Small amount of bacteria

1. CELLS

Erythrocytes

- normal range = up to 2-3 RBCs per HPF
- hematuria = greater than 2-3 RBCs per HPF
- dysmorphic RBCs and/or RBC casts suggest glomerular bleeding (e.g. proliferative GN)
- isomorphic RBCs, no casts suggest extraglomerular bleeding (e.g. bladder Ca)

Leukocytes

- normal range = up to 3 WBCs per HPF
- pyuria = greater than 3 WBCs per HPF
- indicates inflammation or infection
- if persistent sterile pyuria present (i.e. negative culture), consider: chronic urethritis, prostatitis, interstitial nephritis, calculi, papillary necrosis, renal TB, viral infections

Eosinophils

- detected using Wright's or Hansel's stain (not affected by urine pH)
- consider AIN, atheroembolic disease

Oval Fat Bodies

- renal tubular cells filled with lipid droplets
- seen in heavy proteinuria (e.g. nephrotic syndrome)

2. CASTS

- cylindrical structures formed by intratubular precipitation of Tamm-Horsfall mucoprotein; cells may be trapped within the matrix of protein

Table 3. Interpretation of Casts

Hyaline casts	Physiologic (concentrated urine, fever, exercise)
RBC casts	Glomerular bleeding (GN, vasculitis)
WBC casts	Infection (pyelonephritis) Inflammation (interstitial nephritis)
Pigmented granular casts (heme granular casts, muddy brown)	ATN Acute GN
Fatty casts	Heavy proteinuria (>3.5 g/d)

Positive dipstick for leukocyte esterase and nitrites is 94% specific for diagnosing a UTI

3. CRYSTALS

- uric acid: consider acid urine, hyperuricosuria
- calcium phosphate: alkaline urine
- calcium oxalate: consider hyperoxaluria, ethylene glycol poisoning
- sulfur: sulfa-containing antibiotics

Urine Biochemistry

- commonly measure: Na^+ , K^+ , Cl^- , osmolality, and pH
- no 'normal' values; electrolyte excretion depends on intake and current physiological state
- results must be interpreted in the context of a patient's current state
 1. ECF volume depletion: expect low urine $[\text{Na}^+]$ (kidneys should be retaining Na^+)
 - ♦ urine $[\text{Na}^+] (>40 \text{ mEq/L})$ suggests a renal problem or the action of a diuretic
 - ♦ urine $[\text{Na}^+] (<20 \text{ mEq/L})$ suggests a prerenal problem
 2. daily urinary potassium excretion rate should be decreased ($<20 \text{ mEq/d}$) in hypokalemia
 - ♦ if higher than 20 mEq/d , suggests renal contribution to hypokalemia
- osmolality is useful to estimate the kidney's concentrating ability
- FE_{Na} refers to the fractional excretion of Na^+
 - $\text{FE}_{\text{Na}} = \text{urine } [\text{Na}^+] \times \text{plasma } [\text{Cr}] / (\text{plasma } [\text{Na}^+] \times \text{urine } [\text{Cr}])$
 - $\text{FE}_{\text{Na}} < 1\%$ suggests the pathology is prerenal

Examples of Common Urine Electrolyte Abnormalities

- high urine $[\text{Na}^+] (>40 \text{ mEq/L})$ in the setting of AKI: suggests renal disease
- high urine $[\text{Na}^+] (>40 \text{ mEq/L})$ in the setting of hyponatremia: generally from causes such as diuretics, tubular disease (e.g. Bartter's syndrome), SIADH
- additionally, urine pH is useful to grossly assess renal acidification
 - low pH (<5.5) in the presence of low serum pH is an appropriate renal response
 - a high pH in this setting might indicate a renal acidification defect (e.g. RTA)

Fractional Excretion of Sodium

$$\text{FE}_{\text{Na}} = \frac{[\text{Na}^+]_{\text{urine}} \times [\text{Cr}]_{\text{plasma}}}{[\text{Na}^+]_{\text{plasma}} \times [\text{Cr}]_{\text{urine}}} \times 100$$

Many formulas used in nephrology are derived from the division of two fractions, each of which compare a urine and plasma concentration (e.g. $U_1/P_1 \div U_2/P_2$); in the case of FE_{Na} , it is $U_{\text{Na}}/P_{\text{Na}} \div U_{\text{Cr}}/P_{\text{Cr}}$, which then gives the above equation

Electrolyte Disorders

Sodium Homeostasis

- hyponatremia and hypernatremia are disorders of water balance
 - hyponatremia usually suggests too much water in the ECF relative to Na^+
 - hypernatremia usually suggests too little water in the ECF relative to Na^+
- solutes (such as Na^+ , K^+ , glucose) that cannot freely traverse the plasma membrane contribute to effective osmolality and induce transcellular shifts of water
 - water moves out of cells in response to increased ECF osmolality
 - water moves into cells in response to decreased ECF osmolality
- ECF volume is determined by Na^+ content rather than concentration
 - Na^+ deficiency leads to ECF volume contraction
 - Na^+ excess leads to ECF volume expansion
- clinical signs and symptoms of hyponatremia and hypernatremia are secondary to cells (especially in the brain) shrinking (hypernatremia) or swelling (hyponatremia)

Common Electrolytes

- Sodium (Na^+) 135-145 mEq/L
- Potassium (K^+) 3.5-5 mEq/L
- Chloride (Cl^-) 95-105 mEq/L
- Bicarbonate (HCO_3^-) 18-23 mEq/L

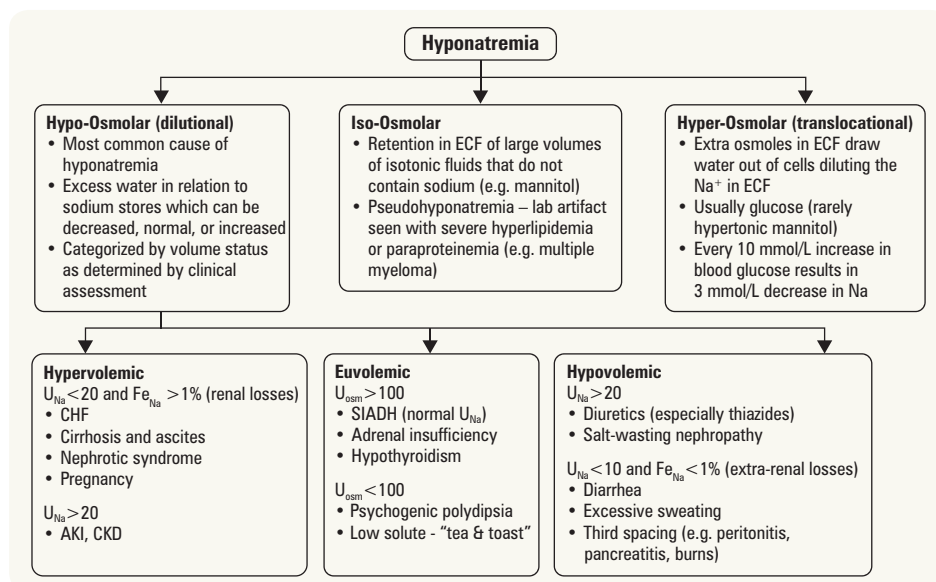

Table 4. Clinical Assessment of ECF Volume (Total Body Na^+)

Fluid Compartment	Hypovolemic	Hypervolemic
Intravascular		
JVP	Decreased	Increased
Blood pressure	Orthostatic drop	Normal to increased
Auscultation of heart	Tachycardia	S3
Auscultation of lungs	Normal	Inspiratory crackles
Interstitial		
Skin turgor	Decreased	Normal/increased
Edema (dependent)	Absent	Present
Other		
Urine output	Decreased*	Variable
Body weight	Decreased	Increased
Hematocrit, serum protein	Increased	Decreased

*If there is a renal abnormality (e.g. osmotic diuresis), the urine output may be increased despite the presence of hypovolemia

Hyponatremia

- hyponatremia: serum $[Na^+]$ <135 mEq/L
- can be associated with hypo-osmolality (most common), iso-osmolality, or hyperosmolality
- consider if it is “appropriate” vs. “inappropriate” ADH secretion
- if appropriate ADH secretion, is it real vs. effective volume loss?

If the urine osmolality is unknown, assume the urine is hypo-osmolar/dilute

Figure 4. Approach to hyponatremia

Signs and Symptoms

- depend on degree of hyponatremia and more importantly, velocity of progression from onset
- acute hyponatremia (<24 -48 h) more likely to be symptomatic
- chronic hyponatremia (>24 -48 h) less likely to be symptomatic due to adaptation
 - adaptation: normalization of brain volume through loss of cellular electrolytes (within hours) and organic osmolytes (within days)
 - adaptation is responsible for the risks associated with overly rapid correction
- neurologic symptoms predominate (secondary to cerebral edema): headache, nausea, malaise, lethargy, weakness, muscle cramps, anorexia, somnolence, disorientation, personality changes, depressed reflexes, decreased LOC

Complications

- seizures, coma, respiratory arrest, permanent brain damage, brainstem herniation, death
- risk of brain cell shrinkage with rapid correction of hyponatremia
 - can develop osmotic demyelination of pontine and extrapontine neurons; may be irreversible (e.g. central pontine myelinolysis: cranial nerve palsies, quadriplegia, decreased LOC)

Risk Factors for Osmotic Demyelination

- rise in serum $[Na^+]$ with correction >8 mEq/L/d if chronic hyponatremia
- associated hypokalemia
- if patient with hyponatremia and hypovolemia is given large volume of isotonic fluid (ADH is stimulated by hypovolemia; when hypovolemia is corrected, the ADH level falls suddenly causing sudden brisk water diuresis, and therefore rapid rise in serum Na^+ level)

Investigations

- ECF volume status assessment (see Table 4)
- serum electrolytes, glucose, Cr
- serum osmolality, urine osmolality
- urine Na^+ (urine $Na^+ < 10$ -20 mEq/L suggests volume depletion as the cause of hyponatremia)
- assess for causes of SIADH (see Table 6)
- TSH, free T4, and cortisol levels
- consider CXR and possibly CT chest if suspect pulmonary cause of SIADH (e.g. small cell lung cancer)
- consider CT head if suspect CNS cause

Central Pontine Myelinolysis

- Cranial nerve palsies
- Quadriplegia
- Decreased LOC

HypOnatremia = swOllen cells
 HyperNatremia = shRunken cells

Treatment of Hyponatremia

- general measures for all patients
 - 1) treat underlying cause (e.g. restore ECF volume if volume depleted, remove offending drug, treat pain, nausea, etc.)
 - 2) restrict free water intake
 - 3) promote free water loss
 - 4) carefully monitor serum Na^+ , urine volume, and urine tonicity (e.g. high output of dilute urine may be a sign of impending rapid serum sodium correction)
 - 5) frequently ensure correction is not occurring too rapidly
 - monitor urine output frequently: high output of dilute urine is the first sign of dangerously rapid correction of hyponatremia

A. Definitely Acute (known to have developed over <24-48 h)

- commonly occurs in hospital (dilute IV fluid, post-operative increased ADH)
- less risk from rapid correction since adaptation has not fully occurred
- if symptomatic
 - correct rapidly with 3% NaCl 1-2 cc/kg/h up to serum $[\text{Na}^+] = 125\text{-}130 \text{ mEq/L}$
 - may need furosemide to address volume overload
- if asymptomatic, treatment depends on severity
 - if marked fall in plasma $[\text{Na}^+]$, treat as symptomatic

B. Chronic or Unknown

1. if severe symptoms (seizures or decreased LOC)
 - must partially correct acutely
 - aim for increase of Na^+ by 1-2 mEq/L/h for 4-6 h
 - limit total rise to 8 mEq/L in 24 h
 - IV 3% NaCl at 1-2 cc/kg/h
 - may need furosemide
2. if asymptomatic
 - water restrict to <1 L/d fluid intake
 - consider IV 0.9% NS + furosemide (reduces urine osmolality, augments excretion of H_2O)
 - consider NaCl tablet
3. refractory
 - furosemide and oral salt tablets
 - oral urea (osmotic aquaresis)
 - V2 receptor antagonists (e.g. tolvaptan)
4. always pay attention to patient's ECF volume status – if already volume-expanded, unlikely to give NaCl; if already volume-depleted, almost never appropriate to give furosemide

C. Options for Treatment of Overly-Rapid Correction

- give water (IV D5W)
- give ADH to stop water diuresis (DDAVP 1-2 μg IV)

Impact of IV Solution on Serum $[\text{Na}^+]$

- formula to estimate the change in serum $[\text{Na}^+]$ caused by retention of 1 L of any infusate
 $[\text{TBW} = (\text{for men}) 0.6 \times \text{wt}(\text{kg}); (\text{for women}) 0.5 \times \text{wt}(\text{kg})]$

$$\text{change in serum } [\text{Na}^+] = \frac{\text{infusate } [\text{Na}^+] - \text{serum } [\text{Na}^+]}{\text{TBW} + 1 \text{ L}}$$

- formula assumes there are no losses of water or electrolytes

SYNDROME OF INAPPROPRIATE ANTIDIURETIC HORMONE SECRETION

1. urine that is inappropriately concentrated for the serum osmolality
2. high urine sodium (>20-40 mEq/L)
3. high FE_{Na}

Beware of Rapid Correction of Hyponatremia

- Inadvertent rapid correction of hyponatremia can easily occur (e.g. patient with hyponatremia due to SIADH from nausea)
- Anti-emetic given for relief of hyponatremia-induced nausea
- ADH quickly turned off in the absence of nausea, the kidneys rapidly excrete the excess free water, and the serum $[\text{Na}^+]$ rises rapidly
- Patient at risk of osmotic demyelination
- High output dilute urine (>100 cc/h, <100 mOsm/L) in the setting of hyponatremia is usually the first sign of dangerously rapid correction of serum sodium

Correction of Na^+ in hyponatremia should not exceed 8 mEq/L/24 h unless definitely known to be <24-48 h duration; frequent monitoring of serum Na^+ and urine output is essential

Concentration of Na^+ in Common Infusates

- $[\text{Na}^+]$ in 0.45% NaCl = 77 mEq/L
- $[\text{Na}^+]$ in 0.9% NaCl = 154 mEq/L
- $[\text{Na}^+]$ in 3% NaCl = 513 mEq/L
- $[\text{Na}^+]$ in 5% NaCl = 855 mEq/L
- $[\text{Na}^+]$ in Ringer's lactate = 130 mEq/L
- $[\text{Na}^+]$ in D5W = 0

Table 5. Disorders Associated with SIADH

Tumor	Pulmonary	CNS	Drugs	Miscellaneous
Small cell cancer Bronchogenic carcinoma Pancreatic adenocarcinoma Hodgkin's lymphoma Thymoma Leukemia	Pneumonia Lung abscess TB Acute respiratory failure Asthma COPD Positive pressure ventilation	Mass lesion Encephalitis Subarachnoid hemorrhage Stroke Head trauma Acute psychosis Acute intermittent porphyria	Antidepressants TCAs SSRIs Antineoplastics Vincristine Cyclophosphamide Anti-epileptics Carbamazepine Barbiturates Chlorpropamide ACEI Other DDAVP Oxytocin Nicotine	Post-operative state Pain Severe nausea HIV

Hypernatremia

- hypernatremia: serum $[\text{Na}^+] > 145 \text{ mEq/L}$
- too little water relative to total body Na^+ ; always a hyperosmolar state
- usually due to NET water loss, rarely due to hypertonic Na^+ gain
- less common than hyponatremia because patients are protected against hypernatremia by thirst and release of ADH

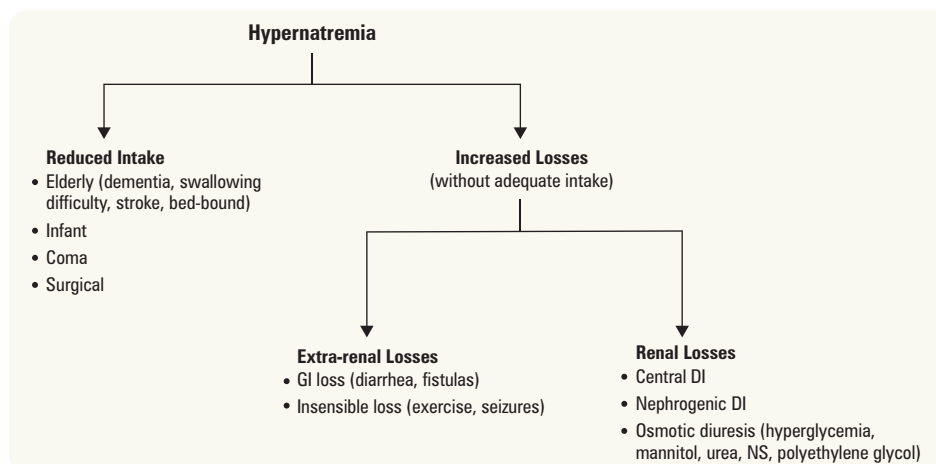

Figure 5. Approach to hypernatremia

Signs and Symptoms

- with acute hypernatremia no time for adaptation, therefore more likely to be symptomatic
- adaptive response: cells import and generate new osmotically active particles to normalize size
- due to brain cell shrinkage: altered mental status, weakness, neuromuscular irritability, focal neurologic deficits, seizures, coma, death
- \pm polyuria, thirst, signs of hypovolemia

Complications

- increased risk of vascular rupture resulting in intracranial hemorrhage
- rapid correction may lead to cerebral edema due to ongoing brain hyperosmolality

Treatment of Hypernatremia

- general measures for all patients
 - give free water (oral or IV)
 - treat underlying cause
 - monitor serum Na^+ frequently to ensure correction is not occurring too rapidly
- if evidence of hemodynamic instability, must first correct volume depletion with NS bolus
- loss of water is often accompanied by loss of Na^+ , but a proportionately larger water loss
- use formula to calculate free water H_2O deficit and replace
- encourage patient to drink pure water, as oral route is preferred for fluid administration
- if unable to replace PO or NG, correct H_2O deficit with hypotonic IV solution (IV D5W, 0.45% NS [half normal saline], or 3.3% dextrose with 0.3% NaCl ["2/3 and 1/3"])
- use formula (see [Hyponatremia, NP8](#)) to estimate expected change in serum Na^+ with 1 L infusate
- aim to lower $[\text{Na}^+]$ by no more than 12 mEq/L in 24 h (0.5 mEq/L/h)
- must also provide maintenance fluids and replace ongoing losses
- general rule: give 2 cc/kg/h of free water to correct serum $[\text{Na}^+]$ by about 0.5 mEq/L/h or 12 mEq/L/d

H₂O Deficit and TBW Equations

- $\text{TBW} = 0.6 \times \text{wt (kg) men}$
 $\text{TBW} = 0.5 \times \text{wt (kg) women}$
- $\text{H}_2\text{O deficit} = \text{TBW} \times ([\text{Na}^+]_{\text{plasma}} - 140) / 140$

Correction of serum $[\text{Na}^+]$ in hypernatremia should not exceed 12 mEq/L/24 h

1 L D5W approximately equals 1 L of free water
1 L 0.45% NS approximately equals 500 mL of free water

DIABETES INSIPIDUS

- collecting tubule is impermeable to water due to absence of ADH or impaired response to ADH
- defect in central release of ADH (central DI) or renal response to ADH (nephrogenic DI)

Etiology

- central DI: neurosurgery, granulomatous diseases, trauma, vascular events, and malignancy
- nephrogenic DI: lithium (most common), hypokalemia, hypercalcemia, and congenital

Diagnosis

- urine osmolality inappropriately low in patient with hypernatremia ($U_{osm} < 300$ mOsm/kg)
- serum vasopressin concentration may be absent, low (central), or elevated (nephrogenic)
- dehydration test: H_2O deprivation until loss of 3% of body weight or until urine osmolality rises above plasma osmolality; if urine osmolality remains < 300 (fails to concentrate urine), most likely DI
- administer DDAVP (exogenous ADH) (10 μ g intranasally or 2 μ g SC or IV)
 - central DI: diagnosed if there is rise in urine osmolality, fall in urine volume
 - treat with DDAVP
 - nephrogenic DI: exogenous ADH fails to concentrate urine as kidneys do not respond
 - treat with water (IV D5W or PO water), thiazides may help as well (reduced ECF volume stimulates proximal tubular reabsorption of sodium and water, leading to less delivery of glomerular filtrate to ADH sensitive parts of renal tubule, and therefore lower urine volume results)

Potassium Homeostasis

- approximately 98% of total body K^+ stores are intracellular
- normal serum K^+ ranges from 3.5-5.0 mEq/L
- in response to K^+ load, rapid removal from ECF is necessary to prevent life-threatening hyperkalemia
- insulin, catecholamines, and acid-base status influence K^+ movement into cells
 - aldosterone has a minor effect
- potassium excretion is regulated at the distal nephron
 - K^+ excretion = urine flow rate \times urine $[K^+]$

Factors which Increase Renal K^+ Loss

- hyperkalemia
- increased distal tubular urine flow rate and Na^+ delivery (thiazides and loop diuretics)
- increased aldosterone activates epithelial sodium channel in cortical collecting duct, causing Na^+ reabsorption and K^+ excretion
- metabolic alkalosis
- hypomagnesemia
- increased non-reabsorbable anions in tubule lumen: HCO_3^- , penicillin, salicylate

Na^+ = predominating extracellular ion
 K^+ = predominating intracellular ion

Hypokalemia

- serum $[K^+] < 3.5$ mEq/L

Signs and Symptoms

- usually asymptomatic, particularly when mild (3.0-3.5 mEq/L)
- N/V, fatigue, generalized weakness, myalgia, muscle cramps, and constipation
- if severe: arrhythmias, muscle necrosis, and rarely paralysis with eventual respiratory impairment
- arrhythmias occur at variable levels of K^+ ; more likely if digoxin use, hypomagnesemia, or CAD
- ECG changes are more predictive of clinical picture than serum $[K^+]$
 - U waves most important (low amplitude wave following a T wave)
 - flattened or inverted T waves
 - depressed ST segment
 - prolongation of Q-T interval
 - with severe hypokalemia: P-R prolongation, wide QRS, arrhythmias; increases risk of digitalis toxicity

Figure 6. ECG changes in hypokalemia

Approach to Hypokalemia

1. emergency measures: obtain ECG; if potentially life threatening, begin treatment immediately
2. rule out transcellular shifts of K^+ as cause of hypokalemia
3. assess contribution of dietary K^+ intake
4. spot urine K:Cr (should be less than 1 in setting of hypokalemia)
 - if <1 consider GI loss
 - if >1 consider a renal loss
5. consider 24 h K^+ excretion
6. if renal K^+ loss, check BP and acid-base status
7. may also assess plasma renin and aldosterone levels, serum $[Mg^{2+}]$

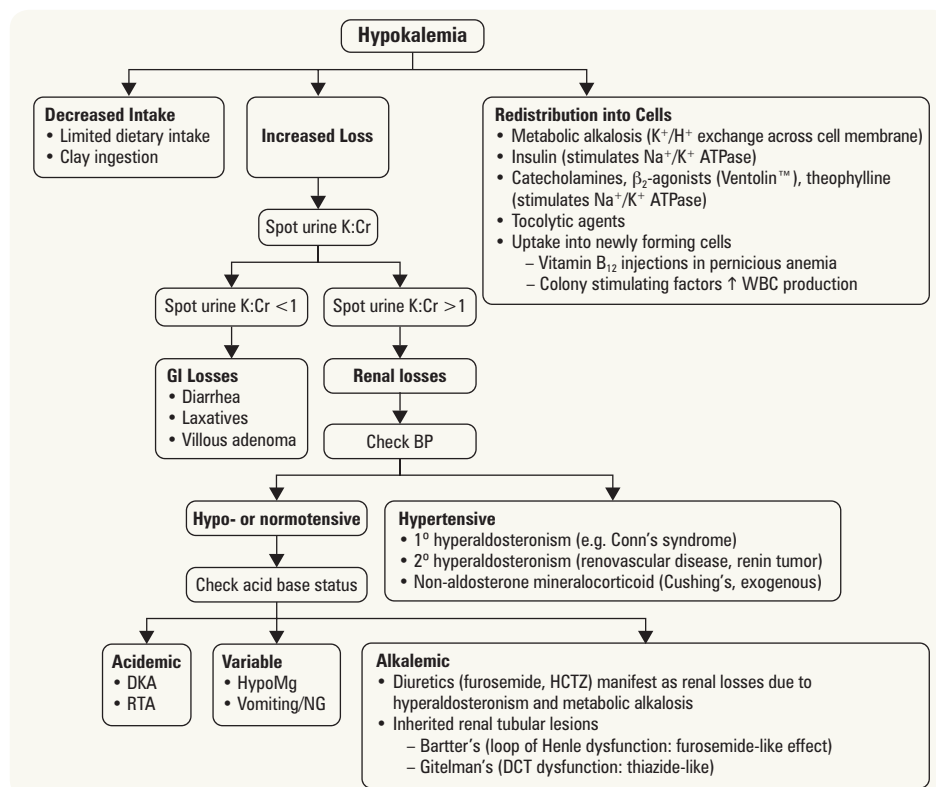

Figure 7. Approach to hypokalemia

Treatment

- treat underlying cause
- if true K^+ deficit, potassium repletion (decrease in serum $[K^+]$ of 1 mEq is roughly 100-200 mEq of total body loss)
 - oral sources – food, tablets (K-Tab™), KCl liquid solutions; preferable route if the patient tolerates PO medications
 - IV – usually KCl in saline solutions, avoid dextrose solutions (may exacerbate hypokalemia via insulin release)
 - max 40 mEq/L via peripheral vein, 60 mEq/L via central vein, max infusion 20 mEq/h
- K^+ -sparing diuretics (triamterene, spironolactone, amiloride) can prevent renal K^+ loss
- restore Mg^{2+} if necessary
- if urine output and renal function are impaired, correct with extreme caution
- risk of hyperkalemia with potassium replacement especially high in elderly, diabetics, and patients with decreased renal function
- beware of excessive potassium repletion, especially if transcellular shift caused hypokalemia

- Hypokalemia often accompanied by metabolic alkalosis
- Potassium leaves cells, replaced by H^+
- Kidney tubular cells see high H^+ , think acidosis and increase ammonium synthesis and excretion
- Increase in bicarbonate generation

Hyperkalemia

- serum $[K^+] > 5.0$ mEq/L

Signs and Symptoms

- usually asymptomatic but may develop nausea, palpitations, muscle weakness, muscle stiffness, paresthesias, areflexia, ascending paralysis, and hypoventilation
- impaired renal ammoniogenesis and metabolic acidosis

- ECG changes and cardiotoxicity (do not correlate well with serum $[K^+]$)
 - peaked and narrow T waves
 - decreased amplitude and eventual loss of P waves
 - prolonged PR interval
 - widening of QRS and eventual merging with T wave (sine-wave pattern)
 - AV block
 - ventricular fibrillation, asystole

Figure 8. ECG changes in hyperkalemia

Table 6. Causes of Hyperkalemia

Factitious	Increased Intake	Transcellular Shift	Decreased Excretion
Sample hemolysis* Sample taken from vein where IV KCl is running Prolonged use of tourniquet Leukocytosis (extreme) Thrombocytosis (extreme)	Diet KCl tabs IV KCl Salt substitute	Intravascular hemolysis Rhabdomyolysis Tumor lysis syndrome Insulin deficiency Acidemia Drugs <ul style="list-style-type: none"> • β-blockers • Digitalis overdose (blocks Na^+/K^+ ATPase) • Succinylcholine 	Decreased GFR <ul style="list-style-type: none"> • Renal failure • Low effective circulating volume • NSAIDs in renal insufficiency Normal GFR but hypoaldosteronism

*Most common

Table 7. Causes of Hyperkalemia with Normal GFR

Decreased Aldosterone Stimulus (low renin, low aldosterone)	Decreased Aldosterone Production (normal renin, low aldosterone)	Aldosterone Resistance (decreased tubular response)
Associated with diabetic nephropathy, NSAIDs, chronic interstitial nephritis, HIV	<ul style="list-style-type: none"> • Adrenal insufficiency of any cause (e.g. Addison's disease, AIDS, metastatic cancer) • ACEI • ARBs • Heparin • Congenital adrenal hyperplasia with 21-hydroxylase deficiency 	<ul style="list-style-type: none"> • K^+-sparing drugs • Spironolactone • Amiloride • Triamterene Renal tubulointerstitial disease

Approach to Hyperkalemia

1. emergency measures: obtain ECG, if life threatening begin treatment immediately
2. rule out factitious hyperkalemia; repeat blood test
3. hold exogenous K^+ (PO and IV) and any K^+ retaining medications
4. assess potential causes of transcellular shift
5. estimate GFR (calculate CrCl using Cockcroft-Gault)

Treatment

- acute therapy is warranted if ECG changes are present, or if patient is symptomatic
- tailor therapy to severity of increase in $[K^+]$ and ECG changes
 - $[K^+] < 6.5$ and normal ECG
 - ♦ treat underlying cause, stop K^+ intake, increase the loss of K^+ via urine and/or GI tract
 - $[K^+]$ between 6.5 and 7.0, no ECG changes: add insulin to above regimen
 - $[K^+] > 7.0$ and/or ECG changes: first priority is to protect the heart, add calcium gluconate to above

1. Protect the Heart

- calcium gluconate 1-2 amps (10 mL of 10% solution) IV
- antagonizes cardiac toxicity of hyperkalemia, protects cardiac conduction system, no effect on serum $[K^+]$
- onset within minutes, lasts 30-60 min (may require repeat doses during treatment course of hyperkalemia)

In patients with DM and increased $[K^+]$ and hyperglycemia, often just giving insulin to restore euglycemia is sufficient to correct the hyperkalemia

Treatment of Hyperkalemia

C BIG K DROP

C – Calcium gluconate

BIG – β -agonist, Bicarb, Insulin, Glucose

K – Kayexalate®

DROP – Diuretics, Dialysis

2. Shift K^+ into Cells

- regular insulin (Insulin R) 10-20 units IV, with 1-2 amp D50W (give D50W before insulin)
 - onset of action 15-30 min, lasts 1-2 h
 - monitor capillary blood glucose q1h because of risk of hypoglycemia
 - can repeat every 4-6 h
 - caution giving D50W before insulin if hyperkalemia is severe as it can cause a serious arrhythmia
- $NaHCO_3$ 1-3 ampules (given as 3 ampules of 7.5% or 8.4% $NaHCO_3$ in 1L D5W)
 - onset of action 15-30 min, transient effect, drives K^+ into cells in exchange for H^+
 - more effective if patient has metabolic acidosis
- β_2 -agonist (Ventolin®) in nebulized form (dose = 2 cc or 10 mg inhaled) or 0.5 mg IV
 - onset of action 30-90 min, stimulates Na^+/K^+ ATPase
 - caution if patient has heart disease as may result in tachycardia

3. Enhance K^+ Removal from Body

- via urine (preferred approach)
 - furosemide (≥ 40 mg IV), may need IV NS to avoid hypovolemia
 - fludrocortisone (synthetic mineralocorticoid) if suspect aldosterone deficiency
- via gastrointestinal tract
 - cation-exchange resins: calcium resonium or sodium polystyrene sulfonate (Kayexalate®)
 - increasingly falling out of favor due to risk of colonic necrosis; works by binding Na^+ in exchange for K^+ , and controversial how much K^+ is actually removed
 - lactulose PO to avoid constipation (must ensure that patient has a bowel movement after resin is administered – main benefit may be the diarrhea caused by lactulose)
 - Kayexalate® enemas with tap water
- dialysis (renal failure, life threatening hyperkalemia unresponsive to therapy)

Acid-Base Disorders

- acid-base homeostasis influences protein function and can critically affect tissue and organ function with consequences to cardiovascular, respiratory, metabolic, and CNS function
- see [Respirology, R5](#) for more information on respiratory acidosis/alkalosis
- normal concentration of HCO_3^- = 24 mEq/L (range: 22-30)
- normal pCO_2 = 40 mmHg (range: 36-44)
- each acid base disorder has an appropriate compensation
 - inadequate compensation or overcompensation can indicate the presence of a second acid-base disorder (e.g. in metabolic acidosis, inadequate compensation means there is also respiratory acidosis; overcompensation means there is also respiratory alkalosis)

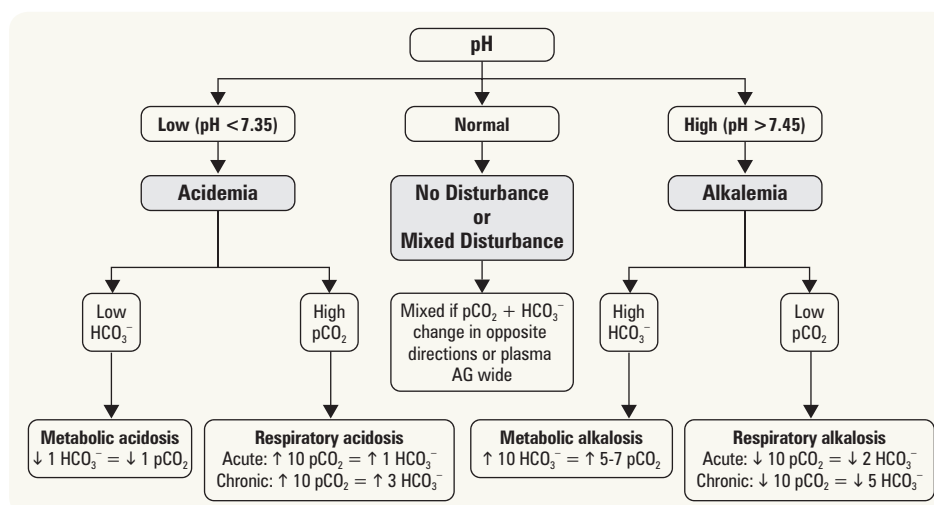

Figure 9. Approach to acid-base disorders

Approach

1. Identify the primary disturbance (see Figure 8)

- respiratory acidosis, metabolic acidosis, respiratory alkalosis, metabolic alkalosis

2. Evaluate compensation. If compensation is not appropriate, a second acid-base disorder is likely present

- compensation occurs in the same direction as the primary disturbance
- metabolic acidosis: for every 1 mEq/L decrease in HCO_3^- , pCO_2 should decrease by 1 mmHg
- metabolic alkalosis: for every 10 mEq/L increase in HCO_3^- , pCO_2 should increase by 5-7 mmHg
- respiratory acidosis: for every 10 mmHg increase in pCO_2 , HCO_3^- should increase by 1 (acute) or 3 (chronic) mEq/L
- respiratory alkalosis: for every 10 mmHg decrease in pCO_2 , HCO_3^- should decrease by 2 (acute) or 5 (chronic) mEq/L

3. Calculate Plasma AG

- $\text{AG} = [\text{Na}^+] - ([\text{HCO}_3^-] + [\text{Cl}^-])$
- baseline = 12, range 10-14 mEq/L
- AG can be altered by plasma albumin level: for each 10 g/L fall in albumin, lower baseline AG by 3 mEq/L (e.g. if plasma [albumin] = 20 g/L, expect AG = 6 mEq/L)

4. If AG elevated, compare increase in AG with decrease in HCO_3^-

- if increase in AG < decrease in HCO_3^- , there is a coexisting non-AG metabolic acidosis
- if increase in AG > decrease HCO_3^- , there is a coexisting metabolic alkalosis

5. Calculate Osmolar Gap

- osmolar gap = measured osmolality – calculated osmolality
 - calculated osmolality = $(2 \times [\text{Na}^+]) + [\text{urea}] + [\text{glucose}]$ (all units are in mEq/L)
 - normal osmolar gap <10
 - if AG >10, consider: methanol poisoning, ethylene glycol poisoning, or another cause of acidosis plus ethanol ingestion

Useful Equations

- $\text{AG} = [\text{Na}^+] - [\text{Cl}^-] - [\text{HCO}_3^-]$ (normal range = 10-14 mEq/L)
- Calculated serum osmolality = $2\text{Na} + \text{BUN}/2.8 + \text{glucose}/18$

Causes of Osmolar Gap

- Methanol
- Ethylene glycol
- Ethanol
- Polyethylene glycol
- Mannitol
- Sorbitol

Metabolic Acidosis

Etiology and Pathophysiology

1. Increased AG Metabolic Acidosis (4 types)

- Lactic acidosis (2 types)
 - L-lactic acid
 - Type A: due to tissue hypoperfusion (any cause of shock), ischemic bowel, profound hypoxemia
 - Type B: non-hypoxic – multiple causes; the most common is failure to metabolize normally produced lactic acid in the liver due to severe liver disease; other causes include: excessive alcohol intake, thiamine deficiency, metformin accumulation (metformin interferes with electron transport chain), certain antiretrovirals, large tumours, mitochondrial myopathies
 - D-lactic acid: rare syndrome characterized by episodes of encephalopathy and metabolic acidosis
 - occurs in the setting of carbohydrate malabsorption (e.g. short bowel syndrome), colonic bacteria metabolize carbohydrate load into D-lactic acid, diminished colonic motility and impaired D-lactate metabolism
- Ketoacidosis
 - diabetic
 - starvation
 - alcoholic (decreased carbohydrate intake and vomiting)
- Toxins
 - methanol (toxic to brain and retina, can cause blindness and brain death): metabolized to formic acid
 - ethylene glycol (toxic to brain and kidneys): metabolized to oxalic acid (envelope shaped crystals in urine) and multiple other acids
 - salicylate (e.g. ASA) overdose: causes acidosis due to salicylic acid, and also accumulation of lactic acid (salicylate at toxic levels impairs electron transport chain) and ketoacid (salicylate activates fat breakdown)
- Advanced renal failure (e.g. serum Cr increased at least 5x above baseline – a very low GFR causes anion retention, and renal disease leads to impaired bicarbonate production)

2. Normal AG Metabolic Acidosis (Hyperchloremic Acidosis)

- diarrhea (HCO_3^- loss from GI tract)
- RTA
 - type I RTA (distal): inability to secrete H^+ in collecting duct, leading to impaired excretion of ammonium into urine
 - type II RTA (proximal): impaired HCO_3^- reabsorption
 - type IV RTA: defective ammoniogenesis due to decreased aldosterone, hyporesponsiveness or hyperkalemia

Causes of Increased AG Metabolic Acidosis

MUDPILES CAT

Methanol
Uremia
Diabetic ketoacidosis
Paraldehyde
Isopropyl alcohol/Iron/Ibuprofen/
Indomethacin
Lactic acidosis
Ethylene glycol
Salicylates
Cyanide and Carbon monoxide
Alcoholic ketoacidosis
Toluene

or

KARMEL

Ketoacidosis
ASA
Renal failure
Methanol
Ethylene glycol
Lactic acidosis

- to help distinguish renal causes from non-renal causes, use $UAG = (Na^+ + K^+) - Cl^-$
- calculation establishes the presence or absence of unmeasured positive ions (e.g. NH_4^+) in urine
 - if $UAG < 0$, suggests adequate NH_4^+ excretion in urine (likely nonrenal cause: diarrhea)
 - if $UAG > 0$, suggests problem is lack of NH_4^+ in urine (e.g. distal RTA)

Treatment of Metabolic Acidosis

- treat underlying cause
 - insulin for DKA
 - restore tissue perfusion for Type A lactic acidosis
 - ethanol/fomepizole + dialysis for methanol or ethylene glycol poisoning
 - alkaline diuresis ± dialysis if ASA overdose
- correct coexisting disorders of K^+ (see *Hyperkalemia*, NP12)
- consider treatment with exogenous alkali (e.g. $NaHCO_3$) if
 - severe reduction in $[HCO_3^-]$ e.g. < 8 mEq/L, especially with very low pH (< 7)
 - no metabolizable anion (e.g. salicylate, formate, oxalate, or sulphate); note that lactate and ketoacid anions can be metabolized to HCO_3^-
- risks of sodium bicarbonate therapy
 - hypokalemia: causes K^+ to shift into cells (correct K^+ deficit first)
 - ECF volume overload: Na^+ load given with $NaHCO_3$, can exacerbate pulmonary edema
 - overshoot alkalosis: abrupt, poorly tolerated transition from overly aggressive alkali loading, partial conversion of accumulated organic anions to HCO_3^- , and persisting hyperventilation

Causes of Non-AG Metabolic Acidosis

HARDUP

Hyperalimentation
Acetazolamide
RTA*
Diarrhea*
Ureteroenteric fistula
Pancreaticoduodenal fistula

*Most common

3 Clinical Scenarios that Produce a Mixed Disorder with Near Normal pH (e.g. increased AG metabolic acidosis + respiratory alkalosis)

- Cirrhosis
- ASA overdose
- Sepsis

Metabolic Alkalosis

Pathophysiology

- requires initiating event and maintenance factors
- precipitating factors
 - GI (vomiting, NG tube) or renal loss of H^+
 - exogenous alkali (oral or parenteral administration), milk alkali syndrome
 - diuretics (contraction alkalosis): decreased excretion of HCO_3^- , decreased ECF volume, therefore increased $[HCO_3^-]$
 - post-hypercapnia: renal compensation for respiratory acidosis is HCO_3^- retention, rapid correction of respiratory disorder results in transient excess of HCO_3^-
- maintenance factors
 - volume depletion: increased proximal reabsorption of $NaHCO_3^-$ and increased aldosterone
 - hyperaldosteronism (1° or 2°): distal Na^+ reabsorption in exchange for K^+ and H^+ excretion leads to HCO_3^- generation; aldosterone also promotes hypokalemia
 - hypokalemia: transcellular K^+/H^+ exchange, stimulus for ammoniagenesis, and HCO_3^- generation

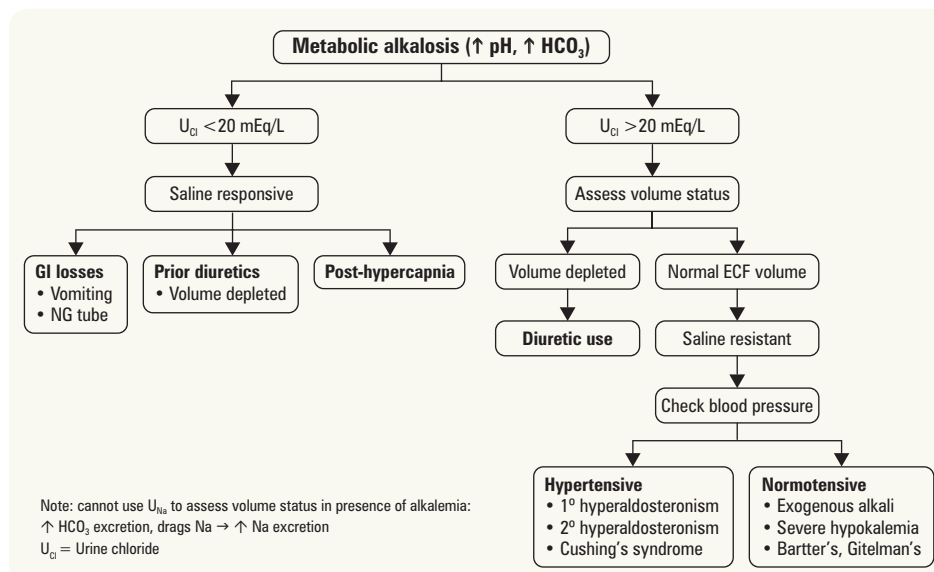

Figure 10. Approach to metabolic alkalosis

Evaluate Compensation (identify co-existing respiratory acid-base disorders)

- hypoventilation (an upper limit to compensation exists – breathing cannot be stopped)

Treatment

- treat underlying cause
- correct underlying disease, replenish K^+ and Mg^{2+} deficits, and possibly K^+ -sparing diuretic

- saline sensitive metabolic alkalosis (most common)
 - volume repletion ± carbonic anhydrase inhibitor (e.g. acetazolamide) to facilitate loss of HCO_3^- in urine
- saline resistant metabolic alkalosis
 - remove source of aldosterone or glucocorticoid ± spironolactone

Parenchymal Kidney Diseases

Vascular Diseases of the Kidney

LARGE VESSEL DISEASE

Table 8. Summary of Vascular Diseases

Large Vessel Disease	Small Vessel Disease
Acute renal artery occlusion (infarct)	Hypertensive nephrosclerosis
Renal artery stenosis (ischemia)	Atheroembolic renal disease
Renal vein thrombosis	Thrombotic microangiopathy
	Scleroderma
	Calcineurin inhibitor nephropathy

1. RENAL INFARCTION (ACUTE RENAL ARTERY OCCLUSION)

- important, potentially reversible cause of renal failure

Etiology

- abdominal trauma, surgery, embolism, vasculitis, extra-renal compression, hypercoagulable state, aortic dissection
- kidney transplant more vulnerable

Signs and Symptoms (depend on presence of collateral circulation)

- fever, N/V, flank pain
- leukocytosis, elevated AST, ALP
- marked elevated LDH (LDH >4x upper limit of normal with minimal elevations in AST/ALT strongly suggestive)
- acute onset HTN (activation of RAAS) or sudden worsening of long-standing HTN
- renal dysfunction, e.g. elevated Cr (if bilateral, or solitary functioning kidney)

Investigations

- renal arteriography (more reliable but risk of atheroembolic renal disease)
- contrast-enhanced CT or MR angiography, duplex Doppler studies (operator dependent)

Treatment

- prompt localization of occlusion and restoration of blood flow
- anticoagulation, thrombolysis, percutaneous angioplasty or clot extraction, surgical thrombectomy
- medical therapy in the long-term to reduce risk (e.g. antihypertensives)

2. ISCHEMIC RENAL DISEASE (RENAL ARTERY STENOSIS)

- chronic renal impairment secondary to hemodynamically significant renal artery stenosis or microvascular disease
- significant cause of ESRD: 15% in patients over 50 yr old (higher prevalence if significant vascular disease)
- usually associated with large vessel disease elsewhere
- causes of renal artery stenosis
 - atherosclerotic plaques (90%): proximal 1/3 renal artery, usually males >55 yr, smokers
 - ♦ electrolytes, osmolality (gently rehydrate when needed, e.g. CHF)
 - fibromuscular dysplasia (10%): distal 2/3 renal artery or segmental branches, usually young females (typical onset <30 yr) (gently rehydrate when needed, e.g. CHF)
- when there is decreased RBF, GFR is dependent on angiotensin II-induced efferent arteriolar constriction which raises the FF (GFR/RBF)
- most common cause of secondary HTN ("renovascular HTN"), 1-2% of all hypertensive patients
 - etiology
 - ♦ decreased renal perfusion of one or both kidneys leads to increased renin release and subsequent angiotensin production
 - ♦ increased angiotensin raises blood pressure in two ways
 1. causes generalized arteriolar constriction
 2. release of aldosterone increases Na^+ and water retention
 - elevated blood pressure can in turn lead to further damage of kidneys and worsening HTN

Risk Factors

- >50 yr old
- smoking
- other atherosclerotic disease (dyslipidemia, DM, diffuse atherosclerosis)

Signs and Symptoms

- severe/refractory HTN and/or hypertensive crises, with negative family history of HTN
- asymmetric renal size
- epigastric or flank bruits
- spontaneous hypokalemia (renin activation in under-perfused kidney)
- increasing Cr with ACEI/ARB
- flash pulmonary edema with normal LV function

Investigations

- must establish presence of renal artery stenosis and prove it is responsible for renal dysfunction
- duplex Doppler U/S (kidney size, blood flow): good screening test (operator dependent)
- digital subtraction angiography (risk of contrast nephropathy)
- CT or MR angiography (effective noninvasive tests to establish presence of stenosis, for MR avoid gadolinium contrast if eGFR <30 mL/min because of risk of systemic dermal fibrosis)
- ACEI renography (e.g. captopril renal scan)
- renal arteriography (gold standard)

Treatment

- surgical: percutaneous angioplasty ± stent, surgical revascularization, occasionally surgical bypass
- medical: BP lowering medications (ACEI is drug of choice if unilateral renal artery disease but contraindicated if bilateral renal artery disease)
- little or no benefit if therapy is late (e.g. kidney is already shrunken), however, therapy can be considered to save the opposite kidney if normal

3. RENAL VEIN THROMBOSIS**Etiology**

- hypercoagulable states (e.g. nephrotic syndrome, especially membranous), ECF volume depletion, extrinsic compression of renal vein, significant trauma, malignancy (e.g. RCC), sickle cell disease
- clinical presentation determined by rapidity of occlusion and formation of collateral circulation

Signs and Symptoms

- acute: N/V, flank pain, hematuria, elevated plasma LDH, ± rise in Cr, sudden rise in proteinuria
- chronic: PE (typical first presenting symptom), increasing proteinuria and/or tubule dysfunction

Investigations

- renal venography (gold standard), CT or MR angiography, duplex Doppler U/S

Treatment

- thrombolytic therapy ± percutaneous thrombectomy for acute renal vein thrombosis
- anticoagulation with heparin then warfarin (1 yr or indefinitely, depending on risk factors)

SMALL VESSEL DISEASE**1. HYPERTENSIVE NEPHROSCLEROSIS**

- see *Hypertension*, NP31

2. ATHEROEMBOLIC RENAL DISEASE

- progressive renal insufficiency due to embolic obstruction of small- and medium-sized renal vessels by atheromatous emboli
- spontaneous or after renal artery manipulation (surgery, angiography, percutaneous angioplasty)
- anticoagulants and thrombolytics interfere with ulcerated plaque healing and can worsen disease
- investigations
 - eosinophilia, eosinophiluria, and hypocomplementia
 - renal biopsy: needle-shaped cholesterol clefts (due to tissue-processing artifacts) with surrounding tissue reaction in small-/medium-sized vessels
- treatment
 - no effective treatment; avoid angiographic and surgical procedures in patients with diffuse atherosclerosis, medical therapy for concomitant cardiovascular disease
- prognosis: poor overall, at least a third will develop ESRD

**Stenting and Medical Therapy for Atherosclerotic Renal Artery Stenosis**
NEJM 2014;370:13-22

Study: Multicenter, unblinded RCT, median follow-up of 43 mo.

Patients: 947 patients with atherosclerotic renal-artery stenosis who also have significant systolic HTN or CKD.

Intervention: Percutaneous revascularization (stenting) with medical therapy (statins, ARB, calcium channel blockers, HCTZ and BP control) vs. medical therapy alone.

Outcomes: Occurrence of adverse CV or renal event (composite of death from CV or renal cause, MI, stroke, hospitalization for CHF, progressive renal insufficiency, or need for renal replacement therapy) and all-cause mortality.

Results: No significant difference in primary composite end point between participants who received stenting or those on medical therapy alone. No significant differences between the treatment groups in the rates of the individual components of the primary end point or in all-cause mortality.

Conclusion: Renal artery stenting did not confer a significant benefit with respect to the prevention of clinical events when added to comprehensive, multifactorial medical therapy in people with atherosclerotic renal artery stenosis and HTN or CKD.

3. THROMBOTIC MICROANGIOPATHY

- etiologies include the spectrum of TTP-HUS, DIC, severe preeclampsia
- renal involvement more common in HUS than TTP
- renal involvement characterized by fibrin thrombi in glomerular capillary loops \pm arterioles
- treatment
 - depends on cause
 - supportive therapy
 - TTP-HUS: plasma exchange, corticosteroids (splenectomy and rituximab if refractory)
- avoid platelet transfusions and ASA

4. CALCINEURIN INHIBITOR NEPHROPATHY

- cyclosporine and tacrolimus
- causes both acute reversible and chronic, largely irreversible nephrotoxicity
- major cause of kidney failure in other solid organ transplants (e.g. heart)
- acute: due to afferent and efferent glomerular capillary constriction leading to decreased GFR (tubular vacuolization)
 - prerenal azotemia
 - treatment: calcium channel blockers or prostaglandin analogs, reduce dose of cyclosporine or switch to another immunosuppressive drug
- chronic: result of obliterative arteriopathy causing interstitial nephritis and CKD (striped fibrosis), less frequent now due to lower doses of calcineurin inhibitors

Reduced Exposure to Calcineurin Inhibitors in Renal Transplantation (ELITE-Symphony Trial)

NEJM 2007;257:2562-2575

Study: Multicenter, RCT with 12 mo follow-up.

Patients: 1,645 patients scheduled to receive a single organ kidney transplant.

Intervention: Mycophenolate mofetil, corticosteroids, and either: 1) standard dose cyclosporine; 2) low dose cyclosporine with daclizumab induction; 3) low dose tacrolimus with daclizumab induction; 4) low dose sirolimus with daclizumab induction.

Primary Outcome: Estimated Cockcroft-Gault GFR 12 mo after transplantation.

Results: The tacrolimus arm showed significantly higher eGFR at 12 mo compared to all other arms (65.4 mL/min vs. 57.1, 59.4, 56.7 for arms 1, 2, 4 respectively, $p \leq 0.001$). The tacrolimus arm also showed decreased rates of acute rejection at 6 mo and 12 mo vs. all arms ($p < 0.001$), improved allograft survival against standard dose cyclosporine and sirolimus, and decreased treatment failure against all other arms. There was no difference in overall patient survival between groups. Sirolimus had the highest incidence of lymphoceles, delayed wound healing, and serious adverse events; tacrolimus had significantly higher rates of new-onset DM; and cyclosporine regimes had the lowest incidence of diarrhea but highest opportunistic infection rates.

Conclusion: Immunosuppression regimens using low dose tacrolimus and daclizumab induction decrease nephrotoxicity while maintaining therapeutic immunosuppression in renal transplant patients.

Glomerular Diseases

HISTOLOGICAL TERMS OF GLOMERULAR CHANGES

Extent of Changes

- terms used to describe histologically the number of glomeruli affected in a given condition
 - diffuse: majority of glomeruli abnormal
 - focal: some glomeruli affected
- terms used to describe histologically the extent to which individual glomeruli are affected in a given condition
 - global: entire glomerulus abnormal
 - segmental: only part of the glomerulus abnormal

Types of Changes

- proliferation: hyperplasia of one of the glomerular cell types (mesangial, endothelial, parietal epithelial), with or without inflammatory cell infiltration
- membranous changes: capillary wall thickening due to immune deposits or alterations in basement membrane
- crescent formation: parietal epithelial cell proliferation and mononuclear cell infiltration form crescent-shape in Bowman's space

CLINICAL PRESENTATION OF GLOMERULAR DISEASE

Important Points to Remember

- glomerular diseases have diverse clinical presentations including hematuria, proteinuria, HTN, edema, and decreased GFR
 - each glomerulopathy presents as one of four major glomerular syndromes (these are NOT diagnoses)
 - asymptomatic urinary abnormalities
 - proteinuria
 - hematuria
 - nephritic syndrome
 - acute GN
 - rapidly progressive GN
 - nephrotic syndrome
 - ESRD
- glomerulopathies can be caused by a primary disease or can occur secondary to a systemic disease
- some glomerulopathies can present as more than one syndrome at different times

The Nephritic-Nephrotic Spectrum

- glomerular pathology can present with a clinical picture anywhere on a spectrum with pure nephritic and pure nephrotic syndromes at the extremes

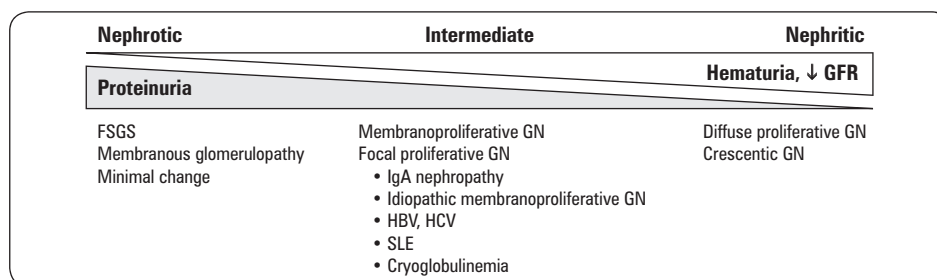

Figure 11. Spectrum of glomerular pathology

PROTEINURIA

- hallmark of nephrotic syndromes
- 24 h urine protein: gold standard to assess degree of proteinuria
- urine ACR: used to screen for diabetic nephropathy
 - microalbuminuria
 - ♦ defined as ACR ≥ 25 mg/g (female) or ACR ≥ 18 mg/g (male)
 - ♦ marker of vascular endothelial function
 - ♦ an important prognostic marker for kidney disease in DM and HTN (see *Diabetes*, NP28)
 - an elevated ACR ≥ 18 or 25 mg/g is the earliest sign of diabetic nephropathy
- composition of normal total urine protein
 - upper limit of normal daily excretion of total protein is 150 mg/d
 - upper limit of normal daily excretion of albumin is 30 mg/d
 - the other normally excreted proteins are either filtered low molecular weight proteins (such as immunoglobulin light chains or β -2 microglobulin) or proteins secreted by the tubular epithelial cells (e.g. Tamm-Horsfall mucoprotein)

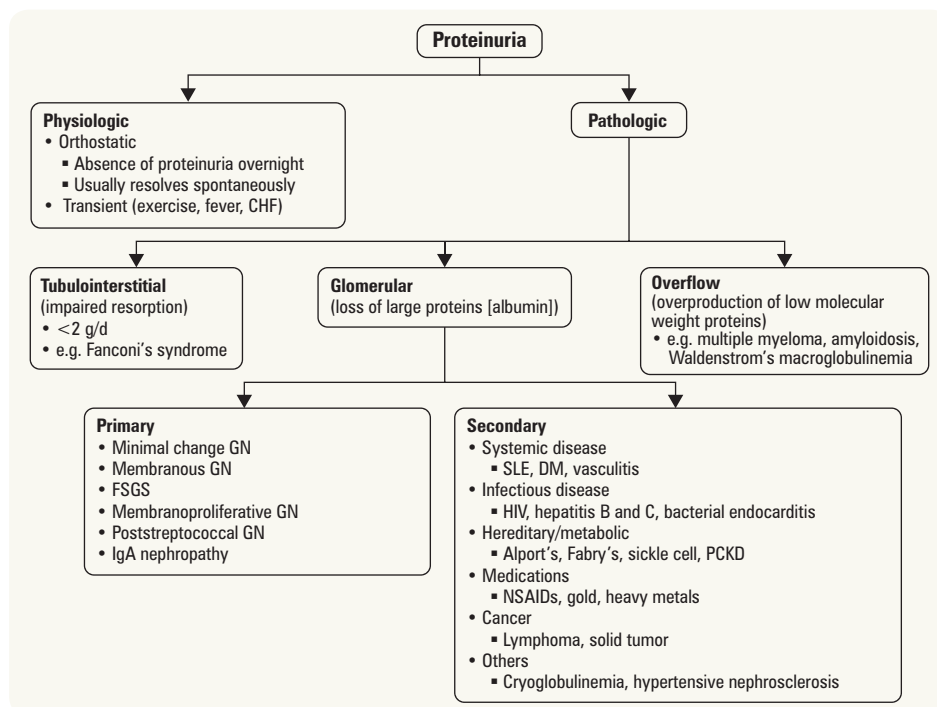

Figure 12. Classification of proteinuria

Table 9. Daily Excretion of Protein

Daily Excretion	Meaning
<150 mg total protein (and <30 mg albumin)	Normal
30-300 mg albumin	Microalbuminuria
>3500 mg total protein/1.73m ² BSA	Nephrotic range proteinuria
Variable amount of proteinuria	Can be seen with glomerular disease; e.g. mild glomerular disease can lead to a mild degree of proteinuria, proliferative lesions may also be associated with some degree of proteinuria
Up to 2,000 mg per d	Possible tubular disease because of failure to reabsorb filtered proteins

Pathologic Proteinuria

Tubulointerstitial

- Normally low molecular weight proteins (<60 kDa) pass through glomerular filtration barrier and are reabsorbed in proximal tubule
- Proximal tubule dysfunction causes impaired reabsorption and increased excretion of low molecular weight proteins
- Albumin (>60 kDa) is not affected; thus, edema is partly secondary to salt and water retention

Glomerular

- Normally, the filtration barrier is selectively permeable to **size** (<60 kDa) and **charge** (repels negative particles); thus, albumin is filtered to a very limited extent through a normal glomerulus
- Damage to any component of the glomerular filtration barrier results in loss of albumin and other high molecular weight proteins; thus, edema is secondary to hypoalbuminemia (low oncotic pressure), but also due to enhanced renal tubular reabsorption of filtered sodium and water (possibly due to filtered proteins stimulating the action of cortical collecting duct epithelial sodium channel)

Overflow

- Increased production of low molecular weight proteins which exceeds the reabsorptive capacity of the proximal tubule
- Plasma cell dyscrasias: produce light chain Ig (multiple myeloma, Waldenstrom's macroglobulinemia, monoclonal gammopathy of undetermined significance)

Investigations

- urine R&M, C&S, urea, Cr
- further workup (if degree of proteinuria >0.5 g/d, casts, and/or hematuria)
 - CBC, glucose, electrolytes, 24 h urine protein, and Cr
 - urine and serum immunoelectrophoresis, abdominal/pelvic U/S
 - serology: ANA, RF, p-ANCA (MPO), c-ANCA (PR3), Hep B, Hep C, HIV, ASOT
- indications for nephrology referral
 - generally, if there is “heavy” (ACR >265 mg/g) proteinuria, should refer to nephrologist
 - definitely if there is nephrotic syndrome: marked proteinuria >3.5 g/1.73m²/d with hypoalbuminemia (<35 g/L)

HEMATURIA

- hallmark of nephritic syndromes
- presence of blood or RBCs in urine
 - gross hematuria: pink, red, or tea-colored urine
 - ♦ in gross hematuria, the urine should be centrifuged:
 - if the sediment is red, true hematuria
 - if the supernatant is red, test for heme with a dipstick
 - if supernatant positive for heme: myoglobinuria or hemoglobinuria
 - if negative for heme: pseudohematuria; consider medications (e.g. rifampin), food dyes (e.g. beets), or metabolites (e.g. porphyria)
- microscopic hematuria: normal colored urine, >2 -3 RBCs/HPF on microscopy

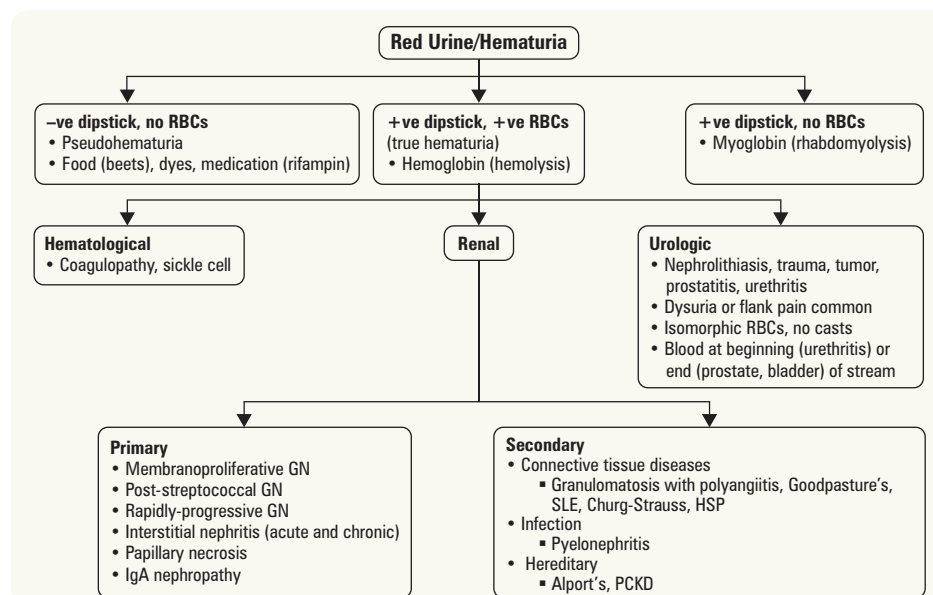

Figure 13. Approach to red urine

Investigations for Hematuria

- Hx and P/E: family history of nephrolithiasis, hearing loss (Alport's), cerebral aneurysm (PKD), diet, recent URTI, irritative and obstructive urinary symptoms (UTI)
- urine R&M, C&S, urea, Cr
- renal U/S
- 24 h urine stone workup if there is a history of stone formation or if there is a stone noted on imaging: calcium, oxalate, citrate, magnesium, uric acid, cysteine
- further workup (if casts and/or proteinuria): CBC, electrolytes, 24 h urine protein and Cr, serology (ANA, RF, C3, C4, p-ANCA, c-ANCA, ASOT)
- consider urology consult and possible cystoscopy if not clearly a nephrologic source for hematuria or if >50 yr of age

Glomerular Syndromes

1. ASYMPTOMATIC URINARY ABNORMALITIES

Clinical/Lab Features

- proteinuria (usually <2 g/d) and/or microscopic or macroscopic hematuria
 - isolated proteinuria
 - can be postural
 - occasionally can signal beginning of more serious GN (e.g. FSGS, IgA nephropathy, amyloid, diabetic nephropathy)
 - hematuria with or without proteinuria
 - IgA nephropathy (Berger's disease): most common type of primary glomerular disease worldwide, usually presents after viral URTI
 - hereditary nephritis (Alport's disease): X-linked nephritis often associated with sensorineural hearing loss; proteinuria <2 g/d
 - thin basement membrane disease: usually autosomal dominant, without proteinuria; benign
 - benign recurrent hematuria: hematuria associated with febrile illness, exercise, or immunization; a diagnosis of exclusion after other possibilities are ruled out

Features of Nephritic Syndrome

PHAROH
 Proteinuria
 Hematuria
 Azotemia
 RBC casts
 Oliguria
 Hypertension

IgA nephropathy is the most common type of primary glomerular disease worldwide

2. NEPHRITIC SYNDROME

ACUTE NEPHRITIC SYNDROME

- a subset of nephritic syndrome in which the clinical course proceeds over days

Etiology

- etiology can be divided into low and normal complement levels (see Figure 14)
- frequently immune-mediated, with Ig and C3 deposits found in GBM
- outcome dependent on etiology

Clinical/Lab Features

- proteinuria (but <3.5 g/1.73 m²/d), abrupt onset hematuria (microscopic or macroscopic, azotemia (increased Cr and urea), RBC casts and/or dysmorphic RBCs in urine, oliguria, HTN (due to salt and water retention), peripheral edema/puffy eyes, smoky urine

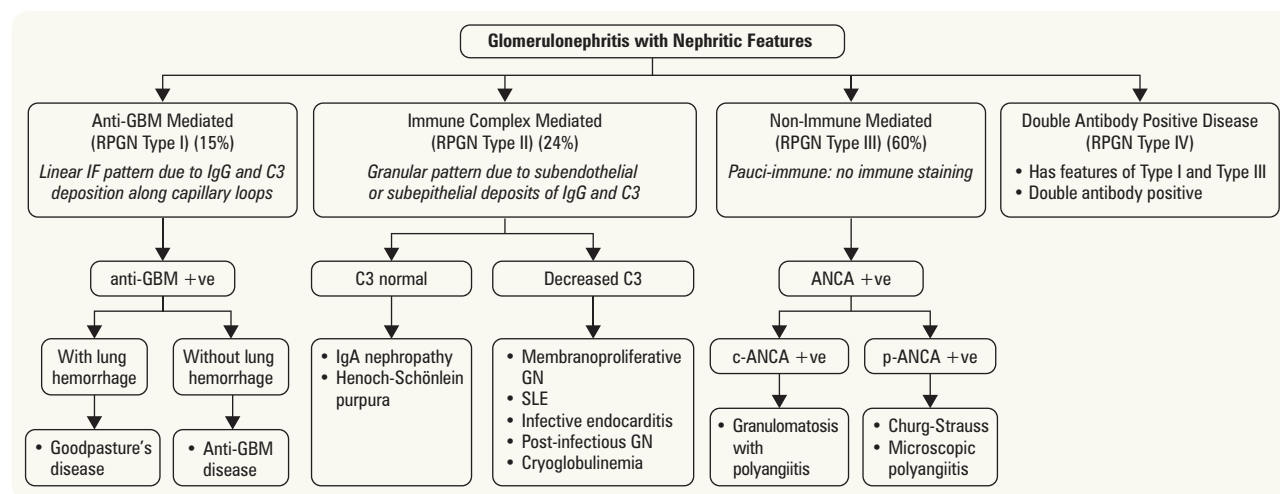

Figure 14. Approach to nephritic syndrome

RAPIDLY PROGRESSIVE GLOMERULONEPHRITIS/CRESCENTIC GLOMERULONEPHRITIS

- a subset of nephritic syndrome in which the clinical course proceeds over weeks to months
- clinical diagnosis, not histopathological
- any cause of GN can present as RPGN (except minimal change disease)
- additional etiologies seen only as RPGN: Goodpasture's syndrome and granulomatosis with polyangiitis (previously called Wegener's granulomatosis)

Clinical/Lab Features

- fibrous crescents typically present on renal histopathology
- RBC casts and/or dysmorphic RBCs in urine
- classified by immunofluorescence staining
- Type I: Anti-GBM mediated (15% of cases)
- Type II: Immune Complex Mediated (24% of cases)
- Type III: Non-Immune Mediated (60% of cases)
- Type IV: Double Antibody Positive
- treatment: underlying cause for postinfectious; corticosteroids + cyclophosphamide or other cytotoxic agent + plasmapheresis in select cases
- prognosis: 50% recovery with early treatment, depends on underlying cause

3. NEPHROTIC SYNDROME**Clinical/Lab Features**

- heavy proteinuria ($>3.5 \text{ g}/1.73\text{m}^2/\text{d}$)
- hypoalbuminemia
- edema
- hyperlipidemia (elevated LDL cholesterol), lipiduria (fatty casts and oval fat bodies on microscopy)
- hypercoagulable state (due to antithrombin III, Protein C, and Protein S urinary losses)
- patient may report frothy urine
- glomerular pathology on renal biopsy
 - minimal change disease (or minimal lesion disease or nil disease) – e.g. glomeruli appear normal on light microscopy
 - membranous glomerulopathy
 - focal segmental glomerulosclerosis (FSGS)
 - membranoproliferative GN
 - nodular glomerulosclerosis
- each can be idiopathic or secondary to a systemic disease or drug (sirolimus can cause proteinuria without obvious glomerular pathology)

**Presentation of Nephrotic Syndrome****HELP**

Hypoalbuminemia
Edema
Lipid abnormalities
Proteinuria

Table 10. Nephrotic Syndrome

	Minimal Change	Membranous Glomerulopathy	Focal Segmental Glomerulosclerosis	Membranoproliferative Glomerulonephritis	Nodular Glomerulosclerosis
Secondary Causes	Hodgkin's lymphoma	HBV, SLE, solid tumors (lung, breast, GI)	Reflux nephropathy, HIV, HBV, obesity	HCV, malaria, SLE, leukemia, lymphoma, infected shunt	DM, amyloidosis
Drug Causes	NSAIDs	Gold, penicillamine	Heroin		
Therapy	Steroids	Reduce BP, ACEI, steroids	Steroids, ACEI/ARB for proteinuria	Aspirin®, ACEI, dipyridamole (Persantine®) – controversial	Treat underlying cause

4. END STAGE RENAL DISEASE

- refer to section *End Stage Renal Disease*, NP35

INVESTIGATIONS FOR GLOMERULAR DISEASE

- blood work
 - first presentation: electrolytes, Cr, urea, albumin, fasting lipids
 - determining etiology: CBC, ESR, serum immunoelectrophoresis, anti-GBM, C3, C4, ANA, p-ANCA, c-ANCA, cryoglobulins, HBV and HCV serology, ASOT (anti-streptolysin titres), VDRL, HIV
- urinalysis: RBCs, WBCs, casts, protein
- 24 h urine for protein and CrCl
- radiology
 - CXR (infiltrates, CHF, pleural effusion)
 - renal U/S
- renal biopsy (percutaneous or open) if heavy proteinuria or renal insufficiency and cause is not obviously diabetic nephropathy
- urine immunoelectrophoresis
 - for Bence-Jones protein if proteinuria present

SECONDARY CAUSES OF GLOMERULAR DISEASE**Amyloidosis**

- nodular deposits of amyloid in mesangium, usually related to amyloid light chain (AL)
- presents as nephrotic range proteinuria with progressive renal insufficiency
- can be primary or secondary
- secondary causes: multiple myeloma, TB, rheumatoid arthritis, malignancy

Systemic Lupus Erythematosus

- lupus nephritis can present as any of the glomerular syndromes
- nephrotic syndrome with an active sediment is most common presentation
- GN caused by immune complex deposition in capillary loops and mesangium with resulting renal injury
- serum complement levels are usually low during periods of active renal disease
- children and males with SLE are more likely to develop nephritis

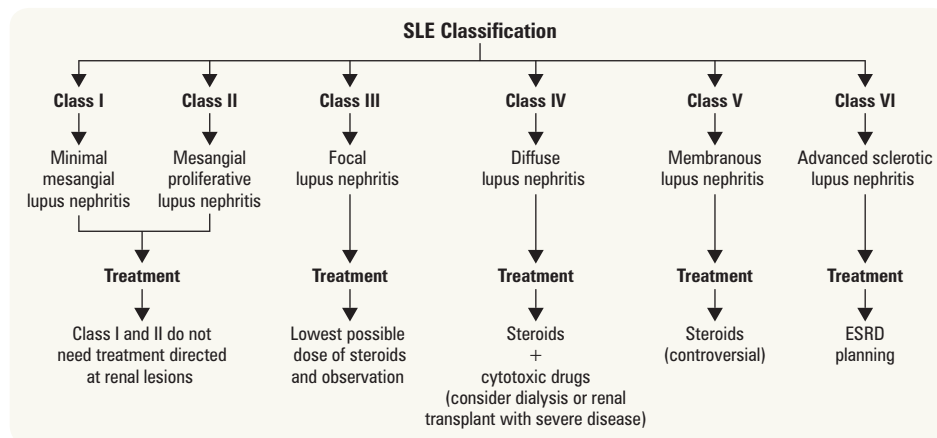

Figure 15. International Society of Nephrology/Renal Pathology Society classification of lupus nephritis 2003

Henoch-Schönlein Purpura

- seen more commonly in children
- purpura on buttocks and legs, abdominal pain, arthralgia, and fever
- glomeruli show varying degrees of mesangial hypercellularity
- IgA and C3 staining of mesangium
- usually benign, self-limiting course, 10% progress to CKD

Goodpasture's Disease

- antibodies against type IV collagen present in lungs and GBM
- more common in 3rd and 6th decades of life, males slightly more affected than females
- present with RPGN type I and hemoptysis/dyspnea
- pulmonary hemorrhage more common in smokers and males
- treat with plasma exchange, cyclophosphamide, prednisone

ANCA-Associated Vasculitis (e.g. Granulomatosis with Polyangiitis and Microscopic Polyangiitis [formerly Wegener's Granulomatosis])

- PR3-ANCA (c-ANCA) most commonly associated with the clinical picture of granulomatosis with polyangiitis (previously called Wegener's granulomatosis)
- MPO-ANCA (p-ANCA) most commonly associated with the clinical picture of microscopic polyangiitis
- renal involvement very common
- focal segmental necrotizing RPGN with no immune staining
- may be indolent or fulminant in progression
- vasculitis and granulomas rarely seen on renal biopsy
- treating typically involves cyclophosphamide and prednisone

Cryoglobulinemia

- cryoglobulins: monoclonal IgM and polyclonal IgG
- presents as purpura, fever, Raynaud's phenomenon, and arthralgias
- at least 50% of patients have hepatitis C
- renal disease seen in 40% of patients (isolated proteinuria/hematuria progressing to nephritic syndrome)
- most patients have decreased serum complement (C4 initially)
- treat hepatitis C, plasmapheresis
- overall prognosis: 75% renal recovery

Shunt Nephritis

- immune-complex mediated nephritis associated with chronically infected ventriculoatrial shunts inserted for treatment of hydrocephalus
- presents as acute nephritic syndrome with decreased serum complement
- nephrotic range proteinuria in 25% of patients

EULAR Recommendations for the Management of Systemic Lupus Erythematosus (SLE)

Ann Rheum Dis 2008;67:195-205

Lupus Nephritis Recommendations

Monitoring: Renal biopsy, urine sediment analysis, proteinuria, and kidney function may have independent predictive ability for clinical outcome in therapy of lupus nephritis but need to be interpreted in conjunction. Changes in immunological tests (anti-dsDNA, serum C3) have only limited ability to predict the response to treatment and may be used only as supplemental information.

Treatment: In patients with proliferative lupus nephritis, glucocorticoids in combination with immunosuppressive agents are effective against progression to end-stage renal disease. Long-term efficacy has been demonstrated only for cyclophosphamide-based regimens, which are also associated with considerable adverse effects. In short- and medium-term trials, mycophenolate mofetil has demonstrated at least similar efficacy compared with pulse cyclophosphamide and a more favorable toxicity profile: failure to respond by 6 mo should evoke discussions for intensification of therapy. Flares following remission are not uncommon and require diligent follow-up.

End-Stage Renal Disease: Dialysis and transplantation in SLE have long-term patient and graft-survival rates comparable with those observed in non-diabetic non-SLE patients, with transplantation being the method of choice.

HIV-Associated Renal Disease

1. direct nephrotoxic effect of HIV infection, antiretroviral drugs (e.g. tenofovir, indinavir), and other drugs used to treat HIV-associated infections
2. HIV-associated nephropathy
 - histology: focal and segmental glomerular collapse with mesangial sclerosis; “collapsing FSGS”
 - tubular cystic dilation and tubulo-reticular inclusions
 - clinical features: predominant in African American men, heavy proteinuria, progressive renal insufficiency
 - prognosis: kidney failure within 1 yr without treatment
 - therapy: short-term, high dose steroids, ACEI, HAART

Infective Endocarditis

- manifests as mild form of acute nephritic syndrome with decreased serum complement
- *S. aureus* is most common infecting agent
- treatment with appropriate antibiotics usually resolves GN

Hepatitis B

- can result in membranous nephropathy, polyarteritis nodosa, membranoproliferative GN

Hepatitis C

- can result in membranoproliferative GN, cryoglobulinemia, and membranous nephropathy

Syphilis

- can result in membranous GN

Tubulointerstitial Disease

TUBULOINTERSTITIAL NEPHRITIS

**Definition**

- cellular infiltrates affecting primarily the renal interstitium and tubular cells
- functional tubule defects are disproportionately greater than the decrease in GFR
- classified as acute or chronic

Signs and Symptoms

- manifestation of disease depends on site of tubule affected
 1. proximal tubule (e.g. multiple myeloma, heavy metals)
 - ♦ Fanconi syndrome: decreased reabsorption in proximal tubule causing glycosuria, aminoaciduria, phosphaturia, hypouricemia
 - ♦ proximal RTA (decreased bicarbonate absorption): Type II RTA
 2. distal tubule (e.g. amyloidosis, obstruction)
 - ♦ distal RTA (Type I RTA), usually hypokalemic
 - ♦ Na⁺-wasting nephropathy
 - ♦ ± hyperkalemia leading to type IV RTA (where reduced renal bicarbonate production is caused by hyperkalemia)
 3. collecting duct (e.g. sickle cell anemia, analgesics, PCKD)
 - ♦ urinary concentrating defect leading to mild nephrogenic DI
 - ♦ polyuria

1. ACUTE TUBULOINTERSTITIAL NEPHRITIS

Definition

- rapid (days to weeks) decline in renal function
- 10-20% of all AKI

Etiology

- hypersensitivity
 1. antibiotics: β-lactams, sulfonamides, rifampin, quinolones, cephalosporins
 2. other: NSAIDs, allopurinol, furosemide, thiazides, triamterene, PPIs, acyclovir, phenytoin, cimetidine
- infections
 - bacterial pyelonephritis, *Streptococcus*, brucellosis, *Legionella*, CMV, EBV, toxoplasmosis, leptospirosis
- immune
 - SLE, acute allograft rejection, Sjögren's syndrome, sarcoidosis, mixed essential cryoglobulinemia
- idiopathic

Pathophysiology

- acute inflammatory cell infiltrates into renal interstitium

Signs and Symptoms

- AKI
- if hypersensitivity reaction: may see fever, skin rash, arthralgia, serum sickness-like syndrome (particularly rifampin)
- if pyelonephritis: flank pain and costovertebral angle (CVA) tenderness
- other signs and symptoms based on underlying etiology
- HTN and edema are uncommon

Investigations

- mild, non-nephrotic range proteinuria and microscopic hematuria
- urine
 - sterile pyuria, WBC casts, mild proteinuria, hematuria
 - eosinophils if AIN
- blood work
 - increased Cr and urea
 - eosinophilia if drug reaction
 - normal AG metabolic acidosis (RTA)
 - hypophosphatemia, hyperkalemia, hyponatremia
- gallium scan often shows intense signal due to inflammatory infiltrate
- renal biopsy definitive

Treatment

- treat underlying cause (e.g. stop offending medications, antibiotics if pyelonephritis)
- corticosteroids (may be indicated in allergic or immune disease)

Prognosis

- recovery within 2 wk if underlying insult can be eliminated
- the longer the patient is in renal failure, the less likely full renal recovery becomes

2. CHRONIC TUBULOINTERSTITIAL NEPHRITIS**Definition**

- characterized by slowly progressive renal failure, moderate proteinuria, and signs of abnormal tubule function

Etiology

- persistence or progression of acute TIN
- urinary tract obstruction: most important cause of chronic TIN (tumors, stones, bladder outlet obstruction, vesicoureteral reflux)
- chronic pyelonephritis due to vesicoureteral reflux or UTI with obstruction
- nephrotoxins
 - exogenous
 - ♦ analgesics: NSAIDs (common), acetaminophen
 - ♦ cisplatin, lithium, cyclosporine, tacrolimus
 - ♦ heavy metals (lead, cadmium, copper, lithium, mercury, arsenic)
 - ♦ radiation
 - ♦ Chinese herbs
 - endogenous
 - ♦ hypercalcemia, hypokalemia, oxalate, uric acid nephropathy
- vascular disease: ischemic nephrosclerosis, atheroembolic disease
- malignancies: multiple myeloma, lymphoma
- granulomatous: TB, sarcoidosis, granulomatosis with polyangiitis
- immune: SLE, Sjögren's, cryoglobulinemia, Goodpasture's, amyloidosis, renal graft rejection, vasculitis
- hereditary: cystic diseases of the kidney, sickle cell disease
- others: radiation, Balkan (endemic) nephropathy

Pathophysiology

- fibrosis of interstitium with atrophy of tubules, mononuclear cell inflammation

Signs and Symptoms

- tubular dysfunction (e.g. acidosis, electrolyte disturbances)
- progressive renal failure with azotemia and uremia
- dependent on underlying etiology

Treatment

- stop offending agent or treat underlying disease
- supportive measures: correct metabolic disorders (Ca^{2+} , PO_4^{3-}) and anemia

Findings which Suggest Chronic Tubulointerstitial Nephritis

- normal AG metabolic acidosis
- hyperkalemia (out of proportion to degree of renal insufficiency)
- polyuria, nocturia
- partial or complete Fanconi's syndrome
- urine: mild proteinuria, few RBCs and WBCs, no RBC casts
- U/S: shrunken kidneys with irregular contours

3. ACUTE TUBULAR NECROSIS

Definition

- abrupt and sustained decline in GFR within minutes to days after ischemic/nephrotoxic insult
- GFR reduced (this serves the purpose of avoiding life-threatening urinary loss of fluid and electrolytes from non-functioning tubules)

Etiology

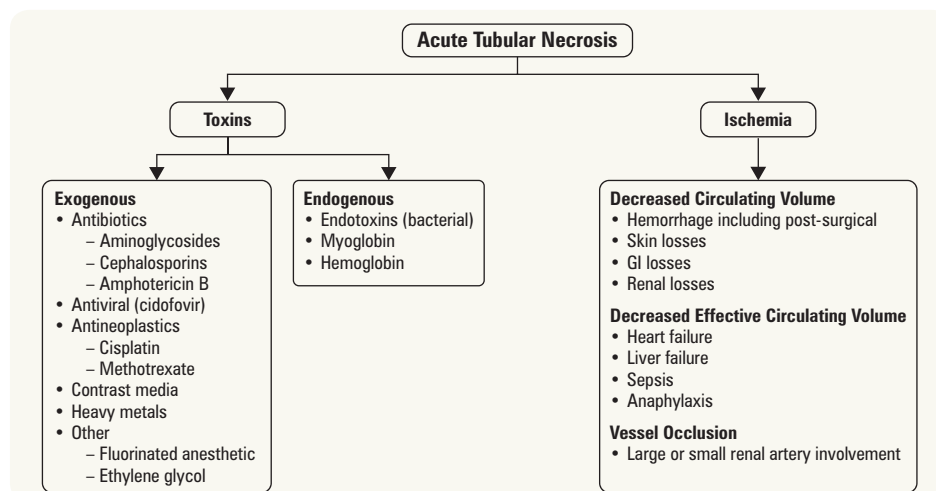

Figure 16. Etiology of ATN

Clinical Presentation

- typically presents as an abrupt rise in urea and Cr after a hypotensive episode, sepsis, rhabdomyolysis, or administration of nephrotoxic drug
- urine: high FE_{Na^+} , pigmented-granular casts

Complications

- hyperkalemia: can occur rapidly and cause serious arrhythmias
- metabolic acidosis, decreased Ca^{2+} , increased PO_4^{3-} , hypoalbuminemia

Investigations

- blood work: CBC, electrolytes, Cr, urea, Ca^{2+} , PO_4^{3-} , blood gases
- urine: R&M, electrolytes, osmolality, microscopic urinalysis searching for pigmented granular casts
- ECG
- abdominal U/S
- rule out other causes of prerenal/postrenal azotemia and intrinsic AKI (GN, AIN, vasculitis)

Therapy

- largely supportive once underlying problem is corrected
- loop diuretics may help manage volume overload and reduce tubular metabolic requirements to allow for recovery (controversial)
- consider early dialysis in severe/rapidly progressing cases to prevent uremic syndrome

Prevention

- correct fluid balance before surgical procedures
- for patients with chronic renal disease requiring radiographic contrast
 - give N-acetylcysteine 600-1200 mg PO bid day before and day of procedure, give intravenous isotonic fluid (either NaCl or NaHCO_3)
 - isotonic NaHCO_3 at 3 mL/kg over 1 h before procedure and 1 mL/kg/h for 6 h post-procedure if not contraindicated
 - avoid giving diuretics, ACEI, cyclosporine on morning of procedure if possible
- use renal-adjusted doses of nephrotoxic drugs in patients with renal insufficiency

Meta-Analysis: Effectiveness of Drugs for Preventing Contrast-Induced Nephropathy

Ann Intern Med 2008;148:284-294

Purpose: To determine the effectiveness of N-acetylcysteine, theophylline, fenoldopam, dopamine, iloprost, statin, furosemide, or mannitol on preventing nephropathy.

Study Selection: Only randomized, controlled trials that used these agents in patients receiving iodinated contrast.

Results: In the 41 RCTs included N-acetylcysteine ($\text{RR}=0.62$ [0.44-0.88]) and theophylline ($\text{RR}=0.49$ [0.23-1.06]) reduced the risk of nephropathy more than saline alone. Furosemide increased the risk ($\text{RR}=3.27$ [1.48-7.26]). Other agents did not affect risk of nephropathy.

Conclusion: N-acetylcysteine is more renoprotective than hydration alone.

Analgesic Nephropathies

1. Vasomotor AKI

- normally prostaglandins vasodilate afferent renal arteriole to maintain blood flow
- NSAIDs act by blocking cyclooxygenase enzyme, thereby preventing prostaglandin synthesis and causing renal ischemia
- more common in elderly, underlying renal disease, hypovolemia (diuretics, CHF, cirrhosis, nephrotic syndrome)
- clinically: develop prerenal azotemia within a few days of starting NSAID
- treatment: discontinue NSAID, dialysis rarely needed

2. Acute Interstitial Nephritis

- fenoprofen (60%), ibuprofen, naproxen
- may be associated with minimal change glomerulopathy and nephrotic range proteinuria
- resolves eventually with discontinuation of NSAID, may require interval dialysis
- short-term high dose steroids (1 mg/kg/d of prednisone) may hasten recovery

3. Chronic Interstitial Nephritis

- due to excessive consumption of antipyretics (phenacetin or acetaminophen) in combination with NSAIDs
- seen in patients who also have emotional stress, psychiatric symptoms, and GI disturbance
- papillary necrosis
 - gross hematuria, flank pain, declining renal function
 - calyceal filling defect seen with IVP – “ring sign”
- increased risk of transitional cell carcinoma of renal pelvis
- good prognosis if discontinue analgesics

4. Acute Tubular Necrosis

- can be caused by acetaminophen
 - incidence of renal dysfunction is related to the severity of acetaminophen ingestion
- vascular endothelial damage can also occur
- both direct toxicity and ischemia contribute to the tubular damage
- renal function spontaneously returns to baseline within 1-4 wk
- dialysis may be required during the acute episode of ingestion

5. Other Effects of NSAIDs

- sodium retention (2° to reduced GFR)
- hyperkalemia, HTN (2° to hyporeninemic hypoaldosteronism)
- excess water retention (due to elimination of ADH – antagonistic effect of prostaglandins)

Systemic Disease with Renal Manifestation

Diabetes

- diabetic nephropathy: presence of microalbuminuria or overt nephropathy (e.g. macroalbuminuria) in patients with DM who lack indicators of other renal diseases
- most common cause of end-stage renal failure in North America
- 35-50% of patients with type 1 DM will develop nephropathy, unknown percentage of type 2
- at diagnosis up to 30% of patients with type 2 DM have albuminuria (75% microalbuminuria, 25% overt nephropathy)
- microalbuminuria is a risk factor for progression to overt nephropathy and cardiovascular disease
- once macroalbuminuria is established, renal function declines, 50% patients reach ESRD within 7-10 yr
- associated with HTN and diabetic retinopathy (especially type 1 DM) and/or neuropathy (especially type 2 DM)
- indication of possible non-diabetic cause of renal disease in patients with DM:
 - rising Cr with little/no proteinuria
 - lack of retinopathy or neuropathy (microvascular complications)
 - persistent hematuria (microscopic or macroscopic)
 - signs or symptoms of systemic disease
 - inappropriate time course; rapidly rising Cr, renal disease in a patient with short duration of DM
 - family history of non-diabetic renal disease (e.g. PCKD, Alport's)

DM is one of the causes of ESRD that does not result in small kidneys at presentation of ESRD. The others are amyloidosis, HIV nephropathy, PCKD, and multiple myeloma

ACEI can cause hyperkalemia. Therefore, be sure to watch serum K⁺, especially if patient has DM and renal insufficiency

DIABETIC RENAL COMPLICATIONS

1. Progressive Glomerulosclerosis

- classic diabetic glomerular lesion: Kimmelstiel-Wilson nodular glomerulosclerosis (15-20%)
- more common lesion is diffuse glomerulosclerosis with a uniform increase in mesangial matrix

Table 11. Stages of Diabetic Progressive Glomerulosclerosis

Stage 1	Stage 2	Stage 3	Stage 4
<ul style="list-style-type: none"> • ↑ GFR (120-150%) – compensatory hyperfiltration • ± slightly increased mesangial matrix 	<ul style="list-style-type: none"> • Detectable microalbuminuria (0-300 mg/24 h) • Albumin-Cr ratio (ACR) 2.0–20 mg/mEq in men (18-180 mg/d), • ACR 2.8-28 mg/mEq in women (25-250 mg/d) • ↑ mesangial matrix 	<ul style="list-style-type: none"> • Macroalbuminuria (>300 mg/24 h) • ACR in men >20 mg/mEq, (>180 mg/d) • ACR in women >28 mg/mEq (>250 mg/d) • Proteinuria (+ve urine dipstick) • Normal GFR • ↑↑↑ mesangial matrix 	<ul style="list-style-type: none"> • ↑ proteinuria (>500 mg/24 h) • ↓ GFR • <20% glomerular filtration surface area present • Sclerosed glomeruli

2. Accelerated Atherosclerosis

- common finding
- decreased GFR
- may increase angiotensin II production resulting in increased BP
- increased risk of ATN secondary to contrast media

3. Autonomic Neuropathy

- affects bladder leading to functional obstruction and urinary retention
- residual urine promotes infection
- obstructive nephropathy

4. Papillary Necrosis

- type 1 DM susceptible to ischemic necrosis of medullary papillae
- sloughed papillae may obstruct ureter
- can present as renal colic or with obstructive features ± hydronephrosis

2013 Canadian Diabetes Association Clinical Practice Guidelines on Chronic Kidney Disease in Diabetes

- screen for microalbuminuria with a random urine test for albumin to Cr ratio (ACR) and eGFR with a serum Cr (e.g. using MDRD equation)
 - type 1 DM: annually in post-pubertal individuals after 5 yr of diagnosis
 - type 2 DM: at diagnosis, then annually
 - If eGFR >60 mL/min or ACR <2.0 mg/mEq: there is no CKD, re-screen in 1 yr
 - If urine ACR >20.0 mg/mEq: diagnose CKD
 - If ACR <20.0 mg/mEq but >2.0 mg/mEq: order serum Cr for eGFR in 3 mo and 2 repeats of random urine ACRs over the next 3 mo; at 3 mo: if eGFR ≤60 mL/min or if >2/3 ACRs are >2.0 mg/mEq, diagnose CKD
 - if CKD diagnosed, ordered urine R+M and dipstick, if negative then diagnose CKD in DM
 - with CKD in DM: urine ACR and serum Cr (for eGFR) every 6 mo
 - delay screening if transient cause of albuminuria or low eGFR
- evaluate for other causes of proteinuria, rule out non-diabetic renal disease
- avoid unnecessary potential nephrotoxins (NSAIDs, aminoglycosides, dye studies)

Priorities in the Management of Patients with DM

1. vascular protection for all patients with DM
 - ACEI, antiplatelet therapy (as indicated)
 - BP control, glycemic control, lifestyle modification, lipid control
 2. optimization of BP in patients who are hypertensive
 - treat according to HTN guidelines
 3. renal protection for DM patients with nephropathy (even in absence of HTN)
 - type 1 DM: ACEI
 - type 2 DM: CrCl >60 mL/min: ACEI or ARB – CrCl <60 mL/min: ARB
 - 2nd line agents: nondihydropyridine calcium channel blockers (diltiazem, verapamil)
 - ACEI and ARB can be safely used together if needed for control of significant proteinuria (monitor for hyperkalemia and acute rise in Cr)
- check serum Cr and K⁺ levels within 1 wk of initiating ACEI or ARB and at time of acute illness
 - serum Cr can safely be allowed to rise up to 30% with initiation of ACEI or ARB, usually stabilizes after 2-4 wk, monitor for significant worsening of renal function or hyperkalemia
 - if >30% rise in serum Cr or hyperkalemia, discontinue medication and consider 2nd line agent
 - consider holding ACEI, ARB, and/or diuretic with acute illness and in women before becoming pregnant
 - consider referral to nephrologist if ACR >60 mg/mEq, eGFR <30 mL/min, progressive kidney function loss, unable to achieve BP targets, or unable to stay on ACEI or ARB

Figure 17. GFR and urine protein over time in DM

Renoprotective Effect of Angiotensin-Receptor Antagonist Irbesartan in Patients with Nephropathy Due to Type 2 DM

NEJM 2001;345:851-860

Study: Multicenter, RCT, mean follow-up of 2.6 yr. **Patients:** 806 patients (mean age 70 yr) with type 2 DM, HTN, and nephropathy (24 h proteinuria >900 mg, serum Cr 88-265 μmol/L [male], serum Cr 106-265 μmol/L [female]).

Intervention: BP control with irbesartan vs. amlodipine vs. placebo, with use of adjuncts (not including ACEIs, ARBs, or CCI) as needed.

Outcomes: Primary composite endpoint included doubling of serum Cr, ESRD, or death. Secondary composite endpoint included morbidity and mortality from CVD causes.

Results: BP control was similar in all three arms. Irbesartan had a relative risk reduction of 20% vs. placebo and 23% vs. amlodipine for the primary end point. The irbesartan group had a 33% risk reduction vs. placebo and 37% reduction vs. amlodipine for risk of doubling serum Cr. Serum Cr increased more slowly in the irbesartan group vs. placebo or amlodipine. No difference in absolute mortality or secondary end point.

Conclusion: Irbesartan conferred significant renoprotective benefits in patients with type 2 DM and nephropathy, independent of blood pressure lowering effects.

Renal Outcomes with Telmisartan, Ramipril, or Both in People at High Vascular Risk (ONTARGET Study)

Lancet 2008;372:547-553

Study: Prospective, multicenter, double-blind, RCT. **Participants:** 25,620 patients with median follow-up of 56 mo.

Intervention: Patients received either ramipril (10 mg/d; n=8,576), telmisartan (80 mg/d; n=8,542), or a combination of both drugs (n=8,502).

Primary Outcome: Composite of dialysis, doubling of creatinine level, and death.

Results: The number of outcome events was similar for telmisartan (n=1,147) and ramipril (1,150; HR 1.00, 95% CI 0.92-1.09), but was increased with combination therapy (1,233; HR 1.09, 1.01-1.18, p=0.037). The need for dialysis or doubling of serum creatinine, was similar with telmisartan (189) and ramipril (174; HR 1.09, 0.89-1.34) and more frequent with combination therapy (212; HR 1.24, 1.01-1.51, p=0.038). Estimated GFR declined least with ramipril compared with telmisartan or combination therapy (p<0.001). The increase in urinary albumin excretion was less with telmisartan (p=0.004) and combination therapy (p=0.001) than with ramipril.

Conclusion: Renal outcomes were similar in both telmisartan and ramipril monotherapy. Combination therapy reduced proteinuria to a greater extent than monotherapy, but was associated with poorer renal outcomes.

Scleroderma

- 50% of scleroderma patients have renal involvement (mild proteinuria, high Cr, HTN)
- histology: media thickened, "onion skin" hypertrophy of small renal arteries, fibrinoid necrosis of afferent arterioles and glomeruli
- 10-15% scleroderma patients have a "scleroderma renal crisis" (occurs in first few years of disease): malignant HTN, ARF, microangiopathy, volume overload, visual changes, HTN encephalopathy
- renal involvement usually occurs early in the course of illness
- treatment: BP control with ACEI slows progression of renal disease

Effects of Losartan on Renal and Cardiovascular Outcomes in Patients with Type 2 DM and Nephropathy

NEJM 2001;345:861-869

Study: Randomized, double-blind, placebo-controlled trial with mean follow-up of 3.4 yr.

Patients: 1,513 patients (mean age 60, 63% male, multi-ethnicity) with NIDDM and nephropathy (urinary albumin:Cr ≥ 300 and serum Cr 115-265 $\mu\text{mol/L}$) on conventional antihypertensives (CCB, diuretics, β -blockers, centrally acting agents).

Intervention: Losartan 50 mg PO OD (could be doubled after 4 wk) vs. placebo.

Outcomes: Primary endpoints included doubling of serum Cr, ESRD, or death. Secondary endpoints included morbidity and mortality from CVD causes.

Results: Losartan reduced incidence of doubling of serum Cr (RR 25%) and ESRD (RR 28%), but had no effect on risk of death. Benefit exceeded that attributable to BP changes alone. Secondary endpoints were similar, although rate of hospitalization for heart failure was significantly lower with losartan (RR 32%).

Conclusion: Losartan conferred significant renal benefits in patients with type 2 DM and nephropathy, and was generally well tolerated.

Multiple Myeloma

- see [Hematology, H49](#)
- malignant proliferation of plasma cells in the bone marrow with the production of immunoglobulins
- patients may present with severe bone disease and renal failure
- light chains are filtered at the glomerulus and appear as Bence-Jones proteins in the urine (monoclonal light chains)
- kidney damage can occur by several mechanisms
 - hypercalcemia
 - light chain cast nephropathy (LCCN, see below) or "myeloma kidney"
 - hyperuricemia
 - infection
 - secondary amyloidosis
 - monoclonal Ig deposition disease (MIDD)
 - diffuse tubular obstruction
- LCCN
 - large tubular casts in urine sediment (light chains + Tamm-Horsfall protein)
 - proteinuria and renal insufficiency, can progress rapidly to kidney failure
- MIDD
 - deposits of monoclonal Ig in kidney, liver, heart, and other organs
 - mostly light chains (85-90%)
 - causes nodular glomerulosclerosis (similar to diabetic nephropathy)
- lab features: increased BUN, increased Cr, urine protein immunoelectrophoresis positive for Bence-Jones protein (not detected on urine dipstick)
- poor candidates for kidney transplantation

Protein Restriction for Diabetic Renal Disease

Cochrane DB Syst Rev 2007;4:CD002181

Purpose: To review the effects of dietary protein restriction on the progression of diabetic nephropathy.

Study Selection: Randomized controlled trials (RCTs) and before and after studies of the effects of restricted protein diet on renal function in subjects with DM. 12 studies were reviewed.

Results: The risk of end-stage renal disease or death was lower in patients on low-protein diet. In patients with type 1 DM no effect on GFR was noted in the low-protein diet group.

Malignancy

- cancer can have many different renal manifestations
- kidney transplantation cannot be performed unless malignancy is cured
 - solid tumors: mild proteinuria or membranous GN
 - lymphoma: minimal change GN (Hodgkin's) or membranous GN (non-Hodgkin's)
 - renal cell carcinoma
 - tumor lysis syndrome: hyperuricemia, diffuse tubular obstruction
 - chemotherapy (especially cisplatin): ATN or chronic TIN
 - pelvic tumors/mets: postrenal failure secondary to obstruction
 - 2° amyloidosis
 - radiotherapy (radiation nephritis)

Long-Term Outcomes of Scleroderma Renal Crisis

Ann Intern Med 2000;133:600-603

Study: Prospective observational cohort study with follow up of 5-10 yr.

Patients: 145 patients with scleroderma renal crisis who received ACEI and 662 patients with scleroderma who did not have renal crisis.

Primary Outcome: The need for dialysis and early death among patients with renal crisis.

Results: Sixty-one percent of patients with renal crisis had good outcomes (55 had no dialysis and 34 received temporary dialysis); only 4 of these patients progressed to chronic renal failure and permanent dialysis. Greater than 50% of the patients who initially required dialysis discontinued it 3-18 mo later. Permanent dialysis or early death occurred in 39% of the patients.

Conclusion: Renal crisis can be managed when HTN is aggressively controlled with ACEI.

Hypertension

- HTN occurs in about 20% of population
- etiology classified as primary ("essential"; makes up 90% of cases) or secondary
- primary HTN can cause kidney disease (hypertensive nephrosclerosis), which may in turn exacerbate the HTN
- secondary HTN can be caused by renal parenchymal or renal vascular disease

Features of Multiple Myeloma

CARLI

Calcium (elevated)

Anemia

Renal Failure

Lytic Bone Lesions

Infections

Hypertensive Nephrosclerosis

Table 12. Chronic vs. Malignant Nephrosclerosis

	Chronic Nephrosclerosis	Malignant Nephrosclerosis
Histology	Slow vascular sclerosis with ischemic changes affecting intralobular and afferent arterioles	Fibrinoid necrosis of arterioles, disruption of vascular endothelium
Clinical Picture	African American, underlying CKD, chronic hypertensive disease	Acute elevation in BP (dBP > 120 mmHg) HTN encephalopathy
Urinalysis	Mild proteinuria, normal urine sediment	Proteinuria and hematuria (RBC casts)
Therapy	Blood pressure control, (target <140/90) with frequent follow-up	Lower dBP to 100-110 mmHg within 6-24 h More aggressive treatment can cause ischemic event Identify and treat underlying cause of HTN
Prognosis	Can progress to renal failure despite patient adherence	Lower survival if renal insufficiency develops

Renovascular Hypertension

- see *Vascular Diseases of the Kidney*, NP17

Renal Parenchymal Hypertension

- HTN secondary to GN, AIN, diabetic nephropathy, or any other chronic renal disease
- mechanism of HTN not fully understood but may include
 - excess RAAS activation due to inflammation and fibrosis in multiple small intra-renal vessels
 - production of unknown vasopressors, lack of production of unknown vasodilators, or lack of clearance of endogenous vasopressor
 - ineffective sodium excretion with fluid overload

Investigations

- as well as investigations for renovascular HTN, additional tests may include
 - 24 h urinary estimations of Cr clearance and protein excretion
 - imaging (U/S, CT)
 - serology for collagen-vascular disease
 - renal biopsy

Treatment

- most chronic renal disease is irreversible, but treatment of HTN can slow the progression of renal insufficiency
- control ECF volume: Na⁺ restriction (88 mEq/d intake), diuretic, dialysis with end-stage disease
- ACEI or ARB may provide added benefit (monitor K⁺ and Cr) if there is significant proteinuria (>300 mg/d)

Cystic Diseases of the Kidney

- characterized by epithelium-lined cavities filled with fluid or semisolid debris within the kidneys
- includes: simple cysts (present in 50% of population over 50), medullary cystic kidney, medullary sponge kidney, polycystic kidney disease (autosomal dominant and recessive), and acquired cystic kidney disease (in chronic hemodialysis patients)

Adult Polycystic Kidney Disease

- autosomal dominant; at least 2 genes: *PKD1* (chr 16p) and *PKD2* (chr 4q)
- *PKD1* (1:400), *PKD2* (1:1,000) accounts for about 10% of cases of renal failure
- patients generally heterozygous for mutant polycystin gene but accumulate a series of second 'somatic hits' precipitating the condition
- *PKD1* encodes a protein that is responsible for cell-cell and cell-matrix interaction and sensing fluid flow by associating with cilia
- *PKD2* encodes a protein that is a Ca²⁺ permeable nonselective cation channel that associates with cilia and is thought to control intracellular Ca²⁺ in response to flow
- defect leads to abnormal proliferation and apoptosis of tubular epithelial cells leading to cyst growth
- extrarenal manifestations: most common; multiple asymptomatic hepatic cysts (33%), cerebral aneurysm (10%), diverticulosis, and mitral valve prolapse (25%)
- polycystic liver disease rarely causes liver failure
- less common: cysts in pancreas, spleen, thyroid, ovary, seminal vesicles, and aorta

Hypercalcemia complicates many cancers and can cause multiple kinds of renal disorders (renal vasoconstriction with reduced GFR, salt-wasting with volume depletion, risk of calcium kidney stones)

Signs and Symptoms

- often asymptomatic; discovered incidentally on imaging or by screening those with FHx
- acute abdominal flank pain/dull lumbar back pain
- hematuria (microscopic frequently initial sign, gross)
- nocturia (urinary concentrating defect)
- rarely extra-renal presentation (e.g. ruptured berry aneurysm, diverticulitis)
- HTN (increased renin due to focal compression of intrarenal arteries by cysts) (60-75%)
- \pm palpable kidneys

**External Manifestations of PKD**

- Hepatic cysts
- Cerebral aneurysms
- Diverticulosis
- Mitral valve prolapse

Common Complications

- urinary tract and cyst infections, HTN, CRF, nephrolithiasis (5-15%), flank and chronic back pain

Clinical Course

- polycystic changes are always bilateral and can present at any age
- clinical manifestations rare before age 20-25
- kidneys are normal at birth but may enlarge to 10x normal size
- variable progression to renal functional impairment (ESRD in up to 50% by age 60)

Investigations

- radiographic diagnosis: best accomplished by renal U/S (enlarged kidneys, multiple cysts throughout renal parenchyma, increased cortical thickness, splaying of renal calyces)
- CT abdo with contrast (for equivocal cases, occasionally reveals more cystic involvement)
- gene linkage analysis for PKD1 for asymptomatic carriers
- Cr, BUN, urine R&M (to assess for hematuria)

Treatment

- goal: to preserve renal function by prevention and treatment of complications
- educate patient and family about disease, its manifestations, and inheritance pattern
- genetic counseling: transmission rate 50% from affected parent
- prevention and early treatment of urinary tract and cyst infections (avoid instrumentation of GU tract)
- TMP/SMX, ciprofloxacin: able to penetrate cyst walls, achieve therapeutic levels
- adequate hydration to prevent stone formation
- avoid contact sports due to greater risk of injury to enlarged kidneys
- screen for cerebral aneurysms if family history of aneurysmal hemorrhages
- monitor blood pressure and treat HTN with ACEI
- dialysis or transplant for ESRD (disease does not recur in transplanted kidney)
- may require nephrectomy to create room for renal transplant

Medullary Sponge Kidney

- common, autosomal dominant, usually diagnosed in 4th-5th decades
- multiple cystic dilatations in the collecting ducts of the medulla
- renal stones, hematuria, and recurrent UTIs are common features
- an estimated 10% of patients who present with renal stones have medullary sponge kidney
- nephrocalcinosis on abdominal x-ray in 50% patients, often detect asymptomatic patients incidentally
- diagnosis: contrast filled medullary cysts on IVP leading to characteristic radial pattern ("bouquet of flowers"), "Swiss cheese" appearance on histological cross-section
- treat UTIs and stone formation as indicated
- does not result in renal failure

Autosomal Recessive Polycystic Kidney Disease

- 1:20,000 incidence
- prenatal diagnosis by enlarged kidneys
- perinatal death from respiratory failure
- patients who survive perinatal period develop CHF, HTN, CKD
- treated with kidney and/or liver transplant

Acute Kidney Injury

Definition

- abrupt decline in renal function leading to increased nitrogenous waste products normally excreted by the kidney
- formerly known as Acute Renal Failure

Clinical Features

- azotemia (increased BUN, Cr)
- abnormal urine volume: formally <0.5 ml/kg/h for >6 h but can manifest as anuria, oliguria, or polyuria

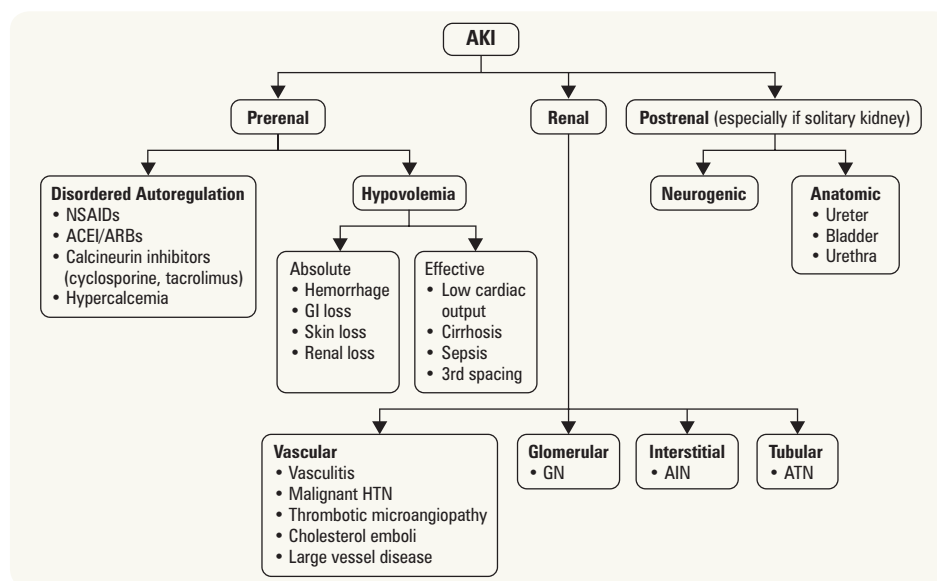

Figure 18. Approach to AKI

Approach to AKI

Investigations

- blood work: CBC, electrolytes, Cr, urea (think prerenal if increase in urea is relatively greater than increase in Cr), Ca^{2+} , PO_4^{3-}
- urine volume, C&S, R&M: sediment, casts, crystals
- urinary indices: electrolytes, osmolality
- fluid challenge (e.g. fluid bolus to rule out most prerenal causes)
- imaging: abdo U/S (assess kidney size, hydronephrosis, postrenal obstruction)
- indications for renal biopsy
 - diagnosis is not certain
 - prerenal azotemia or ATN is unlikely
 - oliguria persists >4 wk

Treatment

1. preliminary measures
 - prerenal
 - ♦ correct prerenal factors: optimize volume status and cardiac performance using fluids that will stay in the plasma subcompartment (NS, albumin, blood/plasma), hold ACEI/ARB (gently rehydrate when needed, e.g. CHF)
 - renal
 - ♦ address reversible renal causes: discontinue nephrotoxic drugs, treat infection, and optimize electrolytes
 - postrenal
 - ♦ consider obstruction: structural (stones, strictures) vs. functional (neuropathy)
 - ♦ treat with Foley catheter, indwelling bladder catheter, nephrostomy, stenting
2. treat complications
 - fluid overload
 - ♦ NaCl restriction
 - ♦ high dose loop diuretics
 - hyperkalemia (refer to *Approach to Hyperkalemia*, NP12)

The 2 most common causes of acute kidney injury in hospitalized patients are prerenal azotemia and ATN; remember that prerenal failure can lead to ATN

Clues to Prerenal Etiology

- Clinical: Decreased BP, increased HR, and orthostatic HR and BP changes
- Increased [urea] \gg Increased [Cr]
- Urine $[\text{Na}^+] < 10\text{--}20$ mEq/L
- Urine osmolality > 500 mOsm/kg
- Fractional excretion of $\text{Na}^+ < 1\%$

Clues to Renal Etiology

- Appropriate clinical context
- Urinalysis positive for casts:
 - Pigmented granular – ATN
 - WBC – AIN
 - RBC – GN

Clues to Postrenal Etiology

- Known solitary kidney
- Older man
- Recent retroperitoneal surgery
- Anuria
- Palpable bladder
- U/S shows hydronephrosis

Differentiating Prerenal from ATN

	Prerenal	ATN
Urinalysis	Normal	RBC, pigmented granular casts
Urine $[\text{Na}^+]$	<20	>40 mEq/L
Urine $[\text{Na}^+]/[\text{Cr}]$	<20	>40
Urine osmolality	>500	<350 mOsm/kgH ₂ O
FeNa	<1	$>1\%$

Drugs Implicated in Prerenal Azotemia

- Diuretics
- NSAIDs
- ACEI/ARBs

Indications for Dialysis (refractory to medical therapy)

AE IOU

Acidosis
Electrolyte imbalance (K^+)
Intoxication
Overload (fluid)
Uremic encephalopathy, pericarditis, urea $>35\text{--}50$ mM

- adjust dosages of medications cleared by kidney (e.g. amiodarone, digoxin, cyclosporin, tacrolimus, some antibiotics, and chemotherapeutic agents)
 - dialysis
3. definitive therapy depends on etiology
- note: renal transplant is not a therapy for AKI

Prognosis

- high morbidity and mortality in patients with sustained AKI and multi-organ failure

Chronic Kidney Disease

Definition

- progressive and irreversible loss of kidney function
- abnormal markers (Cr, urea)
 - GFR <60 mL/min for >3 mo; or
 - kidney pathology seen on biopsy; or
 - decreased renal size on U/S (kidneys <9 cm)
- clinical features of CKD
 - volume overload and HTN
 - electrolyte and acid-base balance disorders (e.g. metabolic acidosis)
 - uremia

Table 13. Stages of CKD (KDIGO, 2013)

	GFR (mL/min/1.73m ²)	Persistent Albuminuria Categories		
		A1	A2	A3
		<30 mg/g <3 mg/mEq	30-300 mg/g 3-30 mg/mEq	>300 mg/g >30 mg/mEq
GFR categories (mL/min/1.73m ²)	G1	≥90	1 if CKD	2
	G2	60-89	1 if CKD	2
	G3a	45-59	1	2
	G3b	30-44	2	3
	G4	15-29	3	4+
	G5	<15 (kidney failure)	4+	4+

The numbers in the boxes are a reflection of the risk of progression and are a guide to the frequency of monitoring/year

"D" is added to G5 for patients requiring dialysis

Classification is based on cause, GFR, and amount of albuminuria

Rate of progression and risk of complications are determined by the cause of CKD

Incidence of Etiologies of CKD

DM	42.9%
HTN	26.4%
Glomerulonephritis	9.9%
Other/Unknown	7.7%
Interstitial nephritis/ Pyelonephritis	4.0%
Cystic/Hereditary/Congenital	3.1%
Secondary GN/Vasculitis	2.4%

Management of Complications of CKD

NEPHRON

- N** – Low-nitrogen diet
- E** – Electrolytes: monitor K⁺
- P** – pH: metabolic acidosis
- H** – HTN
- R** – RBCs: manage anemia with erythropoietin
- O** – Osteodystrophy: give calcium between meals (to increase Ca²⁺) and calcium with meals (to bind and decrease PO₄³⁻)
- N** – Nephrotoxins: avoid nephrotoxic drugs (ASA, gentamicin) and adjust doses of renally excreted medications

Renin Angiotensin System Blockade and Cardiovascular Outcomes in Patients with Chronic Kidney Disease and Proteinuria: A Meta-Analysis

Am Heart J 2008;155:791-805

Purpose: To evaluate the role of RAS blockade in improving cardiovascular CV outcomes in patients with CKD.

Study Selection: Randomized controlled trials that analyzed CV outcomes in patients with CKD/proteinuria treated with RAS blockade (ACEI/ARB). RAS blockade-based therapy was compared with placebo and control therapy (β-blocker, calcium-channel blockers, and other antihypertensive-based therapy) in the study.

Results: Twenty-five trials (n=45,758) were included. Compared to placebo, RAS blockade reduced the risk of heart failure in patients with diabetic nephropathy. In patients with non-diabetic CKD, RAS blockade decreased CV outcome compared to control therapy.

Conclusions: RAS blockade reduced CV outcomes in diabetic nephropathy as well as non-diabetic CKD.

Management of Chronic Kidney Disease

- diet
 - preventing HTN and volume overload
 - ♦ Na⁺ and water restriction
 - preventing electrolyte imbalances
 - ♦ K⁺ restriction (40 mEq/d)
 - ♦ PO₄³⁻ restriction (1 g/d)
 - ♦ avoid extra-dietary Mg²⁺ (e.g. antacids)
 - preventing uremia and potentially delaying decline in GFR
 - ♦ protein restriction with adequate caloric intake in order to limit endogenous protein catabolism
- medical
 - adjust dosages of renally excreted medications
 - HTN: ACEI (target 130/80 or less), loop diuretics when GFR <25 mL/min
 - dyslipidemia: statins
 - calcium and phosphate disorders:
 - ♦ calcium supplements (e.g. TUMS®) treats hypocalcemia when given between meals and binds phosphate when given with meals
 - ♦ consider calcitriol (1,25-dihydroxy-vitamin D) if hypocalcemic
 - ♦ sevelamer (phosphate binder) if both hypercalcemic and hyperphosphatemic
 - ♦ vitamin D analogues are being introduced in the near future
 - ♦ cinacalcet for hyperparathyroidism (sensitizes parathyroid to Ca²⁺, decreasing PTH)
 - metabolic acidosis: sodium bicarbonate
 - anemia: erythropoietin injections (Hct <30%); target Hct 33-36%
 - clotting abnormalities: DDAVP if patient has clinical bleeding or invasive procedures (acts to reverse platelet dysfunction)
- dialysis (hemodialysis, peritoneal dialysis)
- renal transplantation

Prevention of Progression

- as above
- control of HTN, DM, cardiovascular risk factors (e.g. smoking cessation)
- avoid nephrotoxins
- address reversible causes of AKI

End Stage Renal Disease

- end stage renal disease represents a decline in kidney function which can occur over days to weeks (AKI), over months to years (CKD), or as a combination of the two

Presentation of End Stage Renal Disease

1. Volume Overload

- due to increase in total body Na^+ content
- signs: weight gain, HTN, pulmonary or peripheral edema

2. Electrolyte Abnormalities

- high
 - K^+ (decreased renal excretion, increased tissue breakdown)
 - PO_4^{3-} (decreased renal excretion, increased tissue breakdown)
 - Ca^{2+} (rare; happens during recovery phase after rhabdomyolysis-induced AKI or in settings where hypercalcemia contributes to renal failure, such as in multiple myeloma or sarcoidosis)
 - uric acid
- low
 - Na^+ (failure to excrete excessive water intake)
 - Ca^{2+} (decreased Vit D activation, hyperphosphatemia, hypoalbuminemia)
 - HCO_3^- (especially with sepsis or severe heart failure)

3. Uremic Syndrome

- manifestations result from retention of urea and other metabolites as well as hormone deficiencies

Figure 19. Signs and symptoms of end stage renal disease

Complications

- CNS: decreased LOC, stupor, seizure
- CVS: cardiomyopathy, CHF, arrhythmia, pericarditis, atherosclerosis
- GI: peptic ulcer disease, gastroduodenitis, AVM
- hematologic: anemia, bleeding tendency (platelet dysfunction), infections
- endocrine
 - decreased testosterone, estrogen, progesterone
 - increased FSH, LH
- metabolic
 - renal osteodystrophy: secondary increased PTH due to decreased Ca^{2+} , high PO_4^{3-} , and low active vitamin D
 - ♦ osteitis fibrosa cystica
 - hypertriglyceridemia, accelerated atherogenesis
 - decreased insulin requirements, increased insulin resistance
- dermatologic: pruritus, ecchymosis, hematoma, calciphylaxis (vascular Ca^{2+} deposition)

Renal Replacement Therapy

Dialysis

Indications for Dialysis in Chronic Kidney Disease

Table 14. Indications for Dialysis

Absolute Indications	Relative Indications
<ul style="list-style-type: none"> • Volume overload* • Hyperkalemia* • Severe metabolic acidosis* • Neurologic signs or symptoms of uremia (encephalopathy, neuropathy, seizures) • Uremic pericarditis • Refractory accelerated HTN • Clinically significant bleeding diathesis • Persistent severe N/V • Plasma Cr > 12 mg/dL (1060 $\mu\text{mol/L}$) or Urea > 100 mg/dL (36 mEq/L; clinical picture also important) 	<ul style="list-style-type: none"> • Anorexia • Decreased cognitive functioning • Profound fatigue and weakness • Severe anemia unresponsive to erythropoietin • Persistent severe pruritus • Restless leg syndrome

*Unresponsive to medications

- **hemodialysis:** blood is filtered across a semipermeable membrane removing accumulated toxic waste products, solutes, excess fluid (ultrafiltration), and restoring buffering agents to the bloodstream
 - available as intermittent (e.g. 3x/wk), continuous (CVVHD) or sustained low efficiency (SLED)
 - can be delivered at home or in-center, nocturnal
 - vascular access can be achieved through a central line, an artificial graft, or an AV fistula
- patients with CKD should be referred for surgery to attempt construction of a primary AV fistula when their eGFR is <20 mL/min, the serum Cr level quoted as >4.0 mg/dL (>350 $\mu\text{mol/L}$), or within 1 yr of an anticipated need
- **peritoneal dialysis:** peritoneum acts as a semipermeable membrane similar to hemodialysis filter
 - advantages: independence, fewer stringent dietary restrictions, better rehabilitation rates
 - available as continuous ambulatory (CAPD; four exchanges per day) or cyclic (CCPD; machine carries out exchanges overnight)
- refer patients with chronic renal disease to a nephrologist early on to facilitate treatment and plan in advance for renal replacement therapy (RRT)

How to Write Dialysis Orders (MUST BE INDIVIDUALIZED)

- Filter Type (e.g. F80)
- Length (e.g. 4 h 3x/wk or 2 h daily)
- Q Blood Flow (max 500 cc/min)
- Ultrafiltration (e.g. 2 L or to target dry weight)
- Na^+ 140 (can be adjusted by starting at 155 and "ramping" down to minimize cramping)
- K^+ (based on serum K^+)

Serum K^+	Dialysate
4-6	1.5
3.5-4	2.5
<3.5	3.5
- Ca^{2+} 1.25
- HCO_3^- 40
- Heparin (none, tight [500 U/h] or full [1000 U/h])
- IV fluid to support BP (e.g. N/S)

Table 15. Peritoneal Dialysis vs. Hemodialysis

	Peritoneal Dialysis	Hemodialysis
Rate	Slow	Fast
Location	Home	Hospital (usually)
Ultrafiltration	Osmotic pressure via dextrose dialysate	Hydrostatic pressure
Solute Removal	Concentration gradient and convection	Concentration gradient and convection
Membrane	Peritoneum	Semi-permeable artificial membrane
Method	Indwelling catheter in peritoneal cavity	Line from vessel to artificial kidney
Complications	Infection at catheter site Bacterial peritonitis Metabolic effects of glucose Difficult to achieve adequate clearance in patients with large body mass	Vascular access (clots, collapse) Bacteremia Bleeding due to heparin Hemodynamic stress of extracorporeal circuit Disequilibrium syndrome (headache, cerebral edema, hypotension, nausea, muscle cramps related to solute/water flux over short time)
Preferred When	Young, high functioning, residual renal function Success depends on presence of residual renal function	Bed-bound, comorbidities, no renal function Residual renal function not as important

Renal Transplantation

- provides maximum replacement of GFR
- preferred modality of RRT in CKD, not AKI
 - best way to reverse uremic signs and symptoms
 - only therapy shown to improve survival in CKD patients with ESRD
- native kidneys usually left *in situ*
- 2 types: deceased donor, living donor (related or unrelated)
- kidney transplanted into iliac fossa, transplant renal artery anastomosed to external iliac artery of recipient
- 1 yr renal allograft survival rates $\geq 90\%$

Complications

- leading causes of late allograft loss: interstitial fibrosis/tubular atrophy (IFTA) and death with functioning graft
- #1 cause of mortality in transplanted patients is cardiovascular disease
- immunosuppressant drug therapy: side effects include infections, malignancy (skin, Kaposi's sarcoma, post-transplant lymphoproliferative disorder)
- acute rejection: graft site tenderness, rise in Cr, oliguria, \pm fever, although symptoms are uncommon
- *de novo* GN (usually membranous)
- new-onset DM (often due to prednisone use)
- cyclosporine or tacrolimus nephropathy (refer to *Small Vessel Disease*, NP18)
- chronic allograft nephropathy
 - early allograft damage caused by episodes of acute rejection and acute peritransplant injuries
 - immunologic and nonimmunologic factors (HTN, hyperlipidemia, age of donor, quality of graft, new onset DM)
 - transplant glomerulopathy from antibody injury causes nephrotic proteinuria
- CMV (cytomegalovirus) infection and other opportunistic infections usually occur between 1 and 6 mo post-transplant
- BK virus (polyoma virus) nephropathy can result from over-immunosuppression and lead to graft loss

When to Initiate Dialysis

CrCl < 20 mL/min

- Educate patient regarding dialysis; if not a candidate for peritoneal dialysis, make arrangements for AV fistula

CrCl < 15 mL/min

- Weigh risk and benefits for initiating dialysis

CrCl < 10 mL/min

- Dialysis should be initiated

NOTE

- Cockcroft-Gault equation (or MDRD equation) should be used to measure kidney function
- Monitor for uremic complications
- Significant benefits in quality of life can occur if dialysis started before CrCl < 15 mL/min
- It is unclear whether patients who start dialysis early have increased survival
- A preemptive transplant can be considered if patient is stable, in order to avoid dialysis

Source: National Kidney Foundation Kidney Disease Outcomes Quality Initiative.

Commonly Used Immunosuppressive Drugs

Calcineurin inhibitors

- Cyclosporine
- Tacrolimus

Antiproliferative medications

- Mycophenolate mofetil
- Azathioprine

Other agents

- Sirolimus
- Prednisone

Anti-lymphocyte antibodies

- Thymoglobulin
- Basiliximab

Survival Among Nocturnal Home Haemodialysis Patients Compared to Kidney Transplant Recipients

Nephrol Dial Transplant 2009;24:2915-2919

Study: Retrospective, matched cohort with 4-5 yr average follow up.

Population: 177 nocturnal home dialysis (NHD) patients (mean age 46, 68% white) were matched to 533 deceased donor transplant (DTX) patients and 533 live donor (LTX) transplant patients (1:3:3 ratio).

Intervention: Nocturnal home dialysis vs. live or deceased donor transplant.

Outcome: Primary outcome was all cause mortality.

Results: No significant difference in survival or hazard ratio between NHD and DTX. Significant survival benefit for patients undergoing LTX vs. NHD. Significant mortality hazard ratio reduction with LTX (0.51) with no difference in hazard ratio for DTX vs. NHD reference.

Conclusion: NHD has comparable mortality to DTX, but is inferior to LTX.

Common Medications

Table 16. Common Medications in Nephrology

Classification	Examples	Site of Action	Mechanism of Action (Secondary Effect)	Indication	Dosing	Adverse Effects
Loop Diuretics	furosemide (Lasix®) bumetanide (Bumex®/Buinex®) ethacrynate (Edecrin®) torsemide (Demadex®)	Thick ascending limb of Loop of Henle	↓ Na ⁺ /K ⁺ /2Cl ⁻ transport ± renal and peripheral vasodilatory effects (K ⁺ loss; ↑ H ⁺ secretion; ↑ Ca ²⁺ excretion)	Management of edema secondary to CHF, nephrotic syndrome, cirrhotic ascites; ↑ free water clearance (e.g. in SIADH-induced hyponatremia), ↓ BP (less effective due to short action)	furosemide: edema: 20-80 mg IV/IM/PO q6-8h (max 600 mg/d) until desired response HTN: 20-80 mg/d PO OD/bid dosing	Allergy in sulfa-sensitive individuals Electrolyte abnormalities; hypokalemia, hyponatremia, hypocalcemia, hypercalciuria (with stone formation) Volume depletion with metabolic alkalosis Precipitates gouty attacks
Thiazide Diuretics	hydrochlorothiazide (HCTZ) chlorothiazide (Diuril®) indapamide (Lozol®, Lozide®) metolazone (Zaroxolyn®) chlorthalidone (Hygroton®)	Distal convoluted tubule	Inhibit Na ⁺ /Cl ⁻ transporter (K ⁺ loss; ↑ H ⁺ secretion; ↓ Ca ²⁺ excretion)	1st line for essential HTN Treatment of edema Idiopathic hypercalciuria and stones Diabetes insipidus (nephrogenic)	HCTZ: edema: 25-100 mg PO OD HTN: 12.5-25 mg PO OD (max 50 mg/d) nephrolithiasis/hypercalciuria: 25-100 mg OD	Hypokalemia Increased serum urate levels Precipitates gouty attacks, hypercalcemia Elevated lipids Glucose intolerance
Potassium-Sparing Diuretics	spironolactone (Aldactone®) triaterene (Dyrenium®) amiloride (Midamor®)	Cortical collecting duct (↓ Na ⁺ reabsorption)	Aldosterone antagonist Closes apical Na ⁺ channels directly	Reduces K ⁺ loss caused by other diuretics Edema/hypervolemia Severe CHF, ascites (spironolactone), cystic fibrosis (amiloride ↓ viscosity of secretions)	spironolactone: 25-200 mg/d OD/bid dosing HTN: 50-200 mg/d OD/bid dosing Hyperaldosteronism: 100-400 mg/d OD/bid dosing amiloride: edema/HTN: 5-10 mg PO OD	Hyperkalemia (caution with ACEI) Triamterene can be nephrotoxic (rare) Nephrolithiasis Gynecomastia (estrogenic effect of spironolactone)
Combination Agents	Dyazide® (triamterene + HCTZ) Aldactazide® (spironolactone + HCTZ) Moduretic® (amiloride + HCTZ) Vaseretic® (enalapril + HCTZ) Zestoretic® (lisinopril + HCTZ)		Combine ACEI with thiazide for synergistic effect	Combine K ⁺ -sparing drug with thiazide to reduce hypokalemia		
Osmotic Diuretics	mannitol (Osmitol®) glycerol urea	Renal tubules (proximal and collecting duct)	Non-reabsorbable solutes increase osmotic pressure of glomerular filtrate – inhibits reabsorption of water and ↑ urinary excretion of toxic materials	To ↓ intracranial or intraocular pressure Mobilization of excess fluid in renal failure or edematous states	mannitol: ↓ ICP: 0.25-2 g/kg IV over 30-60 min	Transient volume expansion Electrolyte abnormalities (↓/↑ Na ⁺ , ↓/↑ K ⁺)
ACEI	ramipril (Altace®) enalapril (Vasotec®) lisinopril (Prinivil®) trandolapril (Mavik®) captopril (Capoten®)	Lungs Tissues diffusely	Prevents angiotensin II vasoconstricting vascular smooth muscle → net vasodilation → ↓ BP Prevents angiotensin II mediated aldosterone release from adrenal cortex and action on proximal renal tubules → ↑ Na ⁺ and H ₂ O excretion → ↓ BP Reduces fibrosis and atherogenesis	HTN Cardioprotective effects (see Cardiology and Cardiac Surgery) Renoprotective effects 	ramipril: HTN: 2.5-20 mg PO OD/bid dosing renoprotective use: 10 mg PO OD trandolapril: HTN: 1-4 mg PO OD	Cough Asthma Hyperkalemia Angioedema Agranulocytosis (captopril) AKI Teratogenic
ARB	losartan (Cozaar®) candesartan (Atacand®) irbesartan (Avapro®) valsartan (Diovan®) telmisartan (Micardis®) eprosartan (Teveten®) olmesartan (Olmetec®)	Vascular smooth muscle, adrenal cortex, proximal tubules	Competitive inhibitor at the angiotensin II receptor: prevents angiotensin II vasoconstricting action on vascular smooth muscle → ↓ BP Prevents angiotensin II mediated aldosterone release from adrenal cortex and action on proximal renal tubules → ↑ Na ⁺ and H ₂ O excretion	HTN Cardioprotective effects (see Cardiology and Cardiac Surgery) Renoprotective effects 	HTN: losartan 25-100 mg PO OD candesartan 8-32 mg PO OD irbesartan 150-300 mg PO OD valsartan 80-320 mg PO OD telmisartan 20-80 mg PO OD eprosartan 400-800 mg PO OD olmesartan 20-40 mg PO OD	Hyperkalemia Caution – reduce dose in hepatic impairment AKI Teratogenic
Renin Antagonists	aliskiren (Rasilez®)	Direct renin antagonist	Inhibits renin production and activity Cardioprotective and renoprotective abilities being evaluated	HTN	aliskiren 150-300 mg PO OD	Hyperkalemia

Landmark Nephrology Trials

Trial	Reference	Results
4D	<i>NEJM</i> 2005; 353:238-48	Patients with type 2 DM receiving maintenance hemodialysis were randomized to 20 mg of atorvastatin per day or matching placebo; no difference in composite index of death from cardiac causes, nonfatal myocardial infarction, and stroke
AASK	<i>JAMA</i> 2001; 285:2719-28	Ramipril, compared with amlodipine, slows progression of hypertensive renal disease and proteinuria and may benefit patients without proteinuria as well
ACCOMPLISH	<i>NEJM</i> 2008; 359:2417-20	Combination treatment with an ACEI and a CCB (benazepril-amlodipine) was more successful than a combination of ACEI and a thiazide diuretic (benzapril-HCTZ) in reducing cardiovascular events in patients with HTN who were at risk for such events
ACEI and Diabetic	<i>NEJM</i> 1993; 329:1456-62	Captopril protects against deterioration in renal function in insulin-dependent diabetic nephropathy and is significantly more effective than blood pressure control alone
ALERT	<i>Lancet</i> 2003; 361:2024-31	The use of fluvastatin in renal transplant recipients did not significantly decrease the risk of the occurrence of a major adverse cardiac event (defined as cardiac death, non-fatal MI, or coronary intervention procedure) compared with placebo; however, there was a significant reduction in cardiac deaths or non-fatal MI
ALTITUDE	Early Termination (Unpublished Results; protocol – <i>NDT</i> 2009; 24:1663-71)	Combining Aliskiren with ACEI or ARB in high-risk patients with type 2 DM leads to increased incidence of nonfatal stroke, hyperkalemia, and hypotension
ASTRAL	<i>NEJM</i> 2009; 361:1953-62	Renal artery revascularization compared to medical therapy does not improve renal function, BP, renal or cardiovascular events, or mortality, and carries significant operative risks
AURORA	<i>NEJM</i> 2009; 360:1395-407	Patients receiving maintenance hemodialysis randomized to rosuvastatin 10 mg daily or placebo; rosuvastatin lowered the LDL cholesterol level but had no significant effect on the composite primary end point of death from cardiovascular causes, nonfatal myocardial infarction, or nonfatal stroke
BENEDICT	<i>NEJM</i> 2004; 351:1941-51	Treatment with ACEI trandolapril alone or trandolapril combined with verapamil decreased the incidence of microalbuminuria in patients with type 2 DM and HTN with normoalbuminuria
CHOIR	<i>NEJM</i> 2006; 355:2085-98	Patients with CKD were randomly assigned to receive a dose of epoetin alfa targeted to achieve a hemoglobin level of 13.5 g/dL or 11.3 g/dL; the higher target group had an increased risk of death, myocardial infarction, hospitalization for congestive heart failure (without renal replacement therapy), or stroke
CREATE	<i>NEJM</i> 2006; 355:2071-84	Patients with CKD (15-35 mL/min) and mild to moderate anemia (11-12.5 g/dL) were randomized to normal (13-15 g/dL) or sub-normal (10.5-11.5 g/dL) hemoglobin levels; early and complete correction of hemoglobin did not reduce the risk of cardiovascular events
DETAIL	<i>NEJM</i> 2004; 351:1952-61	The ARB telmisartan and the ACEI enalapril are equally effective in slowing renal function deterioration in type 2 DM with mild to moderate HTN and early nephropathy
ELITE-SYMPHONY	<i>NEJM</i> 2007; 357:2562-75	Daclizumab induction, MMF, steroids, and low-dose tacrolimus effectively maintain stable renal function following renal transplantation, without the negative effects on renal function commonly reported for standard CNI regimens
FHN	<i>NEJM</i> 2010;363:2287-300	Patients were randomized to dialysis 6x/wk (frequent) or 3x/wk (conventional); frequent hemodialysis was associated with improvement in composite outcomes of death, or change in left ventricular mass and death, or change in a physical-health composite score; frequent hemodialysis caused more frequent interventions related to vascular access
HEMO	<i>NEJM</i> 2002; 347:2010-19	Use of high dose dialysis or high flux membranes vs. standard dose or low flux in thrice-weekly dialysis does not improve survival or outcomes; possible benefit in cardiac-related outcomes with high flux membranes
IDEAL	<i>NEJM</i> 2010; 363:609-19	Patients with progressive CKD and GFR between 10 and 15 mL/min randomized to initiate dialysis at GFR of 10-14 mL/min (early) or 5-7 mL/min (late); early initiation of dialysis in patients with stage G5 CKD was not associated with an improvement in survival or clinical outcomes
IDNT	<i>NEJM</i> 2001; 345:851-60	Treatment with irbesartan reduced the risk of developing end-stage renal disease and worsening renal function in patients with type 2 DM and diabetic nephropathy
IRMA	<i>NEJM</i> 2001; 345:870-8	Irbesartan is renoprotective independently of its blood pressure lowering effect in patients with type 2 DM and microalbuminuria
MDRD	<i>Ann Intern Med</i> 1995; 123:754-62	Patients with proteinuria of more than 1 g/d should have a target BP <125/75 mmHg; patients with proteinuria of 0.25-1.0 g/d should have a target BP <130/80 mmHg
ONTARGET	<i>Lancet</i> 2008; 372:547-53	Telmisartan and ramipril monotherapy reduced proteinuria and rise in Cr in patients with high vascular risk; combination of the two agents led to increased acute renal failure episodes, syncope, and hypotension
REIN	<i>Lancet</i> 1999; 354:359-64	In non-diabetic nephropathy, ACEI were renoprotective in patients with non-nephrotic range proteinuria
REIN2	<i>Lancet</i> 2005; 365:939-46	In non-diabetic nephropathy already on ACEI, no further benefit from intensified BP control (sBP/dBP <130/80 mmHg) by adding a CCB vs. conventional BP control (dBP <90 mmHg) on ACEI alone
RENAAL	<i>NEJM</i> 2001; 345:861-9	Losartan conferred significant renal benefits in patients with type 2 DM and nephropathy and was generally well-tolerated
RENAL	<i>NEJM</i> 2009; 361:1627-38	High intensity continuous renal-replacement therapy in AKI does not improve survival or outcomes compared to low intensity treatment, and is associated with higher rates of hypophosphatemia

Trial	Reference	Results
ROAD	<i>JASN</i> 2007; 18:1889-98	Uptitration of either ACEI benazepril or ARB losartan to optimal anti-proteinuria doses conferred benefit on renal outcome in patients without DM who had proteinuria and renal insufficiency
ROADMAP	<i>NEJM</i> 2011; 364:907-17	The use of the ARB olmesartan was more effective than placebo in delaying the onset of microalbuminuria in patients with type 2 DM, normoalbuminuria, and good blood pressure control; however, a higher rate of fatal cardiovascular events was found amongst patients with preexisting coronary heart disease in the olmesartan group
SHARP	<i>Lancet</i> 2011; 377:2181-92	Randomized placebo-controlled trial in patients with CKD and no history of MI or coronary revascularization took simvastatin 20 mg plus ezetimibe 10 mg daily vs. matching placebo; simvastatin 20 mg plus ezetimibe 10 mg daily resulted in reduction of LDL cholesterol with associated reduction of major atherosclerotic events in patients with CKD
TREAT	<i>NEJM</i> 2009; 361:2019-32	Patients with type 2 DM, CKD, and anemia were randomized to darbepoetin targeting a hemoglobin of 13 g/dL or placebo; darbepoetin did not reduce the risk of death, a cardiovascular event, or a renal event, and was associated with an increased risk of stroke

CJD	Creutzfeldt-Jakob disease	ICH	intracranial hemorrhage	MoCA	Montreal cognitive assessment	ROM	range of motion
CN	cranial nerve	ICP	intracranial pressure	MS	multiple sclerosis	SAH	subarachnoid hemorrhage
CRVO	central retinal vein occlusion	IIH	idiopathic intracranial hypertension	NCS	nerve conduction studies	TBI	traumatic brain injury
CSF	cerebral spinal fluid	IVIg	intravenous immunoglobulin	NPH	normal pressure hydrocephalus	TIA	transient ischemic attack
DBS	deep brain stimulation	LEMS	Lambert-Eaton myasthenic syndrome	PComm	posterior communicating artery	UMN	upper motor neuron
						VEGF	vascular endothelial growth factor

The Neurological Exam

General Exam and Mental Status

- vitals:** pulse (especially rhythm), BP, temperature
- H&N:** meningismus, head injury/bruises (signs of basal skull fracture: Battle's sign, raccoon eyes, hemotympanum, CSF rhinorrhea/otorrhea), tongue biting
- CVS:** carotid bruits, heart murmurs
- mental status:** orientation (person, place, time), LOC (GCS)
 - GCS/15 – Motor/6, Verbal/5 (T= intubated), Eyes/4
- cognition**
 - Folstein MMSE – /30 (note: dementia is a clinical diagnosis and is not diagnosed by cognitive testing)
 - MoCA – /30 (≥26 is considered normal)
 - frontal lobe testing (for perseveration)
 - clock drawing

Cranial Nerves Exam

- olfactory (CN I):** odor sensation (test each nostril separately)
- optic (CN II)**
 - visual acuity: test each eye individually using best corrected vision
 - visual fields
 - pupil: direct and consensual pupillary reaction (afferent limb), accommodation, swinging flashlight test (see *Relative Afferent Pupillary Defect*, [Ophthalmology, OP33](#))
 - fundoscopy: optic disc edema, optic disc pallor, venous pulsations, hemorrhages
- extraocular movements (EOM)**
 - oculomotor (CN III):** levator palpebrae superioris, medial rectus, superior rectus, inferior rectus, inferior oblique, efferent limb of pupillary light response
 - trochlear (CN IV):** superior oblique
 - abducens (CN VI):** lateral rectus
- trigeminal (CN V)**
 - sensory: V1 (above supraorbital ridge), V2 (buccal area), V3 (mandible), corneal reflex (afferent)
 - motor: temporalis, masseter, pterygoids, jaw jerk reflex
- facial (CN VII)**
 - sensorimotor: muscles of facial expression, hyperacusis (stapedius), corneal reflex (efferent)
 - visceral sensory: taste of anterior 2/3 of tongue
 - visceral motor: salivary and lacrimal glands
- vestibulocochlear (CN VIII)**
 - vestibular: nystagmus, caloric reflexes
 - cochlear: Rinne, Weber
- glossopharyngeal (CN IX) and vagus (CN X):** palatal elevation, gag reflex, vocal cord function, swallowing, taste at posterior third of tongue
- accessory (CN XI):** trapezius and sternocleidomastoid strength
- hypoglossal (CN XII):** tongue muscle bulk, fasciculations, strength

Motor Exam

- bulk:** atrophy, asymmetry
- abnormal movements:** asymmetry of movement (suggests weakness, e.g. satellite sign), tremors, chorea, dystonia, dyskinesia, hemiballism, myoclonus, athetosis, tics, fasciculations
- abnormal posturing:** decerebrate, decorticate
- tone:** hypotonia (flaccid), hypertonia (spasticity, rigidity, paratonia), cogwheeling (rigidity + tremor)
- strength**
- reflexes:** deep tendon reflexes, abdominal reflexes, primitive reflexes, Babinski, Hoffman, clonus

Visit Online Atlas for Cranial Nerves Exam, Motor Exam, and Sensory Exam Techniques

Battle's sign = mastoid ecchymosis

Raccoon eyes = periorbital ecchymosis

When testing CN I, avoid noxious smells like ammonia, as this tests CN V

If patient has not brought their glasses, have them look through a pinhole for best corrected vision

CN Innervation of EOM
LR: CN VI, SO: CN IV, Other: CN III

Contraction of the left sternocleidomastoid turns the head right

Calorics: Brainstem Test
Describe nystagmus by direction of fast component

COWS

Cold
Opposite
Warm
Same

Upper Motor Neuron Tests

Babinski Reflex: 'Up-going' big toe ± fanning of toes indicates an UMN lesion

Hoffman Reflex: Flexion of IP joint of the thumb when tapping the nail of the index or ring finger may indicate an UMN lesion if asymmetrical

Pronator Drift: Unable to maintain full arm extension and supination; side of forearm pronation reflects contralateral pyramidal tract lesion, closing eyes accentuates effect

Table 1. Localization of Motor Deficits

	LMN	UMN	Extrapyramidal
Muscle Tone	Flaccid	Spastic	Rigid
Involuntary Movements	Fasciculations	None	None
Reflexes	Decreased	Increased	Normal
Plantar Reflex	Down-going (flexor)	Up-going (extensor)	Down-going (flexor)
Pattern of Muscle Weakness	Proximal, distal, or focal	Upper extremities: extensors weaker than flexors Lower extremities: flexors weaker than extensors	None

Table 2. Overview of Neuromuscular Diseases

	Upper and Lower Motor Neuron Disease	Peripheral Neuropathy	Neuromuscular Junction	Myopathy
SIGNS AND SYMPTOMS				
Weakness	Segmental and asymmetrical, distal → proximal	Distal (except GBS) but may be asymmetrical	Proximal and fatiguable, or weak then recovers (e.g. LEMS)	Proximal
Fasciculations	Yes	Yes	No	No
Reflexes	Increased	Decreased/absent	Normal	Normal (until late)
Sensory	No	Yes	No	No
Autonomic*	No	Yes	No	No
TESTS				
EMG	Denervation and reinnervation	Signs of demyelination ± axonal loss	Decremental response in MG Jitter on single fiber EMG	Small, short motor potentials
NCS	Normal	Abnormal	Normal	Normal
Muscle enzyme	Normal	Normal	Normal	Increased

*e.g. orthostatic hypotension, anhidrosis, visual blurring, urinary hesitancy or incontinence, constipation, erectile dysfunction

Table 3. Approach to Strength Testing of Radiculopathies vs. Peripheral Neuropathies

How to use this table: For each nerve root, learn two (or more) peripheral nerves (and their associated muscles/movements). In radiculopathies, all associated peripheral nerves (and their movements) will be impaired, whereas in peripheral neuropathies, only one of the nerves (and its movement) will be impaired, sparing the other nerve. Particularly useful peripheral nerve "pairs" are bolded for emphasis.

Root	Peripheral Nerve	Movement	Muscle
C5	Axillary	Shoulder abduction	Deltoid
C6	Musculocutaneous (C5/6) Radial (C6)	Elbow flexion Elbow flexion Wrist extension	Biceps Brachioradialis Extensor carpi radialis longus
C7	Radial Posterior interosseus	Elbow extension Finger extension	Triceps Extensor digitorum communis
C8, T1	Median Ulnar	Thumb flexion Thumb abduction Opposition Finger abduction	Flexor pollicis longus (look for thenar wasting) Abductor pollicis brevis (look for thenar wasting) Opponens pollicis (look for thenar wasting) First dorsal interosseus (look for wasting in first dorsal webbed space)
L2, 3, 4	Femoral Obturator	Hip flexion Hip adduction	Iliopsoas Adductor muscles
L3, 4	Femoral (L3/4) Deep peroneal (L4/5)	Knee extension Dorsiflexion	Quadriceps Tibialis anterior
L5	Sciatic (L5, S1) Tibial Superficial peroneal Deep peroneal	Hip extension Ankle inversion Ankle eversion Big toe extension	Gluteus maximus Tibialis posterior Peroneal muscles
S1	Sciatic Tibial	Knee flexion Plantar flexion	Hamstring muscles Gastrocnemius and soleus

Pyramidal Pattern of Muscle Weakness (i.e. UMN)

Weaker arm extensors: shoulder abduction, elbow extension, wrist extension, finger extension, finger abduction

Weaker leg flexors: hip flexion, knee flexion, ankle dorsiflexion

MRC Muscle Strength Scale

- 5 Full power
- 4 Submaximal power against resistance (ranging 4+, 4, 4-)
- 3 Full ROM against gravity without resistance
- 2 Full ROM with gravity removed
- 1 Muscle flicker
- 0 No muscle contraction

Primitive Reflexes

Grasp, palmomental, root, glabellar tap, snout

Deep Tendon Reflexes

Root	Muscle Tendon
C5/6	Biceps
C6	Brachioradialis
C7	Triceps
C8	Finger flexors
L2/3	Hip adductors
L3/4	Knee extensors
S1/2	Plantar flexion

Deep Tendon Reflex Scoring

0	Absent
1+	Depressed
2+	Normal
3+	Increased
4+	Clonus (≥4 beats)

Sensory Exam

- **primary sensation**
 - spinothalamic tract: pain and temperature
 - dorsal column: proprioception and vibration
- **cortical sensation**
 - graphesthesia, stereognosis, extinction, 2-point discrimination

Coordination Exam and Gait

- **coordination exam**
 - finger-to-nose, heel-to-shin, rapid alternating movements
- **stance and gait**
 - gait: antalgic, hemiplegic, ataxic, apraxic, festination, foot drop, broad-based
 - tandem gait (heel-to-toe walking)
 - Romberg test
 - pull test for postural instability

Basic Anatomy Review

Interpreting a Slow or Uncoordinated Rapid Alternating Movement (RAM)

- Slow RAMs without fatiguing is suggestive of weakness (especially if it is asymmetric)
- Slow RAMs with fatiguing (i.e. decreasing amplitude over time) is suggestive of Parkinsonism
- Uncoordinated RAM is suggestive of cerebellar disorder (i.e. ataxia and irregularly irregular rhythm) or ideomotor apraxia

Romberg Test

Stable with eyes open and closed = normal

Stable with eyes open, falls with eyes closed = positive Romberg, suggesting loss of joint position sense

Common Cerebellar Findings

Frontal executive dysfunction/disinhibition, scanning speech, nystagmus, hypo- or hyper-metric saccades, hypotonia, pendular reflexes, terminal tremor, ataxic finger-nose/heel-shin/tandem, wide based stance, positive rebound

See Functional Neuroanatomy software

Figure 4. Spinothalamic tract from body

Figure 5. Discriminative touch pathway (dorsal column) from face

Figure 6. Spinothalamic tract pathway from face

Figure 7. Corticospinal motor pathway

Figure 8. Sympathetic and parasympathetic pathway

Figure 9. Dermatome map

**Myotomes**

- C5 – Shoulder abduction/elbow flexion
- C6 – Wrist extensors
- C7 – Elbow extension
- C8 – Squeeze hand
- T1 – Finger abduction
- T2-9 – Intercostal (abdominal reflexes)
- T9-10 – Upper abdominals
- T11-12 – Lower abdominals
- L2 – Hip flexion
- L3 – Hip adduction
- L4 – Knee extension and ankle dorsiflexion
- L5 – Ankle dorsiflexion and big toe extension
- S1 – Plantarflexion

Lumbar Puncture

Indications

- diagnostic: CNS infection (meningitis, encephalitis), inflammatory disorder (MS, Guillain-Barré, vasculitis), subarachnoid hemorrhage (if CT negative), CNS neoplasm (neoplastic meningitis)
- therapeutic: to administer anesthesia, chemotherapy, contrast media; to decrease ICP (pseudotumor cerebri, normal pressure hydrocephalus)

Contraindications

- mass lesion causing ICP – could lead to cerebral herniation
 - require CT first
- infection over LP site/suspected epidural abscess
- low platelets (<50,000) or treatment with anticoagulation (high INR or aPTT)
- uncooperative patient

Complications

- tonsillar herniation (rare)
- subdural hemorrhage
- transient 6th nerve palsy
- post-LP headache (5-40%): worse when upright, better supine; generally onset within 24 h
 - prevention: smaller gauge (i.e. 22) needle, reinsert stylet prior to needle removal, blunt-ended needle
 - symptomatic treatment: caffeine and sodium benzoate injection
 - corrective treatment: blood patch (autologous)
- spinal epidural hematoma
- infection

LP Tubes

- **tube #1: cell count and differential:** RBCs, WBCs, and differential
 - xanthochromia (yellow bilirubin pigmentation implies recent bleed into CSF)
- **tube #2: chemistry:** glucose (compare to serum glucose) and protein
- **tube #3: microbiology:** Gram stain and C&S
 - specific tests depending on clinical situation/suspicion
 - ♦ viral: PCR for herpes simplex virus (HSV) and other viruses
 - ♦ bacterial: polysaccharide antigens of *H. influenzae*, *N. meningitidis*, *S. pneumoniae*
 - ♦ fungal: Cryptococcal antigen, culture
 - ♦ TB: acid-fast stain, TB culture, TB PCR
- **tube #4: cytology:** for evidence of malignant cells
- **tube #5: cell count:** compare RBC count to that of tube #1
 - **note:** tube 4 or 5 can be sent for repeat cell count

Table 4. Lumbar Puncture Interpretation (Normal vs. Various Infectious Causes)

Condition	Color	Protein	Glucose	Cells
NORMAL	Clear	<0.45 g/L	60% of serum glc or >54 mg/dL	0-5 x 10 ⁶ /L WBC, 0 RBC, 0 PMNs
INFECTIOUS				
Viral Infection	Clear or opalescent	Normal or slightly increased <0.45-1 g/L	Normal	<1,000 x 10 ⁶ /L Lymphocytes mostly, some PMNs
Bacterial Infection	Opalescent yellow, may clot	>1 g/L	Decreased (<25% serum glc or <36 mg/dL)	>1,000 x 10 ⁶ /L PMNs
Granulomatous Infection (tuberculosis, fungal)	Clear or opalescent	Increased but usually <5 g/L	Decreased (usually <36-72mg/dL)	<1,000 x 10 ⁶ /L Lymphocytes

The needle for a LP is inserted into one of L3-4, L4-5, or L5-S1 interspaces

Do not delay antibiotics while waiting for a LP if infection is suspected

RBCs in tube #1 > #5 → traumatic tap
RBCs in tube #1 = #5 → SAH

Approach to Common Presentations

Weakness

Approach

- **mode of onset:** abrupt (vascular, toxic, metabolic), subacute (neoplastic, infective, inflammatory), insidious (hereditary, degenerative, endocrinologic, neoplastic)
- **course:** worse at onset (vascular), progressive (neoplastic, degenerative, infective), episodic (vascular, inflammatory), activity dependent (NMJ, muscular)
- **pattern:** objective vs. subjective, generalized vs. localized, asymmetric vs. symmetric, proximal vs. distal, UMN vs. LMN, peripheral vs. myotomal
- **associated symptoms:** sensory symptoms, cortical symptoms, spinal symptoms (i.e. bowel/bladder dysfunction), signs/symptoms specific to various etiologies
- **history:** family history, developmental history, medications, risk factors, recent/preceding exposures
- **investigations for LMN:** NCS/EMG
- **investigations for UMN:** imaging (brain and/or spinal cord)

Differential Diagnosis

- objective muscle weakness; also, differentiate between true muscle weakness vs. fatigue
 - generalized
 - ♦ myopathy (proximal > distal weakness)
 - endocrine: hypothyroidism, hyperthyroidism, Cushing's syndrome
 - rheumatologic: polymyositis, vasculitis
 - infectious: HIV, CMV, influenza
 - other: collagen vascular disorders, steroids, statins, alcohol, electrolyte disorders
 - ♦ NMJ (MG, botulism, LEMS, organophosphate poisoning)
 - ♦ cachexia
 - localized
 - ♦ UMN (leukodystrophy, vasculitis, abscess, brain tumor, vitamin B₁₂ deficiency, MS, stroke)
 - ♦ radicular pain (i.e. nerve root)
 - ♦ anterior horn cell (spinal muscular atrophy, ALS, polio, paraneoplastic, lead toxicity)
 - ♦ peripheral neuropathy (peroneal muscle atrophy, GBS, leprosy, amyloid, myeloma, DM, lead toxicity)
- no objective muscle weakness
 - chronic illness (cardiac, pulmonary, anemia, infection, malignancy)
 - depression, deconditioning
- if loss of passive motion, consider intra-articular, peri-articular, or extra-articular causes

Numbness/Altered Sensation

Approach

- positive sensory symptoms: paresthesia/dysesthesia = tingling, pins and needles, prickling, burning, stabbing
- negative sensory symptoms: hypoesthesia/anesthesia = numbness, diminution, or absence of feeling
- determine distribution of sensory loss
 - nerve root vs. peripheral nerve?
 - symmetric stocking-glove pattern? (indicative of distal symmetric polyneuropathy)
 - anterior-posterior spinal cord dissociation
- investigations: NCS, vitamin B₁₂ levels, imaging based on associated findings

Differential Diagnosis

- cerebral: stroke, demyelination, tumor
 - associated symptoms: hemiplegia, aphasia, apraxia
- brainstem: stroke, demyelination, tumor
 - associated symptoms: diplopia, vertigo, dysarthria, dysphagia
- spinal cord/radiculopathy: cord infarction, tumor, MS, syringomyelia, vitamin B₁₂ deficiency, disc lesion
 - associated symptoms: back/neck pain, weakness (paraparesis or Brown-Séquard pattern)
- neuropathy: focal compressive neuropathy (based on location and distribution), DM, uremia, vasculitis, vitamin B₁₂ deficiency, HIV, Lyme disease, alcohol, paraneoplastic, amyloid

Cranial Nerve Deficits

CN I: Olfactory Nerve

Clinical Features

- absence of sense of smell associated with a loss of taste

Differential Diagnosis

- **nasal:** physical obstruction
 - heavy smoking, chronic rhinitis, sinusitis, neoplasms, septal deformity, choanal atresia, vestibular stenosis, foreign body
- **olfactory neuroepithelial:** destruction of receptors or their axon filaments
 - influenza, herpes simplex, interferon treatment of hepatitis C virus, atrophic rhinitis (leprosy)
- **central:** lesion of olfactory pathway
 - Kallmann's syndrome, albinism, head injury, cranial surgery, SAH, chronic meningeal inflammation, meningioma, aneurysm, PD, stroke, MS
- **endocrine/metabolic**
 - DM, adrenal hypo/hyperfunction, pseudohypoparathyroidism, hypothyroidism, renal/liver failure, vitamin deficiency

If anosmia is not associated with loss of taste, consider malingering

Kallmann's syndrome is a congenital disorder of anosmia and hypogonadotropic hypogonadism

Figure 10. Diagnostic positions of gaze to isolate primary action of each muscle

CN II: Optic Nerve

- see *Neuro-Ophthalmology*, N12

CN III: Oculomotor Nerve

Clinical Features

- ptosis, resting eye position is “down and out” (depressed and abducted), pupil dilated (mydriasis)
- vertical and horizontal diplopia; paralysis of adduction, elevation, and depression

Differential Diagnosis

- **PComm aneurysm**: early mydriasis, then CN III palsy
- **cavernous sinus** (internal carotid aneurysm, meningioma, sinus thrombosis): associated with deficits in other CNs near the cavernous sinus
- **ischemia of CN III** (DM, temporal arteritis, HTN, atherosclerosis): pupil sparing CN III palsy
- **midbrain lesion**: complete unilateral CN III palsy with bilateral weakness of the superior rectus and ptosis with contralateral pyramidal signs \pm mydriasis
- **orbital lesion**: associated with optic neuropathy, chemosis, proptosis
- **other** (inflammatory, infection, neoplasia, uncal herniation, trauma)

Figure 11. Cavernous sinus (coronal view)

CN IV: Trochlear Nerve

Clinical Features

- vertical and torsional diplopia; defect of intorsion and depression
- patient may complain of difficulty going down stairs or reading

Differential Diagnosis

- common: ischemic (DM, HTN), idiopathic, trauma (TBI or surgical), congenital
- other: cavernous sinus lesion, superior orbital fissure (tumor, granuloma)

CN V: Trigeminal Nerve

Clinical Features

- ipsilateral facial numbness, weakness of muscles of mastication (V3 only) with pterygoid deviation towards the side of the lesion

Differential Diagnosis

- **brainstem** (ischemia, tumor, syringobulbia, demyelination)
- **peripheral** (tumor, aneurysm, chronic meningitis, metastatic infiltration of nerve)
- **trigeminal ganglion** (acoustic neuroma, meningioma, fracture of middle fossa)
- **cavernous sinus** (carotid aneurysm, meningioma, sinus thrombosis)
- **trauma**
- note: other CN V lesions that cause facial pain = trigeminal neuralgia, herpes zoster

CN VI: Abducens Nerve

Clinical Features

- resting inward deviation (esotropia)
- horizontal diplopia; defect of lateral gaze

Pupillary constrictor fibers run along outside of nerve, whereas vasculature is contained within nerve

For CN III palsy with a reactive pupil, always think ischemic cause (“pupil sparing”)

For CN III palsy with mydriasis, think compressive lesion

DDx of CN III Palsy

iCAM

ischemic

Cavernous sinus

Aneurysm (PComm, internal carotid)

Midbrain lesion

Lesions involving the cavernous sinus can lead to cranial nerve palsies of III, IV, VI, V1, and V2 as well as orbital pain, and proptosis

CN IV is the only cranial nerve that crosses the midline and exits posteriorly

A CN IV lesion may cause a contralateral deficit

CN IV is at risk of trauma during neurosurgical procedures involving the midbrain because of its long intracranial course

Jaw deviation is towards the side of a LMN CN V lesion

Distinguishing CN III, IV, and VI Lesions

	III	IV	VI
Diplopia	Oblique	Vertical	Horizontal
Exacerbating	Near target	Looking down	Far target
Head Tilt	Up and rotated away	Down and flexed away	Rotated towards

CN VI has the longest intracranial course and is vulnerable to increased ICP, creating a false localizing sign

Differential Diagnosis

- **pons** (infarction, hemorrhage, demyelination, tumor): associated with facial weakness and contralateral pyramidal signs
- **tentorial orifice** (compression, meningioma, trauma): false localizing sign of increased ICP
- **cavernous sinus** (carotid aneurysm, meningioma, sinus thrombosis)
- **ischemia of CN VI** (DM, temporal arteritis, HTN, atherosclerosis)
- **congenital** (Duane's syndrome)

Forehead is spared in a UMN CN VII lesion due to bilateral innervation of CN VII nuclei from cerebral hemispheres for the frontalis

CN VII: Facial Nerve**Clinical Features**

- LMN lesion: ipsilateral facial weakness (facial droop, flattening of forehead, inability to close eyes, flattening of nasolabial fold)
- UMN lesion: contralateral facial weakness with forehead sparing (due to bilateral frontalis innervation)
- impaired lacrimation, decreased salivation, numbness behind auricle, hyperacusis, taste dysfunction of anterior 2/3 of tongue

**Facial Nerve Branch Memory Aid****To Zanzibar By Motor Car**

Temporal
Zygomatic
Buccal
Mandibular
Cervical

Differential Diagnosis

- **idiopathic** = Bell's palsy, 80-90% of cases (see [Otolaryngology, OT23](#))
 - most often related to HSV, but other viruses may be implicated (CMV, herpes zoster, EBV)
- **other**: temporal bone fracture, EBV, Ramsay Hunt (HSV), otitis media/mastoiditis, sarcoidosis, DM mononeuropathy, parotid gland disease, Lyme meningitis, HIV

© N. Burachynsky 2012

Figure 12. UMN vs. LMN facial nerve palsy

CN VIII: Vestibulocochlear Nerve

- see [Otolaryngology, OT14](#)

**CN IX: Glossopharyngeal Nerve****Clinical Features**

- unilateral lesion is rare
- taste dysfunction in posterior 1/3 of tongue
- absent gag reflex and dysphagia

Disorders

- **glossopharyngeal neuralgia**: sharp paroxysmal pain of posterior pharynx radiating to ear, triggered by swallowing
 - treated with carbamazepine or surgical ablation of CN IX

When screening for dysphagia and assessing aspiration risk, the presence of a gag reflex is insufficient; the correct screening test is to observe the patient drinking water from a cup while observing for any coughing, choking, or "wetness" of voice

**Differential Diagnosis of Lower Cranial Nerve Deficits (CN IX, X, XI, XII)**

Intracranial/Skull Base: meningioma, neurofibroma, metastases, osteomyelitis, meningitis

Brainstem: stroke, demyelination, syringobulbia, poliomyelitis, astrocytoma

Neck: trauma, surgery, tumors

Normal swallowing is initiated when the tongue moves a bolus back into the palatal archway. Tongue movements are innervated exclusively by CN XII. The bolus stimulates the soft palate to elevate and the bolus is deflected into the oropharynx. Next the pharyngeal constrictors contract, the larynx elevates, and the vocal cords close. Swallowing depends on afferent information via CN V, IX, and X and motor action via CN V, VII, IX, X, and XII.

Connections in the nucleus of the tractus solitarius in the medulla (in proximity to the respiratory center) act as the swallowing center. Swallowing and breathing are coordinated to prevent aspiration.

Uvula deviation is **away from** the side of a LMN CN X lesion due to impaired ipsilateral palatal elevation

CN X: Vagus Nerve

Clinical Features

- oropharyngeal dysphagia (transfer dysphagia) due to palatal and pharyngeal weakness
 - neuromuscular causes of dysphagia
 - ♦ CNS: stroke, cerebral palsy, tumor, trauma, PD, AD, MS
 - ♦ CN: DM, laryngeal nerve palsy, polio, ALS
 - ♦ myopathic(NMJ): dermatomyositis, polymyositis, MG, sarcoidosis
 - other causes of dysphagia: see [Gastroenterology, G8](#)
- dysarthria: inability to produce understandable speech due to impaired phonation and/or resonance

CN XI: Accessory Nerve

Clinical Features

- LMN lesion: paralysis of ipsilateral trapezius and sternocleidomastoid (ipsilateral shoulder drop, weakness on turning head to contralateral side)
- UMN lesion: paralysis of ipsilateral sternocleidomastoid and contralateral trapezius

CN XI is vulnerable to damage during neck surgery

CN XII: Hypoglossal Nerve

Clinical Features

- LMN lesion: tongue deviation towards lesion; ipsilateral tongue atrophy and fasciculations (if chronic)
- UMN lesion: tongue deviation away from lesion; absence of atrophy and fasciculations

Ipsilateral tongue paralysis with contralateral hemiparesis/sensory symptoms is pathognomonic for a medial medullary infarction

Table 5. Cranial Nerve Examination and Associated Deficits

Cranial Nerve	Recommended Physical Exams	Signs/Symptoms of Deficit
Olfactory (CN I)	Odor sensation: test each nostril separately	Anosmia (should be associated with loss of taste)
Optic (CN II)	Visual acuity: test each eye individually; best corrected vision Test visual fields Assess pupils: direct and consensual pupillary reaction (afferent), RAPD (swinging flashlight test) Fundoscopy: optic disc edema and pallor, venous pulsations, hemorrhages	Blindness Absence of light reflexes
Oculomotor (CN III)	Assess extraocular movements and nystagmus Test efferent limb of pupillary light response Assess size and shape of pupils; accommodation and saccadic eye movements	Eyes deviated down and out; can demonstrate mydriasis
Trochlear (CN IV)	Test movement of superior oblique	Vertical diplopia; may tilt head towards unaffected side; affected eye cannot turn inward and downward
Trigeminal (CN V)	Test sensation above supraorbital ridge (V1), buccal area (V2), mandible (V3) Test corneal reflex (afferent limb) Assess motor function: temporalis, masseter, pterygoids, jaw jerk reflex	Loss of facial sensations and corneal reflex on stimulation ipsilaterally Weakness and wasting of muscles of mastication; deviation of open jaw to <i>ipsilateral</i> side; trigeminal neuralgia
Abducens (CN VI)	Test movement of lateral rectus	Horizontal diplopia, esotropia (convergent strabismus), and abductor paralysis of <i>ipsilateral</i> eye
Facial (CN VII)	Sensorimotor nerve function: to muscles of facial expression Test efferent limb of corneal reflex Visceral sensory nerve function: to anterior 2/3 of the tongue Visceral motor nerve function: to salivary and lacrimal glands	Paralysis of ipsilateral upper and lower facial muscles Loss of lacrimation Decreased salivation, dry mouth Loss of taste to anterior 2/3 of the tongue ipsilaterally LMN lesion = ipsilateral facial weakness UMN lesion = contralateral facial weakness, sparing the brow bilaterally
Vestibulocochlear (CN VIII)	Vestibular function (nystagmus, calorics) Cochlear function (Rinne, Weber)	Vertigo, disequilibrium, and nystagmus Neural deafness
Glosso-Pharyngeal (CN IX)	Assess vocal cord function and gag reflex Assess taste to posterior third of the tongue (bitter and sour taste)	Loss of taste in posterior third of the tongue <i>ipsilaterally</i> Loss of gag reflex and dysphasia Unilateral lesion is rare
Vagus (CN X)	Assess vocal cord function and gag reflex Observe uvula deviation and palatal elevation Assess swallowing	Loss of gag reflex, dysphagia, hoarse voice Paralysis of soft palate (failed elevation) Deviation of uvula to contralateral side of lesion; anesthesia of pharynx and larynx <i>ipsilaterally</i>
Accessory (CN XI)	Assess strength of trapezius (shoulder shrug) and sternocleidomastoid muscles (head turn)	<i>Ipsilateral</i> shoulder weakness and turning head to opposite side
Hypoglossal (CN XII)	Inspect tongue for signs of lateral deviation, atrophy, fasciculations, asymmetry of movement and strength	Wasting of <i>ipsilateral</i> tongue muscles and deviation to <i>ipsilateral</i> side on protrusion

NEURO-OPHTHALMOLOGY

Abnormalities of Vision

- see [Ophthalmology](#), OP3

Acute Visual Loss

- see [Ophthalmology](#), OP3

Optic Neuritis

- see *Optic Disc Edema* below, *Multiple Sclerosis*, N52

Anterior Ischemic Optic Neuropathy

- see *Optic Disc Edema*
- **non-arteritic (NAION)**: due to atherosclerosis
- **arteritic (AION)**: due to giant cell arteritis (see [Rheumatology](#), RH20)

If you suspect the diagnosis of giant cell arteritis do not wait for biopsy results
Begin treatment immediately

NAION can be caused by use of Sildenafil (Viagra®) in rare cases

Amaurosis Fugax

- see [Ophthalmology](#), OP37 and *Stroke*, N47

Central Retinal Vein Occlusion

- see [Ophthalmology](#), OP24

Optic Disc Edema

Table 6. Common Causes of Optic Disc Edema

	Optic Neuritis	Papilledema	AION	CRVO
Age	<50 yr	Any	>50 yr but usually >70 yr	>50 yr
Vision	Rapidly progressive monocular central vision loss with ↓ acuity and color vision with recovery	Late visual loss	Painless unilateral acute field defect over hours to days with ↓ color vision	Painless unilateral variable vision loss
Symptoms	Pain (especially with eye movement)	H/A, N/V, local neurological deficits	If GCA: H/A, scalp tenderness, jaw claudication, weight loss, fatigue	Cardiovascular risk factors
Pupil	RAPD	No RAPD	RAPD	± RAPD
Fundus	Disc swelling if anterior Normal disc if retrobulbar	Bilateral disc swelling, retinal hemorrhage, no venous pulsations	Pale segmental disc edema, retinal dot, flame hemorrhages	Swollen disc, venous engorgement, retinal hemorrhage
Etiologies	MS, viral	Increased ICP	Giant cell arteritis Non-arteritic: atherosclerosis	Associated with vasculopathy, thrombus
Investigations	MRI with gadolinium	Emergent CT; LP if CT is normal to measure opening pressure	CBC, ESR, CRP, temporal artery biopsy	Fluorescein angiogram and coherence tomography
Treatment	IV methylprednisolone	Treat cause	Consider ASA if non-arteritic; steroids if arteritic	Optimize risk factors, reduce IOP, ± laser, ± VEGF inhibitors

Optic Disc Atrophy

- **etiologies:** glaucoma, AION, compressive tumor, optic neuritis, Leber's hereditary optic neuropathy, congenital
- **presentation:** disc pallor, low visual acuity, peripheral vision defect, decreased color vision
- **treatment:** none (irreversible), aim to prevent

Bitemporal Hemianopsia DDx by Age

- Children: craniopharyngioma
- Middle aged (20s to 50s): pituitary mass
- Elderly (> 60 yr): meningioma

In homonymous hemianopsia, more congruent deficits are caused by more posterior lesions. Macular sparing may occur with occipital lesions

Check all hemiplegic patients for homonymous hemianopsia (ipsilateral to side of hemiplegia)

A lesion in a cerebral hemisphere causes eyes to "look away" from the hemiplegia, and to look towards the lesion

A lesion in the brainstem causes the eyes to "look toward" the side of the hemiplegia, and to look away from the lesion

Abnormalities of Visual Field

Figure 13. Characteristic visual field defects with lesions along the visual pathway

Abnormalities of Eye Movements

Disorders of Gaze

Pathophysiology

- horizontal gaze: FEF → contralateral PPRF (midbrain/pons) → eyes saccade away from FEF
- vertical gaze: cortex → rostral interstitial nucleus in the MLF (midbrain)

Clinical Features

- unilateral lesion in one FEF → eyes deviate toward the side of the lesion
 - can be overcome with doll's eye maneuver
- unilateral lesion in the PPRF → eyes deviate away from the lesion
 - cannot be overcome with doll's eye maneuver if CN VI nucleus lesion as well
- seizure involving a FEF: eyes deviate away from the focus

Etiology

- common: infarcts (frontal or brainstem), MS, tumors

Internuclear Ophthalmoplegia

Pathophysiology

- results from a lesion in MLF which disrupts coordination between CN VI nucleus in pons and the contralateral CN III nucleus in midbrain → disrupts conjugate horizontal gaze

Clinical Features

- horizontal diplopia on lateral gaze, oscillopsia
- on gaze away from the side of the lesion
 - ipsilateral adduction defect
 - contralateral abduction nystagmus
- cannot be overcome by caloric testing
- accommodation reflex intact
- may be bilateral (especially in MS)

Etiology

- common: MS, brain stem infarct

Investigations

- MRI

Figure 14. Internuclear ophthalmoplegia

Diplopia

Etiology – Monocular

- mostly due to relatively benign optical problems (refractive error, cataract) or functional

Etiology – Binocular (due to ocular misalignment)

- muscle
 - Graves' ophthalmopathy
 - EOM restriction/entrapment
- neuromuscular junction
 - MG (see *Myasthenia Gravis*, N37)
- cranial nerve palsy (see *Cranial Nerve Deficits*, N8)
- INO (see *Intranuclear Ophthalmoplegia*, N13)
- other
 - orbital trauma (orbital floor fracture), tumor, infection, inflammation
 - Miller-Fisher variant of GBS
 - Wernicke's encephalopathy
 - leptomeningeal disease

Approach to Diplopia

- monocular vs. binocular
- horizontal vs. vertical vs. oblique diplopia
- direction of gaze that exacerbates diplopia
- corrective head movements

Workup

- may observe isolated 4th or 6th nerve palsy for a few weeks, but workup if persistent or other symptoms develop
- indications for neuroimaging
 - bilateral or multiple nerve involvement
 - severe sudden onset headache (rule out aneurysm)

Nystagmus

- **definition:** rapid, involuntary, small amplitude movements of the eyes that are rhythmic in nature
- direction of nystagmus is labeled by the **rapid** component of the eye movement
- can be categorized by movement type (pendular, jerking, rotatory, coarse) or as physiological vs. pathological

Table 7. Nystagmus Features

	Peripheral (vestibular)	Central (brainstem)
Direction	Unidirectional, fast phase away from the lesion	May be bilateral/unidirectional
Vertical Nystagmus	–	±
Gaze Fixation	Relieves nystagmus	Does not relieve nystagmus
Vertigo	Severe	Mild
Auditory Symptoms	Common	Extremely rare
Other Neurological Signs	Absent	Often present
DDx	Benign paroxysmal positional vertigo, vestibular neuritis, Ménière disease, toxicity, trauma, Ramsay Hunt syndrome	MS, vascular (brainstem/cerebellar), neoplastic/paraneoplastic

Abnormalities of Pupils

- see [Ophthalmology](#), OP30

Diplopia worse at the end of the day suggests myasthenia gravis (e.g. fatiguable)

If diplopia is only on extremes of gaze, cover each eye in isolation during extremes of gaze

The covered eye that makes the lateral image disappear is the pathological one

© Minyan Wang 2012

Figure 15. Abnormal eye movements

Nutritional Deficiencies and Toxic Injuries

- sufficient nutritional intake is required for optimal nervous system functioning; deficiencies in the following key nutrients, among others, may impair central and peripheral nervous system function (potential neurological symptoms are provided)

Table 8. Nutritional Deficiency Features and Management

Vitamin Deficiency	Neurological Clinical Manifestation	Investigation	Treatment*
Vitamin B12	Paresthesias and a sensory ataxia are the most common initial symptoms Myelopathy; may be accompanied by peripheral neuropathy Neuropsychiatric manifestations: memory impairment, change in personality, delirium, and psychosis Optic neuropathy	Serum cobalamin Serum methylmalonic acid Serum homocysteine	IM Vitamin B12 1,000 µg for 5 d, then once per mo or oral B12 1,000 µg/d
Folate	Myeloneuropathy, peripheral neuropathy May be clinically indistinguishable from Vitamin B12 deficiency	Serum folate Homocysteine	Oral folate 1 mg tid initially; 1 mg daily thereafter
Copper	Myelopathy, pyramidal signs (e.g. brisk muscle stretch reflexes at the knees and extensor plantar responses) Severe sensory loss	Serum copper and ceruloplasmin; urinary copper	Discontinue zinc; oral copper 8 mg/d for 1 wk; 6 mg/d for 1 wk; 4 mg/d for 1 wk; 2 mg/d thereafter
Vitamin E	Ophthalmoplegia, retinopathy, spinocerebellar syndrome with peripheral neuropathy (with signs of cerebellar ataxia)	Serum vitamin E; ratio serum vitamin E to sum of cholesterol and triglycerides	Vitamin E 2,200 mg/kg/d oral or IM
Thiamine	Three well-described manifestations include: beriberi (dry and wet), infantile beriberi, Wernicke encephalopathy with Korsakoff syndrome Alcoholism is a cause of reduced intake of thiamine, leading to deficiency	Clinical diagnosis; brain MRI	Thiamine 100 mg IV followed by 50-100 mg IV or IM until nutritional status stable
Pyridoxine (Vitamin B6)	Painful sensorimotor peripheral neuropathy	Serum pyridoxal phosphate	Pyridoxine 50-100 mg daily
Niacin	Encephalopathy, coma, and peripheral neuropathy	Urinary excretion niacin metabolites	Nicotinic acid 25-50 mg daily oral or IM

*IM = intramuscular; IV = intravenous

- it is also important to consider occupational neurotoxic syndromes secondary to exposure to pesticides, solvents, and metals. Encephalopathy, extrapyramidal features, neurodegenerative diseases, and peripheral neuropathy are commonly encountered. Onset and progression of neurological diseases should be temporally related to neurotoxin exposure. Main toxins associated with neurotoxicity are listed below:

Table 9. Selected Occupational Neurotoxic Syndromes

Toxin	Associated Occupations	Characteristic Neurological Findings
Organic solvents	Printer, spray painters, industrial cleaners, paint or glue manufacturers, graphic industry, electronic industry, plastic industry	Nausea, H/A, concentration difficulty Long-term exposure may lead to "chronic solvent-induced encephalopathy", characterized by mild-to-severe cognitive impairment
Pesticides (e.g. insecticides, fungicides, rodenticides, fumigants, herbicides)	Agricultural work, pesticide manufacturing and formulating employees, highway and railway workers, green house, forestry and nursery workers	Parkinson's disease risk increased by ~70% following pesticide exposure
Metals (e.g. lead, mercury, manganese, aluminum, arsenic)	Battery and metal production (e.g. solder, pipes), chemical and electronic application industries, steel manufacturing, welders, alloy workers, transportation, packaging, construction	Lead: delayed or reversed development, permanent learning disabilities, seizures, coma, death from encephalopathy (rare) Mercury: psychiatric disturbances, ataxia, visual loss, hearing loss, tiredness, memory disturbances Manganese: psychiatric symptoms, hallucinations ("manganese madness"), extrapyramidal features, dystonia, parkinsonism (manganism) Aluminum: implicated in Alzheimer's pathogenesis Arsenic: sleeplessness/sleepiness, irritability, H/A, spasms in muscle extremities and muscle fatigue
Gases (e.g. carbon dioxide, nitrous oxide, formaldehyde)	Anesthesia, disinfection, manufacture of illuminating gas and water-gas	Cognitive/behavioral and emotional symptoms, parkinsonian syndromes

Neurologic Complications due to Toxic Injuries Related to Bariatric Surgery

- deficiencies of both fat- and water-soluble vitamins may occur following malabsorptive bariatric surgery
- patients who have undergone malabsorptive surgery should be monitored for late metabolic complications and neurological manifestations

Seizure Disorders and Epilepsy

Seizure

Definitions

- **seizure:** transient neurological dysfunction caused by excessive activity of cortical neurons, resulting in paroxysmal alteration of behavior and/or EEG changes
- **epilepsy:** chronic condition characterized by two or more unprovoked seizures

Classification

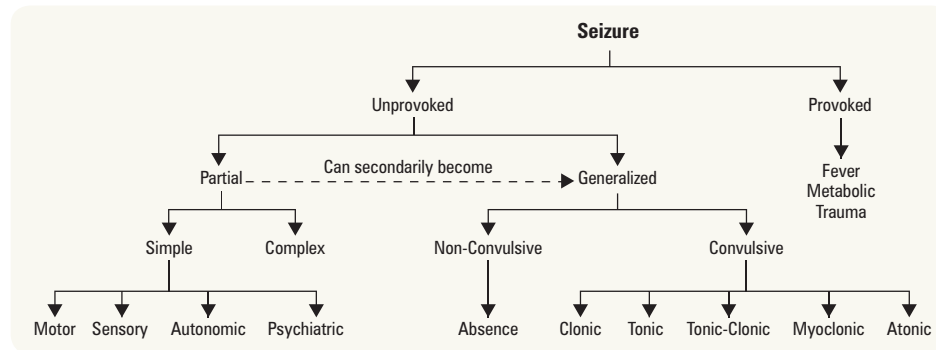

Figure 16. Classification of seizures

NOTE: seizures can also be classified using age of onset (childhood/adolescence, adulthood/late [i.e. >age 30]), setting (sleep, upon awakening), EEG (focal, generalized)

Signs and Symptoms

- **partial seizures**
 - simple or complex can secondarily generalize, or simple → complex → generalized seizures
 - **simple (preserved LOC)**
 - ♦ motor: postural, phonotory, forceful turning of eyes and/or head, focal muscle rigidity/jerking ± Jacksonian march (spreading to adjacent muscle groups)
 - ♦ sensory: unusual sensations affecting vision, hearing, smell, taste, or touch
 - ♦ autonomic: epigastric discomfort, pallor, sweating, flushing, piloerection, pupillary dilatation
 - ♦ psychiatric: symptoms rarely occur without impairment of consciousness and are more commonly complex partial
 - **complex (altered LOC)**
 - ♦ patient may appear to be awake but with impairment of awareness
 - ♦ classic complex seizure is characterized by automatisms such as chewing, swallowing, lip-smacking, scratching, fumbling, running, disrobing, and other stereotypic movements
 - ♦ other forms: dysphasic, dysmnestic (déjà vu), cognitive (disorientation of time sense), affective (fear, anger), illusions, structured hallucinations (music, scenes, taste, smells), epigastric fullness
- **generalized seizures (decreased LOC)**
 - **absence (petit mal):** usually only seen in children, unresponsive for 5-10 s with arrest of activity, staring, blinking or eye-rolling, no post-ictal confusion; 3 Hz spike and slow wave activity on EEG
 - **clonic:** repetitive rhythmic jerking movements
 - **tonic:** muscle rigidity in flexion or extension
 - **tonic-clonic (grand mal, generalized tonic-clonic [GTC])**
 - ♦ prodrome of unease or irritability hours to days before the episode
 - ♦ tonic ictal phase: muscle rigidity
 - ♦ clonic ictal phase: repetitive violent jerking of face and limbs, tongue biting, cyanosis, frothing, incontinence
 - ♦ post-ictal phase: flaccid limbs, extensor plantar reflexes, headache, confusion, aching muscles, sore tongue, amnesia, elevated serum CK lasting hours
 - **myoclonic:** sporadic contractions localized to muscle groups of one or more extremities
 - **atonic:** loss of muscle tone leading to drop attack

Medical Emergency

Status epilepticus can cause irreversible brain damage without treatment

Stroke is the most common cause of late-onset (> 50 yr) seizures, accounting for 50-80% of cases

Seizures and Dementia

Neurodegenerative diseases can underlie seizures; conversely, seizures can be a cause of dementia

Complex partial status epilepticus can resemble schizophrenia or psychotic depression

Temporal lobe epilepsy is suggested by an aura of fear, olfactory or gustatory hallucinations, and visceral or déjà vu sensations

Frontoparietal cortex seizures are suggested by contralateral focal sensory or motor phenomena

Table 10. Classic Factors Differentiating Seizure vs. Syncope

Characteristic	Seizure	Syncope
Time of Onset	Day or night	Day
Position	Any	Upright, not recumbent
Onset	Sudden or brief	Gradual
Aura	Possible specific aura	Lightheaded sensation
Color	Normal or cyanotic	Pallor
Autonomic	Uncommon outside of ictal phase	Common; diaphoresis
Duration	Brief or prolonged	Brief
Incontinence	Common	Possible but rare
Post-ictal	Occurs in tonic-clonic or complex partial	No
Motor Activity	Common	Occasional brief jerks
Injury	Common, tongue biting	Rare unless from fall
Automatisms	Common in absence or complex partial	None
EEG	Usually abnormal	Normal

**DDx of Convulsions**

Syncope, pseudoseizure, hyperventilation, panic disorder, TIA, hypoglycemia, movement disorder, alcoholic blackouts, migraines (confusional, vertebrobasilar), narcolepsy (cataplexy)

Note that frontal seizures (rare) can look like a pseudoseizure due to odd motor activity that may occur

Table 11. Classic Factors Differentiating Seizure vs. Pseudoseizure (Conversion Disorder)

Characteristic	Seizure	Pseudoseizure*
Triggers	Uncommon	Emotional disturbance
Duration	Brief or prolonged	May be prolonged
Motor Activity	Synchronous, stereotypic, automatisms, lateral tongue biting, eyes rolled back	Opisthotonos, rigidity, forced eye closure, irregular extremity movements, shaking head, pelvic thrust, crying, geotropic eye movements, tongue biting at the tip
Timing	Day or night	Day; other people present
Physical Injury	May occur	Rare
Incontinence	May occur	Rare
Reproduction of Attack	Spontaneous	Suggestion ± stimulus
EEG	Often inter-ictal discharges	Normal
Prolactin	Increased	Normal

*Pseudoseizures do not rule out seizures (not uncommon to present with both)

By law, the Ministry of Transportation must be contacted for all patients who have had a seizure; patients will have their license suspended until seizure free for 6 mo; commercial drivers face a longer wait

**Pregnancy Issues**

Teratogenicity of anticonvulsants includes neural tube defects, cleft palate, urogenital malformations, and heart defects. Advise patient planning pregnancy to take 5 mg/d of folic acid. Optimize AEDs with lowest possible dose associated with good seizure control, preferably monotherapy if possible. Risk of fetal malformations with AEDs is 2x general population; highest risk associated with valproic acid and/or 2+ concurrent AEDs. Consider pre-conception AED levels if patient is well-controlled, monthly serum levels during pregnancy, and titrate AED to maintain pre-conception serum levels. Refer to high risk OB for intrapartum fetal screening

Investigations

- CBC, electrolytes, fasting blood glucose, Ca^{2+} , Mg^{2+} , ESR, Cr, liver enzymes, CK, prolactin
- also consider toxicology screen, EtOH level, AED level (if applicable)
- CT/MRI (if new seizure without identified cause or known seizure history with new neurologic signs/symptoms)
- LP (if fever or meningismus)
- EEG

Treatment

- avoid precipitating factors
- indications for medical therapy (anticonvulsants): 2 or more unprovoked seizures, known organic brain disease, EEG with epileptiform activity, first episode of status epilepticus, abnormal neurologic examination or findings on neuroimaging
- psychosocial issues: stigma of seizures, education of patient and family, status of driver's license, pregnancy issues
- safety issues: driving, operating heavy machinery, bathing, swimming alone
- consider surgical treatment if focal and refractory

EEG findings suggestive of epilepsy: abnormal spikes, polyspike discharges, spike-wave complexes

20-59% of first EEG are positive in epilepsy; 59-92% of epilepsy is picked up with repeated EEGs; normal interictal EEGs do not rule out epilepsy

Status Epilepticus

- **definition:** unremitting seizure of greater than 5 min; or successive seizures without return to a baseline state
- **complications:** anoxia, cerebral ischemia and cerebral edema, rhabdomyolysis and renal failure, aspiration pneumonia/pneumonitis, death (20%)
- **initial measures:** ABCs, vitals, monitors, fingerprick glucose (STAT), ECG, nasal O_2 , IV NS, IV glucose, IV thiamine, ABGs (if respiratory distress/cyanotic)

- **blood work:** electrolytes, Ca^{2+} , Mg^{2+} , PO_4^{3-} , glucose, CBC, toxicology screen, EtOH level, AED levels
- **focused history:** onset, past history of seizures, drug and alcohol ingestion, past medical history, associated symptoms, witnesses/collateral history
- **physical exam** (once seizures controlled): LOC, vitals, HEENT (nuchal rigidity, head trauma, tongue biting, papilledema), complete neurological exam, signs of neurocutaneous disorders, decreased breath sounds, cardiac murmurs or arrhythmias, urinary incontinence, MSK exam (rule out injuries)

Figure 17. Status epilepticus treatment algorithm

The most common causes of status epilepticus are failure to take AEDs and first presentation of epilepsy

Status epilepticus as a result of EtOH withdrawal is rare, despite it being a very common cause of seizures

Rule out non-convulsive status epilepticus in any patient who is still unconscious >20 min post-ictal

Order a stat EEG if unsure

Antiepileptic Drugs

- **generalized-onset and partial-onset seizures:** felbamate, lamotrigine, levetiracetam, refinamide, topiramate, valproate, zonisamide
- **partial seizures** (simple partial, complex partial, and secondarily generalized seizures): carbamazepine, gabapentin, lacosamide, oxcarbazepine, phenobarbital, phenytoin, pregabalin, primidone, tiagabine, vigabatrin (note: these drugs may exacerbate generalized seizures)
- **absence seizures:** ethosuximide

Disorders of Consciousness

Definition

- the minimally conscious state and the vegetative state are disorders of consciousness that can be acute and reversible or chronic and irreversible (Bernat, 2006)
- the vegetative state is defined as a state of wakefulness without awareness, while the minimally conscious state is described as wakefulness with transient low levels of awareness to stimuli
- the three main clinical features of vegetative state are:
 - A. cycle of eye opening and closing (indicative of a sleep-wake cycle)
 - B. complete lack of awareness of self or the environment (i.e. no evidence of sustained, reproducible, purposeful, or voluntary behavioral responses to visual, auditory, tactile, or noxious stimuli)
 - C. complete or partial preservation of hypothalamic and brain stem autonomic functions
- those in a vegetative state also show no evidence of language comprehension or expression, and have bowel and bladder incontinence, but have variably preserved cranial-nerve and spinal reflexes
- a vegetative state is considered persistent if it lasts longer than 1 mo and permanent when it lasts longer than six mo for non-traumatic brain injuries and 1 yr for traumatic brain injuries

Etiology

- may develop suddenly (consequence of traumatic or non-traumatic injury), or gradually (in the course of a neurodegenerative disorder)
- may involve diffuse lesions to cortical neurons, thalami, or white matter tracts

Epidemiology

- vegetative state: 0.2-3.4 per 100,000
- minimally conscious state: 1.4 per 100,000

The locked-in syndrome is not a disorder of consciousness but rather a mimic; these individuals have normal sleep-wake cycles, normal levels of awareness, and may exhibit meaningful behavior (via vertical eye-movements and blinking), but are isolated due to quadriplegia and pseudobulbar palsy

Table 12. Selected Intracranial Causes of Acute Confusion

	No Awareness	Minimal Awareness	Normal Awareness
No Arousal	Coma, sleep, anesthesia		
Normal Arousal	Vegetative state	Minimally conscious state	Normal consciousness and locked-in syndrome

Behavioral Neurology

- see [Psychiatry](#), PS16

Acute Confusional State/Delirium

Table 13. Selected Intracranial Causes of Acute Confusion

	Etiology	Key Clinical Features	Investigations
Vascular	Subarachnoid hemorrhage	Thunderclap H/A Increased ICP Meningismus	CT (non-contrast) LP Angiography if CT and LP negative
	Stroke/TIA	Focal neurological signs	CT (non-contrast)
Infectious	Meningitis	Fever, H/A, nausea, photophobia Meningismus	CT, LP
	Encephalitis	Focal neurological signs Fever, H/A, \pm seizure	CT, LP MRI
	Abscess	Increased ICP Focal neurological signs	CT with contrast (often ring enhancing lesion)
Traumatic	Diffuse axonal shear, epidural hematoma, subdural hematoma	Trauma Hx Increased ICP Focal neurological signs	CT (non-contrast) MRI
Autoimmune	Acute CNS vasculitis	Skin rash, active joints	ANA, ANCA, RF MRI Angiography
	Paraneoplastic encephalitis (anti-NMDA-R)	Onset: Psychiatric features, memory loss, seizures Delayed: Movement disorder, and changes in blood pressure, heart rate, and temperature	CSF (test for presence of antibodies)
Neoplastic	Mass effect/edema, hemorrhage, seizure	Increased ICP Focal neurological signs Papilledema	CT (non-contrast) MRI
Seizure	Status epilepticus	See <i>Seizure Disorders and Epilepsy</i> , N16	EEG
Primary Psychiatric	Psychotic disorder, mood disorder, anxiety disorder	No organic signs or symptoms	No specific tests
Other	Drugs (e.g. cocaine)	Chest pain, cough with black sputum, new-onset seizure, HTN, increased ICP, dyspnea	Vital signs Serum chemistry and electrolyte analysis
	Medications (with anticholinergic side effects)	Flushing, dry skin and mucous membranes, mydriasis with loss of accommodation	Serum chemistry and electrolyte analysis

Delirium is a medical emergency carrying significant risk of morbidity and mortality; it is characterized by acute onset, disorientation, fluctuating level of consciousness, poor attention, and marked psychomotor changes

Visual hallucinations more commonly indicate organic disease

Major Neurocognitive Disorder (formerly Dementia)

- see [Psychiatry](#), PS17

Definition

- an acquired, generalized, and (usually) progressive impairment of cognitive function (i.e. memory, recall, orientation, language, abstraction) associated with impairment in activities of daily living (i.e. planning, shopping, food preparation, difficulties with finances)
- affects comprehension, but not level of consciousness

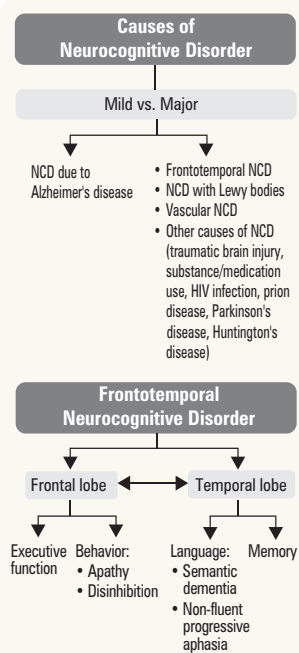

Figure 18. Dementia classification

- Diagnosis of Major NCD requires presence of significant cognitive decline from a previous level of performance in one or more cognitive domains (complex attention, executive function, learning and memory, language, perceptual-motor, or social cognition) based on:
 - A) concern of the individual or a knowledgeable informant AND
 - B) a substantial impairment in cognitive performance either documented by standardized neuropsychological testing or quantified clinical assessment
- see [Psychiatry, PS17](#) for DSM-5 diagnostic criteria
- see [Geriatric Medicine, GM3](#)
- differentiated from mild NCD (formerly mild cognitive impairment) by the extent to which the impairment affects ADLs
 - Mild NCD represents an intermediate stage between dementia and normal aging
 - By definition, IADLs are not affected in Mild NCD

Epidemiology

- major NCD (dementia): 1-2% at age 65 and reaching as high as 30% by age 85
- mild NCD: 2-10% at age 65 and 5-25% by age 85
- note
 - Major NCD due to Alzheimer's disease is uncommon before age 60
 - Major NCD due to frontotemporal lobar degeneration has an earlier onset and represents a progressively smaller fraction of all NCDs with age

Etiology

- see [Table 14](#) for common causes of dementia
- see [Table 15](#) for acquired causes of dementia
- reversible causes: alcohol (intoxication or withdrawal, Wernicke's encephalopathy), medication (benzodiazepines, anticholinergics), heavy metal toxicity, hepatic or renal failure, B₁₂ deficiency, glucose, cortisol, thyroid dysfunction, normal pressure hydrocephalus, depression (pseudodementia), intracranial tumor, subdural hematoma, hypercalcemia (secondary to elevated PTH)
- must rule out delirium

History

- "geriatric giants"
 - confusion/incontinence/falls/polypharmacy
 - memory and safety (wandering, leaving doors unlocked, leaving stove on, losing objects)
 - behavioral (mood, anxiety, psychosis, suicidal ideation, personality changes, aggression)
- ADLs and IADLs
- cardiovascular, endocrine, neoplastic, renal ROS
- alcohol, smoking
- OTCs, herbal remedies, medications (sedative hypnotics, antipsychotics, antidepressants, anticholinergics), compliance, accessibility
- history of vascular disease or head trauma
- collateral history

Physical Exam

- blood pressure
- hearing and vision
- neurological exam with attention to signs of parkinsonism, UMN findings, cerebrovascular disease
- general physical exam depending on risk factors and history
- MMSE or MoCA, clock drawing, frontal lobe testing (go/no-go, word lists, similarities, proverb)

Investigations

- depends on suspected etiologies (see [Tables 13 and 14](#))
 - CBC (note MCV for evidence of alcohol use and B₁₂ deficiency), glucose, TSH, B₁₂, RBC folate
 - electrolytes, LFTs, renal function, lipids, serum calcium
 - CT head, MRI as indicated (MRI preferred), SPECT (optional)
 - as clinically indicated: VDRL, HIV, ANA, anti-dsDNA, ANCA, ceruloplasmin, copper, cortisol, toxicology, heavy metals
- issues to consider
 - failure to cope, fitness to drive, caregiver education and stress, power of attorney, legal will, advanced medical directives, patient and caregiver safety

Sensitivity and Specificity

Tool	Sensitivity	Specificity
MMSE	87%	82%
Clinical Judgment	85%	82%
DSM IV	76%	80%

Vitamin B₁₂ Deficiency Symptoms

- Macrocytic anemia, pallor, SOB, fatigue, chest pain, palpitations
- Confusion or change in mental status (if advanced)
- Decreased vibration sense
- Distal numbness and paresthesia
- Weakness with UMN findings
- Diarrhea, anorexia

Dementia DDx

VITAMIN D VEST

Vitamin deficiency (B₁₂, folate, thiamine)
 Intracranial tumor
 Trauma (head injury)
 Anoxia
 Metabolic (DM)
 Infection (postencephalitis, HIV)
 Normal pressure hydrocephalus
 Degenerative (Alzheimer's, Huntington's, CJD)
 Vascular (multi-infarct dementia)
 Endocrine (hypothyroid)
 Space occupying lesion (chronic subdural hematoma)
 Toxic (alcohol)

Table 14. Common Causes of Major NCD (Dementia)

Etiology	Key Clinical Features	Investigations
PRIMARY DEGENERATIVE		
Alzheimer's disease	Memory impairment Aphasia, apraxia, agnosia	CT or MRI, SPECT
Dementia with Lewy bodies	Visual hallucinations Parkinsonism Fluctuating cognition	CT or MRI, SPECT
Frontotemporal dementia (e.g. Pick's disease)	<u>Behavioral presentation</u> : Disinhibition, perseveration, decreased social awareness, mental rigidity, memory relatively spared <u>Language presentation</u> : Progressive non-fluent aphasia, semantic dementia	CT or MRI, SPECT
Huntington's disease	Chorea	Genetic testing
VASCULAR		
Vascular cognitive impairment (previously Multi-infarct dementia)	Bradyphrenia without features of parkinsonism (slow thinking, slow rate of learning, slow gait) Dysexecutive syndrome May be abrupt onset Stepwise deterioration is classic but progressive deterioration is most common	CT or MRI, SPECT
CNS vasculitis	Systemic S&S of vasculitis	ANA; ANCA; RF CT or MRI Angiography

Table 15. Acquired Causes of Major NCD (Dementia)

Etiology	Key Clinical Features	Investigations
INFECTIOUS		
Chronic meningitis	Fever, headache, nausea Meningismus Localizing neuro deficits	CT, LP
Chronic encephalitis	Fever, H/A	CT or MRI
Chronic abscess	Increased ICP Localizing neuro signs	CT with contrast
HIV	See Infectious Diseases, ID29	HIV serology
Creutzfeldt-Jacob disease	Rapidly progressive, myoclonus	EEG, CT or MRI, LP
Syphilis	Ataxia, myoclonus, tabes dorsalis	LP, CT, or MRI VDRL
TRAUMATIC		
Diffuse axonal shear, epidural hematoma, subdural hematoma	Trauma Hx Increased ICP, papilledema Localizing neuro signs	CT (non-contrast)
RHEUMATOLOGIC		
SLE	See Rheumatology, RH11	MRI ANA, anti-dsDNA
NEOPLASTIC		
Mass effect/edema, hemorrhage, seizure	Increased ICP Localizing neuro signs	CT with contrast MRI
Paraneoplastic encephalitis	Systemic symptoms of cancer	Anti-Hu antibodies

Cholinesterase Inhibitors for Dementia with Lewy Bodies (DLB), Parkinson's Disease Dementia (PDD), and Cognitive Impairment in Parkinson's Disease (CIND-PD)

Cochrane DB Syst Rev 2012;3:CD006504

Study: Meta-analysis of RCTs assessing efficacy of treatment with cholinesterase inhibitors in DLB, PDD, and CIND-PD.

Results: The six trials (n=1,236) included demonstrated therapeutic benefit of cholinesterase inhibitors for global assessment, cognitive function, behavioral disturbance, and activities of daily living. Cholinesterase inhibitors were associated with increased adverse events (OR 1.64) and drop out (OR 1.94). Adverse events were more common with rivastigmine but not with donepezil. Fewer deaths occurred in the treatment group (OR 0.28).

Conclusion: Current evidence supports use of cholinesterase inhibitors for patients with PDD but its role in DLB and CIND-PD is still unclear.

Most common causes of rapidly progressive neurodegenerative dementia (less than 4 yr survival): CJD, frontal temporal lobar dementia, tauopathies, diffuse Lewy body disease, and AD
Arch Neurol 2009;66:201-207

Early Signs of Dementia/Major NCD	Normal Aging
Forgetting the names of close relations	Forgetting the names of acquaintances
Increased frequency of forgetting	Briefly forgetting part of an experience
Repeating phrases/stories in the same conversation	Not putting away things properly
Unpredictable mood changes	Mood changes in response to appropriate causes
Decreased interest in activities and difficulty making choices	Changes in usual interests

Major or Mild NCD due to Alzheimer's Disease

- see [Psychiatry, PS17](#)

Definition

- beyond criterion for NCD, the core features of major or mild NCD due to Alzheimer's disease include an insidious onset and gradual progression of cognitive and behavioral symptoms
- typical presentation: amnesic (i.e. impairment in memory and learning - impaired ability to learn new information)
 - mild phase: impairment in memory and learning sometimes accompanied with deficits in executive function
 - moderate-severe phase: visuoconstructional/perceptual-motor ability and language may also be impaired
 - social cognition tends to be preserved until late in the course of the disease

- atypical nonamnesic presentation (one of the following)
 - a. aphasia: language disturbance
 - b. apraxia: impaired ability to carry out motor activities despite intact motor function
 - c. agnosia: failure to recognize or identify objects despite intact sensory function
- note: there may be no evidence of mixed etiology (i.e. absence of other neurodegenerative or cerebrovascular disease)

Pathophysiology

- genetic factors
 - minority (<7%) of AD cases are familial (autosomal dominant)
 - 3 major genes for autosomal dominant AD have been identified
 - ♦ amyloid precursor protein (chromosome 21), presenilin 1 (chromosome 14), presenilin 2 (chromosome 1)
 - the E4 polymorphism of apolipoprotein E (APOE) is a susceptibility genotype (E2 is protective)
 - note: APOE cannot serve as a diagnostic marker because it is only a risk factor and neither necessary nor sufficient for disease occurrence
- pathology (although not necessarily specific for AD)
 - gross pathology
 - ♦ diffuse cortical atrophy, especially frontal, parietal, and temporal lobes (hippocampi)
 - microscopic pathology
 - ♦ senile plaques (extracellular deposits of amyloid in the gray matter of the brain)
 - ♦ loss of synapses
 - ♦ neurofibrillary tangles (intracytoplasmic paired helical filaments with amyloid and hyperphosphorylated Tau protein)
 - ♦ loss of cholinergic neurons in nucleus basalis of Meynert that project diffusely throughout the cortex
 - biochemical pathology
 - ♦ 50-90% reduction in action of choline acetyltransferase

Epidemiology

- 1/12 of population 65-75 yr of age
- up to 1/3 population >85 yr of age
- accounts for 60-90% of all dementias (depending on setting and diagnostic criteria)

Risk Factors

- age is the largest risk factor
- genetic susceptibility polymorphism: apolipoprotein E4 increases risk and decreases age of onset
- other factors include: traumatic brain injury, family history, Down syndrome, low education, and presence of multiple vascular risk factors (e.g. smoking, HTN, hypercholesterolemia, DM)

Signs and Symptoms

- cognitive impairment
 - memory impairment for newly acquired information (early)
 - deficits in language, abstract reasoning, and executive function
- behavioral and psychiatric manifestations (80% of those with major NCD)
 - mild NCD: major depressive disorder and/or apathy
 - major NCD: psychosis, irritability, agitation, combativeness, and wandering
- motor manifestations (late)
 - gait disturbance, dysphagia, incontinence, myoclonus, and seizures
 - parkinsonism (if present consider DLB)

Investigations

- perform investigations to rule out other potentially reversible causes of dementia
- EEG: usually normal, may observe generalized slowing (nonspecific)
- MRI: preferential atrophy of the hippocampi and precuneus of the parietal lobe; dilatation of lateral ventricles; widening of cortical sulci
- SPECT: hypoperfusion in temporal and parietal lobes
- PET Imaging: imaging using Pittsburgh compound B (PIB) as a tracer enables imaging of beta-amyloid plaque in neuronal tissue

Treatment

- acetylcholinesterase inhibitors have been shown to slow decline in cognitive function
 - donepezil, rivastigmine, galantamine
 - relative contraindications: bradycardia, heart block, arrhythmia, CHF, CAD, asthma, COPD, ulcers, or risk factors for ulcers, and GI bleeding
 - galantamine is contraindicated in patients with hepatic/renal impairment
- memantine is an NMDA-receptor antagonist that has some benefits in later stage AD (i.e. when MMSE <17)
- symptomatic management
 1. pharmacologic
 - low dose neuroleptics for agitation (neuroleptics may worsen cognitive decline)
 - trazodone for sleep disturbance
 - antidepressants (SSRIs)

4 As and one D of AD

Anterograde amnesia
Aphasia
Apraxia
Agnosia
Disturbance in executive function

(Anterograde amnesia plus at least one of the other features is required for AD diagnosis)

Down syndrome predisposes to early onset of Alzheimer's (i.e. age of ~40) due to three copies of the amyloid gene (APP)

2. non-pharmacologic

- redirection
- explore inciting factors for behavior and modify behavior of patient or caregiver
- family support and day care facilities

Prognosis

- mean duration of survival after diagnosis is approximately 10 yr, reflecting the advanced age of the majority of individuals rather than the course of the disease
- in those who survive the full course, death commonly results from aspiration

Major or Mild NCD with Lewy Bodies (formerly Dementia with Lewy Bodies)

Definition

- A NCD that includes not only progressive cognitive impairment (with early changes in complex attention and executive function rather than learning and memory), but also recurrent complex visual hallucinations.
- core diagnostic features
 - fluctuating cognition with pronounced variations in attention and alertness
 - recurrent visual hallucinations that are well formed and detailed
 - spontaneous features of parkinsonism, with onset subsequent to development of cognitive decline (rest tremor may be absent in DLB, but otherwise same classic features of Parkinson's disease)
- suggestive/supportive features
 - meets criteria for rapid eye movement (REM) sleep behavior disorder
 - severe sensitivity to neuroleptic medications (rigidity, neuroleptic malignant syndrome, extrapyramidal symptoms)
 - repeated falls, syncope, or transient episodes of unexplained loss of consciousness
 - auditory or other nonvisual hallucinations, systematic delusions, and depression may also be present

Etiology and Pathogenesis

- Lewy bodies (eosinophilic cytoplasmic inclusions) found in both cortical and subcortical structures
- mixed DLB and AD pathology is common

Diagnostically Suggestive Markers

- low striatal dopamine transporter uptake on SPECT or PET
- relative preservation of medial temporal structures on CT/MRI

Epidemiology

- 0.1-5% of the general elderly population
- Lewy bodies are present in 20-35% of all dementia cases (more common in males)

Treatment

- acetylcholinesterase inhibitors (e.g. donepezil)

Prognosis

- average duration of survival 5-7 yr

Major or Mild Frontotemporal Neurocognitive Disorder (formerly Frontotemporal Dementia)

Definition

- refers to a group of disorders caused by progressive cell degeneration in the brain's frontal or temporal lobes
- there are several variants of FTD each with specific core symptoms
- nevertheless, there is overlap between variants (i.e. NCD criteria along with relative sparing of learning and memory and perceptual-motor function)
- common neurocognitive symptoms include deficits in executive function (e.g. poor mental flexibility, abstract reasoning, response inhibition, planning/organization, and increased distractibility)
- "probable" is distinguished from "possible" frontotemporal NCD by:
 - evidence of causative frontotemporal NCD genetic mutation, from either family history or genetic testing
 - evidence of disproportionate frontal and/or anterior temporal atrophy on MRI or CT
 - evidence of frontal and/or anterior temporal hypoperfusion or hypometabolism on PET or SPECT

Behavioral Variant FTD

- most common variant; disinhibition and apathy are common symptoms
- insidious onset: must show progressive deterioration of behavior and/or cognition by observation or history
- prominent decline in social cognition and/or executive abilities
- typically early symptom presentation (i.e. within the first 3 yr)
- three out of the following symptoms must be present and persistent/recurrent
 - behavioral disinhibition (socially inappropriate behavior, impulsive, careless)
 - apathy or inertia
 - loss of sympathy or empathy (diminished response to others' needs/feelings, social interest)
 - preservative, stereotyped, or compulsive/ritualistic behavior
 - hyperorality and dietary changes (binge eating, increased consumption of alcohol/cigarettes or inedible objects)

Language Variants (Primary Progressive Aphasia)

- prominent decline in language ability, in the form of speech production, word finding, object naming, grammar, or word comprehension
- three subtypes
 - nonfluent/agrammatic variant PPA (NFAV-PPA) or progressive nonfluent aphasia (PNFA): non-fluent, labored articulation/speech, anomia, preserved single word comprehension, word-finding deficit, impaired repetition
 - semantic variant PPA (SV-PPA) or semantic dementia (SD): fluent, normal rate, anomia, impaired single word comprehension, intact repetition, use words of generalization ("thing") or supraordinate categories ("animal" for "dog")
 - logopenic progressive aphasia (LPA): naming difficulty and impaired repetition

FTD Movement Disorders

- corticobasal degeneration (CBD): shakiness, lack of coordination, muscle rigidity and spasms
- progressive supranuclear palsy (PSP): walking and balance problems; frequent falls and muscle stiffness

Etiology and Pathogenesis

- unknown, however there is likely a genetic/familial component (40% have family history of early onset NCD)
- genetic variants: MAPT gene (Tau), PGRN gene (progranulin), VCP gene, TARDBP gene (TDP-43), CHMP2D gene
- unlike AD, FTD does not show amyloid plaques or neurofibrillary tangles, instead it is characterized by severe atrophy and specific neuronal inclusion bodies
- gross changes: atrophy in the frontal and anterior temporal lobes; cortical thinning; possible ventricular enlargement
- histological changes: gliosis, swollen neurons, microvacuolation, inclusion bodies in neurons/glia (Tau or TDP-43)

Epidemiology

- fourth most common cause of dementia (5% of all dementia cases)
- common cause of early-onset NCD in individuals younger than 65 yr

Prognosis

- median survival being 6-11 yr after symptoms onset and 3-4 yr after diagnosis
- survival is shorter and decline is faster than in typical Alzheimer's disease

Major or Mild Vascular Neurocognitive Disorder

Definition

- diagnosis of major or mild NCD with determination of cerebrovascular disease as the dominant if not exclusive pathology that accounts for the cognitive deficits
- vascular etiology suggested by one of the following
 - onset of cognitive deficits is temporally related to one or more cerebrovascular events
 - evidence for decline is prominent in complex attention (including processing speed) and frontal-executive function
- evidence of the presence of cerebrovascular disease from history, physical exam, and/or neuroimaging that is sufficient to account for the neurocognitive deficits
- neuroimaging evidence of cerebrovascular disease comprises one or more of the following
 - one or more large vessel infarct or hemorrhage
 - a strategically placed single infarct or hemorrhage (e.g. angular gyrus, thalamus, basal forebrain)
 - two or more lacunar infarcts outside the brainstem
 - extensive and confluent white matter lesions

- for mild vascular NCD: history of a single stroke or extensive white matter disease is sufficient
- for major vascular NCD: history of two or more strokes, a strategically placed stroke, or a combination of white matter disease, and one or more lacune is generally necessary
- associated features supporting diagnosis: personality and mood changes, abulia, depression, emotional lability, and psychomotor slowing

Etiology and Pathogenesis

- major risk factors are the same as those for cerebrovascular disease (i.e. HTN, DM, smoking, obesity, high cholesterol levels, high homocysteine levels, other risk factors for atherosclerosis, atrial fibrillation, and conditions increasing risk of cerebral emboli)
- major or mild vascular NCD with gradual onset and slow progression is generally due to small vessel disease leading to lesions in white matter, basal ganglia, and/or thalamus
- cognitive deficits can be attributed to disruption of cortical-subcortical circuits

Epidemiology

- second most common cause of NCD
- prevalence estimates for vascular dementia/NCD range from 0.2-13% (by age 70), 16% (ages 80+) to 44.6% (ages 90+)
- higher prevalence in African Americans compared to Caucasians and East Asians
- prevalence higher in males than in females

Creutzfeldt-Jakob Disease

- rare degenerative fatal brain disorder caused by prion proteins causing spongiform changes, astrocytosis, and neuronal loss
- most common forms are sporadic (85%), hereditary (5-10%), and acquired (<1%)
- investigations: CSF analysis, MRI brain (cortical and/or subcortical FLAIR changes), EEG (periodic complexes)
- definitive diagnosis is by brain biopsy
- no treatments currently exist

Prion proteins have a normal form and an infectious form, which results from conversion of the protein from alpha-helix (normal) to beta-pleated sheet (abnormal); these abnormally folded proteins aggregate leading to neuronal loss

Normal Pressure Hydrocephalus

- see [Neurosurgery](#), NS7

Aphasia

Definition

- an acquired disturbance of language characterized by errors in speech production, writing, comprehension, or reading

Neuroanatomy of Aphasia

- Broca's area (posterior inferior frontal lobe) involved in speech production (expressive)
- Wernicke's area (posterior superior temporal lobe) involved in comprehension of language (receptive)
- angular gyrus is responsible for relaying written visual stimuli to Wernicke's area for reading comprehension
- arcuate fasciculus association bundle connects Wernicke's and Broca's areas

Assessment of Language

- assessment of context
 - handedness (writing, drawing, toothbrush, scissors), education level, native language, learning difficulties
- assessment of aphasia
 - spontaneous speech (fluency, paraphasias, repetition, naming, comprehension – auditory and reading, writing, neologisms)

- >99% of right-handed people have left hemisphere language representation
- 70% of left-handed people have left hemisphere language representation, 15% have right hemisphere representation, and 15% have bilateral representation

Types of Paraphasias

- Semantic ("chair" for "table")
- Phonemic ("clable" for "table")

Aphasia localizes the lesion to the dominant cerebral hemisphere

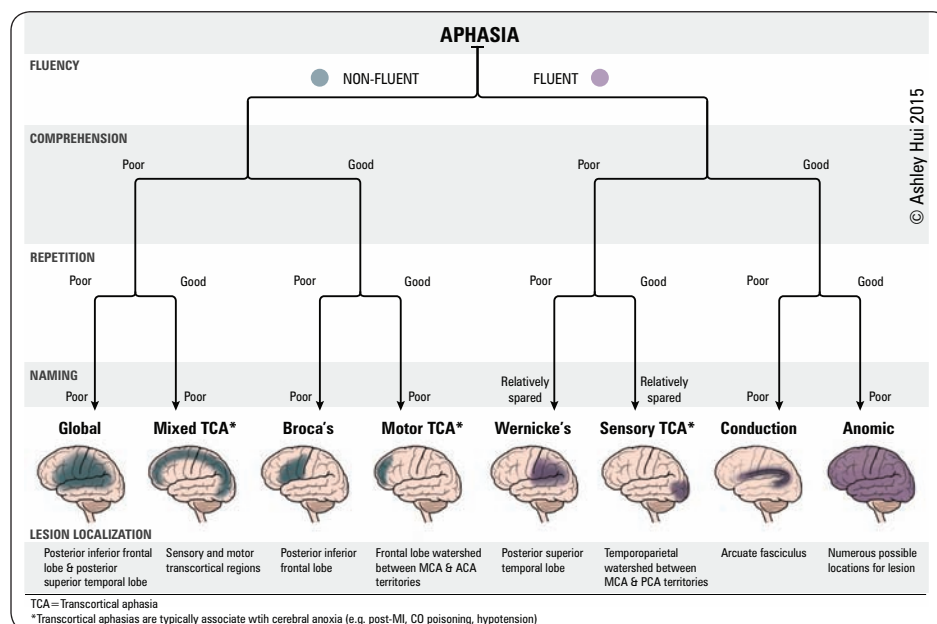

Figure 19. Aphasia classification

Apraxia

Definition

- inability to perform skilled voluntary motor sequences that cannot be accounted for by weakness, ataxia, sensory loss, impaired comprehension, or inattention

Clinicopathological Correlations

Table 16. Apraxia

	Description	Tests	Hemispheres
Ideomotor	Inability to perform skilled learned motor sequences	Blowing out a match; combing one's hair	Left
Ideational	Inability to sequence actions	Preparing and mailing an envelope	Right and left
Constructional*	Inability to draw or construct	Copying a figure	Right and left
Dressing*	Inability to dress	Dressing	Right

*Refers specifically to the inability to carry out the learned movements involved in construction, drawing, or dressing; not merely the inability to construct, draw, or dress. Many skills aside from praxis are needed to carry out these tasks

Agnosia

Definition

- disorder in the recognition of the significance of sensory stimuli in the presence of intact sensation and naming

Clinicopathological Correlations

Table 17. Agnosias

	Description	Lesion
Aperceptive Visual Agnosia	Inability to name or demonstrate the use of an object presented visually 2° to distorted visual perception Recognition by touch remains intact	Bilateral temporo-occipital cortex
Associative Visual Agnosia	Inability to name an object presented visually 2° to disconnect between visual cortex and language areas Visual perception is intact as demonstrated by visual matching	Bilateral inferior temporo-occipital junction
Prosopagnosia	Inability to recognize familiar faces in the presence of intact visual perception and intact auditory recognition	Bilateral occipitotemporal areas or right inferior temporo-occipital region
Color Agnosia	Inability to perceive color	Bilateral inferior temporo-occipital lesions
Impaired Stereognosis	Inability to identify objects by touch	Anterior parietal lobe in the hemisphere opposite the affected hand
Finger Agnosia	Inability to recognize, name, and point to individual fingers	Dominant hemisphere parietal-occipital lesions

Parietal Lobe Lesions

- Lesions of the dominant parietal lobe are characterized by Gerstmann's syndrome: acalculia, agraphia, finger agnosia, and left-right disorientation
- Lesions of the non-dominant parietal lobe are characterized by neglect, anosognosia, and asomatognosia
- Cortical sensory loss (graphesthesia, astereognosis, impaired 2 point discrimination and extinction) can be seen with left or right parietal lesions

Mild Traumatic Brain Injury

Definition

- mild TBI = concussion
- trauma induced transient alteration in mental status that may involve loss of consciousness
- hallmarks of concussion: confusion and amnesia, which may occur within minutes
- loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h

- Extent of retrograde amnesia correlates with severity of injury
- Regained from most distant to recent memories

Epidemiology

- 75% of TBIs are estimated to be mild; remainder are moderate or severe (see [Neurosurgery, NS31](#) and [Emergency Medicine, ER7](#))
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

Clinical Features

- impairments following mild TBI
 - somatic: headache, sleep disturbance, N/V, blurred vision
 - cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
 - emotion and behavior: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils
- associated conditions: brain contusion, diffuse axonal injury, C-spine injury

Investigations

- neuro exam to identify focal neurologic deficits
- neurocognitive assessment
 - simple orientation questions are inadequate to detect cognitive changes
 - initial assessment of severity is determined by
 - ♦ Glasgow Coma Scale: mild: 13-15, moderate: 9-12, severe: 3-8
 - sideline evaluation: Standardized Assessment of Concussion, Westmead Post-Traumatic Amnesia Scale, Sport Concussion Assessment Tool
- neuroimaging
 - x-ray of skull: not indicated for routine evaluation of MTBI
 - CT head as indicated (see [Emergency Medicine, ER8](#))
 - MRI not indicated in initial evaluation – indicated in presence of continued or worsening symptoms despite normal CT

Treatment

- observation for first 24 h after mild TBI in all patients because of risk of intracranial complications
- emergency department for assessment if any loss of consciousness or persistent symptoms
- hospitalization with normal CT if GCS <15, seizures, or bleeding diathesis; or abnormal CT scan
- early rehabilitation to maximize outcomes
 - OT, PT, SLP, vestibular therapy, driving, therapeutic recreation
- pharmacological management of headaches, pain, depression
- CBT, relaxation therapy
- follow Return to Play guidelines (www.thinkfirst.ca)

Prognosis

- most recover from mild TBI with minimal treatment, but some experience long-term consequences
- athletes with a previous concussion are at increased risk of subsequent concussion and cumulative brain injury
- repeat TBI can lead to life threatening cerebral edema (controversially known as second impact syndrome) or permanent impairment
- sequelae include
 - postconcussion syndrome: dizziness, headache, neuropsychiatric symptoms, cognitive impairment (usually resolves within weeks to months)
 - post-traumatic headaches: begin within seven days of injury
 - post-traumatic epilepsy: twofold increase in risk of epilepsy in 5 yr post-TBI, prophylactic anticonvulsants not effective
 - post-traumatic vertigo

Tumors of the Nervous System

- see [Neurosurgery](#), NS10

Movement Disorders

Overview of Movement Disorders

Table 18. Movement Disorder Definitions

Akathisia	Subjective restlessness relieved by stereotypic movements (e.g. squirming)
Asterixis	Loss of muscle contraction (negative myoclonus)
Athetosis	Slow writhing movements, especially distally
Bradykinesia	Slow and/or small amplitude movements
Chorea	Brief, abrupt, irregular movements; can appear purposeful in milder forms
Dyskinesia	Any sudden involuntary movement, but the term is often used to describe the stereotypical movements that come with long-term neuroleptic or dopaminergic use
Dystonia	Co-contraction of agonist and antagonists causing sustained twisting movements
Freezing	Episodes of halted motor action, especially during walking
Hemiballismus	Unilateral violent flinging movement
Myoclonus	Brief muscle group contraction that is either focal, segmental, or generalized
Myokimia	Spontaneous, fine, fascicular contraction of muscle
Tachykinesia	Acceleration of movements
Tics	Stereotyped repetitive actions due to inner urge; can be suppressed
Tremor	Rhythmic alternating muscle contraction and relaxation

In some cases, dystonias may only occur during voluntary movement and sometimes only during specific activities such as writing, chewing, or speaking

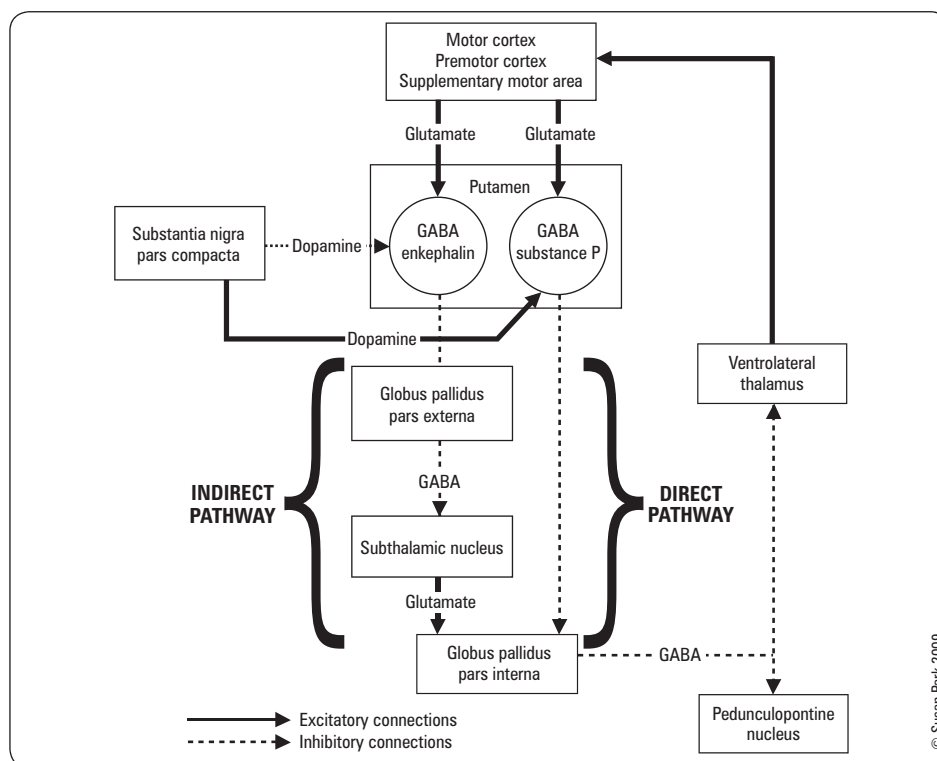

Hemiballismus is most often due to a vascular lesion of the contralateral subthalamic nucleus

Some myoclonus is stimulus sensitive and can be induced by noise, movement, light, visual threat, or pinprick

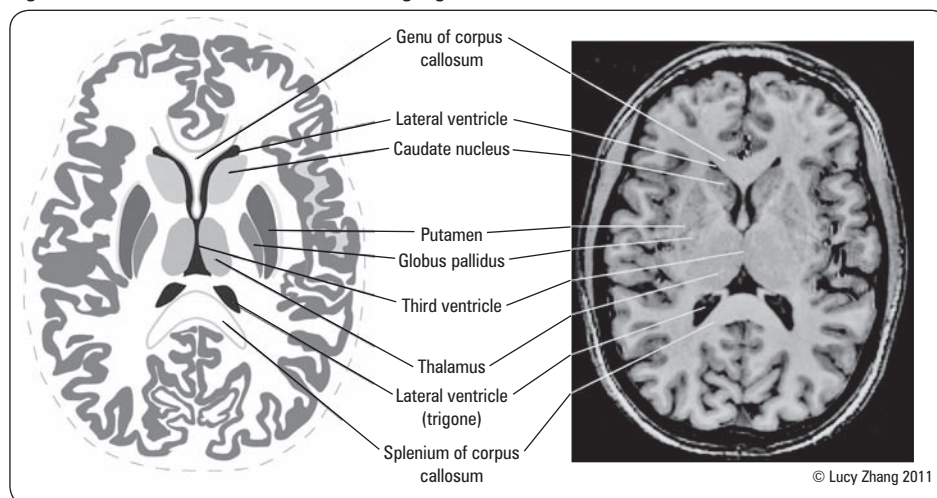

Function of the Basal Ganglia

- the cerebral cortex initiates movement via excitatory (glutamatergic) projections to the striatum, which then activate two pathways: direct and indirect
- direct: cortex → striatum → GPi/SNr → thalamus → motor cortex
 - activation of this pathway removes the inhibitory effect of the GPi on the thalamus, letting the thalamus activate the cortex and ultimately allowing movement
- indirect: cortex → striatum → GPe → STN → GPi/SNr → thalamus → motor cortex
 - activation of this pathway causes inhibition of the thalamus and ultimately prevents movement

Movement Disorders

Differential Diagnoses

1. Tremor

- **postural:** physiologic, anxiety, sedative/alcohol withdrawal, drug toxicity, heavy metal poisoning, carbon monoxide poisoning, thyrotoxicosis, benign essential tremor, cerebellar, Wilson's disease
 - ♦ benign essential tremor is a common autosomal dominant trait that presents as a bilateral postural tremor of the vertical axis, especially in the upper extremities
- **intention:** brainstem lesion, cerebellar lesion, alcohol, anticonvulsants, sedatives, Wilson's disease
- **resting:** Parkinsonism, Wilson's disease, mercury poisoning

In a young patient (<45) must do TSH (thyroid disease), ceruloplasmin (Wilson's disease), and CT/MRI (cerebellar disease) as indicated by type of tremor

Alcohol

- Dampens essential tremor
- Potentiates intention tremor
- Does not improve resting tremor of PD

>90% of essential tremor does not need treatment

Table 19. Approach to Tremors

	Resting	Postural	Intention
Body Part	Distal UE	UE/head/voice	Anywhere
Characteristics	3-7 Hz pill rolling	6-12 Hz fine tremor	< 5 Hz coarse tremor
Worse with	Rest while concentrating	Sustained posture (outstretched arms)	Finger to nose
Associated Sx	"TRAP"	± Autosomal dominant FHx	Cerebellar findings
DDx	PD, Parkinsonism, Wilson's disease	Physiologic, benign essential, drugs, hyperthyroid, hyperglycemic	Cerebellar disorders, Wilson's disease, alcohol, MS
Treatment	Sinemet, surgery, DBS	Propranolol, anticonvulsants, primidone	Treat underlying cause

2. **Chorea:** Huntington's disease, neuroacanthocytosis, SLE, APLA syndrome, Wilson's disease, cerebrovascular disease, tardive dyskinesia, senile chorea, Sydenham's chorea, pregnancy chorea

3. Dystonia

- **primary dystonia:** familial, sporadic (torticollis, blepharospasm, writer's cramp)
- **dystonia-plus syndromes:** dopa-responsive dystonia, myoclonus-dystonia
- **secondary dystonia:** thalamotomy, stroke, CNS tumor, demyelination, PNS injury, drugs/toxins (L-dopa, neuroleptics, anticonvulsants, Mn, CO, cyanide, methanol)
- **heterodegenerative dystonias:** Parkinsonian disorders, Wilson's disease, Huntington's disease

4. Myoclonus

- **physiologic myoclonus:** hiccups, nocturnal myoclonus
- **essential myoclonus**
- **epileptic myoclonus**
- **symptomatic myoclonus**
 - degenerative disorders (Wilson's disease, Huntington's disease, Corticobasal degeneration)
 - infectious disorders (CJD, viral encephalitis, AIDS-dementia complex)
 - metabolic disorders (drug intoxication/withdrawal, hypoglycemia, hyponatremia, HONK, hepatic encephalopathy, uremia, hypoxia)
 - focal brain damage (head injury, stroke, mass)

5. Tics

- **primary tic disorders:** transient tic disorder, chronic tic disorder, Gilles de la Tourette, adult onset or senile
- **secondary tic disorders:** encephalitis, CJD, Sydenham's chorea, head trauma, drugs, mental retardation syndromes
- association with OCD and ADHD

Most common cause of chorea is drug therapy for PD

Palatal myoclonus can result from lesion to the Dentato-Rubro-Olivary tract, and is associated with an audible clicking

Parkinson's Disease

Etiology

- **sporadic:** combination of oxidative stress to dopaminergic neurons, environmental toxins (e.g. pesticides), accelerated aging, genetics
- **familial** (10%): autosomal dominant α -synuclein mutations, autosomal recessive Parkin gene or DJ-1 gene mutation (juvenile onset)
- **MPTP** (neurotoxin)

Epidemiology

- prevalence of 0.3% in industrialized countries, but rises with increased age
- second most common neuro-degenerative disorder, after Alzheimer's
- mean age of onset is 60 yr

Risk Factors

- family history, male, head injury, rural living, exposure to certain neurotoxins
- protective: coffee drinking, smoking, NSAID use, estrogen replacement in post-menopausal women

Pathophysiology

- loss of dopaminergic neurons in pars compacta of substantia nigra, thus reduced dopamine in striatum leading to disinhibition of the indirect pathway and decreased activation of the direct pathway causing increased inhibition of cortical motor areas
- α -synucleinopathy: α -synuclein accumulates in Lewy bodies and causes neurotoxicity in substantia nigra

Key Parkinsonian Features

TRAP

Tremor (resting)
Rigidity
Akinesia/bradykinesia
Postural instability

Diagnostic Criteria

- Bradykinesia, plus one of: resting tremor, muscle rigidity, postural instability not caused by other factors, OR
- 3 or more of the following features:
 - Resting tremor
 - Unilateral onset
 - Persistent asymmetry, with side of onset most affected
 - Progressive disorder
 - Excellent response (70-100%) to levodopa
 - Severe levodopa-induced chorea
 - Response to levodopa for 5 or more yr
 - Clinical course lasting 10 or more yr

Signs and Symptoms

- positive motor
 - resting tremor: asymmetric 4-5 Hz “pill-rolling” tremor, especially in hands
 - rigidity: lead-pipe rigidity with cogwheeling due to superimposed tremor
- negative motor
 - bradykinesia: slow, small amplitude movements, fatiguing of rapid alternating movements, difficulty initiating movement
- related findings: masked facies, hypophonia, aprosody (monotonous speech), dysarthria, micrographia, shuffling gait with decreased arm swing
- freezing: occurs with walking triggered by initiating stride or barriers/destinations, lasting seconds
- postural instability: late finding presenting as falls, festinating gait
- cognition: bradyphrenia (slow to think/respond), dementia (late finding)
- behavioral: decreased spontaneous speech, depression, sleep disturbances, anxiety
- autonomic: constipation, urinary retention, sexual dysfunction, later findings of orthostatic hypotension

Treatment

- pharmacologic
 - mainstay of treatment: Sinemet® (levodopa/carbidopa). Levodopa is a dopamine precursor; carbidopa decreases peripheral metabolism of levodopa, decreasing side effects and increasing half-life of levodopa
 - ♦ levodopa-related fluctuation: delayed onset of response (affected by mealtime), end-of-dose deterioration (“wearing-off”), random oscillations of on-off symptoms
 - ♦ major complication of levodopa is dyskinesia
 - treatment of early PD: dopamine agonists, amantadine, MAOI
 - adjuncts: dopamine agonists, MAOI, anticholinergics (especially if prominent tremors), COMT inhibitors
- surgical: thalamotomy, pallidotomy, deep brain stimulation (thalamic, pallidal, subthalamic)
- psychiatric (see [Psychiatry](#), PS18)

Consider an Alternative Diagnosis if Atypical Parkinsonism

- Poor response to levodopa
- Abrupt onset of symptoms
- Rapid progression
- Early falls
- Early autonomic dysfunction
- Symmetric symptoms at onset
- Early age of onset (<50 yr)
- Early cognitive impairment
- FHx of psychiatric/dementing disorders
- Recent diagnosis of psychiatric disease
- History of encephalitis
- Unusual toxin exposure
- Extensive travel history

Dopamine Agonist Therapy in Early Parkinson's Disease

Cochrane DB Syst Rev 2009;2:CD006564

Study: Meta-analysis of trials of dopamine agonists in early Parkinson's disease.

Results: Twenty-nine trials were included (n=5,247). Dopamine agonists were found to have decreased motor side effects (dyskinesia [OR 0.51], dystonia [OR 0.64], motor fluctuations [OR 0.75]) compared to levodopa, but provided poorer symptom control compared to levodopa. Also, other side effects were increased (constipation [OR 1.59], hallucinations [OR 1.69], dizziness [OR 1.45]).

Conclusion: Dopamine agonists have fewer motor side effects than levodopa, but provide worse symptom control and increased rate of other side effects.

Juvenile Onset (Westphal Variant)

Begins in adolescence with bradykinesia and rigidity with a severe progressive course spanning 5-10 yr

Other Parkinsonian Disorders

- **Dementia/NCD with Lewy bodies (DLB)** (see *Behavioral Neurology*, N23)
- **Progressive supranuclear palsy (PSP)**: tauopathy with limited vertical gaze (classically downgaze), early falls, axial rigidity and akinesia, dysarthria, and dysphagia
- **Corticobasal degeneration (CBD)**: tauopathy with varied presentations but classically presents with unilateral parkinsonism, dystonia/myoclonus, apraxia ± “alien limbs” phenomenon; may also present as progressive non-fluent aphasia
- **Multiple system atrophy (MSA)**: synucleinopathy presenting as either cerebellar predominant (previously olivo-ponto cerebellar atrophy or OPCA) or parkinsonism predominant (previously striato-nigral degeneration); both are associated with early autonomic dysfunction (previously Shy-Drager syndrome)
- **Vascular parkinsonism**: multi-infarct presentation with lower body parkinsonism

Huntington's Disease

Etiology and Pathogenesis

- genetics: autosomal dominant CAG repeats (with anticipation) in Huntington gene on Chromosome 4, which leads to accumulation of defective protein in neurons
- pathology: global cerebral atrophy, especially affecting the striatum, leading to increased activity of the direct pathway and decreased activity of the indirect pathway

Epidemiology

- North American prevalence 4-8/100,000
- mean age of onset 35-44 yr; but varies with degree of anticipation from 5-70 yr

Signs and Symptoms

- typical progression: insidious onset with clumsiness, fidgetiness, and irritability, progressing over 15 yr to frank dementia, psychosis, and chorea
 - dementia: progressive memory impairment and loss of intellectual capacity
 - chorea: begins as movement of eyebrows and forehead, shrugging of shoulders, and parakinesia (pseudopurposeful movement to mask involuntary limb jerking)
 - progresses to dance-like or ballism, and in late stage is replaced by dystonia and rigidity
 - mood changes: irritability, depression, anhedonia, impulsivity, bouts of violence

Investigations

- MRI: enlarged ventricles, atrophy of cerebral cortex and caudate nucleus
- genetic testing
 - expansion of the cytosine-adenine-guanine (CAG) trinucleotide repeats in the HTT gene
 - CAG repeats on chromosome 4p16.3 that encodes the protein huntingtin

Treatment

- no disease altering treatment
- psychiatric symptoms: antidepressants and antipsychotics
- chorea: neuroleptics and benzodiazepines
- dystonia: botulinum toxin

Dystonia

Epidemiology

- third most common movement disorder after Parkinson's disease and essential tremor

Clinical Features

- symptoms exacerbated by fatigue, stress, emotions; relieved by sleep or specific tactile/proprioceptive stimuli ('geste antagoniste', e.g. place hand on face for cervical dystonia)
- more likely to be progressive and generalize if younger onset or leg dystonia

Treatment

- local medical: botulinum toxin
- systemic medical: anticholinergics (benztropine), muscle relaxants (baclofen), benzodiazepines, antidopaminergics (reserpine, neuroleptics); dopamine for dopa-responsive dystonia
- surgical: surgical denervation of affected muscle, stereotaxic thalamotomy (unilateral dystonia), posteroventral pallidotomy

Botulinum toxin (BOTOX®) acts by preventing ACh release at the neuromuscular junction

Tic Disorders

Definition

- a tic is a sudden, rapid, recurrent, nonrhythmic, stereotyped motor movement or vocalization
- common criteria
 - tics may wax and wane in frequency but have persisted for an extended period of time
 - onset before age 18 yr
 - disturbance is not attributable to the physiological effects of a substance or another medical condition

Clinical Classification

- **Tourette's disorder:** multiple motor and one or more vocal tics that have persisted for more than 1 yr since onset
- **Persistent (chronic) motor or vocal tic disorder:** single or multiple motor or vocal tics (but not both motor and vocal) that have persisted for more than 1 yr since onset
- **Provisional tic disorder:** single or multiple motor and/or vocal tics present for <1 yr since first tic onset
- **other specified or unspecified tic disorder:** symptoms characteristic of a tic disorder but do not meet full criteria

Motor vs. Vocal Tics

- simple tics tend to be of short duration (milliseconds)
- complex tics tend to be longer (seconds) and often include a combination of simple tics
 - complex tics may often appear to be purposeful
- motor tics
 - simple: blinking, head jerking, shoulder shrugging, extension of the extremities
 - dystonic: bruxism, grinding teeth, abdominal tension, sustained mouth opening
 - complex: copropraxia (obscene gestures), echopraxia (imitate gestures), throwing, touching
- vocal tics
 - simple: blowing, coughing, grunting, throat clearing
 - complex: coprolalia (shout obscenities), echolalia (repeat others' phrases), palilalia (repeat own phrases)

Treatment

- dopamine blocker

Tourette's Syndrome (Gilles de la Tourette's Syndrome)

Definition According to DSM 5

1. presence of both multiple motor and one or more vocal tics at some point during the illness, although not necessarily concurrently
2. tics may wax and wane in frequency but have persisted for more than 1 yr since first tic onset (with no tic-free periods greater than 3 mo)
3. onset is before age 18 yr
4. not due to effect of a substance or another medical condition

Epidemiology

- estimated prevalence among adolescents 3-8 per 1,000 school-age children; M:F = 2:1 to 4:1

Signs and Symptoms

- **tics:** wide variety that wax and wane in type and severity; can be voluntarily suppressed for some time but are preceded by unpleasant sensation that is relieved once tic is carried out
 - can be worsened by anxiety, excitement, and exhaustion; better during calm focused activities
- **psychiatric:** compulsive behaviors (associated with OCD and ADHD), hyperactive behavior, 'rages', sleep-wake disturbances, learning disabilities

Treatment

- clonidine, clonazepam

Prognosis

- typically begins between ages 4-6
- peak severity occurs between ages 10-12, with a decline in severity during adolescence (50% are tic-free by 18 yr of age)
- tic symptoms however can manifest similarly in all age groups and across the lifespan

Less than 15% of people with Tourette's have coprolalia

Cerebellar Disorders

Clinico-Anatomic Correlations

- **vermis:** trunk/gait ataxia
- **cerebellar lobe (i.e. lateral):** rebound phenomenon, scanning dysarthria, dysidiadochokinesis, dysmetria, nystagmus

Symptoms and Signs of Cerebellar Dysfunction

- nystagmus: observe during extraocular movement testing (most common is gaze-evoked nystagmus)
- dysarthria (ataxic): abnormal modulation of speech velocity and volume – elicit scanning/telegraphic/slurred speech on spontaneous speech (see *CN X Vagus Nerve*, N11)
- ataxia: broad-based, uncoordinated, lurching gait
- dysmetria: irregular placement of voluntary limb or ocular movement
- dysidiadochokinesis: impairment of rapid alternating movements (e.g. pronation – supination task)
- postural instability: truncal ataxia on sitting, titubation (rhythmic rocking of trunk and head), difficulty with tandem and broad-based gait
- intention tremor: typically orthogonal to intended movement, and increases as target is approached
- hypotonia: decreased resistance to passive muscular extension (occurs shortly after injury to lateral cerebellum)
- pendular patellar reflex: knee reflex causes pendular motion of leg (occurs after injury to cerebellar hemispheres)
- rebound phenomenon: overcorrection after displacement of a limb
- hypometric and hypermetric saccades
 - pendular reflexes at triceps

Differentiating Ataxia

	Vestibular	Cerebellar	Sensory
Nystagmus/ Vertigo	+	±	-
Dysarthria	=	±	-
Limb Ataxia	-	+	+
			(esp. legs)
Stance	Worse with eyes closed	Poor with eyes open or closed	Positive Romberg
Vibration/ Proprioception	Normal	Normal	Impaired (esp. distal)
Ankle Reflexes	Normal	Normal	Decreased/ absent

Wernicke-Korsakoff Syndrome

- see [Psychiatry](#), PS23
- note that alcohol can also cause a cerebellar ataxia separate from thiamine deficiency; this ataxia can be due to cerebellar atrophy or alcohol polyneuropathy

Cerebellar Ataxias

Congenital Ataxias

- early onset nonprogressive ataxias associated with various syndromes as well as developmental abnormalities (e.g. Arnold-Chiari malformation, Dandy-Walker cysts)

Hereditary Ataxias

- autosomal recessive:** includes Friedrich's ataxia, ataxia telangiectasia, vitamin E deficiency
 - Friedrich's ataxia: prevalence 2/100,000; onset between 8 and 15 yr
 - signs: gait and limb ataxia, weakness, areflexia, extensor plantar reflex, impaired proprioception and vibration, dysarthria
 - death in 10-20 yr from cardiomyopathy or kyphoscoliotic pulmonary restriction
- autosomal dominant:** most commonly spinocerebellar ataxias (30 types, most due to CAG repeats)
 - signs: ataxia and dysarthria; \pm myoclonus, chorea, polyneuropathy, pyramidal or extrapyramidal features, hyporeflexia, seizures, dementia

Acquired Ataxias

- neurodegeneration** (e.g. multiple system atrophy)
- systemic:** alcohol, celiac sprue, hypothyroidism, Wilson's, thiamine deficiency
- toxins:** carbon monoxide, heavy metals, lithium, anticonvulsants, solvents
- vascular:** infarct, bleed, basilar migraine
- autoimmune:** MS, Miller-Fischer (GBS)

Vertigo

- see [Otolaryngology](#), OT12

Gait Disturbances

Approach to Gait Disturbances

- Characterization of the gait disturbance**
 - posture, stride length, width between feet, height of step, stability of pelvis, symmetry, arm swing, elaborate/inconsistent movements, standing from sitting
- Identification of accompanying neurologic signs**
 - full neurological exam required (diagnosis often can be made by P/E alone)
- Identify red flags**
 - sudden onset, cerebellar ataxia, paresis (hemi, para, or quadra), bowel/bladder incontinence
- Workup**
 - based on etiology – requires blood work, neuroimaging, and urgent neurologist referral

Central Motor Systems

- 3 components to the control of gait:
- Pyramidal: main outflow from cortex to spinal cord
 - Extrapyramidal: basal ganglia inhibits excess movements
 - Cerebellum: affects coordination of gait

Table 20. Types of Gait Disturbance

Location	Description	Disorder
Visual Loss	Broad based gait with tentative steps	Cataract surgery without lens replacement
Proprioceptive Loss	Sensory ataxia: wide-based with high stepping posture and positive Romberg	Demyelinating neuropathies, paraneoplastic syndrome, tabes dorsalis, MS, compressive myelopathy, B ₁₂ deficiency
Peripheral Vestibular Lesion 1. Acute 2. Bilateral	1. Vestibular ataxia 2. Disequilibrium	1. Tumor, trauma, infectious, Ménière's disease 2. Ototoxic drugs
Peripheral Nerve Disorder 1. Foot drop 2. Lumbosacral radiculopathy	Steppage gait	Acquired/hereditary peripheral neuropathy, compressive peroneal neuropathy, L4-5 radiculopathy
Myopathies	Waddling gait: broad based, short stepped gait with pronounced lumbar lordosis, rotation of pelvis	Progressive muscular dystrophy
Pyramidal/Corticospinal Tract Lesion 1. Unilateral 2. Bilateral	Spastic gait: spastic foot drop, circumduction, scissoring of legs or toe walking with bilateral circumduction	Unilateral: stroke (ischemic/hemorrhagic) Bilateral: cervical spondylosis, cerebral palsy, spinal cord tumor, combined spinal cord degeneration, MS, motor neuron disease
Basal Ganglia	1. Parkinsonian gait: small paces, stooped posture, reduced armswing 2. Choreic/hemiballistic/dystonic gait	Infarct, Huntington's, Sydenham's chorea, Wilson's disease, SLE, neuroleptic medications, polycythemia vera, genetic dystonia
Cerebellar Disorder	Cerebellar ataxic gait: wide-based without high stepping; veers to side of lesion Alcoholic gait	Primary and secondary neoplasm, toxins (alcohol), vit E deficiency, hypothyroid, hypoxia, hypoglycemia, paraneoplastic syndrome

Motor Neuron Disease

Amyotrophic Lateral Sclerosis (Lou Gehrig's Disease)

Definition

- progressive neurodegenerative disease that causes UMN and LMN symptoms and is ultimately fatal

Etiology

- idiopathic (most), genetic (5-10% familial, especially SOD1 mutation, other: C9orf72, TARDBP)

Pathology

- disorder of anterior horn cells of spinal cord, cranial nerve nuclei, and corticospinal tract

Epidemiology

- 5/100,000; incidence increases with age

Signs and Symptoms

- limb motor symptoms: segmental and asymmetrical UMN and LMN symptoms
- bulbar findings: dysarthria (flaccid or spastic), dysphagia, tongue atrophy and fasciculations, facial weakness and atrophy
- pseudobulbar affect, frontotemporal dementia (up to 10%)
- sparing of sensation, ocular muscles, and sphincters

Investigations

- EMG: chronic denervation and reinnervation, fasciculations
- NCS: to rule out peripheral neuropathy (i.e. multifocal motor neuropathy with conduction block)
- CT/MRI: to rule out cord disease/compression

Management

- riluzole (modestly slows disease progression)
- symptomatic relief
 - spasticity/cramping: baclofen, tizanidine, regular exercise, and physical therapy
 - sialorrhea: TCA (i.e. amitriptyline), sublingual atropine drops, parotid/submandibular botox (rare)
 - pseudobulbar affect: dextromethorphan/quinidine, TCA, SSRI
 - non-pharmacologic: high caloric diet, ventilatory support (especially BiPAP), early nutritional support (i.e. PEG tube), rehabilitation (PT, OT, SLP), psychosocial support

Prognosis

- median survival 3 yr; death due to respiratory failure

Red Flags Inconsistent with ALS

Sensory sx, predominant pain, bowel or bladder incontinence, cognitive impairment, ocular muscle weakness

The only interventions that have been shown to extend survival in ALS are riluzole and use of BiPAP

Denervation on EMG

Fibrillations, positive sharp waves, complex repetitive discharges; reinnervation – increased amplitude and duration of motor units

Other Motor Neuron Diseases

- degenerative
 - **progressive muscular atrophy (progressive bulbar palsy):** only LMN symptoms with asymmetric weakness, later onset than ALS, 5-10% of patients in ALS centers
 - **primary lateral sclerosis (progressive pseudobulbar palsy):** UMN symptoms, later onset, not fatal with variable disability; 5-10% of patients in ALS centers
 - **spinal muscular atrophy:** pediatric disease with symmetric LMN symptoms
- infectious
 - **post-polio syndrome:** residual asymmetric muscle weakness, atrophy
- acquired
 - **multifocal motor neuropathy:** conduction block on NCS, asymmetric LMN symptoms, ± anti-GM1 Ab, treatable with IVIg

Peripheral Neuropathies

Diagnostic Approach to Peripheral Neuropathies

1. Differentiate: motor vs. sensory vs. autonomic vs. mixed
2. Pattern of deficit: symmetry; focal vs. diffuse; upper vs. lower limb; cranial nerve involvement
3. Temporal pattern: acute vs. chronic; relapsing/remitting vs. constant vs. progressive
4. History: PMH, detailed FHx, exposures (e.g. insects, toxins, sexual, travel), systemic symptoms
5. Detailed peripheral neuro exam: LMN findings, differentiate between root and peripheral nerves, cranial nerves, respiratory status

Classification

- **monoradiculopathy**: dermatomal deficit due to single nerve root lesion
 - due to disc herniation or root compression causing radicular pain
 - little tactile anesthesia, as dermatomes overlap
- **polyradiculopathy**: multiple dermatome deficits due to multiple nerve root lesions
 - one type is cauda equina syndrome (lumbosacral roots)
- **plexopathy**: deficit matching distribution of a nerve plexus
 - **brachial plexopathy**
 - ♦ upper (C5-C7): LMN sx of shoulder and upper arm muscles (Erb's palsy)
 - ♦ lower (C8-T1): LMN sx and sensory sx of forearm and hand (Klumpke's palsy)
 - ♦ DDx: trauma, idiopathic neuritis, tumor infiltration, radiation, thoracic outlet syndrome (i.e. cervical rib)
 - **lumbosacral plexopathy** (rare, especially unilateral)
 - ♦ DDx: idiopathic neuritis, infarction (i.e. DM), compression
- **mononeuropathy**: single nerve deficit
 - **carpal tunnel syndrome** (most common): compression of median nerve at wrist
 - ♦ symptoms: wrist pain, paresthesia first 3 and ½ digits, ± radiation to elbow, worse at night
 - ♦ signs: Tinel's sign, Phalen's test, thenar muscle wasting, sensory deficit
 - ♦ EMG and NCS: slowing at wrist (both motor and sensory)
 - ♦ etiology: entrapment, pregnancy, DM, gammopathy, rheumatoid arthritis, thyroid disease
 - **Bell's palsy** (most common cranial neuropathy): see [Otolaryngology, OT23](#)
 - other less common mononeuropathies due to entrapment/compression: ulnar (compression at elbow), median (at pronator teres), radial (at spiral groove of humerus), obturator (from childbirth), peroneal (due to crossing legs or surgical positioning), posterior tibial (tarsal canal)
- **mononeuropathy multiplex**: deficit affecting multiple discrete nerves (asymmetric)
 - must rule out vasculitis or collagen vascular disease
- **polyneuropathy**: symmetrical distal stocking-glove pattern
 - symmetrical distal sensorimotor deficit affecting longest fibers first (stocking-glove distribution), hypotonia; progression of dysesthesia early and weakness later
 - etiology: DM (most common), renal disease, substances, toxins, genetics, SLE, HIV, leprosy, alcohol, B₁₂ deficiency, uremia
 - **chronic inflammatory demyelinating polyneuropathy (CIDP)**
 - ♦ chronic relapsing sensorimotor polyneuropathy with increase protein in CSF and demyelination (shown on EMG/NCS)
 - ♦ course is fluctuating, in contrast with the acute onset of GBS
 - ♦ treatment: first-line is prednisone; alternatives are plasmapheresis, IVIg, and azathioprine

Table 21. Differential Diagnosis of Symmetric Polyneuropathy

	Etiology	Mechanism	Course	Modalities	Investigations
Vascular	PAN	Ischemic	Chronic	S/M	see Rheumatology, RH19
	SLE	Ischemic	Chronic	S/M	see Rheumatology, RH11
	RA	Ischemic	Chronic	S/M	see Rheumatology, RH8
Infectious	HIV	Axonal/demyelination	Chronic	S/A	HIV serology
	Leprosy	Infiltrative	Chronic	S/A	Leprosy serology Nerve biopsy
	Lyme	Axonal/demyelination	Chronic	M	Lyme serology
Immune	GBS	Demyelination	Acute	M	LP (↑ protein; no ↑ cells)
	CIDP	Demyelination	Chronic	S/M	LP (↑ protein)
Hereditary	HMSN	Axonal/demyelination	Chronic	S/M	Genetic testing
Neoplastic	Paraneoplastic	Axonal/demyelination	Chronic	S/M	Paraneoplastic antibodies
	Myeloma	Axonal/demyelination	Chronic	S/M	SPEP Skeletal bone survey
	Lymphoma	Axonal	Chronic	M	SPEP Bone marrow biopsy
	Monoclonal gammopathy	Demyelination	Chronic	S/M	SPEP Bone marrow biopsy
Toxin	EtOH	Axonal	Sub-acute	S/M	GGT, MCV
	Heavy metals	Axonal	Sub-acute	S/M	Urine heavy metals
	Medications	Axonal	Sub-acute	S/M	Drug levels
Metabolic	DM	Ischemic/axonal	Chronic	S/A	Fasting glucose, HbA1c, 2 h OGTT
	Hypothyroidism	Axonal	Chronic	S/M	TSH, T ₃ , T ₄
	Renal failure	Axonal	Chronic	S/A	Electrolytes, Cr, BUN
Nutritional	B ₁₂ deficiency	Axonal	Sub-acute	S/M	Vitamin B ₁₂
Other	Porphyria	Axonal	Sub-acute	M	Urine porphyrins
	Amyloid	Axonal	Sub-acute	S	Nerve biopsy

A = autonomic; CIDP = chronic inflammatory demyelinating polyradiculoneuropathy; GGT = gamma-glutamyl transferase; HMSN = hereditary motor sensory neuropathy; M = motor; OGTT = oral glucose tolerance test; PAN = polyarteritis nodosa; RA = rheumatoid arthritis; S = sensory; SLE = systemic lupus erythematosus; SPEP = serum protein electrophoresis

Tinel's Sign: Tap lightly over the median nerve at the wrist; the patient's symptoms of carpal tunnel will be elicited in a positive test

Phalen's Test: Hold both wrists in forced flexion (with the dorsal surfaces of the hands pressed against each other) for 30-60 s; test is positive if symptoms of carpal tunnel are elicited

Diabetic Neuropathies

- Peripheral neuropathy: pain or loss of sensation in a glove and stocking distribution (hands and feet affected before arms and legs)
- Autonomic: anhidrosis, orthostatic hypotension, impotence, gastroparesis, bowel and bladder dysfunction
- Mononeuropathy multiplex: nerve infarct or compression
- Cranial neuropathy: CN III (pupil sparing) > IV > VI
- Lumbosacral plexopathy

DDx of Demyelinating Neuropathy
GBS, CIDP, paraproteinemia, diphtheria, amiodarone, Charcot-Marie-Tooth, storage diseases, pressure palsy predisposition, paraneoplastic

Axonal neuropathies have decreased amplitude on NCS; demyelinating neuropathies have decreased velocity on NCS

Ototoxic drugs (e.g. aminoglycosides) should not be given to diabetics

Sensory neuropathy of the feet prevent them from adequately compensating for loss of vestibular function

Evaluation of Distal Symmetric Polyneuropathy: Role of Laboratory and Genetic Testing
Neurology 2009;72:185-192

Screening Lab Tests: Blood glucose, serum B12 with metabolites, serum protein immunofixation electrophoresis.

Genetic Testing: Indicated for cryptogenic polyneuropathy exhibiting classic hereditary neuropathy phenotype. Screen for CMT1A duplication/deletion and Cx32 mutations.

Guillain-Barré Syndrome

- **definition:** acute rapidly evolving demyelinating inflammatory polyneuropathy that often starts in the distal lower limbs and ascends
- **etiology**
 - autoimmune attack and damage to peripheral nerve myelin
 - sometimes preceded by viral/bacterial infections
- **signs and symptoms**
 - sensory: distal and symmetric paresthesias, loss of proprioception and vibration sense, neuropathic pain
 - motor: weakness starting distally in legs, areflexia
 - autonomic: blood pressure dysregulation, arrhythmias, bladder dysfunction
- **investigations**
 - CSF: albuminocytological dissociation (high protein, normal WBC)
 - EMG/NCS: conduction block, differential or focal (motor > sensory) slowing, decreased F-wave, sural sparing
- **subtypes**
 1. acute inflammatory demyelinating polyneuropathy (AIDP)
 2. acute motor-sensory axonal neuropathy (AMSAN)
 3. acute motor axonal neuropathy (AMAN)
- **treatment**
 - IVIg or plasmapheresis, ± pain management, monitor vitals and vital capacity
- **prognosis**
 - peak of symptoms at 2-3 wk, resolution at 4-6 wk
 - 5% mortality (higher if require ICU); up to 15% have permanent deficits

GBS is a neurological emergency due to risk of imminent respiratory failure

The most common antecedent infection in GBS is *Campylobacter jejuni*

Miller-Fischer Variant of GBS – Triad

- Ophthalmoplegia
- Ataxia
- Areflexia

IVIg and plasmapheresis lead to more rapid improvement, less intensive care and less ventilation, but do not change mortality or relapse rate

Neuromuscular Junction Diseases

Clinical Approach to Disorders of the Neuromuscular Junction

Table 22. Common Disorders of the Neuromuscular Junction

	Myasthenia Gravis	Lambert-Eaton	Botulism
Ocular/Bulbar Paresis	+	–	++ (early)
Limb Weakness	+	+	+
Fatigability	+	+	+
Post-Exercise Enhancement	–	+	+
Reflexes	N	↓	↓
Anticholinergic Sx	–	+	++
Sensory Sx	–	–	–
Associated Conditions	Thymoma	Small cell carcinoma	GI S&S
Repetitive EMG Stimulation	Decremental response	Incremental response	↑ (rapid stimulation) ↓ (slow stimulation)

- Diseases of the neuromuscular junction typically feature prominent fatigability
- Fatigability can be tested by holding the arms out or by holding the gaze in the upward position (especially in MG)
- Muscle weakness due to fatigability will improve with rest or ice

Myasthenia Gravis

Etiology and Pathophysiology

- progressive autoimmune disorder due to anti-AChR antibodies, resulting in early saturation at the NMJ and inadequate muscle activation with increasing nerve stimulation
- 15% of patients with MG have associated thymic neoplasia, 85% have thymic hyperplasia

Epidemiology

- bimodal age of onset – 20s (mostly women) and 60s (mostly men)

Signs and Symptoms

- see Table 22
- fatigable, symmetric or asymmetric weakness without reflex changes, sensory changes, or coordination abnormalities
- ocular (diplopia/ptosis), bulbar (dysarthria/dysphagia), and/or proximal limb weakness
- symptoms may be exacerbated by infection, pregnancy, menses, and various drugs
- respiratory muscle weakness may lead to respiratory failure

© Minyan Wang 2012

Figure 22. Myasthenia gravis

Investigations

- edrophonium (Tensilon®) test
 - assess for improvement over 2 min following edrophonium injection
- EMG
 - repetitive stimulation → decremental response
 - single fiber electromyography shows increased jitter (80-100% sensitivity)
- spirometry – forced vital capacity may be used to monitor adequacy of respiratory effort over time
- anti-acetylcholine receptor antibody assay (70-80% sensitivity)
- MUSK antibody may be used if seronegative for AChR antibody
- CT/MRI to screen for thymoma/thymic hyperplasia

Treatment

- thymectomy
 - 85% of patients show improvement or remission
- symptomatic relief
 - acetylcholinesterase inhibitors (e.g. pyridostigmine)
 - does not affect primary pathologic process so rarely results in control of disease when used alone
- immunosuppression
 - steroids are mainstay of treatment (70-80% remission rate)
 - azathioprine, cyclophosphamide, and mycophenolate as adjuncts or as steroid sparing therapy
- short-term immunomodulation (for crises)
 - IVIg and plasmapheresis

Prognosis

- 30% eventual spontaneous remission
- with treatment, life expectancy is equal to that of a person without MG, but quality of life may vary

Tensilon® is a drug that inhibits acetylcholinesterase; it improves muscle function immediately in myasthenia gravis, but not in a cholinergic crisis

This test is infrequently used; when performed, a crash cart should be nearby as respiratory difficulty and/or bradycardia may occur

Lambert-Eaton Myasthenic Syndrome

Etiology and Pathophysiology

- autoimmune disorder due to antibodies against presynaptic voltage-gated calcium channels, causing decreased ACh release at the NMJ
- 50-66% are associated with small cell carcinoma of the lung

Signs and Symptoms

- see Table 22
- weakness of skeletal muscles without sensory or coordination abnormalities
- reflexes are diminished or absent, but increase after active muscle contraction
- bulbar and ocular muscles affected in 25% (vs. 90% in MG)
- prominent anticholinergic autonomic symptoms (dry mouth > impotence > constipation > blurred vision)

Investigations

- edrophonium test (see *Myasthenia Gravis*, N37) → no response
- EMG
 - rapid (>10 Hz) repetitive stimulation → incremental response
 - post-exercise facilitation → an incremental response with exercise
- screen for malignancy, especially small cell lung cancer

Treatment

- tumor removal
- acetylcholine modulation
 - increased acetylcholine release (3,4-diaminopyridine)
 - decreased acetylcholine degradation (pyridostigmine)
- immunomodulation
 - steroids, plasmapheresis, IVIg

LEMS

On exam there is initial post-exercise enhancement, but with prolonged effort muscles will fatigue

Figure 23. Lambert-Eaton myasthenic syndrome (LEMS)

Botulism

Etiology and Pathophysiology

- caused by a toxin produced by spores of *Clostridium botulinum* bacteria, which is found in soil and water throughout the world
- bacteria can enter the body through wounds or by ingesting improperly preserved foods
- infantile botulism is the most common form, and is usually from ingestion of honey or corn syrup

Signs and Symptoms

- occur 6-48 h after ingestion
- difficulty with convergence, ptosis, paralysis of extraocular muscles
- dilated, poorly reactive pupils

- other autonomic dysfunction: jaw weakness, dysarthria, dysphagia
- spreads to trunk and limbs
 - abdominal cramps with N/V
 - symmetric weakness with paralysis and absent/decreased deep tendon reflexes
 - anticholinergic symptoms: dry mouth, constipation, urinary retention
- rarely respiratory distress, potentially advancing to respiratory failure
 - pattern of paresis often starts with GI symptoms (constipation, early satiety), then paresis of extraocular muscles, then dysphagia, then limbs/respiratory involvement; all associated with dry mouth

Investigations

- blood test for toxin
- stool culture

Treatment

- botulinum anti-toxin – good prognosis with prompt treatment
- supportive therapy as required

Myopathies

Clinical Approach to Muscle Diseases

Table 23. Myopathies

	Etiology	Key Clinical Features	Key Investigations
Inflammatory	Polymyositis	Myalgias Pharyngeal involvement	↑ CK Biopsy: endomysial infiltrates; necrosis
	Dermatomyositis	Myalgias Characteristic rashes Can be paraneoplastic	↑ CK Biopsy: perifascicular atrophy
	Sarcoidosis	See Respirology, R14	ACE level Biopsy: granulomas
	Inclusion body myositis	Weak quadriceps and deep finger flexors	↑ CK Biopsy: inclusion bodies
Endocrine	Thyroid (↑ or ↓) Cushing's syndrome Parathyroid (↑ or ↓)	See Endocrinology, E20, E33	TSH, serum cortisol, calcium panel
Toxic	Medication	Medication or toxin history	Toxicology screen
	Critical illness myopathy	ICU patient Hx steroids and nondepolarizing paralyzing agents Failure to wean from ventilation	Biopsy: selective loss of thick myosin filaments
Infectious	Parasitic, bacterial, or viral	Myalgias Inflammatory myopathy	↑ myoglobin
Hereditary Dystrophy	Duchenne	Early onset (Duchenne and Becker)	Dystrophin analysis: absent
	Becker	Progressive proximal muscle weakness Calf pseudohypertrophy	Dystrophin analysis: abnormal
	Myotonic dystrophy	Distal myopathy Myotonia Genetic anticipation	Genetic testing
Hereditary Metabolic	McArdle's	Exercise-related myalgias, cramping, and myoglobinuria	↑ lactate ↑ serum/urinary myoglobin post-exercise
Hereditary Periodic Paralysis	"Channelopathy"	Episodic weakness Normal between attacks	Normal, ↑ or ↓ K ⁺
Hereditary Mitochondrial	MERRF	Myoclonus, generalized seizures, dementia, myopathy	Biopsy: ragged red fibers Increased lactate
	MELAS	Pediatric onset, stroke-like symptoms, episodic vomiting, dementia	
	Kearns Sayre	Progressive ophthalmoplegia, retinal pigment degeneration, cardiac conduction abnormalities	

MELAS = mitochondrial encephalomyopathy, lactic acidosis, and stroke-like episodes; MERRF = mitochondrial encephalomyopathy with ragged red fibers

Myopathies are characterized by prominent symmetric proximal weakness and absent sensory changes

Good Questions to Assess Proximal Weakness

- Legs: climbing stairs, stand from sit
- Arms: reach above head, wash hair

Common Medications that Cause Myopathy: steroids, statins, antiretrovirals, thyroxine, fibrates, cyclosporine, ipecac

Common Drugs that Cause Myopathy: ethanol, cocaine, heroin

Polymyositis/Dermatomyositis

- see [Rheumatology](#), RH15

Myotonic Dystrophy

Etiology and Pathophysiology

- unstable trinucleotide (CTG) repeat in DMK gene (protein kinase) at 19q13.3, number of repeats correlates with severity of symptoms
- autosomal dominant

Epidemiology

- most common adult muscular dystrophy
- prevalence 3-5/100,000

Signs and Symptoms

- appearance: ptosis, bifacial weakness, frontal baldness (including women), triangular face giving a drooping/dull appearance
- physical exam
 - distribution of weakness: distal weaker than proximal (in contrast to other myopathies), steppage gait
 - myotonia: delayed relaxation of muscles after exertion (elicit by tapping on thenar muscles with hammer)
 - cardiac: 90% have conduction defects (1° heart block; atrial arrhythmias)
 - respiratory: hypoventilation 2° to muscle weakness
 - ocular: subcapsular cataracts, retinal degeneration, decreased intraocular pressure
 - other: DM, infertility, testicular atrophy
- EMG: subclinical myotonia – long runs with declining frequency and amplitude

Treatment and Prognosis

- no cure, progressive, death usually around 50 yr
- management of myotonia: phenytoin

Duchenne and Becker Muscular Dystrophy

- see [Pediatrics](#), P45

Pain Syndromes

Approach to Pain Syndromes

Definitions

- **nociceptive pain:** pain arising from normal activation of peripheral nociceptors
- **neuropathic pain:** pain arising from direct injury to neural tissue, bypassing nociceptive pathways
- **spontaneous pain:** unprovoked burning, shooting, or lancinating pain
- **paresthesiae:** spontaneous abnormal nonpainful sensations (e.g. tingling)
- **dysesthesiae:** evoked pain with inappropriate quality or excessive quantity
- **allodynia:** a dysesthetic response to a non-noxious stimulus
- **hyperalgesia:** an exaggerated pain response to a noxious stimulus

Non-Pharmacological Management

- physical (PT, acupuncture, chiropractic manipulation, massage)
- psychoeducational (CBT, family therapy, education, psychotherapy)

Medical Pain Control

- combination multi-modal therapy is important
- primary analgesics: acetaminophen, NSAIDs (often used for soft tissue injuries, strains, sprains, headaches, and arthritis), opiates
- adjuvants: antidepressants (TCAs, SSRIs), anticonvulsants (gabapentin, carbamazepine, pregabalin), baclofen, sympatholytics (phenoxymethamine), α 2-adrenergic agonists (clonidine)

- Pinprick sensation mediated by A δ fibers
- Pain due to tissue damage is mediated by C fibers

WHO Pain Ladder

- **Mild Pain:** Non-opioid (acetaminophen and/or NSAID) \pm adjuvant
- **Moderate Pain:** Opioid for mild to moderate pain (codeine/oxycodone) + non-opioid \pm adjuvant
- **Severe Pain:** Opioid for moderate to severe pain (morphine/hydromorphone) + non-opioid \pm adjuvant

Axonal regeneration is directed by intact nerve sheaths; if the nerve sheath is damaged, axons grow without direction, become tangled and form a neuroma, which can result in ectopic electrical impulses and neuropathic pain

Surgical Pain Control

- peripheral ablation: nerve blocks, facet joint denervation
- direct delivery: implantable morphine pump
- central ablation: stereotactic thalamotomy, spinal tractotomy, or dorsal root entry lesion
- DBS or dorsal column stimulation

Neuropathic Pain

Definition

- pain resulting from a disturbance of the central or peripheral nervous system

Symptoms and Signs

- hyperalgesia/allodynia
- subjectively described as burning, heat/cold, pricking, electric shock, perception of swelling, numbness (i.e. stocking/sock distribution)
- can be spontaneous or stimulus evoked
- distribution may not fall along classical neuro-anatomical lines
- associated issues: sleep difficulty, anxiety/stress/mood alteration

Causes of Neuropathic Pain

- **sympathetic**
 - complex regional pain syndrome
- **central**: abnormal CNS activity
 - phantom limb, post spinal cord injury, post stroke, MS
- **non-sympathetic**: damage to peripheral nerves
 - **systemic disease**: DM, thyroid disease, renal disease, rheumatoid arthritis
 - **nutritional/toxicity**: alcoholism, pernicious anemia, chemotherapy
 - **infectious**: post-herpetic, HIV
 - **trauma/compression**: nerve entrapment, trigeminal neuralgia, post surgical, nerve injury, cervical/lumbar radiculopathy, plexopathy

Treatment

- identify/treat underlying cause
- **pharmacotherapy**
 - anticonvulsant: pregabalin, gabapentin, sodium valproate
 - antidepressant: amitriptyline, venlafaxine, duloxetine
 - opioids: dextromethorphan, morphine sulphate, tramadol, oxycodone
 - other: capsaicin and isosorbide dinitrate spray
- **common non-pharmacologic therapies**
 - percutaneous electrical stimulation (moderate evidence)
 - neuropsychiatry: CBT, psychotherapy
 - rehabilitation: physiotherapy
- **surgical therapies**: dorsal column neurostimulator, DBS (thalamus)

Tic Douloureux (Trigeminal Neuralgia)

Clinical Features

- recurrent episodes of sudden onset, excruciating unilateral paroxysmal shooting “electric” pain in trigeminal root territory ($V3 > V2 > V1$)
- may have normal sensory exam
- pain lasts seconds/minutes over days/weeks; may remit for weeks/months
- triggers: touching face, eating, talking, cold wind, shaving, applying make-up

Etiology

- **classic TN**: idiopathic
- **secondary TN**: compression by tortuous blood vessel (superior cerebellar artery), cerebellopontine angle tumor (5%), MS (5%)

Epidemiology

- F > M; usually middle-aged and elderly

Diagnosis

- clinical diagnosis
- investigate for secondary causes, which are more likely if bilateral TN or associated sensory loss
 - MRI to rule out structural lesion, MS, or vascular lesion

Treatment

- first line: carbamazepine or oxcarbazepine
- second line: baclofen or lamotrigine
- narcotics not generally recommended
- if medical treatment fails: Gasserian ganglion percutaneous technique, gamma knife, invasive percutaneous denervation (radiofrequency/glycerol), percutaneous balloon microcompression, microvascular decompression

Postherpetic Neuralgia

Clinical Features

- pain persisting in the region of a cutaneous outbreak of herpes zoster
- constant deep ache or burning, intermittent spontaneous lancinating/jabbing pain, allodynia
- distribution: thoracic, trigeminal, cervical > lumbar > sacral
- associated impaired sleep, decreased appetite, decreased libido

Etiology and Pathogenesis

- destruction of the sensory ganglion neurons (e.g. dorsal root, trigeminal, or geniculate ganglia) secondary to reactivation of herpes zoster infection

Epidemiology

- incidence in those with zoster increases with age (2% in <60 yr, 19% in >70 yr)
- risk factors: older age, greater acute pain, greater rash severity

Prevention

- varicella zoster vaccine in childhood reduces incidence of varicella zoster
- herpes zoster vaccine (Zostavax®) reduces incidences of shingles, PHN, and other herpetic sequel (currently recommended by the Centers for Disease Control and Prevention [CDC] for those >60 yr old)

Treatment

- medical: TCA (i.e. amitriptyline), anti-convulsants (i.e. pregabalin, gabapentin), analgesia (i.e. opiates, lidocaine patch), intrathecal methylprednisolone, topical capsaicin
 - early treatment of acute herpes zoster with antivirals (acyclovir; longer-acting famciclovir and valacyclovir more effective)
 - treatment of herpes zoster with corticosteroids DOES NOT decrease PHN
- surgical: spinal tractotomy, dorsal root entry zone lesion, DBS of thalamus

Herpes Zoster of Trigeminal Nerve
typically involves V1 (ophthalmic division)

Hutchinson's Sign: tip of nose involvement predicts corneal involvement

Painful Diabetic Neuropathy

Approach

- determine if pain is neuropathic or vascular
- more likely neuropathic if
 - feet > calves
 - sharp/tingling pain
 - pain present at rest and improves with walking

Treatment

- Level A: pregabalin
- Level B: venlafaxine, duloxetine, amitriptyline, gabapentin, valproate, rarely opioids, capsaicin

Complex Regional Pain Syndromes

Clinical Features

- presence of an initiating noxious event (MI, stroke)
- continuing pain, allodynia, or hyperalgesia with pain disproportionate to inciting event
- evidence during the course of symptoms of edema, changes in skin blood flow or abnormal vasomotor activity
- absence of conditions that would otherwise account for degree of pain and dysfunction
- other features can include edema, osteoporosis, hyperhidrosis, hair loss, fascial thickening

Classification

- **CRPS type I (reflex sympathetic dystrophy):** minor injuries of limb or lesions in remote body areas precede onset of symptoms
- **CRPS type II (causalgia):** injury of peripheral nerves precedes the onset of symptoms

Investigations

- trial of differential neural blockade may be helpful in diagnosis
- autonomic testing (evidence of sympathetic dysfunction)
- bone scan, plain radiography, MRI

Prevention

- early mobilization after injury/infarction

Treatment

- goal of treatment: to facilitate function
- conservative treatment: education, support groups, PT/OT, smoking cessation
- medical: topical capsaicin, TCA, NSAID, tender point injections with corticosteroid/lidocaine, gabapentin/pregabalin/lamotrigine, calcitonin or bisphosphonates, oral corticosteroids
- surgical: paravertebral sympathetic ganglion blockade
- refer to pain management clinic

Headache

- see [Emergency Medicine](#), ER24 and [Family Medicine](#), FM34

Clinical Approach

- **history**
 - pain characteristics: onset, frequency, duration, intensity, location, radiation, other specific features (e.g. worse in AM, worse with bending/cough/Valsalva)
 - associated symptoms: visual changes, change in mental status, N/V, fever, meningismus, photophobia, phonophobia, TMJ popping/clicking, jaw claudication, neurological symptoms
 - precipitating/alleviating factors (triggering factors, analgesics), medications (especially nitrates, CCBs, NSAIDs, anticoagulants), PMH, FHx
 - red flags (possible indications for CT scan/further investigation): new-onset headache (especially if age <5 or >50), quality worse/different than previous headaches, sudden and severe ('thunderclap'), immunocompromised, fever, focal neurological deficits, trauma
- **physical exam**
 - vitals (including BP and temp), Kernig's/Brudzinski's, MSK examination of head and neck
 - HEENT: fundi (papilledema, retinal hemorrhages), red eye, temporal artery tenderness, sinus palpation, TMJ
 - full neurological exam (including LOC, orientation, pupils (symmetry), and focal neurological deficits)
 - **red flags:** papilledema, altered LOC, fever, meningismus, focal neurological deficits, signs of head trauma

Classification

- **primary**
 - tension, migraine, cluster, other autonomic cephalgias
- **secondary**
 - cervical OA, TMJ syndrome, SAH, ICH, stroke, venous sinus thrombosis, meningitis/encephalitis, trauma, increased ICP (space-occupying lesion, malignant HTN or pseudotumor cerebri), temporal arteritis, sinusitis, acute-angle closure glaucoma, pre-eclampsia, post LP, drugs/toxins (e.g. nitroglycerin use and analgesia withdrawal); all can be associated with serious morbidity or mortality

Table 24. Headaches – Selected Primary Types

	Tension-Type	Migraine	Cluster
Prevalence	70%	~10-20%	<1%
Age of Onset	15-40	10-30	20-40
Sex Bias	F>M	F>M	M>F
Family History	None	+++	+
Location	Bilateral frontal Nuchal-occipital	Unilateral > bilateral Fronto-temporal	Retro-orbital
Duration	Minutes – days	Hours – days	10 min-2 h
Onset/Course	Gradual; worse in PM	Gradual; worse in PM	Daily attacks for weeks to months; more common early AM or late PM
Quality	Band-like; constant	Throbbing	Constant, aching, stabbing

If CT is negative but clinically there is suspicion of SAH or meningitis, perform a LP

Headache DDx

ER VISIT

Eye (acute angle closure glaucoma, sinusitis)
 Recurrent/Chronic (migraine, tension, cluster, TMJ disease, cervical OA)
 Vascular (SAH, ICH, temporal arteritis)
 Infectious (meningitis, encephalitis)
 Systemic (anemia, anoxia, CO, pre-eclampsia)
 ICP (mass/abscess, HTN encephalopathy, pseudotumor cerebri)
 Trauma (concussion, SDH, EDH)

Table 24. Headaches – Selected Primary Types (continued)

	Tension-Type	Migraine	Cluster
Severity	Mild-moderate	Moderate-severe	Severe (wakes from sleep)
Triggers/Provoking	Depression Anxiety Noise Hunger Sleep deprivation	Noise/light Caffeine/alcohol Hunger Stress Sleep deprivation	Light EtOH
Palliating	Rest	Rest	Walking around
Associated Sx	No vomiting No photophobia	N/V Photo/phonophobia Aura	Red watery eye Nasal congestion or rhinorrhea Unilateral Horner's
Management	Non-pharmacological • Psychological counseling • Physical modalities (e.g. heat, massage) Pharmacological • Simple analgesics • Tricyclic antidepressants	Acute Rx • ASA • NSAIDs • Triptans • Ergotamine Prophylaxis 1. TCA 2. Anticonvulsants 3. Propranolol	Acute Rx • O ₂ • Sumatriptan (nasal or injection) Prophylaxis • Verapamil • Lithium • Methysergide • Prednisolone

Table 25. Prophylactic Management of Migraine Headaches

Class	Drug	Evidence	Contraindications	Side Effects
Beta-blockers	Propanolol	A	Asthma, DM (mask hypoglycemia)	Fatigue
	Timolol	A		Depression
	Metoprolol	B	CHF	Light-headedness
TCA	Amitriptyline	A	Heart disease, glaucoma	Sedation
	Nortriptyline	C	*Avoid in elderly	Dry mouth Weight gain Light-headedness
CCBs	Flunarizine	A	Depression, obesity	Weight gain, depression, PD (rare)
	Verapamil	B	Heart disease	Weight gain (10-20 lb), constipation
AED	Valproate	A	Liver, renal, pancreatic diseases	Weight gain, tremor, alopecia, teratogenic: neural tube defect
	Topiramate + folic acid supplement	A	Renal disease	Paresthesia, weight loss, cognitive: memory loss, difficulty concentrating, renal stone (rare)

Table 26. Headaches – Selected Serious but Rare Secondary Types

	Meningeal Irritation	Increased ICP	Temporal Arteritis
Age of Onset	Any age	Any age	> 60 yr
Location	Generalized	Any location	Temporal
Onset/Course	Meningitis: hours-days SAH: thunderclap onset	Gradual; worse in AM	Variable
Severity	Severe	Severe	Variable; can be severe
Provoking	Head movement	Lying down Valsalva Head low Exertion	Jaw claudication
Associated Sx	Neck stiffness Photophobia Focal deficits (e.g. CN palsies)	N/V Focal neuro symptoms Decreased level of consciousness	Polymyalgia rheumatica Visual loss
Physical Signs	Kernig's sign Brudzinski's sign Meningismus	Focal neuro symptoms Papilledema	Temporal artery changes: • Firm, nodular, incompressible • Tender
Management	CT/MRI with gadolinium LP, antibiotics for bacterial meningitis	CT/MRI and treatment to reduce pressure See Neurosurgery , NS6	Prednisone See Rheumatology , RH20
Etiology	Meningitis, SAH	Tumor, ITH, malignant HTN	Vasculitis (GCA)

ITH = idiopathic intracranial hypertension

**The Rational Clinical Examination: Does this Patient with Headache have a Migraine or Need Neuroimaging?**

JAMA 2006;296:1274-1283

Does this patient with headache have a migraine?

The most useful panel of questions for diagnosing migraine is summarized by the POUNDING mnemonic:

P – Pulsatile quality**O** – duration of 4-72 h**U** – Unilateral location**N** – Nausea or vomiting**D** – Disabling intensity

The LR for definite or possible migraine diagnosis varies with the number of features present: with ≥4, 3 and ≥2 features, the LRs are 24 (1.5-388), 3.5 (1.3-9.2), and 0.41 (0.32-0.52), respectively.

Does this patient with headache need neuroimaging?

In patients with new or changed headache the prevalence of significant intracranial pathology is 32% (24-42%), and in those presenting with thunderclap headache the prevalence is 43% (20-68%).

Several individual clinical features were found to be predictive of significant intracranial pathology:

Symptom	OR
Cluster-type headache	10.7 (2.2-52)
Abnormal neurological exam	5.3 (2.4-12)
Undefined-type headache	3.8 (2.0-7.1)
(non-tension/migraine/cluster-type)	
Headache with aura	3.2 (1.6-6.6)
Aggravated by exertion/Valsalva	2.3 (1.4-3.8)
Headache with vomiting	1.8 (1.2-2.6)

**Acute and Preventive Pharmacologic Treatment of Cluster Headache**

Neurology 2010;75:463-473

Study: Meta-analysis of prospective, double-blind, RCTs of pharmacologic agents for prevention or treatment of CH.**Results:** 27 trials were included. Sumatriptan 6 mg SC, zolmitriptan nasal spray 5-10 mg, and 100% oxygen 6-12 L/min received Level A recommendation for acute treatment. For prevention, Level B recommendations were given for intranasal civamide 100 µg daily and suboccipital steroid injections.**Conclusion:** Sumatriptan, zolmitriptan, and mid flow oxygen are effective acute treatments for CH.**Anticonvulsants in Migraine Prophylaxis**

Cochrane DB Syst Rev 2009;3:CD003226

Study: Meta-analysis of prospective, controlled trials of anticonvulsant drugs in migraine headache prophylaxis.**Results:** Twenty-three studies (n=2,927) were included. Anticonvulsants reduce migraine frequency by 1.3 attacks per 28 d compared to placebo and double the number of patients for whom migraine frequency is reduced by 50% (RR=2.25, NNT=3.9). Valproate and topiramate are better than placebo, while clonazepam, acetazolamide, lamotrigine, and vigabatrin are not. Clinically important adverse events were associated with valproate and topiramate with NNH 7.0-18.8 and 2.4-31.2, respectively.**Conclusion:** Anti-convulsants are effective in reducing migraine frequency and reasonably well-tolerated. Valproate and topiramate are the two most studied but further studies of head-to-head comparisons between agents is needed.

Migraine Headaches

Definition (Common Migraine)

- ≥ 5 attacks fulfilling each of the following criteria
 - 4-72 h duration
 - 2 of the following: unilateral, pulsating, moderate-severe (interferes with daily activity), aggravated by routine physical activity
 - 1 of the following: N/V, photophobia/phonophobia/osmophobia

Epidemiology

- 18% females, 6% males; frequency decreases with age (especially at menopause)

Etiology and Pathophysiology

- theories of migraine etiology
 - depolarizing wave of "cortical spreading depression" across the cerebral cortex that may cause an aura (e.g. visual symptoms due to wave through occipital cortex) and also activate trigeminal nerve afferent fibers
 - possible association with vasoconstriction/dilation
- significant genetic contribution
- **triggers:** stress, sleep excess/deprivation, drugs (estrogen, nitroglycerin), hormonal changes, caffeine withdrawal, chocolate, tyramines (e.g. red wine), nitrites (e.g. processed meats)

Signs and Symptoms

- stages of uncomplicated migraine
 - i. prodrome (hours to days before headache onset)
 - ii. aura
 - iii. headache (see Table 24 for description of typical headache)
 - iv. postdrome
- aura
 - fully reversible symptom of focal cerebral dysfunction lasting <60 min
 - examples: visual disturbance (fortification spectra – zigzags; scintillating scotomata – spots), unilateral paresthesia and numbness or weakness, aphasia
- prodrome/postdrome: appetite change, autonomic symptoms, altered mood, psychomotor agitation/retardation
- classification of migraines
 - common migraine: no aura
 - classic migraine: with aura (headache follows reversible aura within 60 min)
 - complicated migraine: with severe/persistent sensorimotor deficits
 - ♦ examples
 - basilar-type migraine (occipital headache with diplopia, vertigo, ataxia, and altered level of consciousness)
 - hemiplegic/hemisensory migraine
 - ophthalmoplegic migraine
 - acephalgic migraine (i.e. migraine equivalent): aura without headache

Management

- avoid triggers
- mild to moderate migraine
 - 1st line: NSAIDs (ibuprofen, naproxen)
- moderate to severe migraine
 - triptans (most effective), ergots (dihydroergotamine, DHE)
- migraine prophylaxis: anticonvulsants (divalproex, topiramate, gabapentin), TCA (amitriptyline, nortriptyline), propranolol, calcium channel blocker (verapamil)

The oral contraceptive pill is contraindicated with complicated migraine due to risk of stroke

Migraine auras can mimic other causes of transient neurological deficits (e.g. TIAs and seizures)

"Menstrual Migraine" Subtype
Migraine headache that is associated with the onset of menstruation – usually 2 d before to 3 d after the onset of menstrual bleeding

If patient presents to ED with severe migraine and N/V – consider treating with IV anti-emetics (chlorpromazine, prochlorperazine)

Pharmacological Treatments for Acute Migraine
Pain 2002;97:247-257

Study: Meta-analysis of 54 double-blind, placebo-controlled RCTs of pharmacologic treatment of acute migraine of moderate to severe intensity (21,022 patients in total).

Data Extraction: Number of patients, dosing regimes, details of study design, and timing or type of rescue medication. Outcomes include headache relief at 1 and 2 h, freedom from pain at 2 h, sustained relief for 24 h, and adverse effects within 24 h.

Main Results: Data were available for 9 oral medications, 2 intranasal medications, and subcutaneous sumatriptan. For H/A relief at 2 h, all interventions were effective except Cafergot[®], with NNTs ranging from 2.0 for sumatriptan 6 mg SC to 5.4 for naratriptan 2.5 mg. The lowest NNT for oral medication was 2.6 for eletriptan 80 mg. For patients pain free at 2 h, the lowest NNT was 2.1 for sumatriptan 6 mg SC, with the lowest NNT for oral medication being 3.1 for rizatriptan 10 mg. For sustained relief over 24 h NNT ranged from 2.8 for eletriptan 80 mg to 8.3 for rizatriptan 5 mg. Side effects could not be analyzed systematically. There were no drug-to-drug comparisons.

Conclusion: Overall, most treatments were effective. Subcutaneous sumatriptan and oral triptans were most effective.

A prophylactic agent is recommended only if migraine attacks are severe enough to cause impairment of a patient's quality of life or if a patient has >3 migraines/mo that have not responded adequately to treatment

Neurology 2000;55:754-763

Sleep Disorders

Overview of Sleep

Definition

- newborn: 18 h sleep (50% REM), adolescents: 10 h, adults: 7-9 h but most get insufficient amounts
- many elderly have reduced sleep as a consequence of underlying sleep disorders

Sleep Architecture

- **polysomnogram (PSG) measures:** EEG, eye movements (electro-oculogram – EOG), EMG, respiratory effort, oxygenation, ECG

Table 27. Sleep Stage Characteristics

	EEG	EOG	Muscle Tone	Other Characteristics
Waking State	Low voltage high frequency, dominant α rhythm (8-13 Hz)	Rapid, blinking	High	
Stage N1 (~5%)	<50% α activity replaced with θ (4-7 Hz), vertex waves	Slow, roving eye movements	High, but gradually dropping	Marker for very light quality sleep or sleep disruption
Stage N2 (~50%)	K complexes high voltage negative and positive discharges with spindles (11-16 Hz)	Still	High	
Stage N3 (previously 3 and 4)/Slow Wave/Delta Sleep (~20%)	Slow wave activity – high voltage (> 75 μ V), low frequency (<2 Hz)	Still	Low	Homeostatic sleep Reduced BP, HR, cardiac output, RR Growth hormone release
Rapid Eye Movement (REM) Sleep (~25%)	Mixed frequency, low voltage, sawtooth waves	Rapid eye movements	Very low	Irregular respiration Arrhythmias, heart rate variation Classical dreaming state

**Elements of Sleep History**

- Initiation of sleep
 - Events prior to bed
 - Lights
 - Latency (estimated)
 - Restless legs
 - Hallucinations
- Maintaining sleep
 - Number of wakeups/night
 - Sleep walking/talking
 - Snoring/gasping
 - Dreams/nightmares
- Consequences of sleep
 - Restorative
 - Morning headache
 - Falling asleep in inappropriate setting

Disturbances of Alertness and Sleep

**Coma**

- see [Neurosurgery, NS34](#)

Insomnia• **definition/criteria**

- difficulty initiating or maintaining sleep, or waking up earlier than desired (leading to sleep that is chronically non-restorative/poor quality) despite adequate opportunity and circumstances for sleep

• **types**

- sleep state misperception, psychophysiologic insomnia (learned sleep-preventing associations – i.e. clock watching), fatal familial insomnia (rare prion protein mutation causing autonomic dysfunction), idiopathic (lifelong difficulty)
- **secondary causes**
 - ♦ psychiatric disorders (80% of psychiatric patients): anxiety and depression (see [Psychiatry, PS10, PS7](#))
 - ♦ neurologic disorders: neurodegenerative disease, epilepsy, neuromuscular disorders, many others
 - ♦ sleep disorders: restless legs syndrome (sleep initiation difficulties), sleep apnea (sleep maintenance difficulties)
 - ♦ medical conditions: pregnancy, cardiorespiratory (COPD/HF), GERD, pain (arthritis, fibromyalgia, cancer)
 - ♦ drugs/toxins: caffeine, alcohol, stimulants, antidepressants, glucocorticoids, sedative withdrawal

• **treatment**

- sleep log, sleep hygiene, stimulus control, sleep restriction, relaxation response, CBT

Sleep Apnea• **definition**

- disorder of breathing in sleep associated with sleep disruption and consequent excessive somnolence (or drowsiness)

• **epidemiology**

- >2-4% of the population
- increasing obesity
- significant morbidity: HTN, stroke, heart failure, sleepiness, mortality (accidents)

• **types**

- obstructive sleep apnea: see [Respirology, R31](#)
- central sleep apnea: no effort to breathe over 10 s
- mixed apnea: starts as central, but eventually becomes obstructive

• **etiology of central apnea:** heart failure, opiates, brainstem pathology, myotonic dystrophy• **diagnosis:** apnea hypopnea index (AHI) or respiratory disturbance index (RDI) should be <5 in the normal state• **treatment:** conservative measures, dental devices, CPAP (common), surgery (rare), ensure driving safety**Drug Effects on Wakefulness and Sleep**

- Antihistamines associated with increased sleepiness
- Stimulants increase arousal
- Caffeine (an adenosine antagonist) increases wakefulness
- Benzodiazepines reduce slow wave sleep
- Antidepressants (TCA/MAOI/SSRI) reduce REM, prolong REM latency
- Alcohol may hasten sleep onset but associated with increased arousals

Avoid sleep medications (especially in elderly patients) due to increased risk of falls, pseudodepression, and memory loss

Restless Leg Syndrome and Periodic Limb Movement in Sleep

- **definition**
 - urge to move with accompanied uncomfortable sensations that begin or worsen with rest, are partially or totally relieved with movement, and are worse in evening/night
 - RLS refers to sensation
 - PLMS refers to the manifestation
- **epidemiology:** 10% North Americans, 90% of RLS have PLMS, 50% of patients with PLMS have RLS
- **etiology:** central (spasticity), peripheral nervous system (radiculopathy, neuropathy), pregnancy, iron deficiency, alcohol use
- **treatment**
 - underlying contributors (iron and B₁₂ supplementation), dopaminergic agonists (first line), clonazepam (causes tachyphylaxis), opioids (only exceptional circumstances)
 - NOT recommended: Sinemet®, causes augmentation

Narcolepsy

- **definition/clinical features:** excessive daytime sleepiness (all narcolepsy), cataplexy = loss of muscle tone with emotional stimuli (pathognomonic), sleep paralysis (unable to move upon waking), hypnagogic hallucinations (vivid dreams or hallucinations at sleep onset)
- **epidemiology:** prevalence 1:2,000, onset in adolescence/early adulthood; life-long disorder
- **etiology:** presumed autoimmune attack on orexin/hypocretin system, post head injury, MS, hypothalamic tumors; rarely familial
- **diagnosis:** based on clinical history + multiple sleep latency test findings of short sleep latency <8 min and REM within 15 min of sleep onset on 2/4 naps
- **treatment**
 - sleep hygiene and scheduled brief naps, restricted driving
 - alerting agents modafinil (non-amphetamine stimulant), stimulant (i.e. methylphenidate)
 - anti-cataplectic: TCAs, SSRIs, sodium oxybate

Parasomnias

- **definition/clinical features:** unusual behaviors in sleep with clinical features appropriate to stage of sleep
- **etiology:** in elderly, REM sleep behavior disorder may be associated with PD; in children, slow wave sleep arousals (sleep walking) may be associated with sleep disordered breathing
- **diagnosis:** clinical history in children, polysomnography in adults to exclude nocturnal seizures
- **treatment:** behavioral management (safety, adequate sleep); clonazepam for REM sleep behavior, tonsillectomy if appropriate in children

Circadian Rhythm

- **definition/clinical features:** abnormalities based on time of day rather than sleep (i.e. jet lag, shift work)
- **diagnosis:** clinical history

CNS Infections

- see [Infectious Diseases](#), ID19

Spinal Cord Syndromes

- see [Neurosurgery](#), NS27

Stroke

Terminology

- **stroke:** sudden onset of neurological deficits of a vascular basis with infarction of CNS tissue
 - infarction is permanent tissue injury (confirmed by neuroimaging)
- **TIA:** sudden onset of neurological deficits of a vascular basis without infarction (i.e. resolution)

Pathophysiology

- two major types: ischemic (~80%) and hemorrhagic (~20%)

1. Ischemic

- **arterial thrombosis:** thrombus formation in artery (local/*in situ*)
 - ♦ **large vessel:** stenosis or occlusion of the internal carotid artery, vertebral, or intracranial arteries
 - mechanisms
 - insufficient blood flow beyond lesion (hemodynamic stroke)
 - underlying processes: atherosclerosis (most common cause), dissection, and vasculitis
 - ♦ **small vessel/lacunar**
 - mechanism: chronic HTN and DM cause vessel wall thickening and decreased luminal diameter
 - affects mainly small penetrating arteries (primarily basal ganglia, internal capsule, and thalamus)
- **cardioembolic:** blockage of cerebral arterial blood flow due to particles originating from a cardiac source
 - ♦ atrial fibrillation (most common), rheumatic valve disease, prosthetic heart valves, recent MI, fibrous and infectious endocarditis
- **systemic hypoperfusion** (global cerebral ischemia)
 - ♦ inadequate blood flow to brain, usually secondary to cardiac pump failure (e.g. cardiac arrest, arrhythmia, or MI)
 - ♦ primarily affects watershed areas (between the major cerebral arterial territories)

2. Hemorrhagic

- **intracerebral hemorrhage**
 - ♦ mechanisms
 - hypertensive (most common): rupture of small microaneurysms (Charcot-Bouchard aneurysms) causing intraparenchymal hemorrhage
 - most common sites: putamen, thalamus, cerebellum, and pons
 - other: trauma, amyloid angiopathy (associated with lobar hemorrhage), vascular malformations, vasculitis, drug use (cocaine or amphetamines)
- **subarachnoid hemorrhage** see [Neurosurgery](#), NS18

Stroke Syndromes According to Vascular Territory

- **ACA:** contralateral leg paresis and sensory loss
- **MCA:** proximal occlusion involves
 1. contralateral weakness and sensory loss of face and arm
 2. cortical sensory loss
 3. may have contralateral homonymous hemianopia or quadrantanopia
 4. if left hemisphere: aphasia
 5. if right hemisphere: neglect
 6. eye deviation towards the side of the lesion and away from the weak side
- **PCA**
 1. contralateral hemianopia or quadrantanopia
 2. midbrain findings: CN III and IV palsy/pupillary changes, hemiparesis
 3. thalamic findings: sensory loss, amnesia, decreased level of consciousness
 4. if bilateral: cortical blindness or prosopagnosia
- **basilar artery** (locked-in syndrome)
 1. quadriparesis
 2. dysarthria
 3. impaired eye movements
- **PICA (lateral medullary or Wallenberg syndrome):** ipsilateral ataxia, ipsilateral Horner's, ipsilateral facial sensory loss, contralateral limb impairment of pain and temperature sensation, nystagmus, vertigo, N/V, dysphagia, dysarthria, hiccups
- **medial medullary infarct** (anterior spinal artery, which can be associated with anterior cord infarct): contralateral hemiparesis (facial sparing), contralateral impaired proprioception and vibration sensation, ipsilateral tongue weakness
- **lacunar infarcts (deep hemispheric white matter)**
 - pure motor hemiparesis (posterior limb of internal capsule): contralateral arm, leg, and face
 - pure sensory loss (thalamic): hemisensory loss
 - ataxic hemiparesis: ipsilateral ataxia and leg paresis
 - dysarthria-clumsy hand syndrome: dysarthria, facial weakness, dysphagia, mild hand weakness and clumsiness

HTN Encephalopathy

Acute severe HTN (typically dBp >130 or sBP >200) can cause hypertensive encephalopathy – abnormal fundoscopic exam (papilledema, hemorrhages, exudates, cotton-wool spots), focal neurologic symptoms, N/V, visual disturbances and change in LOC

Consider transfer of acute stroke patient to a designated stroke center for neuroprotective or thrombolytic therapy if the patient is seen in first few hours

Early seizure activity occurs in 5-25% of patients after ICH

Cerebral venous sinus thrombosis should be considered in the differential diagnosis of stroke and headache. It is an uncommon cause of either, but is associated with high morbidity and mortality. Patients often present with headache alone, but can also have seizures, focal neurological deficits, or cranial nerve palsies. This is diagnosed with MRV or CTV. Treatment is typically anticoagulation with heparin initially, then transition to warfarin

20-40% of patients with ischemic stroke may develop hemorrhagic transformation within 1 wk after the initial infarction

Figure 24. Vascular territories

Blood work should only delay treatment if: patient is on anticoagulants, low platelet count suspected, abnormal electrolytes suspected, or any bleeding abnormality suspected

Suspect an alternate diagnosis if: fever, decreased LOC, fluctuating symptoms, gradual onset, no focal neurological symptoms, and/or positive symptoms

Infarcted area of brain tissue can often appear normal on CT during the first several hours after the onset of stroke

Aspect Score: 10-point quantitative score to assess ischemic changes on CT scan

- 10/10 is normal and <4/10 signifies high risk of bleed with rtPA
- Subtract 1 point for each of following structures if abnormal within the ischemic hemisphere: caudate, lentiform, insula, internal capsule, MCA 1, 2, 3, 4, 5, 6 regions

If rtPA given at stroke onset, delay acute antiplatelet/anticoagulation treatment by 24 h

The **National Institute of Health Stroke Scale (NIHSS)** is a standardized clinical examination that determines the severity of an acute stroke; it can also be used to monitor response to treatment over time

The scale uses 11 items that evaluate:

- Level of consciousness
- Visual system
- Motor system
- Sensory system
- Language abilities

Scoring (x/42):
 0 = no stroke
 1-4 = mild stroke
 5-15 = moderate stroke
 15-20 = moderate to severe stroke
 21-42 = severe stroke
 rtPA should be considered if score 6 or greater

Absolute Contraindications to rtPA

Hx: improving sx, minor sx, seizure at stroke onset, recent major surgery (within 14 d) or trauma, recent GI or urinary hemorrhage (within 21 d), recent LP or arterial puncture at noncompressible site, PMHx ICH, sx of SAH/pericarditis/MI, pregnancy

P/E: sBP ≥ 185 , dBP ≥ 110 , aggressive treatment to decrease BP, uncontrolled serum glucose, thrombocytopenia

Ix: hemorrhage or mass on CT, high INR or aPTT

Assessment and Treatment of Ischemic Stroke

General Assessment

- ABCs, full vital sign monitoring, check glucose, urgent CODE STROKE if <4.5 h from symptom onset (for possible thrombolysis)
- history
 - onset: time when last known to be awake and symptom free
 - mimics to rule out: seizure/post-ictal, hypoglycemia, migraine, conversion disorder
- investigations
 - non-contrast CT head (STAT): to rule out hemorrhage and assess extent of infarct
 - ECG: to rule out atrial fibrillation (cardioembolic cause)
 - CBC, electrolytes, creatinine, PTT/INR, blood glucose
- imaging (i.e. CT) signs of stroke
 - loss of cortical white-gray differentiation
 - sulcal effacement (i.e. mass effect decreases visualization of sulci)
 - hypodensity of parenchyma
 - insular ribbon sign
 - hyperdense MCA sign

ACUTE STROKE MANAGEMENT

1. Thrombolysis

- rtPA (recombinant tissue plasminogen activator)
- given **within 4.5 h** of acute ischemic stroke onset provided there are clinical indications and no contraindications to use
- indications: based on NIH Stroke Scale
- contraindications: see sidebar

2. Anti-Platelet Therapy

- give at presentation of TIA or stroke if rtPA not received
- antiplatelet agents
 - ASA: recommended dose 81 mg chewed
 - if patient intolerant to ASA, use other antiplatelet agent (i.e. clopidogrel)

3. Acute Anti-Coagulant Therapy

- for patients with TIA or stroke and atrial fibrillation if rtPA not received
 - recommend IV heparin (or ensuring INR between 2-3 if already anticoagulated on warfarin)

Other Acute Management Issues

- avoid hyperglycemia which can increase the infarct size
- lower temperature if febrile
- prevent complications
 - NPO if dysphagia (to be reassessed by SLP)
 - DVT prophylaxis if bed-bound
 - initiate rehabilitation early

Blood Pressure Control

- do NOT lower the blood pressure unless the HTN is severe
 - antihypertensive therapy is withheld for at least 5 d after thromboembolic stroke unless sBP >220 mmHg or dBP >120 mmHg, or in the setting of acute MI, renal failure, aortic dissection
- acutely elevated BP is necessary to maintain brain perfusion to the ischemic penumbra
- most patients with an acute cerebral infarct are initially hypertensive and their BP will fall spontaneously within 1-2 d
- IV labetalol first-line if needed

Etiological Diagnosis

- further investigations
 - additional neuroimaging (MRI)
 - vascular imaging: CTA/MRA/carotid dopplers
 - cardiac tests: ECHO, holter monitoring
 - correct etiological diagnosis is critical for appropriate secondary prevention strategies

Primary and Secondary Prevention of Ischemic Stroke

Anti-Platelet Therapy

- primary prevention
 - current evidence has not firmly established a protective role for antiplatelet agents for low-risk patients without a prior stroke/TIA
- secondary prevention
 - ASA is the initial antiplatelet of choice for stroke prevention
 - other agents (generally reserved for those who suffer cerebrovascular symptoms while on ASA or if unable to tolerate ASA)
 - ♦ Aggrenox® (ESPRIT trial)
 - ♦ clopidogrel (CAPRIE trial)

Carotid Stenosis

- primary prevention (asymptomatic)
 - carotid endarterectomy is controversial: if stenosis >60%, risk of stroke is 2% per yr; carotid endarterectomy reduces the risk of stroke by 1% per yr (but 5% risk of complications)
- secondary prevention (previous stroke/TIA in carotid territory)
 - carotid endarterectomy clearly benefits those with symptomatic severe stenosis (70-99%), and is less beneficial for those with symptomatic moderate stenosis (50-69%) (NASCET trial), see [Vascular Surgery, VS10](#)
- according to the CREST trial, endarterectomy and carotid stenting have similar benefits in a composite endpoint of reduction of stroke, MI, and death; however, in the periprocedural period, stenting results in a higher rate of stroke, while endarterectomy results in a higher rate of MI

Atrial Fibrillation

- primary and secondary prevention with anticoagulation
 - risk stratification using CHADS² score
 - ♦ 0 (very low risk): antiplatelet
 - ♦ 1 (low risk): anticoagulant or antiplatelet – patient specific decision
 - ♦ >2 (mod-high risk): anticoagulant
 - anticoagulation therapy
 - ♦ warfarin (titrate to INR 2-3)
 - ♦ dabigatran (110 or 150 mg bid) may be an option to warfarin, but should be used cautiously due to lack of a reversal agent should bleeding occur

Dabigatran vs. Warfarin in Patients with Atrial Fibrillation (The RE-LY Trial)

NEJM 2011;365:883-891

Study Type: Prospective, multicenter RCT. Double-blinded between different doses of dabigatran, unblinded comparison between dabigatran and warfarin.

Population: 18,113 patients with atrial fibrillation and a risk of stroke followed over 2 yr.

Primary Outcome: Stroke or systemic embolism.

Results: Rates of outcome were 1.69% per yr in warfarin group and 1.53% per yr in dabigatran group (RR 0.91, p<0.001 for non-inferiority). Minor bleeds were slightly increased in warfarin group (3.36% vs. 2.71% with dabigatran; p=0.003). Risk of hemorrhagic stroke was lower with dabigatran (0.12% vs. 0.38 %; p<0.001).

Conclusions: Dabigatran at 110 mg PO bid was associated with similar rates of stroke and systemic embolism and lower rates of major hemorrhage compared to warfarin in patients with atrial fibrillation. The 150 mg PO bid dose of dabigatran was more effective at stroke prevention and had a similar bleeding risk to warfarin.

High-Dose Atorvastatin after Stroke or Transient Ischemic Attack (SPARCL Trial)

NEJM 2006;355:549-559

Method: Multicenter double-blind RCT.

Population: 4,731 patients with stroke or TIA within 1-6 mo before study entry, LDL 100-190 mg/dL, no coronary heart disease.

Intervention: 80 mg atorvastatin PO OD or placebo.

Outcome: First non-fatal or fatal stroke over 5 yr.

Results: Patients receiving atorvastatin had a lower rate of stroke (ARI 2.2%, hazard ratio 0.84; p=0.03). There was a five yr absolute reduction in risk of 3.5% (p=0.002). There was no significant change in mortality rate, but a small significant increase in the risk of hemorrhagic stroke.

Conclusions: High-dose atorvastatin decreases overall incidence of strokes and cardiovascular events in patients with a history of recent stroke or TIA.

Carotid endarterectomy needs to be done within 2 wk of the ischemic event for the most benefit

CHADS²

Stroke risk stratification for patients with atrial fibrillation

CHF (1 point)

HTN sBP >160 mmHg/treated HTN

(1 point)

Age >75 yr (1 point)

DM (1 point)

Prior Stroke or TIA (2 points)

Hypertension

- primary prevention
 - targets: BP <140/90 (or <130/80 for diabetics or renal disease)
 - ramipril 10 mg PO OD is effective in patients at high risk for cardiovascular disease (HOPE trial)
 - ♦ ACEI reduce the risk of stroke beyond their antihypertensive effect
- secondary prevention
 - ACEI and thiazide diuretics are recommended in patients with previous stroke/TIA (PROGRESS trial)

Hypercholesterolemia

- primary prevention
 - statins reduce the risk of stroke in patients with CAD or at high risk for cardiovascular events, even with normal cholesterol (CARE trial)
- secondary prevention
 - statins reduce risk of subsequent stroke – best evidence is for high dose atorvastatin (SPARCL trial) but lower doses may be more appropriate if patient cannot tolerate high dose

Diabetes

- ideal management: HbA1c <7%, fasting blood glucose between 4 and 7

Smoking

- primary prevention
 - smoking increases risk of stroke in a dose-dependent manner
- secondary prevention
 - after smoking cessation, the risk of stroke decreases to baseline within 2-5 yr

Physical Activity

- regular physical activity is an important lifestyle measure in stroke prevention and its beneficial effect has a dose-related response in terms of intensity and duration of activity

Stroke Rehabilitation

- individualized based on severity and nature of impairment; may require inpatient program and continuation through home care or outpatient services
- multidisciplinary approach includes dysphagia assessment and dietary modifications, communication rehabilitation, cognitive and psychological assessments including screen for depression, therapeutic exercise programs, assessment of ambulation and evaluation of need for assistive devices, splints or braces, vocational rehabilitation

ABCD² Score

To predict/identify individuals at high risk of stroke following TIA

Age: 1 point for age >60 yr

Blood pressure (at presentation):

1 point for HTN

(>140/90 mmHg at initial evaluation)

Clinical features: 2 points for unilateral weakness, 1 point for speech disturbance without weakness

Duration of symptoms: 1 point for 10-59 min, 2 points for >60 min

DM: 1 point

Stroke risk: 0-3: low risk, 4-5: moderate risk, 6-7: high risk

ACE Inhibitor in Stroke Prevention – HOPE Trial

NEJM 2000;342:145-153

Study: Randomized, blinded, placebo-controlled trial. Mean follow-up 5 yr.

Patients: 9,297 patients 55 yr of age or older (mean age 66 yr, 73% men) who had evidence of vascular disease or DM plus one other cardiovascular risk factor and who were not known to have a low ejection fraction or heart failure.

Intervention: Ramipril 10 mg daily orally vs. matching placebo.

Main Outcomes: Stroke, MI, or death from cardiovascular causes.

Results:

Outcome	RRR (95%CI)	NNT (CI)
Stroke	32% (16-44)	67 (43-145)
MI, stroke, or CV mortality	22% (14-30)	26 (19-43)
All-cause mortality	16% (5-25)	56 (32-195)

Treatment with ramipril reduced the risk of stroke (3.4% vs. 4.9%; RR 0.68; p<0.001).

Conclusions: In adults at high risk for cardiovascular events, ramipril reduced the risk of stroke, as well as other vascular events and overall mortality.

Cerebral Hemorrhage

Investigations

- general investigations, see *Assessment and Treatment of Ischemic Stroke*, N49
- further investigations
 - LP (if suspect subarachnoid hemorrhage despite negative CT)
 - may require cerebral angiogram if suspect aneurysm or AVM
 - if typical location for hypertensive hemorrhage, repeat CT head in 4-6 wk after hemorrhage has resolved to rule out an underlying lesion

Management

- medical
 - anti-hypertensives: no conclusive BP target ranges for managing ICH exist; 2010 AHA/ASA guidelines suggest that reducing sBP to as low as 140 mmHg with IV anti-hypertensives is safe and appropriate management (target sBP 140-160)
 - ICP lowering medical management (if necessary): see [Neurosurgery](#), NS7
- surgical: see [Neurosurgery](#), NS19

Multiple Sclerosis

Definition

- a chronic inflammatory disease of the CNS characterized by relapsing remitting, or progressive neurologic symptoms due to inflammation, demyelination, and axonal degeneration

Clinical Patterns of MS

- relapsing remitting (RRMS) 85%, primary progressive (PPMS) 10%, progressive relapsing (PRMS) 5%, secondary progressive (SPMS)
- most RRMS goes on to become SPMS

MS Variants

- Devic's = neuromyelitis optica (NMO):** severe optic neuritis and extensive transverse myelitis extending >3 vertebral segments (NMO antibody positive)
- clinically isolated syndrome (CIS):** single MS-like episode, which may progress to MS
- tumefactive MS:** solitary lesion >2 cm mimicking neoplasms on MRI
- fulminant MS (Marburg):** rapidly progressive and fatal MS associated with severe axonal damage, inflammation, and necrosis
- acute disseminated encephalomyelitis (ADEM):** monophasic demyelinating disorder with multifocal neurologic symptoms seen mainly in children often following infection or vaccination

Etiology

- genetic
 - polygenetic: the HLA-DRB1 gene has been demonstrated to be a genetically susceptible area
 - 30% concordance for monozygotic twins, 2-4% risk in offspring of affected mother or father
- environmental
 - MS is more common in regions with less sun exposure and lower stores of vitamin D (Europe, Canada, US, New Zealand, SE Australia)
 - MS has also been linked to certain viruses (EBV is associated with MS)

Epidemiology

- onset 17-35 yr; F:M = 3:1
- PPMS occurs in an older population with F=M

Diagnosis

- dissemination in space and in time as based on the revised McDonald criteria
 - dissemination in time: 2 or more attacks, new gadolinium enhancing lesion 3 mo later, or new T2 lesions >1 mo after first attack
 - dissemination in space: clinical evidence of 2 or more lesions; or three of (1 gadolinium enhancing or 9 T2 lesions), (1 infratentorial lesion), (1 juxtacortical lesion), (3 periventricular lesions)

Clinical Features

- symptoms include numbness, visual disturbance (optic neuritis), weakness, spasticity, diplopia (e.g. INO), impaired gait, vertigo, bladder dysfunction
- Lhermitte's sign:** flexion of neck causes electric shock sensation down back into limbs indicating cervical cord lesion
- Uhthoff's phenomenon:** worsening of symptoms (classically optic neuritis) in heat
- SPMS: classically weakness of legs in pyramidal distribution paired with cerebellar findings of arms (i.e. intention tremor)
- symptoms not commonly found in MS: visual field defects, aphasia, apraxia, progressive hemiparesis
- relapse: acute/subacute onset of clinical dysfunction that peaks from days to weeks, followed by remission with variable symptom resolution (symptoms must last at least 24 h)
- in RRMS, average 0.4 to 0.6 relapses/yr, but higher disease activity in first yr of disease

Investigations

- MRI:** demyelinating plaques appear as hyperintense lesions on T2 weighted MRI, with active lesions showing enhancement with gadolinium
 - typical locations: periventricular, corpus callosum, cerebellar peduncles, brainstem, juxtacortical region, and dorsolateral spinal cord
 - Dawson's fingers: periventricular lesions extending into corpus callosum
 - cranial MRI is more sensitive than spinal MRI
- CSF:** oligoclonal bands in 90%, increased IgG concentration
- evoked potentials (visual/auditory/somatosensory):** delayed but well-preserved wave forms

Figure 25. Clinical patterns of MS

Chronic Cerebrospinal Venous Insufficiency (CCSVI)

A theory proposed in 2008 describing abnormal venous blood flow in patients with MS. While some RCTs are still underway, recent studies have largely discredited this highly controversial theory. That is, studies indicate no connection between CCSVI and MS

Most symptoms in MS are due to cord, brainstem, and optic nerve lesions

The Expanded Disability Status Scale (EDSS) is used as a measure of disability progression and is scored from 0 to 10 based on the neurologic exam and ambulation

Recombinant Interferon Beta or Glatiramer Acetate for Delaying Conversion of the First Demyelinating Event to Multiple Sclerosis

Cochrane DB Syst Rev 2008;2:CD005278

Study: Meta-analysis of RCTs of clinically isolated syndrome (CIS) patients treated with immunomodulatory drugs.

Primary Outcomes: Proportion of patients converting to clinically definite MS and adverse effects.

Results: Three trials (n=1,160) tested the efficacy of interferon (IFN-β) and no trial tested glatiramer acetate (GA). A pooled odds ratio (OR) of 0.53 (95% CI 0.40-0.71, p<0.0001) for patients on IFN vs. placebo at 1 yr. Two year follow-up odds ratio was 0.52 (95% CI 0.38-0.70, p<0.0001). There was no significant increase in adverse events for those on IFN-β.

Conclusions: IFN-β treatment can delay progression to clinically definite MS in patients with CIS over 2 yr.

Treatment

- **acute treatment:** methylprednisolone 1,000 mg IV daily x 3-7 d (no taper required); if poor response to corticosteroids may consider plasma exchange
- **disease modifying therapy**
 - goals: decrease relapse rate, decrease progression of disability, slow accumulation of MRI lesions
 - first line: interferon- β (injection: Betaseron®, Avonex®, Rebif®), glatiramer acetate (injection: Copaxone®)
 - second line: natalizumab (Tysabri®) (monthly IV infusion)
 - new oral agents: fingolimod (available) and cladribine (not yet available)
 - ♦ indications for fingolimod: newly diagnosed patients with active RRMS who prefer oral treatment despite increased risks or those intolerant of first line therapies
 - CIS: early treatment with interferons may delay potential second attack
 - RRMS: DMT reduces rate of relapse by about 30%
 - PPMS/SPMS: no proven efficacy of DMTs
- **symptomatic treatment**
 - spasticity: baclofen, tizanidine, dantrolene, benzodiazepine, botulinum toxin
 - bladder dysfunction: oxybutynin
 - pain: TCA, carbamazepine, gabapentin
 - fatigue: amantidine, modafinil, methylphenidate
 - depression: antidepressant, lithium
 - constipation: high fiber intake, stool softener, laxatives
 - sexual dysfunction: sildenafil, tadalafil, vardenafil
- **education and counseling:** MS Society, support groups, psychosocial issues

Prognosis

- good prognostic indicators: female, young, RRMS, presenting with optic neuritis, low burden of disease on initial MRI, low rate of relapse early in disease
- PPMS: poor prognosis, higher rates of disability, poor response to therapy

**Oral Fingolimod or Intramuscular Interferon for Relapsing Multiple Sclerosis***NEJM* 2010;362:402-415**Method:** Multicenter double-blind RCT.**Population:** 1,292 patients with relapsing-remitting MS and at least one relapse.**Intervention:** Oral fingolimod at 0.5-1.25 mg or 30 μ g IM interferon- β .**Outcomes:** Annualized relapse rate over 1 yr; lesions on T2-weighted MRI.**Results:** Annualized relapse rate was lower in both groups receiving fingolimod compared to interferon: 0.20 (95% CI 0.16-0.26) with 1.25 mg fingolimod, 0.16 (95% CI 0.12-0.21) with 0.5 mg fingolimod, 0.33 with interferon (95% CI 0.26-0.42; $p < 0.001$).

MRI findings also showed greater reduction of lesions in fingolimod-treated patients. Progression of disability was unchanged. Side effects included severe infections like HSV encephalitis, disseminated VZV, other HSV infections, and skin cancer.

Conclusions: Oral fingolimod is superior to interferon- β injections in reducing relapses and MRI lesion load in patients with MS.

Common Medications

Table 28. Common Medications – Major Issues

Indications	Mechanism of Action/Class	Generic Name	Trade Name	Dosing	Contraindications	Side Effects
Parkinson's Disease	Dopamine precursor	levodopa + carbidopa	Sinemet®	Carbidopa 25 mg/levodopa 100 mg PO tid Maximum 200 mg carbidopa and 2,000 mg levodopa per day	Narrow-angle glaucoma, use of MAO inhibitor in last 14 d, history of melanoma or undiagnosed skin lesions	Nausea, hypotension, hallucinations, dyskinesias in last 14 d, history of melanoma or undiagnosed skin lesions
	Dopamine agonist	bromocriptine	Parlodel®	1.25 mg PO bid, increase by 2.5 mg/d q2-4wk, up to 10-30 mg PO tid	Concomitant use of potent inhibitors of CYP3A4, uncontrolled HTN, ischemic heart disease, peripheral vascular disease; caution with renal or hepatic disease	Hypotension, N/V, dizziness, constipation, diarrhea, abdominal cramps, H/A, nasal congestion, drowsiness, hallucinations
	MAO B inhibitor	selegiline	Eldepryl®	5 mg PO bid	Concomitant use of meperidine or tricyclic antidepressants	H/A, insomnia, dizziness, nausea, dry mouth, hallucinations, confusion, orthostatic hypotension, increased akinesia, risk of hypertensive crisis with tyramine-containing foods
Myasthenia Gravis	Acetylcholinesterase inhibitor	pyridostigmine	Mestinon®	600 mg/d PO divided in 5-6 doses Range 60-1,500 mg/d	GI or GU obstruction	N/V, diarrhea, abdominal cramps, increased peristalsis, increased salivation, increased bronchial secretions, miosis, diaphoresis, muscle cramps, fasciculations, muscle weakness
Acute Migraine	Triptan (selective 5-hydroxytryptamine receptor agonist)	sumatriptan	Imitrex®	25-100 mg PO prn, maximum 200 mg/d	Hemiplegic/basilar migraine, ischemic heart disease, cerebrovascular disease, uncontrolled HTN, use of ergotamine/5-HT ₁ agonist in past 24 h, use of MAO inhibitor in last 14 d, severe hepatic disease	Vertigo, chest pain, flushing, sensation of heat, hypertensive crisis, peripheral vascular disease, coronary artery vasospasm, cardiac arrest, N/V, H/A, hyposalivation, fatigue
	Ergot (5-HT _{1D} receptor agonist)	dihydroergotamine	Migranal®	Nasal spray 0.5 mg/spray, maximum 4 sprays/d	Hemiplegic/basilar migraine, high-dose ASA therapy, uncontrolled HTN, ischemic heart disease, peripheral vascular disease, severe hepatic or renal dysfunction, use of triptans in last 24 h, use of MAO inhibitors in last 14 d	Coronary artery vasospasm, transient myocardial ischemia, myocardial infarction, ventricular tachycardia, ventricular fibrillation; may cause significant rebound H/A
Migraine Prophylaxis	Anticonvulsant	topiramate	Topamax®	25 mg OD PO (in evening); may increase weekly by 25 mg/d to a max 50 mg bid		Sedation, mood disturbance, cognitive dysfunction, anorexia, nausea, diarrhea, paresthesias, metabolic acidosis, glaucoma, SJS/TEN
	β-blocker	propranolol	Inderal®	80 mg/d divided every 6-8 h; increase by 20-40 mg/dose every 3-4 wk to max 160-240 mg/d in divided doses q6-8h	Uncompensated CHF, severe bradycardia or heart block, severe COPD or asthma	Fatigue, cognitive dysfunction, disturbed sleep, rashes, dyspepsia, dry eyes, heart failure, bronchospasm, risk of acute tachycardia and HTN if withdrawal
Epilepsy	Anticonvulsant for partial ± 2° generalization, generalized tonic-clonic	carbamazepine	Tegretol® (Carbatrol)	Start at 100-200 mg PO OD-tid increase by 200 mg/d up to 800-1,200 mg/d	History of bone marrow depression, hepatic disease, hypersensitivity to the drug, use of MAO inhibitor in last 14 d	Drowsiness, H/A, unsteadiness, dizziness, N/V, skin rash, agranulocytosis/aplastic anemia (rare)
	Anticonvulsant for partial, tonic-clonic, status epilepticus	phenytoin	Dilantin®	100 mg PO tid, maintenance dose up to 200 mg PO tid SE: 10-15 mg/kg IV loading dose then maintenance doses of 100 mg PO or IV q6-8h	Hypersensitivity, pregnancy, breastfeeding; caution with P-450 interactions	Hypotension, SJS/TEN, SLE-type symptoms, gingival hypertrophy, peripheral neuropathy, H/A, blood dyscrasias, nystagmus, N/V, constipation, sedation, teratogenic
	Anticonvulsant for partial or generalized, absence seizures	valproic acid	Depacon® Depakene® Depakote®	10-15 mg/kg/d PO in divided doses, increase incrementally until therapeutic dose to max of 60 mg/kg/d	Hypersensitivity, hepatic disease, urea cycle disorders	Hepatic failure, H/A, somnolence, alopecia, N/V, diarrhea, tremor, diplopia, thrombocytopenia, hypothermia, pancreatitis, encephalopathy
	Anticonvulsant for absence seizures	ethosuximide	Zarontin®	500 mg/d PO, increase by 250 mg every 4-7 d to max 1.5 g/d in divided doses	Hypersensitivity (succinimides)	CNS depression, blood dyscrasias, SLE, SJS, GI symptoms

Table 28. Common Medications – Major Issues (continued)

Indications	Mechanism of Action/Class	Generic Name	Trade Name	Dosing	Contraindications	Side Effects
Stroke Prevention in AF	Anticoagulant (direct thrombin inhibitor)	dabigatran	Pradax®	110 mg PO bid or 150 mg PO bid	CrCl <30 mL/min, significant hemostatic impairment or CNS lesions within 6 mo with high risk of bleeding	Dyspepsia, gastritis, bleeding
Mild to Moderate AD or DLB	Cholinesterase Inhibitor	donepezil	Aricept®	5 mg PO OD, may increase to 10 mg PO OD after 4-6 wk	Hypersensitivity to donepezil or to piperidine derivatives	Diarrhea, N/V, insomnia, muscle cramps, fatigue, anorexia, HTN, syncope, AV block
Multiple Sclerosis	MS Disease Modifying Therapy	interferon-β-1b interferon-β-1a SC interferon-β-1a IM	Betaseron® Rebif® Avonex®	0.25 mg (8 MU) SC every other day 44 µg SC 3 times/wk 30 µg IM once weekly	Pregnancy, hypersensitivity to natural or recombinant interferon-β	Injection site reactions, injection site necrosis, flu-like symptoms (fever, chills, myalgia; tend to decrease over time)
	MS Disease Modifying Therapy	glatiramer acetate	Copaxone®	20 mg SC OD	Hypersensitivity to glatiramer or mannitol	Injection site reactions, nausea, transient chest pain, vasodilation
	MS Disease Modifying Therapy	natalizumab	Tysabri®	300 mg IV given over 1 h, every 4 wk	Hypersensitivity to natalizumab, progressive multifocal leukoencephalopathy (PML)	Rash, nausea, arthralgia, H/A, infections, rare risk of PML and melanoma
	MS Disease Modifying Therapy	fingolimod	Gilenya®	0.5 mg PO OD	Not available	Diarrhea, transaminitis, H/A, bradyarrhythmia, lymphocytopenia
Spasticity (i.e. MS)	Muscle Relaxant – Antispastic	baclofen	Lioresal® (injectable)	5 mg PO tid, increase by 15 mg/d q3d to max dose 80 mg/d in three divided doses	Hypersensitivity to baclofen	Transient drowsiness, daytime sedation, dizziness, weakness, fatigue, convulsions, constipation, nausea

Landmark Neurology Trials

Trial	Reference	Results
CREST	<i>NEJM</i> 2010;363:11-23	Carotid stenting and endarterectomy had similar benefits in reduction of stroke, MI, and death in carotid stenosis, but in the periprocedural period, stenting had a higher rate of stroke, while endarterectomy had a higher rate of MI
ECASS 3	<i>NEJM</i> 2008;359:1317-29	rtPA improved clinical outcomes when administered within 3 to 4.5 h of acute ischemic stroke
Interferon- β Multiple Sclerosis Study Group Trial	<i>Neurology</i> 1993;43:655-61	Interferon- β -1b reduces relapse rate and severity of relapses in RRMS
NASCET	<i>NEJM</i> 1991;7:445-53	Patients with symptomatic carotid stenosis of 70-99% benefited more from carotid endarterectomy than best medical therapy
NINDS rtPA	<i>NEJM</i> 1995;333:1581-7	rtPA reduces mortality and long-term disability when administered within 3 h of acute stroke
PROFESS	<i>NEJM</i> 2008;359:1238-51	ASA + dipyridamole and clopidogrel showed similar benefits in secondary stroke prevention
RELY	<i>NEJM</i> 2009;361:1139	Dabigatran superior to warfarin for stroke prevention in patients with atrial fibrillation
SPARCL	<i>NEJM</i> 2006;355:549-59	The observed benefit of statins in cardiovascular disease is also extended to patients with a recent stroke or TIA

Differential Diagnoses of Common Neurosurgical Presentations

Intracranial Mass Lesions	Disorders of the Spine	Peripheral Nerve Lesions
Tumor Metastasis Astrocytoma Meningioma Vestibular schwannoma (acoustic neuroma) Pituitary adenoma Primary CNS lymphoma	Extradural Degenerative: disc herniation, canal stenosis, spondylolisthesis/spondylolysis Infection/inflammation: osteomyelitis, discitis Ligamentous: ossification of posterior longitudinal ligament (OPLL) Trauma: mechanical compression/instability, hematoma Tumors (55% of all spinal tumors): lymphoma, metastases (lymphoma, lung, breast, prostate), neurofibroma	Neuropathies Traumatic Entrapments Iatrogenic Inflammatory Tumors
Pus/inflammation Cerebral abscess, extradural abscess, subdural empyema Encephalitis (see Infectious Diseases, ID20) Tumefactive MS	Intradural extramedullary Vascular: dural arteriovenous fistula, subdural hematoma (especially if on anticoagulants) Tumors (40% of all spinal tumors): meningioma, schwannoma, neurofibroma	
Blood Extradural (epidural) hematoma Subdural hematoma Ischemic stroke Hemorrhage: SAH, ICH, IVH	Intradural intramedullary Tumors (5% of all spinal tumors): astrocytomas and ependymomas most common; also hemangioblastomas and dermoids Syringomyelia (common causes: trauma, congenital, idiopathic) Infectious/inflammatory: TB, sarcoid, transverse myelitis Vascular: AVM, ischemia	
Cyst Arachnoid cyst Dermoid cyst Epidermoid cyst Colloid cyst (3rd ventricle)		

INTRACRANIAL PATHOLOGY

Intracranial Pressure Dynamics

Table 1. Approach to Intracranial Pathology

Issue	Time Frame	Features
Vascular	Sudden	No H/A = occlusive H/A = hemorrhagic
Metabolic	Hours to days	Affects entire CNS
Infectious	Days to weeks	Often a source of infection on history
Tumor	Months	Increased ICP: Initially → H/A <ul style="list-style-type: none"> • Constant • Progressive • Severe • Worse in morning As ICP increases: <ul style="list-style-type: none"> • Blurry vision • Projectile vomiting Severely raised ICP: <ul style="list-style-type: none"> • Cushing's reflex <ul style="list-style-type: none"> • Bradycardia • HTN • Respiratory changes

Table 2. Consequences of Common Brain Lesions

Location of Lesion	Consequence
Frontal lobe	1. Disinhibition 2. Concentration deficits 3. Orientation deficits 4. Judgment deficits 5. ± Primitive reflex re-emergence 6. ± Contralateral motor deficits if motor cortex involved
Broca's area (inferior frontal gyrus of dominant hemisphere)	1. Non-fluent aphasia 2. Repetition impaired 3. Comprehension relatively spared
Wernicke's area (superior temporal gyrus of dominant hemisphere)	1. Fluent aphasia 2. Repetition impaired 3. Comprehension markedly impaired
Occipital lobe	Contralateral visual field deficits
Right parietal lobe	Hemispatial neglect syndrome <ul style="list-style-type: none"> • Contralateral agnosia
Basal ganglia	1. Rest tremor 2. Chorea 3. Athetosis
Subthalamic nucleus	Contralateral hemiballismus
Mammillary bodies (bilateral)	Wernicke-Korsakoff syndrome <ol style="list-style-type: none"> 1. Wernicke <ul style="list-style-type: none"> • Confusion • Ophthalmoplegia • Ataxia 2. Korsakoff <ul style="list-style-type: none"> • Anterograde amnesia • Confabulation • Personality changes
Hippocampus	Anterograde amnesia
Reticular activating system (midbrain)	Reduced levels of arousal and wakefulness
Paramedian pontine reticular formation	Gaze deviation away from side of lesion
Frontal eye fields	Gaze deviation toward side of lesion
Cerebellar hemisphere	1. Intention tremor 2. Limb ataxia 3. Fall towards side of lesion
Cerebellar vermis	1. Truncal ataxia 2. Dysarthria

ICP/Volume Relationship

- adult skull is rigid with a constant intracranial volume
- contents (CSF, blood, brain) are incompressible
- increase in one constituent/space-occupying lesion = 1) increase in ICP, 2) require redistribution of CSF, blood, or brain
- however, ICP does not rise initially due to compensatory mechanisms
 - **immediate:** displacement of CSF to lumbar theca, displacement of blood from venous sinuses
 - **delayed:** displacement of ECF or ICF, displacement of brain tissue into compartments under less pressure (herniation)
- once compensation is exhausted, ICP rises exponentially

Figure 4. ICP-volume curve

Adapted from: Lindsay KW, et al. Neurology and neurosurgery illustrated. © 2004. With permission from Elsevier

$$\text{CBF} = \text{CPP} / \text{CVR}$$

$$\text{CPP} = \text{MAP} - \text{ICP}$$

Cerebral Blood Flow

- brain receives about 15% of cardiac output (~750 mL/min)
- CBF depends on cerebral perfusion pressure (CPP) and cerebral vascular resistance (CVR)
- normal CPP >50 mmHg in adults
- cerebral autoregulation maintains constant CBF by compensating for changes in CPP, unless:
 - high ICP such that CPP <60 mmHg
 - MAP >150 mmHg or MAP <50 mmHg
 - brain injury: e.g. SAH, severe trauma

ICP Measurement

- normal ICP <15 mmHg (8-18 cmH₂O) for adult, 3-7 mmHg (4-9.5 cmH₂O) for child; varies with patient position
 - moderate elevation: increase in mean pressure >20 mmHg
 - severe elevation: increase in mean pressure >40 mmHg
- waveform: comprised of respiratory and cardiac pulsations (Traube-Hering waves); the amplitude increases with ICP
 - β -waves: coarse, variably increased amplitude, frequency 1/2-2/min, often related to respiration
 - plateau waves: elevation of ICP over 50 mmHg lasting 5-20 min, precursor of further deterioration

Acute Monitoring

- lumbar puncture (LP)
- intraventricular catheter/ventriculostomy/external ventricular drain (EVD) ("gold standard", also permits therapeutic drainage of CSF to decrease ICP)

Chronic Monitoring

- fiberoptic monitor (intraventricular, intraparenchymal, subdural), subarachnoid bolt (Richmond screw), and epidural monitor

Elevated ICP

Etiology

- intracranial space-occupying lesion
 - tumor
 - pus
 - blood (trauma → hematoma [most common], subarachnoid hemorrhage)
 - depressed skull fracture
 - foreign body
- increased intracranial blood volume
 - vasodilatation (increased pCO₂/decreased pO₂/decreased extracellular pH, e.g. hypoventilation)
 - venous outflow obstruction (venous sinus thrombosis, superior vena cava syndrome, space-occupying lesion)
 - cranial dependency
- cerebral edema
 - vasogenic (vessel damage, e.g. hypertensive encephalopathy, tumor)
 - cytotoxic (tissue/cell death, e.g. hypoxia, brain injury)
 - osmotic (acute hyponatremia, hepatic encephalopathy)

Figure 5. Cerebral autoregulation curve

Adapted from: Lindsay KW, et al. Neurology and neurosurgery illustrated. © 2004. With permission from Elsevier

Consider Monitoring of ICP in the Following Situations

- Patients with an abnormal head CT and GCS score of 3-8 after cardiopulmonary resuscitation
- Or
- Patients with a normal head CT and GCS score of 3 to 8 AND the presence of two or more of the following:
 - Age >40 yr
 - Unilateral or bilateral motor posturing
 - sBP <90 mmHg
- Post-operative monitoring
- Investigation of NPH

Lumbar puncture is contraindicated with known/suspected intracranial mass

- hydrocephalus
 - obstructive: acquired aqueductal stenosis
 - non-obstructive: decreased CSF absorption with SAH
- pseudotumor cerebri (idiopathic intracranial HTN)
- impaired autoregulation (hypotension, HTN, brain injury)
- status epilepticus (chronic seizure resulting in brain edema)

Clinical Features

1. Acute Elevated ICP

- H/A: worse in the morning, aggravated by stooping, and bending
- N/V
- decreased LOC if ICP = dBP, or midbrain compressed
- drop in GCS = best index to monitor progress and predict outcome of acute intracranial process (see *Neurotrauma*, NS29)
- papilledema ± retinal hemorrhages (may take 24-48 h to develop)
- abnormal extra-ocular movements (EOM):
 - CN VI palsy: often falsely localizing (causative mass may be remote from nerve)
 - upward gaze palsy (especially in children with obstructive hydrocephalus)
- herniation syndromes
- focal signs/symptoms due to lesion

2. Chronic Elevated ICP

- H/A
 - postural: worsened by coughing, straining, and bending over
 - morning/evening H/A → vasodilatation due to increased CO₂ with recumbency
- visual changes
 - due to papilledema
 - enlarged blind spot, if advanced → episodic constrictions of visual fields ("gray-outs")
 - optic atrophy/blindness
 - differentiate from papillitis (usually unilateral with decreased visual acuity)
- decreased level of consciousness

Investigations

- patients with suspected elevated ICP require an urgent CT/MRI
- ICP monitoring where appropriate

Blood Brain Barrier

Glucose and amino acids cross slowly
Non-polar/lipids cross fast

Blood Brain Barrier

Infarction/neoplasm → destroy tight junctions → vasogenic edema

Cushing's Triad of Acute Raised ICP (full triad seen in 1/3 of cases)

- HTN
- Bradycardia (late finding)
- Irregular respiratory pattern

Papilledema

- Optic disc swelling with blurred margins (most commonly bilateral)
- Larger blind spot

Herniation Syndromes

Table 3. Herniation Syndromes

Herniation Syndrome	Definition	Etiology	Clinical Features
1. Subfalcine	Cingulate gyrus herniates under falx	• Lateral supratentorial lesion	<ul style="list-style-type: none"> • Usually asymptomatic • Warns of impending transtentorial herniation • Risk of ACA compression
2. Central Tentorial (Axial)	Displacement of diencephalon through tentorial notch	<ul style="list-style-type: none"> • Supratentorial midline lesion • Diffuse cerebral swelling • Late uncal herniation 	<ul style="list-style-type: none"> • Small pupils, moderately dilated, fixed (rostral to caudal deterioration), sequential failure of diencephalon, medulla • Decreased LOC (midbrain compression), EOM/upward gaze impairment ("sunset eyes"): compression of pretectum and superior colliculi • Brainstem hemorrhage ("Duret's" – secondary to shearing of basilar artery perforating vessels) • Diabetes insipidus (traction on pituitary stalk and hypothalamus), end-stage sign
3. Lateral Tentorial (Uncal)	Uncus of temporal lobe herniates down through tentorial notch	• Lateral supratentorial lesion (often rapidly expanding traumatic hematoma)	<ul style="list-style-type: none"> • Ipsilateral non-reactive dilated pupil (earliest, most reliable sign) + ipsilateral EOM paralysis, ptosis (CN III compression) • Decreased LOC (midbrain compression) • Contralateral hemiplegia ± extensor (upgoing) plantar response ± ipsilateral hemiplegia ("Kernohan's notch" – a false localizing sign resulting from pressure from the edge of the tentorium on the contralateral cerebral peduncle)
4. Upward	Cerebellar vermis herniates through tentorial incisura	• Large posterior fossa mass (common after VP shunting)	<ul style="list-style-type: none"> • Cerebellar infarct (superior cerebellar artery [SCA] compression) • Hydrocephalus (cerebral aqueduct compression)
5. Tonsillar	Cerebellar tonsils herniate through foramen magnum	<ul style="list-style-type: none"> • Infratentorial lesion • Following central tentorial herniation • Following LP in presence of intracranial mass lesion 	<ul style="list-style-type: none"> • Neck stiffness and head tilt (tonsillar impaction) • Decreased LOC (midbrain compression) • Flaccid paralysis • Respiratory irregularities, respiratory arrest (compression of medullary respiratory centers) • Blood pressure instability (compression of medullary cardiovascular centers)

Figure 6. Herniation types

© Heidi Maj

Treatment of Elevated ICP

- CT or MRI to identify etiology, assess for midline shift/herniation
- treat primary cause (i.e. remove mass lesions, ensure adequate ventilation)
- if elevated ICP persists following treatment of primary cause, consider therapy when ICP >20 mmHg
- goals: keep ICP <20 mmHg, CPP >65 mmHg, MAP >90 mmHg

Conservative Measures

- elevate head of bed at 30°, maintain neck in neutral position → increases intracranial venous outflow with minimal effect on arterial pressure
- prevent hypotension with fluid and vasopressors, dopamine, norepinephrine prn
- ventilate to normocarbica ($p\text{CO}_2$ 35-40 mmHg) → prevents vasodilatation
- oxygen to maintain $p\text{O}_2$ >60 mmHg → prevents hypoxic brain injury
- osmolar diuresis (mannitol 20% IV solution 1-1.5 g/kg, then 0.25 g/kg q6h to serum osmolality of 315-320)
 - can give rapidly, acts in 15-30 min, must maintain sBP >90 mmHg
- corticosteroids → decrease edema over subsequent days around brain tumor, abscess, blood
 - no proven value in head injury or stroke

Aggressive Measures

- sedation ("light" e.g. barbiturates/codeine → "heavy" e.g. fentanyl/MgSO₄)
- paralysis with vecuronium → reduces sympathetic tone, reduces HTN induced by muscle contraction
- hyperventilate to $p\text{CO}_2$ 30-35 mmHg
 - use for brief periods only – also results in decreased cerebral blood flow
- drain 3-5 mL CSF via ventricles, assess each situation independently
- insert EVD (if acute) or shunt
- barbiturate-induced coma induced with pentobarbital to reduce cerebral blood flow and metabolism (10 mg/kg over 30 min, then 1 mg/kg q1h continuous infusion)
 - decreases mortality, but no improvement in neurological outcome
- decompressive craniectomy is a last resort
- no role for the use of hypothermia in head injury

Treatment of Elevated ICP:

ICP HEAD

Intubate
Calm (sedate)/Coma
Place drain/Paralysis

Hyperventilate
Elevate head
Adequate BP
Diuretic (mannitol)

Hydrocephalus

- hydrocephalus in children, see *Pediatric Neurosurgery*, NS36

Definition

- accumulation of excess CSF in the brain
- CSF: produced by choroid plexus lateral ventricles
- total volume ~120 mL, including 30 cc within ventricular system, remainder in SA space
- flow: lateral ventricle → 3rd ventricle → cerebral aqueduct → 4th ventricle → subarachnoid space
- re-absorbed by arachnoid villi into dural venous sinuses

Etiology

- congenital vs. acquired
- obstruction to CSF flow
- decreased CSF absorption
- increased CSF production (rarely) – e.g. choroid plexus papilloma (0.4-1% of intracranial tumors)

Epidemiology

- estimated prevalence 1-1.5%; incidence of congenital hydrocephalus ~1-2/1,000 live births

1. Lateral ventricles
2. Choroid plexus
3. Third ventricle
4. Cerebral aqueduct (of Sylvius)
5. Fourth ventricle
6. Foramina of Luschka and Magendie
7. Arachnoid granulations
8. Subarachnoid space
9. Superior sagittal sinus

© Kari Francis 2004

Figure 7. The flow of CSF

Classification

Table 4. Classification of Hydrocephalus

Disorder	Definition	Etiology	Findings on CT/MRI
Obstructive (Non-Communicating) Hydrocephalus	Circulation blocked within ventricular system proximal to the arachnoid granulations	Acquired <ul style="list-style-type: none"> Aqueductal stenosis (adhesions following infection, hemorrhage) Intraventricular lesions (tumors e.g. 3rd ventricle colloid cyst, hematoma) Mass causing tentorial herniation, aqueduct/4th ventricle compression Others: neurosarcooidosis, abscess/granulomas, arachnoid cysts Congenital <ul style="list-style-type: none"> Aqueductal stenosis, Dandy-Walker malformation, Chiari malformation (see <i>Pediatric Neurosurgery</i>, NS34) 	<ul style="list-style-type: none"> Ventricular enlargement proximal to block Periventricular hypodensity (transependymal migration of CSF forced into extracellular space) Sulcal effacement
Non-Obstructive (Communicating) Hydrocephalus	CSF absorption blocked at extraventricular site = arachnoid granulations	<ul style="list-style-type: none"> Post-infectious (#1 cause) meningitis, cysticercosis Post-hemorrhagic (#2 cause) → SAH, IVH, traumatic Choroid plexus papilloma (rare, causes increased CSF production) Idiopathic → normal pressure hydrocephalus 	<ul style="list-style-type: none"> All ventricles dilated
Normal Pressure Hydrocephalus (NPH)	Persistent ventricular dilatation in the context of normal CSF pressure	<ul style="list-style-type: none"> Idiopathic (50%) Others: subarachnoid hemorrhage, meningitis, trauma, radiation-induced 	<ul style="list-style-type: none"> Enlarged ventricles without increased prominence of cerebral sulci
Hydrocephalus Ex Vacuo	Ventricular enlargement resulting from atrophy of surrounding brain tissue	<ul style="list-style-type: none"> Normal aging Alzheimer's, Creutzfeldt-Jacob Disease 	<ul style="list-style-type: none"> Enlarged ventricles and sulci Cerebral atrophy

CSF produced by choroid plexus, flows to: ventricles → foramina of Luschka (lateral) and Magendie (medial) → subarachnoid space → absorbed by arachnoid villi/granulations into venous sinuses

CSF production = CSF reabsorption = ~500 mL/d in normal adults
Normal CSF volume ~150 mL (50% spinal, 50% intracranial → 25 mL intraventricular, 50 mL subarachnoid)

Clinical Features

- acute hydrocephalus
 - signs and symptoms of acute elevated ICP (see *Elevated ICP*, NS5)
 - impaired upward gaze ("sunset eyes") and/or CN VI palsy
- chronic/gradual onset hydrocephalus (i.e. NPH)
 - gradual onset of classic triad developing over weeks or months
 - pressure of ventricle on lower extremity motor fibers → gait disturbance (ataxia and apraxia usually initial symptoms)
 - pressure on cortical bowel/bladder center → urinary incontinence
 - pressure on frontal lobes → dementia
 - CSF pressure can be measured within clinically "normal" range

Investigations

- CT/MRI (periventricular lucency suggests raised CSF pressure)
- ultrasound (through anterior fontanelle in infants)
- ICP monitoring (e.g. LP) may be used to investigate NPH, test response to shunting (lumbar tap test)
- radionuclide cisternography can test CSF flow and absorption rate (unreliable)
- β-2 transferrin assay to test for the presence of CSF leak

Treatment

- ventricular drainage
- surgical removal of obstruction (if possible) or excision of choroid plexus papilloma
- shunts
 - ventriculoperitoneal (VP): most common
 - ventriculopleural
 - ventriculo-atrial (VA): relatively increased risk of infections, shunt emboli
 - lumboperitoneal: for communicating hydrocephalus and pseudotumor cerebri
- third ventriculostomy (for obstructive hydrocephalus) via ventriculoscopy
- LPs for transient hydrocephalus (e.g. SAH), IVH in premature infants, etc.

Classic Triad of NPH Progression

AID

Ataxia/Apraxia of gait
Incontinence
Dementia

Shunt Complications

Table 5. Shunt Complications

Complication	Etiology	Clinical Features	Investigations
Obstruction (most common)	<ul style="list-style-type: none"> Obstruction by choroid plexus Buildup of proteinaceous accretions, blood, cells (inflammatory or tumor) Infection Disconnection or damage 	<ul style="list-style-type: none"> Acute hydrocephalus Increased ICP 	<ul style="list-style-type: none"> "Shunt series" (plain x-rays of entire shunt that only rule-out disconnection, break, tip migration) CT Radionuclide "shuntogram"
Infection (3-6%)	<ul style="list-style-type: none"> <i>S. epidermidis</i> <i>S. aureus</i> <i>P. acnes</i> Gram-negative bacilli 	<ul style="list-style-type: none"> Fever, N/V, anorexia, irritability Meningitis Peritonitis Signs and symptoms of shunt obstruction Shunt nephritis (VA shunt) 	<ul style="list-style-type: none"> CBC Blood culture Tap shunt for C&S (LP usually NOT recommended)
Overshunting (10% over 6.5 yr)	<ul style="list-style-type: none"> Slit ventricle syndrome, collapse of ventricles leading to occlusion of shunt ports by ependymal lining Subdural hematoma Collapsing brain tears bridging veins (especially common in NPH patients) Secondary craniostylosis (children): apposition and overlapping of the cranial sutures in an infant following decompression of hydrocephalus 	<ul style="list-style-type: none"> Chronic or recurring H/A often relieved when lying down Asymptomatic H/A, vomiting, somnolence Abnormal head shape 	<ul style="list-style-type: none"> CT/MRI Slit-like ventricles on imaging CT Clinical CT
Seizures (5.5% risk in 1st yr, 1.1% after 3rd yr)			<ul style="list-style-type: none"> EEG
Inguinal Hernia (17% incidence with VP shunt inserted in infancy) ± skin breakdown over hardware	<ul style="list-style-type: none"> Increased intraperitoneal pressure/fluid results in hernia becoming apparent 	<ul style="list-style-type: none"> Inguinal swelling, discomfort 	<ul style="list-style-type: none"> U/S

Idiopathic Intracranial Hypertension (Pseudotumor Cerebri)

Definition

- raised intracranial pressure and papilledema without evidence of any mass lesion, hydrocephalus, infection, or hypertensive encephalopathy (diagnosis of exclusion)

Etiology

- unknown (majority), but associated with
 - lateral venous sinus thrombosis
 - habitus/diet: obesity, hyper/hypovitaminosis A
 - endocrine: reproductive age, menstrual irregularities, Addison's/Cushing's disease, thyroid irregularities
 - hematological: iron deficiency anemia, polycythemia vera
 - drugs: steroid administration or withdrawal, tetracycline, nalidixic acid, etc.
- risk factors overlap with those of venous sinus thrombosis; similar to those for gallstones ("fat, female, fertile, forties")

Epidemiology

- incidence ~0.5/100,000 per year
- usually in 3rd and 4th decade (F>M)

Clinical Features

- symptoms and signs of raised ICP (H/A in >90%, pulsatile intracranial noise), but no LOC or diplopia
- decreased visual acuity, papilledema, visual field defect, optic atrophy (key morbidity)
- usually self-limited, recurrence is common, chronic in some patients
- risk of blindness is not reliably correlated to symptoms or clinical course

Important Features to Note on CT and MRI (± contrast enhancement)

- Lesions (± edema, necrosis, hemorrhage)
- Midline shifts and herniations
- Effacement of ventricles and sulci (often ipsilateral), basal cisterns
- Single or multiple (multiple implies metastasis)

Investigations

- CT: normal
- CSF studies: normal
- MRI: must look for venous sinus thrombosis

Treatment

- rule out conditions that cause intracranial HTN (especially sinus thrombosis)
- discontinue offending medications, encourage weight loss, fluid/salt restriction
- pharmacotherapy: acetazolamide (decreases CSF production), thiazide diuretic, or furosemide
- if above fail: serial LPs, shunt
- optic nerve sheath decompression (if progressive impairment of visual acuity)
- 2 yr follow-up with imaging to rule out occult tumor, ophthalmology follow-up

Tumors

Figure 8. Tumors

Classification

- primary vs. metastatic, intra-axial (parenchymal) vs. extra-axial, supratentorial vs. infratentorial, adult vs. pediatric
- benign: non-invasive, but can be devastating due to expansion of mass in fixed volume of skull (mass effect)
- malignant: implies rapid growth, invasiveness, but rarely extracranial metastasis
- types of intracranial tumors (* = most common)
 - neuroepithelial tissue
 - ♦ astrocytic tumors: astrocytoma, glioblastoma
 - ♦ oligodendroglial tumors
 - ♦ oligoastrocytic tumors
 - ♦ neuronal and mixed neuronal-glial tumors: ganglion cell tumors, cerebral neurocytomas/neuroblastomas
 - ♦ embryonal tumors: medulloblastoma, neuroectodermal
 - ♦ other: pineal, ependymal, and choroid plexus tumors
 - meningeal: meningiomas*, mesenchymal, hemangioblastomas
 - cranial and paraspinal nerves: schwannoma, neurofibroma
 - lymphomas and hematopoietic neoplasms
 - germ cell: germinomas, teratomas
 - pituitary adenomas*
 - sellar region: craniopharyngiomas, spindle cell oncocytoma
 - cysts: epidermoid/dermoid cysts, colloid cysts
 - local extension: chordomas, glomus jugulare tumors
 - metastatic tumors

Clinical Features

- supratentorial lesions
 - progressive neurological deficit (70%)
 - ♦ frontal lobe: hemiparesis, dysphasia, personality changes, cognitive changes
 - ♦ temporal lobe: auditory/olfactory hallucinations, memory deficits, contralateral superior quadrantanopsia

Primary Sources of Metastatic Brain Tumors

Lung	44%
Breast	10%
Kidney (RCC)	7%
GI	6%
Melanoma	3%

Primary CNS lymphoma reported in 6-20% of HIV infected patients

Brain Metastasis

~1/3 of all adult brain tumors
Well circumscribed, often at gray-white matter junction

Primary Brain Tumors

- Rarely undergo metastasis
- Adults = mostly supratentorial
- Children = mostly infratentorial

- parietal lobe: contralateral sensory or motor impairment, apraxia
- occipital lobe: contralateral visual field deficits, alexia
- H/A (50%) ± symptoms of elevated ICP (N/V, papilledema)
- seizures (25%)
- symptoms suggestive of TIA (ictal, post-ictal, occlusion of vessel by tumor cells or 2° to “steal phenomenon”)
- endocrine disturbances with pituitary tumors
- rarely presents with hemorrhage
- **infratentorial lesions**
 - most commonly presents with signs of elevated ICP
 - ♦ H/A
 - ♦ N/V
 - ♦ papilledema
 - diplopia (direct compression CN VI vs. indirect compression from increased ICP)
 - vertigo
 - ataxia (due to cerebellar lesions)
- **familial syndromes associated with CNS tumors**
 - von Hippel-Lindau (hemangioblastoma of brain, spinal cord, and eye)
 - tuberous sclerosis (giant cell astrocytoma, cortical tubers, and subependymal nodules)
 - neurofibromatosis type 1 and 2 (astrocytoma, acoustic neuroma respectively)
 - Li-Fraumeni (astrocytoma)
 - Turcot syndrome (glioblastoma multiforme)
 - multiple endocrine neoplasia type 1 (MEN-1) (pituitary adenoma)

Investigations

- CT, MRI, stereotactic biopsy (tissue diagnosis), metastatic workup

Treatment

- conservative: serial Hx, Px, imaging for slow growing/benign lesions
- medical: corticosteroids to reduce cytotoxic cerebral edema, pharmacological (see *Pituitary Adenoma*, NS13)
- surgical: total or partial excision (decompressive, palliative), shunt if hydrocephalus
- radiotherapy: conventional fractionated radiotherapy (XRT), stereotactic radiosurgery (e.g. Gamma Knife®)
- chemotherapy: e.g. alkylating agents (temozolomide)

Table 6. Tumor Types: Age, Location

Age	Supratentorial	Infratentorial (posterior fossa)
<15 yr	Astrocytoma (all grades) (50%) Craniopharyngioma (2-5%) Others: pineal region tumors, choroid plexus tumors, ganglioglioma, DNET	Medulloblastoma (15-20%) Cerebellar astrocytoma (15%) Ependymoma (9%) Brainstem astrocytoma
>15 yr	High grade astrocytoma (12-15%, e.g. GBM) Metastasis (15-30%, includes infratentorial) Meningioma (15-20%) Low grade astrocytoma (8%) Pituitary adenoma (5-8%) Oligodendroglioma (5%) Other: colloid cyst, CNS lymphoma, dermoid/epidermoid cysts	Metastasis Acoustic neuroma (schwannoma) (5-10%) Hemangioblastoma (2%) Meningioma

Guideline on the Management of Newly Diagnosed Brain Metastasis(es) (American Society for Radiation Oncology)

Pract Radiat Oncol 2012;2:210-225

Prognostic Factors

Three prognostic groups based on 1,200 patients:

Class I – Karnofsky performance status (KPS) ≥70 yr, <65 yr with controlled primary (3-mo stability on imaging or newly diagnosed), no extracranial metastases (median survival 7.1 mo).

Class II – everything else (median survival 4.2 mo).

Class III – KPS <70 (median survival 2.3 mo).

Summary of Evidence for Single and Multiple Brain Metastasis(es)

1) For patients with good performance status (e.g. KPS ≥70), limited extracranial disease and resectable metastasis, complete resection improves the probability of extended survival. WBRT in addition to resection improves local and overall brain control but does not affect overall survival or duration of functional independence.

2) For patients with a good prognosis (>3 mo expected survival), single brain metastases <4 cm in size, good performance status, and controlled extracranial disease, the addition of radiosurgery to WBRT improves survival when compared with WBRT alone.

3) In patients with a good prognosis and up to 4 brain metastases <4 cm in size, radiosurgery added to WBRT improves lesion site and overall brain control compared with WBRT alone, but does not influence survival. Therefore, WBRT alone may be considered in these patients.

4) The use of radiosurgery boost to WBRT may improve KPS and decrease the need for steroids at 6 mo in patients with up to 3 brain metastases.

5) For selected patients with poor life expectancy (<3 mo), the use of WBRT may or may not significantly improve symptoms from brain metastases. Comfort measures, or short course (20 Gy in 5 daily fractions) WBRT are reasonable options.

6) There is no evidence of a survival benefit with the combined use of radiosensitizers with WBRT.

7) Although chemotherapy trials have reported improved response rates with combined chemotherapy and WBRT, the addition of chemotherapy leads to increased toxicity and does not improve survival. The routine use of chemotherapy in the management of brain metastases is not generally recommended.

Figure 9. Multiple brain metastases (see arrows)

Metastatic Tumors

- most common brain tumor seen clinically
- 15-30% of cancer patients present with cerebral metastatic tumors
 - most common sources: lungs, breast
 - other sources: kidney, thyroid, stomach, prostate, testis, melanoma
- hematogenous spread most common

Location

- 80% are hemispheric, often at gray-white matter junction or junction of temporal-parietal-occipital lobes (likely emboli spreading to terminal MCA branches)

Investigations

- identify primary tumor
 - metastatic workup (CXR, CT chest/abdo, abdominal U/S, bone scan, mammogram)
- CT with contrast → round, well-circumscribed, often ring enhancing, ++ edema, often multiple
- MRI more sensitive, especially for posterior fossa
- consider biopsy in unusual cases, or if no primary identified

Treatment

- medical
 - phenytoin (or levetiracetam) for seizure prophylaxis if patient presents with seizure
 - dexamethasone to reduce edema given with ranitidine
 - chemotherapy (e.g. small cell lung cancer)
- radiation
 - stereotactic radiosurgery: for discrete, deep-seated/inoperable tumors
 - multiple lesions: use WBRT; consider stereotactic radiosurgery if <3 lesions
 - post-operative WBRT is commonly used
- surgical
 - single/solitary lesions: use surgery + radiation

Prognosis

- median survival without treatment once symptomatic is ~1 mo, with optimal treatment 6-9 mo but varies depending on primary tumor type

Figure 10. High grade astrocytoma on CT

Astrocytoma

- most common primary intra-axial brain tumor, common in 4th-6th decades

Table 7. Astrocytoma Grading System

World Health Organization (WHO)	Typical CT/MRI Findings	Survival
I – Pilocytic astrocytoma	± mass effect, ± enhancement	> 10 yr, cure if gross total resection
II – Low grade/diffuse	Mass effect, no enhancement	5 yr
III – Anaplastic	Complex enhancement	1.5-2 yr
IV – Glioblastoma multiforme (GBM)	Necrosis (ring enhancement)	12 mo, 10% at 2 yr

Clinical Features

- sites: cerebral hemispheres >> cerebellum, brainstem, spinal cord
- symptoms: recent onset of new/worsening H/A, N/V, seizure, ± focal deficits or symptoms of increased ICP

Investigations

- CT/MRI with contrast: variable appearance depending on grade (see Table 8)
 - hypodense on CT, hypointense on T1 MRI, hyperintense on T2 MRI
 - low grade: most do not enhance and have calcification on CT
 - high grade: most enhance with CT contrast dye/gadolinium
- tissue biopsy: WHO grade and histology correlates with prognosis, but 25% chance of sampling error due to tumor heterogeneity

Treatment

- low grade diffuse astrocytoma
 - close follow-up, radiation, chemotherapy, and surgery all valid options
 - surgery: not curative, trend towards better outcomes
 - radiotherapy alone or post-operative prolongs survival (retrospective evidence)
 - chemotherapy: usually reserved for tumor progression
- high grade astrocytomas (anaplastic astrocytoma and GBM)
 - surgery
 - ♦ gross total resection: maximal safe resection + fractionated radiation with 2 cm margin + concomitant and adjuvant temozolomide
 - except: extensive dominant lobe GBM, significant bilateral involvement, end-of-life near, extensive brainstem involvement
 - ♦ stereotactic biopsy if resection not possible, followed by fractionated radiation with 2 cm margin
 - expectant (based on functional impairment – Karnofsky score <70; patient's/family's wishes)
 - aim to prolong "quality" survival
 - chemotherapy: ~20% response rate, temozolomide (agent of choice); better response to temozolomide predicted by MGMT gene hypermethylation
- multiple gliomas: WBRT ± chemotherapy

Bevacizumab Plus Radiotherapy-Temozolamide for Newly Diagnosed Glioblastoma

NEJM 2014;370:709-722

Purpose: To evaluate the effect of combined bevacizumab and radiotherapy-temozolamide in the treatment of newly diagnosed glioblastoma.

Study: Patients with supratentorial glioblastoma randomly assigned to receive intravenous bevacizumab or placebo plus radiotherapy and oral temozolamide for 30 wk total in cycles, followed by bevacizumab or placebo monotherapy. Outcomes were progression-free survival and overall survival.

Results: 458 patients in bevacizumab group, 463 patients in placebo. The median progression-free survival was longer in the bevacizumab group compared with placebo (10.6 mo vs. 6.2 mo, HR 0.64, 95% CI 0.55-0.74), although overall survival did not differ significantly between groups (HR 0.88, 95% CI 0.76-1.02). Baseline health-related QOL and performance status were maintained longer in the bevacizumab group although there was a higher frequency of adverse events.

Conclusions: The addition of bevacizumab to radiotherapy-temozolamide improves progression-free survival but not overall survival in patients with glioblastoma.

Meningioma

- most common *primary* intracranial tumor, arise from arachnoid membrane
- often calcified, cause hyperostosis of adjacent bone
- classically see Psammoma bodies on histology
- common locations: parasagittal convexity or falx (70%), sphenoid wing, tuberculum sellae, foramen magnum, olfactory groove

Clinical Features

- middle aged, slight female preponderance (M:F = 2:3), high progesterone receptors (increase in size with pregnancy), symptoms of increased ICP, focal deficits, usually solitary (10% multiple, likely with loss of NF2 gene/22q12 deletion)

Investigations

- CT with contrast: homogeneous, densely enhancing, along dural border ("dural tail"), well circumscribed
- contrast enhanced MRI provides better detail
- angiography
 - most are supplied by external carotid feeders (meningeal vessels)
 - also assesses venous sinus involvement, "tumor blush" commonly seen (prolonged contrast image)
- octreotide scintigraphy: to establish if expression of somatostatin receptor

Treatment

- conservative management for non-progressive, asymptomatic lesions
- surgery is treatment of choice if symptomatic or progression on sequential imaging (curative if complete resection)
- SRS may be an option for lesions <3 cm
- endovascular embolization to facilitate surgery
- SRS or XRT for recurrent atypical/malignant meningiomas

Prognosis

- >90% 5 yr survival, recurrence rate variable (often ~10-20%)
- depends on extent of resection (Simpson's classification)

WHO Classification of Meningioma (by histology)

- Grade 1: low risk of recurrence
- Grade 2: intermediate risk of recurrence
- Grade 3: high risk of recurrence

Figure 11. Meningioma on CT

Progressive unilateral or asymmetrical sensorineural hearing loss = acoustic neuroma until proven otherwise

Figure 12. Vestibular schwannoma (tumor in cerebello-pontine angle)

Vestibular Schwannoma (Acoustic Neuroma)

- slow-growing (average of 1-10 mm/yr), benign posterior fossa tumor
- arises from vestibular component of CN VIII in internal auditory canal, expanding into bony canal and cerebello-pontine angle (CPA)
- if bilateral, diagnostic of neurofibromatosis type II
- epidemiology: all age groups affected, peaks at 4th-6th decades

Clinical Features

- compression of structures in CPA, often CN VIII (unilateral hearing loss 98%, tinnitus, disequilibrium), followed by CN V and VII
- ataxia and raised ICP are late features

Investigations

- MRI with gadolinium or T2 FIESTA sequence (>98% sensitive/specific), CT with contrast 2nd choice
- audiogram, brainstem auditory evoked potentials, caloric tests

Treatment

- conservative: serial imaging (CT/MRI q6mo) and audiometry
- radiation: stereotactic radiosurgery or fractionated radiotherapy
- surgery if: lesion >3 cm, brainstem compression, edema, hydrocephalus
 - curable if complete resection (almost always possible)
 - operative complications: CN VII, VIII dysfunction (only significant disability if bilateral), CSF leak

Pituitary Adenoma

- primarily from anterior pituitary, 3rd-4th decades, M=F
- incidence in autopsy studies approximately 20%
- classification
 - microadenoma <1 cm; macroadenoma ≥1 cm
 - endocrine active (functional/secretory) vs. inactive (non-functional)
 - ♦ most common functional: prolactinomas, adrenocorticotrophic, growth-hormone producing
- differential: parasellar tumors (e.g. craniopharyngioma, tuberculum sellae meningioma), carotid aneurysm

Clinical Features

- mass effects
 - H/A
 - bitemporal hemianopsia (compression of optic chiasm)
 - CN III, IV, V₁, V₂, VI palsy (compression of cavernous sinus)
- endocrine effects
 - hyperprolactinemia (prolactinoma): infertility, amenorrhea, galactorrhea, decreased libido
 - ACTH production: Cushing's disease, hyperpigmentation
 - GH production: acromegaly/gigantism
 - panhypopituitarism (hypothyroidism, hypoadrenalism, hypogonadism)
 - associated MEN-1 syndrome
 - diabetes insipidus
- pituitary apoplexy (sudden expansion of mass due to hemorrhage or necrosis)
 - abrupt onset H/A, visual disturbances, ophthalmoplegia, reduced mental status, and panhypopituitarism
 - CSF rhinorrhea and seizures (rare)
 - signs and symptoms of subarachnoid hemorrhage (rare)

Go Look For The Adenoma Please – GH, LH, FSH, TSH, ACTH, Prolactin
A compressive adenoma in the pituitary will impair hormone production in this order (i.e. GH-secreting cells are most sensitive to compression)

Investigations

- formal visual fields, CN testing
- endocrine tests (prolactin level, TSH, 8 AM cortisol, fasting glucose, FSH/LH, IGF-1), electrolytes, urine electrolytes, and osmolality
- imaging (MRI with and without contrast)

Treatment

- medical
 - for apoplexy: rapid corticosteroid administration ± surgical decompression
 - for prolactinoma: dopamine agonists (e.g. bromocriptine)
 - for Cushing's: serotonin antagonist (cyproheptadine), inhibition of cortisol production (ketoconazole)
 - for acromegaly: somatostatin analogue (octreotide) ± bromocriptine
 - endocrine replacement therapy
- surgical
 - trans-sphenoidal, trans-ethmoidal, trans-cranial approaches for non-secreting adenomas causing mass effect and Cushing/acromegaly (50% cure rate)

Pus

Sources of Pus/Infection

- four routes of microbial access to CNS
 1. hematogenous spread (most common): arterial and retrograde venous
 - ♦ adults: chest is #1 source (lung abscess, bronchiectasis, empyema)
 - ♦ children: congenital cyanotic heart disease with R to L shunt
 - ♦ immunosuppression (AIDS – toxoplasmosis)
 2. direct implantation (dural disruption)
 - ♦ trauma
 - ♦ iatrogenic (e.g. following LP, post-operative)
 - ♦ congenital defect (e.g. dermal sinus)
 3. contiguous spread (adjacent infection): from air sinus, naso/oropharynx, surgical site (e.g. otitis media, mastoiditis, sinusitis, osteomyelitis, dental abscess)
 4. spread from PNS (e.g. viruses: rabies, herpes zoster)
- common examples
 - epidural abscess: in cranial and spinal epidural space, associated with osteomyelitis
 - ♦ treatment: immediate drainage and antibiotics, surgical emergency if cord compression
 - subdural empyema: bacterial/fungal infection, due to contiguous spread from bone or air sinus, progresses rapidly
 - ♦ treatment: surgical drainage and antibiotics, 20% mortality
 - meningitis, encephalitis (see [Infectious Diseases, ID19, ID20](#))
 - cerebral abscess

Cerebral Abscess

Definition

- pus in brain substance, surrounded by tissue reaction (capsule formation)

Etiology

- modes of spread: 10-60% of patients have no cause identified
- pathogens
 - *Streptococcus* (most common), often anaerobic or microaerophilic
 - *Staphylococcus* (penetrating injury)
 - Gram-negatives, anaerobes (*Bacteroides*, *Fusobacterium*)
 - in neonates: *Proteus* and *Citrobacter* (exclusively)

- immunocompromised: fungi and protozoa (*Toxoplasma*, *Nocardia*, *Candida albicans*, *Listeria monocytogenes*, *Mycobacterium*, and *Aspergillus*)

Risk Factors

- lung abnormalities (infection, AV fistulas; especially Osler-Weber-Rendu syndrome [i.e. hereditary hemorrhagic telangiectasia])
- congenital coronary heart disease: R-to-L shunt bypasses pulmonary filtration of micro-organisms
- bacterial endocarditis
- penetrating head trauma
- immunosuppression (e.g. AIDS)
- dental abscess

Clinical Features

- focal neurological signs and symptoms
 - H/A, decreased LOC; hemiparesis and seizures in 50%
- mass effect, increased ICP and sequelae (cranial enlargement in children)
- hemiparesis and seizures in 50%
- ± signs and symptoms of systemic infection (low-grade fever, leukocytosis)

Complications

- with abscess rupture: ventriculitis, meningitis, venous sinus thrombosis
- CSF obstruction
- transtentorial herniation

Investigations

- CT scan often first test in emergency department (see Figure 13)
- MRI
 - imaging of choice
 - apparent diffusion coefficient (ADC) used to differentiate abscess (black) from tumor (white)
- WBC/ESR may be normal, blood cultures rarely helpful and LP contraindicated if large mass
- CSF: non-specific (high ICP, high WBC, high protein, normal carbohydrate), rarely helpful, usually negative culture

Treatment

- aspiration ± excision and send for Gram stain, acid fast bacillus (AFB), C&S, fungal culture
- excision preferable if location suitable
- antibiotics
 - empirically: vancomycin + ceftriaxone + metronidazole or chloramphenicol or rifampin (6-8 wk therapy)
 - revise antibiotics when C&S known
- anti-convulsants (1-2 yr)
- follow-up CT is critical (do weekly initially, more frequent if condition deteriorates)

Prognosis

- mortality with appropriate therapy ~10%, permanent deficits in ~50%

Figure 13. Cerebral abscess on CT

Blood

Table 8. Comparison of Epidemiology and Etiology of Intracranial Bleeds

Types of Hematoma/Hemorrhage	Etiology	Epidemiology	Clinical Features	CT Features	Treatment	Prognosis
Epidural Hematoma	Skull fracture causing middle meningeal bleed	M>F (4:1), associated with trauma	Lucid interval before LOC	Hyperdense lenticular mass with sharp margins, usually limited by suture lines	Craniotomy	Good with prompt management (Note: respiratory arrest can occur from uncal herniation)
Acute SDH	Ruptured subarachnoid bridging vessels	Age >50, associated with trauma	No lucid interval, hemiparesis, pupillary changes	Hyperdense crescentic mass, crossing suture lines	Craniotomy if bleed >1 cm thick	Poor
Chronic SDH	Ruptured subarachnoid bridging vessels	Age >50, EtOH abusers, anti-coagulated	Often asymptomatic, minor H/A, confusion, signs of increased ICP	Hypodense crescentic mass, crossing suture lines	Burr hole to drain; craniotomy if recurs	Good
SAH	Trauma, spontaneous (aneurysms, idiopathic, AVM)	Age 55-60 20% cases under age 45	Sudden onset thunderclap H/A, signs of increased ICP	Hyperdense blood in cisterns/fissures (sensitivity decreases over time)	Conservative: NPO, IV NS, ECG, Foley, BP 120-150, vasospasm prophylaxis (nimodipine); open vs. endovascular surgery to repair if rebleed	Poor: 50% mortality 30% of survivors have moderate to severe disability
ICH	HTN, vascular abnormality, tumors, infections, coagulopathy	Age >55, male, drug use (cocaine, EtOH, amphetamine)	TIA-like symptoms, signs of increased ICP	Hyperdense intraparenchymal collection	Medical: decrease BP, control ICP Surgical: craniotomy	Poor: 44% mortality due to cerebral herniation

Extradural ("Epidural") Hematoma

Etiology

- temporal-parietal skull fracture: 85% are due to ruptured middle meningeal artery; remainder of cases are due to bleeding from middle meningeal vein, dural sinus, or bone/diploic veins

Epidemiology

- young adult, M>F = 4:1; rare before age 2 or after age 60
- 1-4% of traumatic head injuries

Clinical Features

- classic sequence (seen in <30%): post-traumatic reduced LOC, a lucid interval of several hours, then obtundation, hemiparesis, ipsilateral pupillary dilatation, and coma
- signs and symptoms depend on severity but can include H/A, N/V, amnesia, altered LOC, aphasia, seizures, HTN, and respiratory distress
- deterioration can take hours to days

Investigations

- CT without contrast: "lenticular-shaped" usually limited by suture lines but not limited by dural attachments

Treatment

- admission, close neurological observation with serial CT indicated if all of the following are present:
 - small volume clot, minimal midline shift (MLS <5 mm), GCS >8, no focal deficit
- otherwise, craniotomy to evacuate clot, follow up CT
- mannitol pre-operative if elevated ICP or signs of brain herniation

Prognosis

- good with prompt management, as the brain is often not damaged
- worse prognosis if bilateral Babinski or decerebration pre-operative
- death is usually due to respiratory arrest from uncal herniation (injury to the midbrain)

Figure 14. Extradural hematoma on CT

Poor Prognostic Indicators for Epidural Hematoma

- Older age
- Low GCS on admission
- Pupillary abnormalities (especially non-reactive)
- Longer delay in obtaining surgery (if needed)
- Post-operative elevated ICP

CT Density and MRI Appearance of Blood

Time	CT	MRI T1	MRI T2
Acute (< 72 h)	Hyper.	Gray	Black
Subacute (< 3 wk)	Iso.	White	White
Chronic (> 3 wk)	Hypo.	Black	Black

MRI-T1: "George Washington Bridge"
MRI-T2: "Oreo" cookie – Black/White/Black

Use of Drains vs. No Drains After Burr-Hole Evacuation of Chronic Subdural Hematoma: A Randomized Control Trial

Lancet 2009;374:1067-1073

Purpose: To examine the effect of drains on recurrence rates of chronic subdural hematoma (SDH), and clinical outcomes.

Study: RCT with 269 patients ≥18 yr of age with chronic SDH. Half of the patients were randomly assigned to receive a subdural drain and the other half no drain after evacuation.

Results: Recurrence occurred in 9.3% of people with a drain and 24% without ($p=0.003$; 95% CI 0.14-0.70). Although rates of complications were the same between the study groups, mortality at 6 mo was 8.6% in the group receiving a drain and 18.1% in the group not receiving a drain ($p=0.042$; 95% CI 0.1-0.99).

Conclusions: Use of drains after burr-hole drainage of chronic SDH is safe and associated with a reduced recurrence and mortality at 6 mo.

Subdural Hematoma

ACUTE SUBDURAL HEMATOMA

- 1-2 d after bleeding onset

Etiology

- rupture of vessels that bridge the subarachnoid space (e.g. cortical artery, large vein, venous sinus) or cerebral laceration

Risk Factors

- trauma, acceleration-deceleration injury, anticoagulants, alcohol, cerebral atrophy, infant head trauma (see [Pediatrics](#))

Clinical Features

- no lucid period, signs and symptoms can include altered LOC, pupillary irregularity, hemiparesis

Investigations

- CT: hyperdense concave "crescentic" mass, crossing suture lines

Treatment

- craniotomy if clinically symptomatic, if hematoma >1 cm thick, or if MLS >5 mm (optimal if surgery <4 h from onset); otherwise observe with serial imaging

Prognosis

- poor overall since the brain parenchyma is often injured (mortality range is 50-90%, due largely to underlying brain injury)
- prognostic factors: initial GCS and neurologic status, post-operative ICP

CHRONIC SUBDURAL HEMATOMA

- ≥15 d after bleeding onset

Etiology

- many start out as acute SDH
- blood within the subdural space evokes an inflammatory response:
 - fibroblast invasion of clot and formation of neomembranes within days → growth of neocapillaries → fibrinolysis and liquefaction of blood clot (forming a hygroma)
- course is determined by the balance of rebleeding from neomembranes and resorption of fluid

Risk Factors

- older, alcoholics, patients with CSF shunts, anticoagulants, coagulopathies

Clinical Features

- often due to minor injuries or no history of injury
- may present with minor H/A, confusion, language difficulties, TIA-like symptoms, symptoms of raised ICP ± seizures, progressive dementia, gait problem
- obtundation disproportionate to focal deficit; “the great imitator” of dementia, tumors

Investigations

- CT: hypodense (liquefied clot), crescentic mass

Treatment

- seizure prophylaxis only if post-traumatic seizure
- reverse coagulopathies
- burr hole drainage of liquefied clot indicated if symptomatic or thickness >1 cm; craniotomy if recurs more than twice

Prognosis

- good overall as brain usually undamaged, but may require repeat drainage

Figure 15. Subdural hematoma on CT

Hemicraniectomy in Older Patients with Extensive Middle-Cerebral-Artery Stroke

NEJM 2014;370:1091-1100

Purpose: To determine if early decompressive hemicraniectomy reduces mortality among patients >60 yr.

Study: 112 patients >60 yr (median age 70 yr) with malignant MCA infarction randomly assigned to conservative ICU treatment vs. hemicraniectomy. Endpoint was survival without severe disability (modified Rankin scale score 0-4).

Results: The proportion of patients who survived without severe disability was 38% in the hemicraniectomy group and 18% in the control group (OR 2.91, 95% CI 1.06-7.49). Modified Rankin scale scores in hemicraniectomy vs. control group in terms of percentages of patients: 0-2 (0%, 0%), 3 or moderate disability (7%, 3%), 4 or moderate severe disability (32%, 15%), 5 or severe disability (28%, 13%) and 6 or death (33%, 70%). Infections were more frequent in the hemicraniectomy group and herniation more frequent in the control group.

Conclusions: Hemicraniectomy increased survival without severe disability among patients >60 yr with a malignant MCA infarction.

Fisher Grade (SAH on CT scan)

Grade	Finding
1	Normal scan
2	<1 mm thick blood
3	>1 mm thick blood
4	SAH + ICH or IVH

Cerebrovascular Disease

Ischemic Cerebral Infarction (80%)

- embolic, thrombosis of intracerebral arteries, vasculitis, hypercoagulability, etc. (see [Neurology](#))

Intracranial Hemorrhage (20%)

- SAH, spontaneous ICH, IVH

Figure 16. Aneurysms of the Circle of Willis

Subarachnoid Hemorrhage

Definition

- bleeding into subarachnoid space (intracranial vessel between arachnoid and pia)

Etiology

- trauma (most common)
- spontaneous
 - ruptured aneurysms (75-80%)
 - idiopathic (14-22%)
 - AVMs (4-5%)
- coagulopathies (iatrogenic or primary), vasculitides, tumors, cerebral artery dissections (<5%)

Epidemiology

- ~10-28/100,000 population/yr
- peak age 55-60, 20% of cases occur under age 45

Risk Factors

- HTN
- pregnancy/parturition in patients with pre-existing AVMs, eclampsia
- oral contraceptive pill
- substance abuse (cigarette smoking, cocaine, alcohol)
- conditions associated with high incidence of aneurysms (see *Intracranial Aneurysms*, NS21)

Clinical Features of Spontaneous SAH

- sudden onset (seconds) of severe "thunderclap" H/A usually following exertion and described as the "worst headache of my life" (up to 97% sensitive, 12-25% specific)
- N/V, photophobia
- meningismus (neck pain/stiffness, positive Kernig's and Brudzinski's sign)
- decreased LOC (due to either raised ICP, ischemia, seizure)
- focal deficits: cranial nerve palsies (CN III, IV), hemiparesis
- ocular hemorrhage in 20-40% (due to sudden raised ICP compressing central retinal vein)
- reactive HTN
- sentinel bleeds
 - represents undiagnosed SAH
 - SAH-like symptoms lasting <1 d ("thunderclap H/A")
 - may have blood on CT or LP
 - ~30-60% of patients with full blown SAH give history suggestive of sentinel bleed within past 3 wk
- differential diagnosis: sentinel bleed, dissection/thrombosis of aneurysm, venous sinus thrombosis, benign cerebral vasculitis, benign exertional H/A

Investigations

- non-contrast CT – for diagnosis of SAH
 - 98% sensitive within 12 h, 93% within 24 h; 100% specificity
 - may be negative if small bleed or presentation delayed several days
 - acute hydrocephalus, IVH, ICH, infarct or large aneurysm may be visible
- lumbar puncture (highly sensitive) – for diagnosis of SAH if CT negative but high suspicion:
 - elevated opening pressure (>18 cmH₂O)
 - bloody initially, xanthochromic supernatant with centrifugation ("yellow") by ~12 h, lasts 2 wk
 - RBC count usually >100,000/mm³ without significant drop from first to last tube (in contrast to traumatic tap)
 - elevated protein due to blood breakdown products
- four vessel cerebral angiography ("gold standard" for aneurysms)
 - demonstrates source of SAH in 80-85% of cases
 - angiogram negative SAH: repeat angiogram in 7-14 d, if negative → "perimesencephalic SAH"
- MRA and CTA: sensitivity up to 95% for aneurysms, CTA>MRA for smaller aneurysms and delineating adjacent bony anatomy

Hunt and Hess Grade (clinical grading scale for SAH)

Grade	Description
1	No Sx or mild H/A and/or mild meningismus
2	Grade 1 + CN palsy
3	Confusion/lethargy, mild hemiparesis, or aphasia
4	GCS <15 but >8, moderate-severe hemiparesis, mild rigidity
5	Coma (GCS <9), decerebrate, moribund appearance

Mortality of Grade 1-2 20%, increased with grade

World Federation of Neurological Surgeons Grading of SAH

WFNS Grade	GCS Score	Aphasia, Hemiparesis, or Hemiplegia
0 *		
1	15	–
2	13-14	–
3	13-14	+
4	7-12	+ or –
5	3-6	+ or –

*Intact aneurysm

Figure 17. Diagnosis of SAH

Figure 18. Approach to SAH

Treatment

- admit to ICU or NICU
 - oxygen/ventilation prn
 - NPO, bed rest, elevate head of bed 30°, minimal external stimulation, neurological vitals q1h
 - aim to maintain sBP = 120-150 (balance of vasospasm prophylaxis, risk of re-bleed, risk of hypotension since CBF autoregulation impaired by SAH)
 - cardiac rhythm monitor, Foley prn, strict monitoring of ins and outs
- medications
 - IV NS with 20 mEq KCl/L at 125-150 cc/h
 - nimodipine 60 mg PO/NG q4h x 21 d for delayed cerebral ischemia neuroprotection; may discontinue earlier if patient is clinically well
 - seizure prophylaxis: levetiracetam (Keppra®) 500 mg PO/IV q12h x 1 wk
 - mild sedation prn

Complications

- vasospasm: vasoconstriction and permanent pathological vascular changes in response to vessel irritation by blood – can lead to delayed cerebral ischemia and death
 - onset: 4-14 d post-SAH, peak at 6-8 d; most commonly due to SAH, rarely due to ICH/IVH
 - clinical features (new onset ischemic deficit): confusion, decreased LOC, focal deficit (speech or motor e.g. pronator drift)
 - risk factors: large amount of blood on CT (high Fisher grade), smoking, increased age, HTN
 - “symptomatic” vasospasm in 20-30% of SAH patients
 - “radiographic” vasospasm in 30-70% of arteriograms performed 7 d following SAH
 - diagnosed clinically, and/or with transcranial Doppler (increased velocity of blood flow)
 - risk of cerebral infarct and death
 - treatment
 - ♦ hyperdynamic (“triple H”) therapy using fluids and pressors, usually after ruptured aneurysm has been clipped/coiled
 - ♦ direct vasodilation via angioplasty or intra-arterial verapamil for refractory cases
- hydrocephalus (15-20%): due to blood obstructing arachnoid granules
 - can be acute or chronic, requires extraventricular drain (EVD) or shunt, respectively
- neurogenic pulmonary edema

Nontraumatic Subarachnoid Hemorrhage in the Setting of Negative Cranial Computed Tomography Results: External Validation of a Clinical and Imaging Prediction Rule

Ann Emerg Med 2012;59:460-8.e1-7.doi:10.1016

Background: Two rules for SAH diagnosis exist.

A clinical prediction rule states that patients with acute severe H/A but without the clinical variables age ≥ 40 yr, neck pain, loss of consciousness, or onset of H/A with exertion are at low risk for SAH. An imaging prediction rule bases diagnosis on non-contrast cranial CT for patients within 6 h of H/A onset.

Methods: Matched case-control study of 55 patients at 21 emergency departments between 2000 and 2011, and diagnoses were verified by lumbar puncture.

Results: The clinical prediction rule for diagnosis of SAH was 97.1% sensitive, 22.7% specific, and had a negative likelihood ratio of 0.13. Using the imaging prediction rule resulted in a false negative rate of 20%.

Conclusions: Performing the clinical and imaging rules together has the potential for maximizing sensitivity of prediction and reducing rates of lumbar puncture, but using imaging alone can result in missed cases.

Calcium Antagonists for Aneurysmal Subarachnoid Hemorrhage

Cochrane DB Syst Rev 2007;3:CD000277

Introduction: This study looked to review the evidence in regards to whether calcium antagonists improve the outcome in patients with aneurysmal subarachnoid hemorrhage.

Methods/Population: The review included 3,361 patients presenting with aneurysmal subarachnoid hemorrhage from 16 RCTs comparing treatment with calcium antagonists vs. control from 1980 to March 2006.

Results: The results were based mainly on one large trial of oral nimodipine, which showed a RR of 0.67 (95% CI 0.55-0.81) and the evidence for other calcium agonists was not statistically significant.

Conclusion: The authors endorse the use of oral nimodipine in patients with aneurysmal subarachnoid hemorrhage.

“Triple H” Therapy for Vasospasm

HTN

Hypervolemia

Hemodilution

- hyponatremia: due to cerebral salt wasting (increased renal sodium loss and ECFV loss), not SIADH
- diabetes insipidus
- cardiac: arrhythmia (>50% have ECG changes), MI, CHF

Prognosis

- 10-15% mortality before reaching hospital, overall 50% mortality (majority within first 2-3 wk)
- 30% of survivors have moderate to severe disability
- a major cause of mortality is rebleeding, for untreated aneurysms:
 - risk of rebleed: 4% on first day, 15-20% within 2 wk, 50% by 6 mo
 - if no rebleed by 6 mo, risk decreases to same incidence as unruptured aneurysm (2%)
 - only prevention is early clipping or coiling of "cold" aneurysm
 - rebleed risk for "perimesencephalic SAH" is approximately same as for general population

Intracerebral Hemorrhage

Definition

- hemorrhage within brain parenchyma, accounts for ~10% of strokes
- can dissect into ventricular system (IVH) or through cortical surface (SAH)

Etiology

- HTN (usually causes bleeds at putamen, thalamus, pons, and cerebellum)
- hemorrhagic transformation (reperfusion post stroke, surgery, strenuous exercise, etc.)
- vascular anomalies
 - aneurysm, AVMs, and other vascular malformations (see *Vascular Malformations*, NS22)
 - venous sinus thrombosis
 - arteriopathies (cerebral amyloid angiopathy, lipohyalinosis, vasculitis)
- tumors (1%): often malignant (e.g. GBM, lymphoma, metastases)
- drugs (amphetamines, cocaine, alcohol, anticoagulants, etc.)
- coagulopathy (iatrogenic, leukemia, TTP, aplastic anemia)
- CNS infections (fungal, granulomas, herpes simplex encephalitis)
- post trauma (immediate or delayed, frontal and temporal lobes most commonly injured via coup-contrecoup mechanism)
- eclampsia
- post-operative (post-carotid endarterectomy cerebral reperfusion, craniotomy)
- idiopathic

Epidemiology

- 12-15 cases/100,000 population/yr

Risk Factors

- increasing age (mainly >55 yr)
- male gender
- HTN
- Black/Asian > Caucasian
- previous CVA of any type (23x risk)
- both acute and chronic heavy alcohol use; cocaine, amphetamines
- liver disease
- anticoagulants

Clinical Features

- TIA-like symptoms often precede ICH, can localize to site of impending hemorrhage
- gradual onset of symptoms over minutes-hours, usually during activity
- H/A, N/V, and decreased LOC are common
- specific symptoms/deficits depend on location of ICH

Investigations

- hyperdense blood on non-contrast CT
- CTA routine, if spot sign demonstrated there is high likelihood of clot growth

Treatment

- medical
 - decrease MAP to pre-morbid level or by ~20% (target BP 140/90)
 - check PTT/INR, and correct coagulopathy
 - control raised ICP (see *Intracranial Pressure Dynamics*, NS4)
 - levetiracetam/phenytoin for seizure prophylaxis
 - follow electrolytes (SIADH common)
 - angiogram to rule out vascular lesion unless >45 yr, known HTN, and putamen/thalamic/posterior fossa ICH (yield ~0%)

ICH Risk Factors

CALL HARM

CVA past history
Age (>55 yr)
Liver disease
Liquid blood (anticoagulated)
HTN
Alcohol, cocaine, amphetamines
Race (Black/Asian > Caucasian)
Male

Location of ICH

Basal Ganglia/Internal Capsule (50%)
Thalamus (15%)
Cerebral White Matter (15%)
Cerebellum/Brainstem – usually pons (15%)
Other (5%)

Commonest Locations of Saccular Aneurysms

- AComm: 30%
- PComm: 25%
- MCA: 20%
- Basilar tip: 7%

- surgical
 - craniotomy with evacuation of clot, treatment of source of ICH (i.e. AVM, tumor, cavernoma), ventriculostomy to treat hydrocephalus
 - indications
 - ♦ symptoms of raised ICP or mass effect
 - ♦ rapid deterioration (especially if signs of brainstem compression)
 - ♦ favorable location (e.g. cerebellar, non-dominant hemisphere)
 - ♦ young patient (<50 yr)
 - ♦ if tumor, AVM, aneurysm, or cavernoma suspected (resection or clip to decrease risk of rebleed)
 - contraindications
 - ♦ small bleed: minimal symptoms, GCS >10
 - ♦ poor prognosis: massive hemorrhage (especially dominant lobe), low GCS/coma, lost brainstem function
 - ♦ medical reasons (e.g. very elderly, severe coagulopathy, difficult location [e.g. basal ganglia, thalamus])

Prognosis

- 30-d mortality rate 44%, mostly due to cerebral herniation
- rebleed rate 2-6%, higher if HTN poorly controlled

Intracranial Aneurysms

Epidemiology

- prevalence 1-4% (20% have multiple)
- F>M; age 35-65 yr

Risk Factors

- autosomal dominant polycystic kidney disease (15%)
- fibromuscular dysplasia (7-21%)
- AVMs
- connective tissue diseases (Ehlers-Danlos, Marfan)
- family history
- bacterial endocarditis
- Osler-Weber-Rendu syndrome (hereditary hemorrhagic telangiectasia)
- atherosclerosis and HTN
- trauma

Types (for location, see Figure 4, NS3)

- saccular (berry)
 - most common type
 - located at branch points of major cerebral arteries (Circle of Willis)
 - 85-95% in carotid (anterior) system, 5-15% in vertebrobasilar (posterior) circulation
- fusiform
 - atherosclerotic
 - more common in vertebrobasilar system, rarely rupture
- infectious
 - secondary to any infection of vessel wall, 20% multiple
 - 60% *Streptococcus* and *Staphylococcus*
 - 3-15% of patients with bacterial endocarditis

Table 9. Five Year Cumulative Rupture Risk in Unruptured Aneurysms Based on Size and Location

	Cavernous Carotid	AC/MC/IC	Vertebrobasilar/PC/PComm
<7 mm	0%	0%	2.5%
7-12 mm	0%	2.6%	14.5%
13-24 mm	3%	14.5%	18.4%
≥24 mm	6.4%	40%	50%

AC = anterior cerebral/anterior communicating artery; IC = internal carotid artery; MC = middle cerebral artery; PC = posterior cerebral artery; PComm = posterior communicating artery
Lancet 2003;362:103-10

Clinical Presentation

- rupture (90%), most often SAH, but 30% ICH, 20% IVH, 3% subdural bleed
- sentinel hemorrhage ("thunderclap H/A") → requires urgent clipping/coiling to prevent catastrophic bleed
- mass effect (giant aneurysms)
 - internal carotid or anterior communicating aneurysm may compress:
 - ♦ the pituitary stalk or hypothalamus causing hypopituitarism
 - ♦ the optic nerve or chiasm producing a visual field defect
 - basilar artery aneurysm may compress midbrain, pons (limb weakness), or CN III
 - posterior communicating artery aneurysm may produce CN III palsy

Risk of Recurrent Subarachnoid Hemorrhage, Death, or Dependence and Standardized Mortality Ratios after Clipping or Coiling of an Intracranial Aneurysm in the International Subarachnoid Aneurysm Trial (ISAT): Long-Term Follow-Up

Lancet Neurol 2009;8:427-433

Objective: To assess the long-term risk of death, disability, and rebleeding in patients randomly assigned to clipping or endovascular coiling after rupture of an intracranial aneurysm in the follow-up of the ISAT trial.

Methods: Randomized controlled trial comparing endovascular coiling treatment with craniotomy and clipping for ruptured intracranial aneurysms in 2,143 patients who were considered eligible for either modality of therapy. Annual follow-up was done for a mean length of 9 yr to assess long-term survival and dependency.

Results: 10 patients in the coiled group and 3 patients in the clipped group had rebleed from the original aneurysm. In patients with ruptured intracranial aneurysms suitable for both treatments, the survival rate at 5 yr after endovascular coiling was higher at 89% vs. 86% for neurosurgical clipping (relative risk 0.77, $p=0.03$). The likelihood of independence at 5 yr following treatment is the same for both groups (83% for coiling vs. 82% for clipping).

Conclusions: The risk of death at 5 yr was significantly lower in the coiled group than it was in the clipped group. There was a small increased risk of recurrent bleeding from a coiled aneurysm compared with a clipped aneurysm.

Long-Term, Serial Screening for Intracranial Aneurysms in Individuals with a Family History of Aneurysmal Subarachnoid Hemorrhage: A Cohort Study

Lancet Neurol 2014;13:385-392

Purpose: To examine the yield of long-term serial screening for intracranial aneurysms for individuals with a positive family history of aneurysmal subarachnoid hemorrhage (aSAH) (two or more first degree relatives who have had aSAH or unruptured intracranial aneurysms).

Study: Screening results from April 1 1993 to April 1 2013 were reviewed in a cohort study. MRA or CTA was done from age 16-18 to 65-70 yr. After a negative screen, individuals were advised to contact the clinic in 5 yr for follow up.

Results: Aneurysms were identified in 11% of individuals at first screening ($n=458$), 8% at second screening ($n=261$), 5% at third screening ($n=128$), and 5% at fourth screening ($n=63$). Smoking (OR 2.7, 95% CI 1.2-5.9), history of previous aneurysms (3.9, 1.2-12.7), and familial history of aneurysms (3.5, 1.6-8.1) were significant risk factors for aneurysm at first screening. History of previous aneurysms was the only significant risk factor for aneurysms at follow-up screening (HR 4.5, 95% CI 1.1-18.7).

Conclusions: The benefit of long-term screening in individuals with a family history of aSAH is substantial up to and after 10 yr of follow-up and two initial negative screens.

- intracavernous aneurysms (CN III, IV, V₁, V₂, VI)
- distal embolization (e.g. amaurosis fugax)
- seizures
- H/A (without hemorrhage)
- incidental CT or angiography finding (asymptomatic)

Investigations

- CT angiogram (CTA), magnetic resonance angiography (MRA), cerebral angiogram

Treatment

- ruptured aneurysms
 - overall trend towards better outcome with early surgery or coiling (48-96 h after SAH)
 - treatment options: surgical placement of clip across aneurysm neck, trapping (clipping of proximal and distal vessels), thrombosing using Guglielmi detachable coils (coiling), wrapping (last resort)
 - choice of surgery vs. coiling not yet well defined, consider location, size, shape, and tortuosity of the aneurysm, patient comorbidities, age, and neurological condition. In general:
 - ♦ coiling: posterior > anterior circulation, deep/eloquent location, basilar artery bifurcation/apex, older age, presence of comorbidities, presence of vasospasm
 - ♦ clipping: superficial > deep, broad aneurysmal base, branching arteries at the aneurysm base, tortuosity/atherosclerosis of afferent vessels, dissection, hematoma, acute brainstem compression
- unruptured aneurysms
 - average 1% annual risk of rupture: risk dependent on size and location of aneurysm
 - no clear evidence on when to operate: need to weigh life expectancy
 - risk of morbidity/mortality of SAH (20%-50%) vs. surgical risk (2%-5%)
 - generally treat unruptured aneurysms >10 mm
 - consider treating when aneurysm 7-9 mm in middle-aged, younger patients or patients with a family history of aneurysms
 - follow smaller aneurysms with serial angiography

Development of the PHASES Score for Prediction of Risk of Rupture of Intracranial Aneurysms: A Pooled Analysis of Six Prospective Cohort Studies

Lancet Neurol 2014;13:59-66

Purpose: The construction of an algorithm for estimating 5 yr aneurysm rupture risk.

Study: Systematic review and analysis of patient data. 8,382 patients, 6 prospective cohort studies. Outcome was SAH.

Results: Predictors of aneurysm rupture were age, HTN, history of subarachnoid hemorrhage, aneurysm size, aneurysm location, and geographical region. In North America and European populations, the 5 yr risk of rupture ranged from 0.25% in individuals <70 yr without vascular risk factors and with ICA aneurysm <7 mm to >15% in patients ≥70 yr with HTN, a history of SAH, and >20 mm posterior circulation aneurysm. Finnish and Japanese people had a 3.6- and 2.8-fold higher risk of rupture, respectively, compared with North American and European populations.

Conclusions: The PHASES score may help to predict risk of rupture for incidental intracranial aneurysms.

Spetzler-Martin AVM Grading Scale

Item	Score
Size	
0.0-3.0 cm	1
3.1-6.0 cm	2
>6.0 cm	3
Location	
Non-eloquent	0
Eloquent	1
Deep Venous Drainage	
Not present	0
Present	1

AVM grades calculated by adding the 3 individual Spetzler-Martin Scale scores from the above table, e.g. a 2 cm tumor in noneloquent location without deep venous drainage = Grade I

Vascular Malformations

Types

- arteriovenous malformations (AVMs)
- cavernous malformations (= cavernomas, cavernous hemangiomas/angiomas)
- venous angioma
- capillary telangiectasias
- arteriovenous fistula (AVF) (carotid-cavernous fistula, dural AVF, vein of Galen aneurysm)
- "angiographically occult vascular malformations" (any type, 10% of malformations)

Arteriovenous Malformations

Definition

- tangle of abnormal vessels/arteriovenous shunts, with no intervening capillary beds or brain parenchyma; usually congenital

Epidemiology

- prevalence ~0.14%, M:F = 2:1, average age at diagnosis = 33 yr
- 15-20% of patients with hereditary hemorrhagic telangiectasia (Osler-Weber-Rendu syndrome) will have cerebral AVMs

Clinical Features

- hemorrhage (40-60%): small AVMs are more likely to bleed due to direct high pressure AV connections
- seizures (50%): more common with larger AVMs
- mass effect
- focal neurological signs secondary to ischemia (high flow → "steal phenomena")
- localized H/A, increased ICP
- bruit (especially with dural AVMs)
- may be asymptomatic ("silent")

Investigations

- MRI (flow void), MRA
- angiography (7% will also have one or more associated aneurysms)

Treatment

- decreases risk of future hemorrhage and seizure
 - surgical excision is treatment of choice
 - SRS (stereotactic radiosurgery) is preferred for small (<3 cm) or very deep lesions
 - endovascular embolization (glue, balloon) can be curative (5%) or used as adjuvant to surgery or SRS in larger lesions
- conservative (e.g. palliative embolization, seizure control if necessary)

Figure 19. MRI of cavernous malformation

A. T2 weighted imaging MRI

B. Gradient echo sequencing MRI

Prognosis

- 10% mortality, 30-50% morbidity (serious neurological deficit) per bleed
- risk of major bleed in untreated AVMs: 2-4% per year

Cavernous Malformations

- benign vascular hamartoma consisting of irregular sinusoidal vascular channels located within the brain without intervening neural tissue or associated large arteries/veins
- several genes now described: CCM1, CCM2, CCM3
- prevalence of 0.1-0.2%, both sporadic and hereditary forms described

Clinical Features

- seizures (60%), progressive neurological deficit (50%), hemorrhage (20%), H/A
- often an incidental finding
- hemorrhage risk less than AVM, usually minor bleeds

Investigations

- T2WI MRI (non-enhancing; see Figure 19) gradient echo sequencing (best for diagnosis)

Treatment

- surgical excision
 - only appropriate for symptomatic lesions that are surgically accessible (supratentorial lesions are less likely to bleed than infratentorial lesions)

**Untreated Clinical Course of Cerebral Cavernous Malformations: A Prospective, Population-Based Cohort Study**

Lancet Neurol 2012;11:217-224

Purpose: To determine whether or not the risk of hemorrhage and focal neurological deficits from cerebral cavernous malformations (CCMs) is influenced by factors such as sex and CCM location.

Methods: Population-based study to identify CCM diagnoses in residents of Scotland from 1999-2003. Primary outcome was a composite of intracranial hemorrhage and focal neurological deficit related to CCM.

Results: 139 patients with at least one CCM. The 5 yr risk of a first hemorrhage was lower than the risk of recurrent hemorrhage (2.4% vs. 29.5%; $p < 0.0001$) during 1,177 person yr of follow-up. For the primary outcome, the 5 yr risk of a first event was lower than the risk of recurrence (9.3% vs. 42.4%; $p < 0.0001$). The annual risk of recurrence of the primary outcome declined from 19.8% in yr 1 to 5.0% in yr 5 and was higher for women than men.

Conclusions: The risk of recurrent hemorrhage or focal neurological deficit from a CCM is greater than the risk of a first event, is greater for women, and declines over 5 yr.

EXTRACRANIAL PATHOLOGY**Approach to Limb/Back Pain**

- see [Orthopedics](#)

**Extradural Lesion**

Figure 20. Vascular supply of spinal cord

**RED FLAGS for Back Pain****BACK PAIN**

Bowel/Bladder (retention or incontinence)

Anesthesia (saddle)

Constitutional symptoms

Chronic disease

Parasthesia

Age >50 yr or <20 yr

IV drug use

Neuromotor deficits

Cauda Equina

- Urinary retention or incontinence, fecal incontinence or loss of anal sphincter tone, saddle anesthesia, uni/bilateral, leg weakness/pain

Malignancy

- Age >50 yr, previous Hx of cancer, pain unrelieved by bed rest, constitutional symptoms

Infection

- Increased ESR, IV drug use, immunosuppressed, fever

Compression Fracture

- Age >50 yr, trauma, prolonged steroid use

Root Compression

Differential Diagnosis

- herniated disc
- neoplasm (neurofibroma, schwannoma)
- synovial cyst, abscess
- hypertrophic bone/spur

Sensory Fibers

Fasciculus gracilis/cuneatus:
proprioception, fine touch, vibration
Spinothalamic tract: pain and temperature

Motor Fibers

Corticospinal tract: skilled movements

Cervical Disc Syndrome

Etiology

- nucleus pulposus herniates through annulus fibrosus and impinges upon nerve root, most commonly at C6-C7 (C7 root)

Clinical Features

- pain in arm follows nerve root distribution, worse with neck extension, ipsilateral rotation, and lateral flexion (all compress the ipsilateral neural foramen)
- LMN signs and symptoms
- central cervical disc protrusion causes myelopathy as well as nerve root deficits

Investigations

- if red flags: C-spine x-ray, CT, MRI (imaging of choice)
- only consider EMG, nerve conduction studies if diagnosis uncertain and presenting more as peripheral nerve issue.

Treatment

- conservative
 - no bedrest unless severe radicular symptoms
 - activity modification, patient education (reduce sitting, lifting)
 - physiotherapy, exercise programs focus on strengthening core muscles
 - analgesics, NSAIDs are more efficacious
 - avoid cervical manipulation, like traction
- surgical indications
 - anterior cervical discectomy is usual approach
 - intractable pain despite adequate conservative treatment for >3 mo
 - progressive neurological deficit

Prognosis

- 95% improve spontaneously in 4-8 wk

Disc herniations impinge the nerve root at the level below the interspace (i.e. C5-6 disc affects the C6 nerve root)

Table 10. Lateral Cervical Disc Syndromes

	C4-5	C5-6	C6-7	C7-T1
Root Involved	C5	C6	C7	C8
Incidence	2%	19%	69%	10%
Sensory	Shoulder	Thumb	Middle finger	Ring finger, 5th finger
Motor	Deltoid, biceps, supraspinatus	Biceps	Triceps	Digital flexors, intrinsic
Reflex	No change	Biceps, brachioradialis	Triceps	Finger jerk (Hoffmann's sign)

Cervical Stenosis (Cervical Spondylosis)

Definition

- cervical spondylosis is chronic disc degeneration and associated facet arthropathy
- resultant syndromes include mechanical neck pain, radiculopathy, myelopathy, and combinations

Epidemiology

- typically begins at age 40-50, M>F, most commonly at the C5-C6 > C6-C7 levels

Pathogenesis

- any of: disc degeneration/herniation, osteophyte formation, ossification, and hypertrophy of ligaments
- pathophysiology includes static compression, dynamic compression, and vascular compromise

Clinical Features

- insidious onset of mechanical neck pain exacerbated by excess vertebral motion (particularly rotation and lateral bending with a vertical compressive force – Spurling's test)
- occipital H/A is common
- radiculopathy may involve 1 or more roots, and symptoms include neck, shoulder and arm pain, paresthesias and numbness

- cervical myelopathy may be characterized by weakness (upper > lower extremity), decreased dexterity, and sensory changes
- UMN findings such as hyperreflexia, clonus, and Babinski reflex may be present
- most worrisome complaint is lower extremity weakness (corticospinal tracts)
- myelopathy may be associated with funicular pain, characterized by burning and stinging ± Lhermitte's sign (lightning-like sensation down the back with neck flexion)

Investigations

- x-ray of cervical spine ± flexion/extension (alignment, fractures)
- MRI most useful for determination of compression of the neural element
- CT is only used for better determination of bony anatomy (i.e. OPLL)
- EMG/nerve conduction studies reserved for peripheral nerve investigation

Treatment

- decompression and stabilization need to be included in the management
- NSAIDs, moist heat, strengthening and range of motion exercises, analgesics, cervical collar, cervical traction
- surgical indications: myelopathy with motor impairment, progressive neurologic impairment, intractable pain

Figure 21. T2-weighted MRI of lumbar disc herniation

Lumbar Disc Herniation: What are Reliable Criteria Indicative for Surgery?

Orthopedics 2009;32:589-597

- 1) The only clear indication for early surgery in LDH is cauda equina syndrome.
- 2) Pain may also be an indication for surgery. If conservative treatment is intended, it should be considered for at least 2 mo but not beyond 1 yr if the patient shows minimal improvement, since the beneficial effects of surgery will diminish after this period.
- 3) The type of herniation on MRI is not relevant to the decision of whether or not to operate on patients with LDH.
- 4) Although paresis is often a red flag symptom for patients with LDH, neither the magnitude nor the duration of paresis should be used as an indication for early surgery.

Magnetic Resonance Imaging in Follow-Up Assessment of Sciatica

NEJM 2013;368:999-1007

Background: Follow-up MRI is a controversial method for monitoring sciatica in patients with known lumbar-disc herniation.

Methods: Participants (n=283) were recruited from a simultaneous, parallel, randomized study comparing surgery and conservative care for sciatica (the Sciatica Trial). MRI and clinical assessment were undertaken pre-treatment and 1 yr post-treatment randomization to visualize disc herniation and evaluate outcome.

Results: At 1 yr, disc herniation was visible in 35% with a favorable outcome (complete, or nearly complete symptom resolution) and in 33% with an unfavorable outcome (p=0.70). A favorable outcome was reported in 85% of patients with disc herniation and 83% without disc herniation (p=0.70).

Conclusions: Anatomical abnormalities visible on repeated MRI 1 yr after treatment for sciatica due to lumbar-disc herniation could not distinguish patients with resolution of their symptoms from patients still experiencing symptoms.

Lumbar Disc Syndrome

Etiology

- posteriolaterally herniated disc compressed nerve root exiting **BELOW** the level of the disc or the traversing nerve root
- far lateral disc herniation compressed nerve root **AT** the level of the disc or the exiting nerve root
- central herniation causes cauda equina or lumbar stenosis (neurogenic claudication)

Clinical Features

- initially back pain, then leg pain > back pain
- limited back movement (especially forward flexion) due to pain
- motor weakness, dermatomal sensory changes, decreased reflexes
- exacerbation with valsalva; relief with flexing the knee or thigh
- nerve root tension signs
 - straight leg raise (SLR, Lasegue's test) or crossed SLR (pain should occur at less than 60 degrees) suggests L5, S1 root involvement
 - femoral stretch test suggests L2, L3, or L4 root involvement

Investigations

- MRI is modality of choice
- x-ray spine (only to rule out other lesions), CT (bony anatomy)
- myelogram and post-myelogram CT (only if MRI is contraindicated)

Treatment

- conservative (same as cervical disc disease)
- surgical indications
 - same as cervical disc + cauda equina syndrome

Prognosis

- 95% improve spontaneously within 4 to 8 wk
- do not follow patients with serial MRIs; clinical status is more important at guiding management

Table 11. Lateral Lumbar Disc Syndromes

	L3-4	L4-5	L5-S1
Root Involved	L4	L5	S1
Incidence	<10%	45%	45%
Pain	Femoral pattern	Sciatic pattern	Sciatic pattern
Sensory	Medial leg	Dorsal foot to hallux Lateral leg	Lateral foot
Motor	Tibialis anterior (dorsiflexion)	Extensor hallucis longus (hallux extension)	Gastrocnemius, soleus (plantar flexion)
Reflex	Knee jerk	Medial hamstrings	Ankle jerk

Table 12. Differentiating Conus Medullaris Syndrome from Cauda Equina Syndrome

	Conus Medullaris Syndrome	Cauda Equina Syndrome
Onset	Sudden, bilateral	Gradual, unilateral
Spontaneous Pain	Rare, if present usually bilateral, symmetric in perineum or thighs	Severe, radicular type: in perineum, thighs, legs, back, or bladder
Sensory Deficit	Saddle; bilateral and symmetric; sensory dissociation	Saddle; no sensory dissociation; may be unilateral and asymmetric
Motor Deficit	Symmetric; paresis less marked; fasciculations may be present	Asymmetric; paresis more marked; atrophy may be present; fasciculations rare
Reflexes	Only ankle jerk absent (preserved knee jerk)	Knee and ankle jerk may be absent
Autonomic Symptoms (bladder dysfunction, impotence, etc.)	Urinary retention and atonic anal sphincter prominent early; impotence frequent	Sphincter dysfunction presents late; impotence less frequent

Cauda Equina Syndrome

Etiology

- compression or irritation of lumbosacral nerve roots below conus medullaris (below L2 level)
- decreased space in the vertebral canal below L2
- common causes: herniated disc ± spinal stenosis, vertebral fracture, and tumor

Clinical Features

- usually acute (develops in less than 24 h); rarely subacute or chronic
- motor (LMN signs)
 - weakness/paraparesis in multiple root distribution
 - reduced deep tendon reflexes (knee or ankle)
- autonomic
 - urinary retention (or overflow incontinence) and/or fecal incontinence due to loss of anal sphincter tone
- sensory
 - low back pain radiating to legs (sciatica) aggravated by Valsalva maneuver and by sitting; relieved by lying down
 - bilateral sensory loss or pain: depends on the level affected
 - saddle area (S2-S5) anesthesia
 - sexual dysfunction (late finding)

Investigations

- urgent MRI to confirm compression of S2-S3-S4 nerve root by a large disc herniation
- post-void residual very helpful to determine if true retention is present; volumes controversial but anything over 250 cc in a healthy individual is cause for concerns

Treatment

- surgical decompression (<48 h) to preserve bowel, bladder, and sexual function, and/or to prevent progression to paraplegia

Prognosis

- markedly improves with surgical decompression
- recovery correlates with function at initial presentation: if patient is ambulatory, likely to continue to be ambulatory; if unable to walk, unlikely to walk after surgery

Lumbar Spinal Stenosis

Etiology

- congenital narrowing of spinal canal combined with degenerative changes (herniated disc, hypertrophied facet joints, and ligamentum flavum)

Clinical Features

- gradually progressive back and leg pain with standing and walking that is relieved by sitting or lying down (neurogenic claudication – 60% sensitive)
- neurologic exam may be normal, including straight leg raise test

Investigations

- MRI is the optimal investigation to confirm and localize the level of stenosis (unlike nerve root compression which can be localized with clinical exam)

Treatment

- conservative: NSAIDs, analgesia
- surgical: laminectomy with root decompression (the role of fusion may need to be considered if the amount of bone removed with the laminectomy results in de-stabilization)

Neurogenic Claudication

Etiology

- ischemia of lumbosacral nerve roots secondary to vascular compromise and increased demand from exertion, often associated with lumbar stenosis

Clinical Features

- dermatomal pain/paresthesia/weakness of buttock, hip, thigh, or leg initiated by standing or walking
- slow relief with postural changes (sitting >30 min), NOT simply exertion cessation
- induced by variable degrees of exercise or standing
- may be elicited with lumbar extension, but may not have any other neurological findings, no signs of vascular compromise (e.g. ulcers, poor capillary refill, etc.)

Investigations

- bicycle test may help distinguish neurogenic claudication (NC) from vascular claudication (the waist-flexed individuals on the bicycle with NC can last longer)

Treatment

- same as for lumbar spinal stenosis

Key Features of Neurogenic vs. Vascular Claudication

Neurogenic Claudication: dermatomal distribution with positional relief occurring over minutes

Vascular Claudication: sclerotomal distribution with relief occurring with rest over seconds

Intradural Intramedullary Lesions

Syringomyelia (Syrinx)

Definition

- cystic cavitation of the spinal cord
- presentation is highly variable, usually progresses over months to years
- initially pain, weakness; later atrophy and loss of pain and temperature sensation

Etiology

- 70% are associated with Chiari I malformation, 10% with basilar invagination
- post-traumatic
- tumor
- tethered cord

Clinical Features

- nonspecific features for any intramedullary spinal cord pathology
 - initially pain, weakness, atrophy, loss of pain and temperature in upper extremities (central syrinx) with progressive myelopathy over years
 - sensory loss with preserved touch and proprioception in a band-like distribution at the level of cervical syrinx
 - sensory loss with preserved touch and proprioception in a band-like distribution at the level of cervical syrinx
 - dysesthetic pain often occurs in the distribution of the sensory loss
 - LMN arm/hand weakness or wasting
 - painless neuropathic arthropathies (Charcot's joints), especially in the shoulder and neck due to loss of pain and temperature sensation

Investigations

- MRI is best method, myelogram with delayed CT

Treatment

- treat underlying cause (e.g. posterior fossa decompression for Chiari I, surgical removal of tumor if causing a syrinx)
- rarely does the syrinx need to be shunted, only when progressive and size allows for insertion of tube

Figure 22. T1 Weighted MRI of syringomyelia

Spinal Cord Syndromes

- spinal cord injury impairment classified according to ASIA score
- ASIA A: complete, no motor/sensory below neurological level including S4/5
- ASIA B: incomplete, sensory but not motor function preserved below neurological level including S4/5

Compartmentalize spinal cord syndromes anatomically by location

- ASIA C: incomplete, motor function preserved below neurological level, and more than half of the key muscles below neurological level have a muscle grade <3
- ASIA D: incomplete, motor function preserved below neurological level, and more than half of the key muscles below neurological level have a muscle grade 3 or more
- ASIA E: normal motor and sensory function

Complete Spinal Cord Lesion

- bilateral loss of motor/sensory and autonomic function at ≥ 4 segments below lesion/injury, with UMN signs
- about 3% of patients with complete injuries will develop some recovery within 24 h, beyond 24 h, no distal function will recover

Incomplete Spinal Cord Lesion

- any residual function at ≥ 4 segments below lesion
- signs include sensory/motor function in lower limbs and "sacral sparing" (perianal sensation, voluntary rectal sphincter contraction)

Table 13. Comparison Between Incomplete Spinal Cord Lesion Syndromes

Syndrome	Etiology	Motor	Sensory
Brown-Séquard	Hemisection of cord	Ipsilateral LMN weakness at the lesion Ipsilateral UMN weakness below the lesion	Ipsilateral loss of vibration and proprioception Contralateral loss of pain and temperature Preserved light touch
Anterior Cord	Anterior spinal artery compression or occlusion	Bilateral LMN weakness at the lesion Bilateral UMN weakness below the lesion Urinary retention	Preserved vibration and proprioception Bilateral loss of pain and temperature Preserved light touch
Central Cord (most common)	Syringomyelia, tumors, spinal hyperextension injury	Bilateral motor weakness: Upper limb weakness (LMN lesion) > Lower limb weakness (UMN lesion) Urinary retention	Variable bilateral suspended sensory loss Loss of pain and temperature > loss of vibration and proprioception
Posterior Cord	Posterior spinal artery infarction, trauma	Preserved	Bilateral loss of vibration, proprioception, light touch at and below the lesion Preserved pain and temperature

Figure 23. Spinal cord lesion syndromes

Peripheral Nerves

- see [Neurology, N35](#)

Seddon's Classification of Peripheral Nerve Injury

- class I: **neurapraxia** – axon structurally intact but fails to function; recovery within hours to months (average 6-8 wk)
- class II: **axonotmesis** – axon and myelin sheath disrupted but endoneurium and supporting structures intact → Wallerian degeneration of axon segment distal to injury → spontaneous axonal recovery at 1 mm/d, max at 1-2 yr
- class III: **neurotmesis** – nerve completely transected, need surgical repair for possibility of recovery
- etiologies: ischemia, nerve entrapment – nerve compressed by nearby anatomic structures, often secondary to localized, repetitive mechanical trauma with additional vascular injury to nerve

Investigations

- neurological exam (power, sensation, reflexes), localization via Tinel's sign (paresthesias elicited by tapping along the course of a nerve)
- electrophysiological studies (EMG, nerve conduction study) may be helpful in assessing nerve integrity and monitoring recovery, not helpful until 2-3 wk post-injury
- labs: blood work, CSF
- imaging: C-spine, chest/bone x-rays, myelogram, CT, magnetic resonance neurography
- angiogram if vascular damage is suspected

Treatment

- early neurosurgical consultation if injury is suspected
- entrapment
 - conservative: prevent repeated stress/injury, physiotherapy, NSAIDs, local anesthesia/steroid injection
 - surgical: nerve decompression ± transposition for progressive deficits, muscle weakness/atrophy, failure of medical management
- stretch/contusion
 - follow-up clinically for recovery; exploration if no recovery in 3 mo
- axonotmesis
 - if no evidence of recovery, resect damaged segment

Figure 24. Peripheral nerve structure

- prompt physical therapy and rehabilitation to increase muscle function, maintain joint range of motion, and maximize return of useful function
- recovery usually incomplete
- neurotmesis
 - surgical repair of nerve sheath unless known to be intact (suture nerve sheaths directly if ends approximate or nerve graft [usually sural nerve])
 - clean laceration: early exploration and repair
 - contamination or associated injuries: tag initially with nonabsorbable suture, reapproach within 10 d

Complications

- neuropathic pain: with neuroma formation
- complex regional pain syndrome: with sympathetic nervous system involvement

SPECIALTY TOPICS

Neurotrauma

Trauma Management (see [Emergency Medicine, ER7](#))

Indications for Intubation in Trauma

1. depressed LOC (patient cannot protect airway): usually GCS ≤ 8
2. need for hyperventilation
3. severe maxillofacial trauma: patency of airway is doubtful
4. need for pharmacologic paralysis for evaluation or management
 - if basal skull fracture suspected, avoid nasotracheal intubation as may inadvertently enter brain
 - note: intubation prevents patient's ability to verbalize for determining GCS

Trauma Assessment

INITIAL MANAGEMENT

ABCs of Trauma Management

- see [Emergency Medicine, ER2](#)

NEUROLOGICAL ASSESSMENT

Mini-History

- period of LOC, post-traumatic amnesia, loss of sensation/function, type of injury/accident

Neurological Exam

- GCS
- head and neck (lacerations, bruises, basal skull fracture signs, facial fractures, foreign bodies)
- spine (palpable deformity, midline pain/tenderness)
- eyes (pupillary size and reactivity)
- brainstem (breathing pattern, CN palsies)
- cranial nerve exam
- motor exam, sensory exam (only if GCS is 15), reflexes
- sphincter tone
- record and repeat neurological exam at regular intervals

Investigations

- spinal injury precautions (cervical collar) are continued until C-spine is cleared
- C,T,L-spine x-rays
 - AP, lateral, odontoid views for C-spine (must see from C1 to T1; swimmer's view if necessary) or CT
 - rarely done: oblique views looking for pars interarticularis fracture ("Scottie dog" sign)
- CT head and upper C-spine (whole C-spine if patient unconscious) look for fractures, loss of mastoid or sinus air spaces, blood in cisterns, pneumocephalus
- cross and type, ABG, CBC, drug screen (especially alcohol)
- chest and pelvic x-ray as indicated

TREATMENT

Treatment for Minor Head Injury

- observation over 24-48 h
- wake every hour
- judicious use of sedatives or pain killers during monitoring period

Glasgow Coma Scale

Eye Response	Verbal Response	Motor Response
4 spontaneous	5 oriented	6 obeys commands
3 opens eyes to voice	4 confused	5 localizes to pain
2 opens eyes to pain	3 inappropriate words	4 withdraws from pain
1 no eye opening	2 incomprehensible sounds	3 flexion to pain (decorticate posturing)
	1 no response	2 extension to pain (decerebrate posturing)
	T intubated	1 no response

Best response for each component recorded individually (e.g. E3V3M5)
 ≥ 13 is mild injury; 9-12 is moderate injury; ≤ 8 is severe injury

Assessment of Spine CT/X-Ray (Parasagittal View)

ABCDs

Alignment (columns: anterior vertebral line, posterior vertebral line, spinolaminar line, posterior spinous line)
Bone (vertebral bodies, facets, spinous processes)
Cartilage
Disc (disc space and interspinous space)
Soft tissues

- Never do lumbar puncture in head injury unless increased ICP has been ruled out
- All patients with head injury have C-spine injury until proven otherwise
- Suspect hematoma in alcoholic-related injuries
- Low BP after head injury means injury elsewhere
- Must clear spine both radiologically AND clinically

Comparative Effectiveness of Using Computed Tomography Alone to Exclude Cervical Spine Injuries in Obtunded or Intubated Patients: Meta-Analysis of 14,327 Patients with Blunt Trauma

J Neurosurg 2011;115:541-549

Purpose: To determine the effectiveness of helical CT alone (vs. CT and adjunct imaging such as MR) to diagnose acute unstable cervical spine injury following blunt trauma.

Results: 17 studies with 14,327 patients total. Sensitivity and specificity for modern CT were both $>99.9\%$ (95% CI 0.99-1.00 for both). The negative predictive value of a normal CT scan was 100% (95% CI 0.96-1.00) and accuracy was not affected by the global severity of injury, CT slice thickness, or study quality.

Conclusions: CT alone is sufficient to detect unstable cervical spine injuries in trauma patients and adjunct imaging is unnecessary with a negative CT scan result. Consequently, if a CT scan is negative for acute injury, the cervical collar may be removed from obtunded or intubated trauma patients.

Treatment for Severe Head Injury (GCS ≤ 8)

- clear airway and ensure breathing (if GCS ≤ 8 , intubate)
- secure C-spine
- maintain adequate BP
- monitor for clinical deterioration
- monitor and manage increased ICP if present (see *Herniation Syndromes*, NS6)

Admission required if:

- skull fracture (indirect signs of basal skull fracture, see *Head Injury*)
- confusion, impaired consciousness, concussion with >5 min amnesia
- focal neurological signs, extreme H/A, vomiting, seizures
- unstable spine
- use of alcohol
- poor social support

Head Injury

Epidemiology

- M:F = 2-3:1

Pathogenesis

- acceleration/deceleration: contusions, subdural hematoma, axon and vessel shearing/mesencephalic hematoma
- impact: skull fracture, concussion, epidural hematoma
- penetrating: worse with high velocity and/or high missile mass
 - low velocity: highest damage to structures on entry/exit path
 - high velocity: highest damage away from missile tract

Scalp Injury

- rich blood supply
- considerable blood loss (vessels contract poorly when ruptured)
- minimal risk of infection due to rich vascularity

Skull Fractures

- depressed fractures: double density on skull x-ray (outer table of depressed segment below inner table of skull), CT with bone window is gold standard
- simple fractures (closed injury): no need for antibiotics, no surgery
- compound fractures (open injury): increased risk of infection, surgical debridement within 24 h is necessary
 - internal fractures into sinus may lead to meningitis, pneumocephalus
 - risk of operative bleed may limit treatment to antibiotics
- basal skull fractures: not readily seen on x-ray, rely on clinical signs
 - retroauricular ecchymoses (Battle's sign)
 - periorbital ecchymoses (raccoon eyes)
 - hemotympanum
 - CSF rhinorrhea, otorrhea (suspect CSF if halo or target sign present); suspect with Lefort II/III midface fracture

Cranial Nerve Injury

- most traumatic causes of cranial nerve injury do not warrant surgical intervention
- surgical intervention
 - CN II: local eye/orbit injury
 - CN III, IV, VI: if herniation secondary to mass
 - CN VIII: repair of ossicles
- CN injuries that improve
 - CN I: recovery may occur in a few months; most do not improve
 - CN III, IV, VI: majority recover
 - CN VII: recovery with delayed lesions
 - CN VIII: vestibular symptoms improve over weeks, deafness usually permanent (except when resulting from hemotympanum)

Arterial Injury

- e.g. carotid-cavernous (C-C) fistula, carotid/vertebral artery dissection

Intracranial Bleeding

- see *Blood*, NS15 and *Cerebrovascular Disease*, NS17

**The Canadian CT Head Rule for Patients with Minor Head Injury**

Lancet 2001;357:1391-1396

CT Head is only required for patients with minor head injuries with any one of the following:

High Risk (for neurological intervention)

- GCS score <15 at 2 h after injury.
- Suspected open or depressed skull fracture.
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, cerebrosplinal fluid otorrhea/rhinorrhea, Battle's sign).
- Vomiting ≥ 2 episodes.
- Age ≥ 65 yr.

Medium Risk (for brain injury on CT)

- Amnesia after impact >30 min.
- Dangerous mechanism (pedestrian struck by motor vehicle, occupant ejected from motor vehicle, fall from height >3 feet or five stairs).

Minor Head Injury is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

**A Trial of Intracranial-Pressure Monitoring in Traumatic Brain Injury**

NEJM 2012;367:2471-2481

Background: ICP monitoring is frequently used to monitor severe traumatic brain injury, but controversy exists over whether it is beneficial.

Methods: Study sample ($n=324$ patients, ≥ 13 yr) consisted of those who had severe traumatic brain injury and were being treated in ICU in Bolivia or Ecuador. Patients were randomly assigned to one management group:

1. ICP-monitoring based management.
2. Management based on imaging and clinical examination.

Primary outcome was a composite of survival time, impaired consciousness, functional status (at 3, 6 mo), and neuropsychological status (at 6 mo).

Results: No significant difference between management groups based on primary outcome, 6-mo mortality, median length of ICU stay, or occurrence of serious adverse events. However, duration of brain-specific treatments (e.g. use of hyperosmolar fluids or hyperventilation) higher in the imaging-clinical examination group (4.8 d vs. 3.4 d, $p=0.002$).

Conclusion: Maintaining monitored ICP at 20 mmHg or less is not superior to care based on imaging and clinical examination.

Brain Injury

Primary Impact Injury

- mechanism of injury determines pathology: penetrating injuries, direct impact
 - low velocity: local damage
 - high velocity: distant damage possible (due to wave of compression), concussion
- concussion**: a trauma-induced alteration in mental status
 - American Academy of Neurology (AAN) Classification
 - no parenchymal abnormalities on CT
- coup** (damage at site of blow) and **contrecoup** (damage at opposite site of blow)
 - acute decompression causes cavitation followed by a wave of acute compression
- contusion** (hemorrhagic)
 - high density areas on CT \pm mass effect
 - commonly occurs with brain impact on bony prominences (inferior frontal lobe, pole of temporal lobe)
- diffuse axonal injury/shearing**
 - wide variety of damage results
 - may tear blood vessels (hemorrhagic foci)
 - often the cause of decreased LOC if no space-occupying lesion on CT

Secondary Pathologic Processes

- same subsequent biochemical pathways for each traumatic etiology
- delayed and progressive injury to the brain due to
 - high glutamate release \rightarrow NMDA receptor activation \rightarrow cytotoxic cascade
 - cerebral edema
 - intracranial hemorrhages
 - ischemia/infarction
 - raised ICP, intracranial HTN
 - hydrocephalus

Extracranial Conditions

- hypoxemia
 - due to trauma to the chest, upper airway, brainstem
 - extremely damaging to vulnerable brain cells
 - leads to ischemia, raised ICP
- hypercarbia
 - leads to raised ICP (secondary to vasodilation)
- systemic hypotension
 - caused by blood loss (e.g. ruptured spleen)
 - loss of cerebral autoregulation leads to decreased CPP, ischemia
- hyperpyrexia
 - leads to increased brain metabolic demands \rightarrow ischemia
- fluid and electrolyte imbalance
 - iatrogenic (most common)
 - SIADH caused by head injury
 - diabetes insipidus (DI)
 - may lead to cerebral edema and raised ICP
- coagulopathy

Intracranial Conditions

- raised ICP due to traumatic cerebral edema OR traumatic intracranial hemorrhage

Brain Injury Outcomes

- mildly traumatic (GCS 13-15): post-concussive symptoms: H/A, fatigue, dizziness, nausea, blurred vision, diplopia, memory impairment, tinnitus, irritability, low concentration; 50% at 6 wk, 14% at 1 yr
- moderately traumatic (GCS 9-12): proportional to age (>40) and CT findings; 60% good recovery, 26% moderately disabled, 7% severely disabled, 7% vegetative/dead
- severe (GCS ≤ 8): difficult to predict, correlates with post-resuscitation GCS (especially motor) and age

AAN Classification

Grade 1: altered mental status < 15 min
 Grade 2: altered mental status > 15 min
 Grade 3: any loss of consciousness

Figure 25. CT showing coup-contrecoup injury

SIADH \rightarrow hyponatremia
 DI \rightarrow hypernatremia

Management Associated with AAN Concussion Grades

AAN Grade	Management Options
1	<ul style="list-style-type: none"> Examine 15 min for amnesia and other symptoms Return to normal activity if symptoms clear within 15 min
2	<ul style="list-style-type: none"> Remove from activity for 1 d, then re-examine CT or MRI if H/A or other symptoms worsen or last > 1 wk Return to normal activity after 1 wk without symptoms
3	<ul style="list-style-type: none"> Emergent neurological exam + imaging; if initial exam is normal, may go home with close follow-up Admit if any signs of pathology or persistent abnormal mental status CT or MRI if H/A or other symptoms If brief loss of consciousness (< 1 min), return to normal activity after 1 wk without symptoms If prolonged loss of consciousness (> 1 min), return to normal activity only after 2 wk without symptoms

Late Complications of Head/Brain Injury

- seizures: 5% of head injury patients develop seizures
 - incidence related to severity and location of injury (increased with local brain damage or intracranial hemorrhage)
 - post-traumatic seizure may be immediate, early, or late
 - presence of early (within first wk) post-traumatic seizure raises incidence of late seizures

- meningitis: associated with CSF leak from nose or ear
- hydrocephalus: acute hydrocephalus or delayed normal pressure hydrocephalus (NPH)

Spinal Cord Injury

- see [Orthopedics](#), OR21 and [Emergency Medicine](#), ER9

Neurogenic and Spinal Shock

1. neurogenic shock: hypotension that follows SCI (sBP usually ≤ 80 mmHg) caused by:
 - interruption of sympathetics (unopposed parasympathetics) below the level of injury
 - loss of muscle tone due to skeletal muscle paralysis below level of injury \rightarrow venous pooling (relative hypovolemia)
 - blood loss from associated wounds (true hypovolemia)
2. spinal shock: transient loss of all neurologic function below the level of the spinal cord injury, causing flaccid paralysis and areflexia for variable periods

Whiplash-Associated Disorders

- definition: traumatic injury to the soft tissue structures in the region of the cervical spine due to hyperflexion, hyperextension, or rotational injury to the neck

Initial Management of SCI

- major causes of death in SCI are aspiration and shock
- the following patients should be treated as having a SCI until proven otherwise:
 - all victims of significant trauma
 - minor trauma patients with decreased LOC or complaints of neck or back pain, weakness, abdominal breathing, numbness/tingling, or priapism

Stabilization and Initial Evaluation in the Hospital

1. ABCs, immobilization (backboard/head strap), oxygenation, Foley catheter to urometer, temperature regulation
2. hypotension: maintain sBP >90 mmHg with pressors (dopamine), hydration, and atropine
 - DVT prophylaxis
3. monitor CBC/electrolytes
4. focused history (see [Trauma Assessment](#), NS29)
5. spine palpation: point tenderness or deformity
6. motor level assessment (including rectal exam for voluntary anal sphincter contraction)
7. sensory level assessment: pinprick, light touch, and proprioception
8. evaluation of reflexes
9. signs of autonomic dysfunction: altered level of perspiration, bowel or bladder incontinence, priapism
10. radiographic evaluation
 - 3 views C-spine x-rays (AP, lateral, and odontoid) to adequately visualize C1 to C7-T1 junction
 - flexion-extension views to disclose occult instability
 - CT scan (bony injuries) typically most trauma centers use CT as the modality of choice for looking at fractures, very sensitive with the high resolution scanners
 - MRI mandatory if neurological deficits (soft tissue injuries)

Medical Management Specific to SCI

- option: methylprednisolone (given within 8 h of injury) this is controversial and you need to confer with Neurosurgery service
- \pm decompression in acute, non-penetrating SCI

Pharmacological Therapy for Acute Spinal Cord Injury: Congress of Neurological Surgeons (CNS) and American Association of Neurological Surgeons (AANS) Guidelines

Neurosurgery 2013;72(Suppl 2):93-105

Level I Recommendations

- No Class I or Class II medical evidence supports the use of methylprednisone in the treatment of acute SCI. Several Class II and Class III studies have been published stating inconsistent effects of methylprednisone likely related to random chance or selection bias.
- Administration of GM-1 ganglioside (Sygen) for the treatment of acute SCI is not recommended.

Early vs. Delayed Decompression for Traumatic Cervical Spinal Cord Injury: Results of the Surgical Timing in Acute Spinal Cord Injury Study (STASCIS)

PLoS ONE 2012;7:e32037. doi:10.1371/journal.pone.0032037

Introduction: This study sought to determine the relative effectiveness of early (<24 h after injury) vs. late (≥ 24 h after injury) decompressive surgery following a traumatic cervical spinal cord injury (SCI).

Methods/Population: A prospective cohort study completed in 2002-2009 involving 6 North American institutions. Participants were 16-80 yr of age with a cervical SCI. Outcomes evaluated were changes in American Spinal Injury Association Impairment Scale (AIS) grade at 6 mo follow-up, complications, and mortality.

Results: Of 313 participants enrolled, 182 underwent early surgery and 131 underwent late surgery. 222 participants were available for follow-up at 6 mo. The odds of at least 2 grade AIS improvement were greater for those who had early surgery compared to those with late surgery (OR = 2.83, 95% CI 1.10, 7.28). Mortality was observed for each group during the first 30 d post injury. No statistically significant differences were observed for complications ($p=0.21$).

Conclusion: Early decompression surgery following a SCI is safe and associated with higher AIS improvement at 6 mo following injury.

Fractures of the Spine

FRACTURES AND FRACTURE-DISLOCATIONS OF THE THORACIC AND LUMBAR SPINE

- assess ligamentous instability using flexion/extension x-ray views of C-spine \pm MRI
- thoracolumbar spine unstable if 4/6 segments disrupted (3 columns divided into left and right)
 - anterior column: anterior half of vertebral body, disc, and anterior longitudinal ligament
 - middle column: posterior half of vertebral body, disc, and posterior longitudinal ligament
 - posterior column: posterior arch, facet joints, pedicle, lamina and supraspinous, interspinous, and ligamentum flavum ligaments

Types of Injury (Denis Classification)

- **compression fracture**
 - produced by flexion

- posterior ligament complex (supraspinous and interspinous ligaments, ligamentum flavum, and intervertebral joint capsules) remain intact
- fractures are stable but lead to kyphotic deformity
- **burst fracture**
 - stable: anterior and middle columns parted with bone retropulsed nearby
 - ♦ hallmark is pedicle widening on AP x-ray
 - ♦ spinal cord (seen on x-ray and CT); posterior column is uninjured
 - unstable: same as the stable but with posterior column disruption (usually ligamentous)
- **flexion distraction injury**
 - hyperflexion and distraction of posterior elements
 - ♦ middle and posterior columns fail in distraction
 - classic: Chance = horizontal fracture through posterior arch, pedicles, posterior vertebral body
 - can be purely ligamentous, i.e. through PLL and disc
- **fracture-dislocation**
 - anterior and cranial dislocation of superior vertebral body → 3 column failure
 - three types:
 - ♦ flexion-rotation
 - ♦ flexion-distraction
 - ♦ shear/hyperextension (rare)

Management of Thoracolumbar Injury

- management based on TLICS classification

FRACTURES OF THE CERVICAL SPINE

Types of Injury

- C1 vertebral fracture (Jefferson fracture)
 - vertical compression forces the occipital condyles of the skull down on the C1 vertebra (atlas), pushing the lateral masses of the atlas outward and disrupting the ring of the atlas
 - also can cause an occipital condylar fracture
- odontoid process fracture
 - causes C1 and odontoid of C2 to move independently of C2 body
 - this occurs because
 - ♦ normally C1 vertebra and odontoid of C2 are a single functional unit
 - ♦ alar and transverse ligaments on posterior aspect of odontoid most commonly remain intact following injury
 - patients often report a feeling of instability and present holding their head with their hands
- C2 vertebral fracture (hangman fracture, traumatic spondylolisthesis of axis):
 - bilateral fracture through the pars interarticularis of C2 with subluxation of C2 on C3
 - usually neurologically intact
- Clay-Shoveler fracture
 - avulsion of spinous process, usually C6 or C7

Imaging

- AP spine x-ray (open-mouth and lateral view), CT

Treatment

- immobilization in cervical collar or halo vest until healing occurs (usually 2-3 mo)
- Type II and III odontoid fractures
 - consider surgical fixation for comminution, displacement, or inability to maintain alignment with external immobilization
 - confirm stability after recovery with flexion-extension x-rays

TLICS Scoring

Parameter	Points
Morphology	
Compression fracture	1
Burst fracture	2
Translational/rotational fracture	3
Distraction	4
Neurologic Status	
Intact	0
Nerve root injury	2
Spinal Cord Status	
Incomplete	3
Complete	2
Cauda equine	3
Posterior Ligamentous Complex	
Intact	0
Injury suspected/indeterminate	2
Injured	3

- TLICS scoring based on morphology of injury, status of posterior ligamentous complex, and neurological status
- Non-operative management if TLICS = 0-3, operative management if TLICS = 5+, either operative or non-operative if TLICS = 4

Type 1

Type 2

Type 3

© Hidenori Miyagawa 2006

Figure 26. Odontoid fracture classification

Neurologically Determined Death

Definition

- irreversible and diffuse brain injury resulting in absence of clinical brain function
- cardiovascular activity may persist for up to 2 wk

Criteria of Diagnosis

- prerequisites: no CNS depressant drugs/neuromuscular blocking agents, no drug intoxication/poisoning, temperature >32°C, no electrolyte/acid-base/endocrine disturbance
- absent brainstem reflexes
 - absent pupillary light reflex
 - absent corneal reflexes
 - absent oculoccephalic response
 - absent caloric responses (e.g. no deviation of eyes to irrigation of each ear with 50 cc of ice water – allow 1 min after injection, 5 min between sides)

- absent pharyngeal and tracheal reflexes
- absent cough with tracheal suctioning
- absent respiratory drive at $\text{PaCO}_2 > 60$ mmHg or > 20 mmHg above baseline (apnea test)
- 2 evaluations separated by time, usually performed by two specialists (e.g. anesthetist, neurologist, neurosurgeon)
- confirmatory testing: flat EEG, absent perfusion assessed with cerebral angiogram

Coma

Definition

- an unrousable state in which patients show no meaningful response to environmental stimuli

Pathophysiology

- lesions affecting the cerebral cortex bilaterally, the reticular activating system (RAS) or their connecting fibers
- focal supratentorial lesions do not alter consciousness except by herniation (compression on the brainstem or on the contralateral hemisphere) or by precipitating seizures

Classification

- structural lesions (tumor, pus, blood, infarction, CSF): 1/3 of comas
 - supratentorial mass lesion: leads to herniation
 - infratentorial lesion: compression of or direct damage to the RAS or its projections
- metabolic disorders/diffuse hemispheric damage: 2/3 of comas
 - deficiency of essential substrates (e.g. oxygen, glucose, vitamin B_{12})
 - exogenous toxins (e.g. drugs, heavy metals, solvents)
 - endogenous toxins/systemic metabolic diseases (e.g. uremia, hepatic encephalopathy, electrolyte imbalances, thyroid storm)
 - infections (meningitis, encephalitis)
 - trauma (concussion, diffuse shear axonal damage)

Investigations and Management

- ABCs
- labs: electrolytes, extended electrolytes, TSH, LFTs, Cr, BUN, toxin screen, glucose
- CT/MRI, LP, EEG

Persistent Vegetative State

Definition

- a condition of complete unawareness of the self and the environment accompanied by sleep-wake cycles with either complete or partial preservation of hypothalamic and brainstem autonomic function
- “awake but not aware”
- follows comatose state

Etiology/Prognosis

- most commonly caused by cardiac arrest or head injury
- due to irreversible loss of cerebral cortical function but intact brainstem function
- average life expectancy is 2-5 yr

Pediatric Neurosurgery

Spinal Dysraphism

SPINA BIFIDA OCCULTA

Definition

- congenital absence of a spinous process and a variable amount of lamina
- no visible exposure of meninges or neural tissue

Epidemiology

- 15-20% of the general population; most common at L5 or S1

Etiology

- failure of fusion of the posterior neural arch

Figure 27. Spina bifida occulta

Clinical Features

- no obvious clinical signs
- presence of lumbosacral cutaneous abnormalities (dimple, sinus, port-wine stain, or hair tuft) should increase suspicion of an underlying anomaly (lipoma, dermoid, diastematomyelia)

Investigations

- plain film: absence of the spinous process along with minor amounts of the neural arch
- U/S, MRI to exclude spinal anomalies

Treatment

- requires no treatment

MENINGOCELE (SPINA BIFIDA APERTA)**Definition**

- herniation of meningeal tissue and CSF through a defect in the spine, without associated herniation of neural tissue

Etiology

- primary failure of neural tube closure

Clinical Features

- most common in lumbosacral area
- usually no disability, low incidence of associated anomalies, and hydrocephalus

Investigations

- plain films, CT, MRI, U/S, echo, GU investigations

Treatment

- surgical excision and tissue repair (excellent results)

**Figure 28. Meningocele****MYELOMENINGOCELE (SPINA BIFIDA APERTA)****Definition**

- herniation of meningeal and CNS tissue through a defect in the spine

Etiology

- same as meningocele

Clinical Features

- sensory and motor changes distal to anatomic level producing varying degrees of weakness
- urinary and fecal incontinence
- 65-85% of patients with myelomeningocele have hydrocephalus
- most have Type II Chiari malformation (see *Chiari Malformations*, NS36)

Investigations

- plain films, CT, MRI, U/S, echo, GU investigations

Treatment

- surgical closure to preserve neurologic status and prevent CNS infections
- closure *in utero* shown to decrease hydrocephalus and improve post natal motor scores

Prognosis

- operative mortality close to 0%, 95% 2 yr survival
- 80% have IQ >80 (but most are 80-95), 40-85% ambulatory, 3-10% have normal urinary continence
- early mortality usually due to Chiari malformation complications (respiratory arrest and aspiration), whereas late mortality is due to shunt malfunction

**Figure 29. Myelomeningocele****Intraventricular Hemorrhage**

- see [Pediatrics](#), P72

Hydrocephalus in Pediatrics

Etiology

- congenital
 - aqueductal anomalies, primary aqueductal stenosis in infancy
 - secondary gliosis due to intrauterine viral infections (mumps, varicella, TORCH)
 - Dandy-Walker malformation (2-4%)
 - Chiari malformation, especially Type II
 - myelomeningocele
- acquired
 - post meningitis
 - post hemorrhage (SAH, IVH)
 - masses (vascular malformation, neoplastic)

Clinical Features

- symptoms and signs of hydrocephalus are age related in pediatrics
- increased head circumference (HC), bulging anterior fontanelle, widened cranial sutures
- irritability, lethargy, poor feeding, and vomiting
- “cracked pot” sound on cranial percussion
- scalp vein dilation (increased collateral venous drainage)
- sunset sign – forced downward deviation of eyes
- episodic bradycardia and apnea

Investigations

- skull x-ray, U/S, CT, MRI, ICP monitoring

Treatment

- similar to adults (see *Hydrocephalus*, NS7)

Dandy-Walker Malformation

Definition

- atresia of foramina of Magendie and Luschka, resulting in
 - complete or incomplete agenesis of the cerebellar vermis with widely separated, hypoplastic cerebellar hemispheres
 - posterior fossa cyst, enlarged posterior fossa
 - dilatation of 4th ventricle (also 3rd and lateral ventricles)
- associated anomalies
 - hydrocephalus (90%)
 - agenesis of corpus callosum (17%)
 - occipital encephalocele (7%)

Epidemiology

- 2-4% of pediatric hydrocephalus

Clinical Features

- 20% are asymptomatic, seizures occur in 15%
- symptoms and signs of hydrocephalus combined with a prominent occiput in infancy
- ataxia, spasticity, poor fine motor control common in childhood

Investigations

- ultrasound, CT, MRI

Treatment

- asymptomatic patients require no treatment
- associated hydrocephalus requires surgical treatment
 - e.g. ventriculoperitoneal (VP) shunt, cystoperitoneal (CP) shunt, lumboperitoneal (LP) shunt, ventriculoatrial (VA) shunt, lumbar drain

Prognosis

- 75-100% survival, 50% have normal IQ

Chiari Malformations

Definition

- malformations at the medullary-spinal junction

Etiology

- unclear, likely maldevelopment/dysgenesis during fetal life

Categories

- Type I (cerebellar ectopia)
 - definition: cerebellar tonsils lie below the level of the foramen magnum
 - epidemiology: average age at presentation 15 yr
 - clinical features:
 - ♦ many are asymptomatic
 - ♦ scoliosis
 - ♦ brain compression
 - ♦ central cord syndrome (65%)
 - ♦ syringomyelia (50%)
 - ♦ foramen magnum compression syndrome (22%)
 - ♦ cerebellar syndrome (11%)
 - ♦ hydrocephalus (10%)
- Type II
 - definition: part of cerebellar vermis, medulla, and 4th ventricle extend through the foramen magnum often to midcervical region
 - almost always associated with a myelomeningocele
 - epidemiology: present in infancy
 - clinical features: findings due to brainstem and lower cranial nerve dysfunction
 - syringomyelia, hydrocephalus in >80%

Figure 30. Chiari malformations

Investigations

- MRI

Treatment

- indications for surgical decompression
 - Type I: symptomatic patients (early surgery recommended; <2 yr post symptom onset) → suboccipital craniectomy, duraplasty
 - Type II: neurogenic dysphagia, stridor, apneic spells → cervical laminectomy, duraplasty

Craniosynostosis

Definition

- premature closure of the cranial suture(s)

Classification

- sagittal (most common): long narrow head with ridging sagittal suture (scaphocephaly)
- coronal: expansion in superior and lateral direction (brachiocephaly)
- metopic (trigonocephaly)
- lambdoid: least common

Epidemiology

- 0.6/1,000 live births, most cases are sporadic; familial incidence is 2% of sagittal and 8% of coronal synostosis

Clinical Features

- skull deformity, raised ICP ± hydrocephalus
- ophthalmologic problems due to increased ICP or bony abnormalities of the orbit
- must differentiate between positional plagiocephaly (secondary to back sleeping)

Investigations

- plain radiographs, CT scan

Treatment

- parental counseling about nature of deformity, associated neurological symptoms
- surgery for cosmetic purposes, except in cases of elevated ICP (≥2 sutures involved)

Pediatric Brain Tumors

- see *Tumors*, NS10

Epidemiology

- 20% of all pediatric cancers (second only to leukemia)
- 60% of pediatric brain tumors are infratentorial
- pediatric brain tumors arise from various cellular lineages
 - glia: low-grade astrocytoma (supra- or infratentorial), anaplastic astrocytoma, glioblastoma multiforme (largely supratentorial) (see *Astrocytoma*, NS12)
 - primitive nerve cells: supratentorial PNET
 - ♦ 90% of neonatal brain tumors, infratentorial (medulloblastoma), pineal gland (pineoblastoma)
 - non-neuronal cells: germ cell tumor, craniopharyngioma, dermoid, meningioma, neurinoma (schwannoma), pituitary adenoma, others

Clinical Features

- vomiting, seizure, macrocrania, hydrocephalus
- developmental delay, poor feeding, failure to thrive
- often initially escapes diagnosis due to expansile cranium and neural plasticity in children

Table 14. Overview of Childhood Primary Brain Tumors

Pilocytic (low grade) Astrocytoma	<ul style="list-style-type: none"> • Usually in posterior fossa • Well circumscribed • Benign, good prognosis
Medulloblastoma	<ul style="list-style-type: none"> • A primitive neuroectodermal tumor (PNET) • In cerebellum → compresses 4th ventricle → hydrocephalus • Highly malignant
Ependymoma	<ul style="list-style-type: none"> • In 4th ventricle → hydrocephalus • Poor prognosis
Hemangioblastoma	<ul style="list-style-type: none"> • Often cerebellar • Associated with von Hippel-Lindau syndrome with retinal angiomas • Can produce EPO → secondary polycythemia
Craniopharyngioma	<ul style="list-style-type: none"> • Causes bitemporal hemianopsia (thus often confused with pituitary adenoma) • Most common supratentorial childhood tumor • Benign

Most Common Pediatric Brain Tumors

Astrocytoma, low grade
Supratentorial
Infratentorial
Medulloblastoma
Ependymoma
Glioblastoma

Functional Neurosurgery

Movement Disorders

- see [Neurology](#), *Tremor*, *Parkinson's Disease*, *Dystonia*, and *Multiple Sclerosis* sections in, N28, N30, N32, N52, respectively

Table 15. Surgical Targets for Movement Disorders

Disorder	Indications	Procedures	Outcomes	Morbidity
Parkinson's Disease	Intractable contralateral bradykinesia/tremor Failure of medical management (advanced disease) Drug-induced dyskinesias (see dystonia, below)	Simultaneous, bilateral surgery/stimulation is most common Preferred target: anterodorsal subthalamic nucleus (STN) Other targets: stereotactic ablation (pallidotomy)/stimulation of posteroventral globus pallidus pars interna (GPi) Caudal zona incerta Parkinsonian tremor: stereotactic ablation (thalamotomy)/stimulation of ventral intermediate (Vim) nucleus of thalamus	39-48% improvement in Unified Parkinson's Disease Rating Scale (UPDRS) scores Reduced dosage of medications (STN) More effective than medical management in advanced PD Early intervention may reduce severity, course, and progression of disease Of little benefit for patients with atypical presentations	Intracerebral hemorrhage, infection, seizure (1%-4%) Paresthesias Involuntary movements Cognitive functioning: decreased lexical fluency, impaired executive function (STN > GPi) Psychiatric: depression, mania, anxiety, apathy (STN > GPi)
Dystonia	Contralateral primary (generalized) dystonias; cervical and tardive dystonias (GPi) Contralateral secondary dyskinesia (i.e. drug-induced: L-dopa, neuroleptics; STN)	Preferred target (primary dystonia): stereotactic ablation (pallidotomy)/stimulation of posteroventral GPi Secondary dystonia: stimulation of anterodorsal STN Stimulation of ventral posterior lateral (VPL) thalamic nucleus	Primary dystonia: 51% reduction in Burke-Fahn-Marsden Dystonia Scale (BFMDs) score Secondary dystonia: 62-89% improvement in dystonias Delayed effects: weeks → months	Intracerebral hemorrhage, infection, seizure (1%-4%) Minor effects on cognitive functioning (especially decreased lexical fluency; STN > GPi)
Tremor	Contralateral appendicular ET (first disorder to be treated by DBS; DBS is viable alternative to Rx) Intention tremor (IT) resulting from demyelination of cerebellar outflow tracts (e.g. in multiple sclerosis) Brainstem tremor (Holmes tremor)	Preferred target: stereotactic ablation (thalamotomy)/stimulation of Vim nucleus of thalamus Other targets: stimulation of caudal zona incerta Parkinsonian tremor: stimulation of anterodorsal STN	Durable reductions in essential tremor rating scale (ETRS) scores Reduced dosage of medications Conflicting data on vocal/facial tremor	Intracerebral hemorrhage, infection, seizure (1%-4%) Paresthesias/pain Dysarthria Ataxia Minor effects on cognitive functioning (especially decreased lexical fluency) Tolerance may develop over time

Neuropsychiatric Disorders

- see [Neurology](#), N33 and [Psychiatry](#), PS13, PS7 for *Tourette's Syndrome, Obsessive Compulsive Disorder and Depression*

Table 16. Surgical Targets for Neuropsychiatric Disorders

Disorder	Indications	Procedures	Outcomes	Morbidity
Obsessive Compulsive Disorder (OCD)	Severe symptoms refractory to medical management	Anterior capsulotomy/stimulation of the anterior limb of the internal capsule (IC)	Currently under investigation Reportedly 25-75% response rate	Intracerebral hemorrhages (1-2%) Mild effects on cognitive functioning Anxiety \pm panic disorder (case report)
Tourette's Syndrome	Severe symptoms refractory to medical management	Stimulation of midline intralaminar nuclei of the thalamus Stimulation of motor and limbic portions of GPi Stimulation of the anterior limb of the IC	Currently under investigation Reportedly >70% reduction in vocal or motor tics + urge	Intracerebral hemorrhages (1-2%) Mild sexual dysfunction
Major Depressive Disorder (MDD)	Severe depression refractory to medical management and ECT	Stimulation of the subgenual cingulate cortex	Currently under investigation Reportedly 60% response rate; 35% remission rate	Intracerebral hemorrhages (1-2%) Pain, H/A Worsening mood, irritability

Chronic Pain

Table 17. Surgical Targets for Chronic Pain

Disorder	Indications	Procedures	Outcomes	Morbidity
Neuropathic Pain	Severe, intractable, organic neuropathic pain (e.g. post-stroke pain, phantom limb pain, trigeminal neuralgia, chronic low-back pain, complex regional pain syndrome)	Preferred target: stimulation of the contralateral VPL VPM thalamic nuclei \pm periventricular/periaqueductal gray matter (PVG/PAG) Other targets: stimulation of the contralateral IC Stimulation of the contralateral motor cortex	47% improvement in perception of pain intensity Less favorable results in central pain syndromes and poorly localized pain	Intracerebral hemorrhages (1-2%) Paresthesia Anxiety \pm panic disorder
Nociceptive Pain	Severe, intractable, organic nociceptive pain	Bilateral (most common) stimulation of the PVG/PAG	Reportedly 63% improvement in perception of pain intensity	Intracerebral hemorrhages (1-2%) Paresthesia Anxiety \pm panic disorder

Surgical Management of Epilepsy

- see [Neurology](#), N16 for the medical treatment of epilepsy

Indications

- medically refractory seizures, usually defined as seizures resistant to two first line anti-seizure medications used in succession
- identification of a distinct epileptogenic region through clinical history, EEG, MRI, and neuropsychological testing; other localizing investigations include magnetoencephalography, SPECT, and PET
- if a distinct epileptogenic region cannot be identified, the patient may be a candidate for a palliative procedure such as corpus callosotomy

Procedure

- adults: resection of the hippocampus and parahippocampal gyrus for mesial temporal lobe epilepsy arising from mesial temporal sclerosis
- children: resection of an epileptogenic space-occupying lesion
- hemispherectomy and corpus callosotomy are less common

Outcomes

- 41-79% of adult patients are seizure free for 5 yr after temporal lobe resection
- 58-78% of children are seizure free after surgery
- surgery is associated with improvements in preexisting psychiatric conditions such as depression and anxiety, as well as improvement in quality of life measures

Morbidity

- 0.4-4% of surgical patients will have partial hemianopsia, aphasia, motor deficit, sensory deficit, or cranial nerve palsy following anteromedial temporal lobectomies

- most patients will have some decline in verbal memory following dominant temporal lobectomy and in visuospatial memory in non-dominant temporal resection
- the degree of memory decline stabilizes after 1-2 yr

Predictors

- positive predictive factors for seizure freedom following anteromedial temporal lobectomy
 - hippocampal sclerosis (unilateral)
 - focal localization of interictal epileptiform discharges
 - absence of pre-operative generalized seizures
 - tumoral cause
 - complete resection of the lesion
 - SES

A Randomized, Controlled Trial of Surgery for Temporal Lobe Epilepsy

NEJM 2001;345:311-318

Introduction: This RCT evaluates the efficacy and safety of neurosurgery for temporal lobe epilepsy.

Methods: 80 patients with poorly controlled temporal lobe epilepsy were randomized for surgery (n=40) or for continued treatment with antiepileptic drugs (n=40). The primary outcome was freedom from seizures that impair awareness of self and surroundings during the period of 1 yr. Secondary outcomes included frequency and severity of seizures, quality of life, disability and death.

Results: The surgical group had higher cumulative proportion of patients without seizures impairing awareness compared to the medical group (p<0.01). The surgical group also had lower seizure frequency (p<0.001) and better quality of life (p<0.001). 4 patients in the surgical group had adverse effects (thalamic infarct, n=1; wound infection, n=1; verbal memory decline impairment occupation, n=2). One patient in the medical group died; no patients died in the surgical group.

Conclusions: In patients with poorly controlled temporal-lobe epilepsy, surgery is superior to prolonged medical therapy.

Surgical Management for Trigeminal Neuralgia

- reserved for cases refractory to medical management; see [Neurology, N8](#) for medical management

Surgical Options

- trigeminal nerve branch procedures
 - local blocks (phenol, alcohol)
 - neurectomy of the trigeminal branch
- nerve branches
 - V₁ block at the supraorbital, supratrochlear nerves
 - V₂ block at the foramen rotundum or infraorbital nerves
 - V₃ block at the foramen ovale
- percutaneous trigeminal rhizotomy
 - glycerol injection
 - mechanotrauma via catheter balloon
- radiofrequency thermocoagulation
- Gamma Knife® radiosurgery
- microvascular decompression
 - posterior fossa craniotomy with microsurgical exploration of the root entry zone, displacement of the vessel impinging on the nerve with placement of non-absorbable Teflon® felt

Common Medications

Table 18. Common Medications

Drug Name	Dosing Schedule	Indications	Side Effects	Common Interactions	Contraindications	Comments
lorazepam (Ativan®)	4 mg IV over 2 min, q10-15min (do not exceed 8 mg/12h)	Status epilepticus	Drowsiness, sedation	Other CNS depressants, digoxin (increases digoxin levels)		Start phenytoin loading simultaneously
carbamazepine (Tegretol®)	Trigeminal neuralgia (tic douloureux): 100 mg PO bid, increase by 200 mg/d up to a maximum of 1,200 mg/d Seizures: 200 mg PO bid, increase by 200 mg (inpatient: q3d; outpatient: q7d) until therapeutic level achieved (usual optimum dosage: 800-1,200 mg/d; range: 600-2,000 mg/d)	Trigeminal neuralgia Seizures	Worsening of seizures, heart failure, arrhythmias, AV block, aplastic anemia, agranulocytosis, thrombocytopenia, hepatitis, erythema multiforme, Stevens-Johnson syndrome	Lithium (increases lithium toxicity), MAOI Other meds may increase carbamazepine levels or have decreased effects	Hypersensitivity to TCAs, previous bone marrow suppression, MAOI in past 14 d	Monitor CBC (potential hematological toxicity)
phenytoin (Dilantin®)	Seizures: Loading dose: 18 mg/kg slow IV or 300-600 mg PO/d divided bid/tid Maintenance: 200-500 mg IV/d (max rate: <40-50 mg/min or 300 mg PO q4h); average maintenance dose: 300 mg/d PO Status epilepticus: 200 mg IV over 30 min (~20 mg/kg; if not taking regularly), or 500 mg IV over 10 min (if already on phenytoin)	Seizures Status epilepticus	Thrombocytopenia, leukopenia, agranulocytosis, pancytopenia, toxic hepatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis	Other meds may increase phenytoin levels and toxicity or have decreased effects	Bradycardias, heart block	Important to give over time to prevent causing a cardiac arrest

Table 18. Common Medications (continued)

Drug Name	Dosing Schedule	Indications	Side Effects	Common Interactions	Contraindications	Comments
dexamethasone (Decadron®)	Loading dose: 10-20 mg IV Maintenance: 4-6 mg IV/d divided qid (may be PO)	Cerebral edema (e.g. secondary to tumor, head injury, pseudotumor cerebri) Pre-operative preparation for patients with increased ICP secondary to brain neoplasms	Pseudotumor cerebri, seizures, heart failure, arrhythmias, thromboembolism, pancreatitis, acute adrenal insufficiency; avoid abrupt withdrawal	Aminoglutethimide, antidiabetics, ASA, NSAIDs, barbituates, phenytoin, rifampin, cardiac glycosides, cyclosporine, ephedrine, oral anticoagulants, potassium-depleting drugs, salicylates, skin-testing antigens, toxoids, vaccines	Systemic fungal infections, immunosuppressive dose with live virus vaccines	No longer used in acute spinal cord injury
mannitol	1-1.5 g/kg IV rapid infusion (350 mL of 20% solution) followed by 0.25 g/kg IV q6h	Raised ICP	Seizures, heart failure	Lithium (increases excretion of lithium)	Anuria, severe pulmonary congestion, frank pulmonary edema, severe heart failure, severe dehydration, metabolic edema, progressive renal disease or dysfunction, active intracranial bleeding except during craniotomy	Effect occurs in 1-5 min, maximal at 20-60 min Often alternated with furosemide 10-20 mg IV q6h Indwelling urinary catheter to measure ins and outs
nimodipine (Nimotop®)	60 mg PO/NG q4h x 21 d started within 96 h of SAH	Vasospasm in SAH	Decreased blood pressure, tachycardia, dyspnea	Antihypertensives (may increase hypotensive effects), CCB (may increase effects), cimetidine (increases nimodipine bioavailability)	None known	Causes vasodilation Only calcium channel blocker that crosses blood brain barrier Use half the normal dose for liver failure; monitor BP always

Basic Anatomy Review

Figure 1. Placental blood flow

Placenta

- site of fetal nutritive, respiratory, and excretory function
- discoid mass composed of fetal (chorion frondosum) and maternal (decidua basalis) tissues divided by fissures into cotyledons (lobules) on the uterine side
- produces hormones such as progesterone, placental lactogen, estrogen, relaxin, β -hCG, and IGFs
- poor implantation can lead to spontaneous abortion
- abnormal location, implantation, or detachment can lead to antepartum hemorrhage (see *Antepartum Hemorrhage*, OB24)

Pregnancy

Diagnosis of Pregnancy

History

- obstetrical and gynecological history
- obtain the year, location, mode of delivery, duration of labor, sex, gestational age, birth weight, and complications of every pregnancy; organize into **GTPAL** format
 - **Gravidity (G)**
 - ♦ **G**: total number of pregnancies of any gestation
 - ♦ includes current pregnancy, abortions, ectopic pregnancies, and hydatidiform moles (multiple gestation = one pregnancy)
 - **Parity (TPAL)**
 - ♦ **T**: number of term infants delivered (>37 wk)
 - ♦ **P**: number of premature infants delivered (20-36+6 wk)
 - ♦ **A**: number of abortions (loss of intrauterine pregnancy prior to viability of fetus <20 wk and/or <500 g fetal weight)
 - induced (therapeutic) and spontaneous (miscarriage)
 - ♦ **L**: number of living children
- symptoms: amenorrhea, N/V, breast tenderness, urinary frequency, fatigue

Physical Signs

- Goodell's sign: softening of the cervix (4-6 wk)
- Chadwick's sign: bluish discoloration of the cervix and vagina due to pelvic vasculature engorgement (6 wk)
- Hegar's sign: softening of the cervical isthmus (6-8 wk)
- uterine enlargement
- breast engorgement

Acronyms

AC	abdominal circumference
ACOG	American Congress of Obstetricians and Gynecologists
AFI	amniotic fluid index
AFLP	acute fatty liver of pregnancy
AFV	amniotic fluid volume
AP	anteroposterior
APS	antiphospholipid antibody syndrome
BPP	biophysical profile
C/S	Cesarean section
CPD	cephalopelvic disproportion
CTG	cardiotocography
CVS	chorionic villus sampling
D&C	dilatation and curettage
DIC	disseminated intravascular coagulation
DVT	deep vein thrombosis
ECV	external cephalic version
EDC	estimated date of confinement
EFM	electronic fetal monitoring
EFW	estimated fetal weight
FDP	fibrin degradation products
FHR	fetal heart rate
FISH	fluorescence <i>in situ</i> hybridization
FL	femur length
FM	fetal movement
FPG	fasting plasma glucose
FTS	first trimester screen
GA	gestational age
GBS	Group B <i>Streptococcus</i>
GDM	gestational diabetes mellitus
GTN	gestational trophoblastic neoplasia
HC	head circumference
HELLP	hemolysis, elevated liver enzymes, low platelets
IGF	infant growth factors
IMM	intrauterine fetal death
IOL	induction of labor
IPS	integrated prenatal screen
IUFD	intrauterine fetal death
IUGR	intrauterine growth restriction
IVH	intraventricular hemorrhage
LLDP	left lateral decubitus position
LMP	last menstrual period
MSAFP	maternal serum α -fetoprotein
MSS	maternal serum screen
MTX	methotrexate
NIPT	non-invasive prenatal testing
NST	non-stress test
NTDs	neural tube defects
NTUS	nuchal translucency ultrasound
OA	occiput anterior
OGTT	oral glucose tolerance test
oNTD	open neural tube defect
OP	occiput posterior
OT	occiput transverse
PAPP-A	pregnancy-associated plasma protein A
PG	plasma glucose
PPD	postpartum depression
PPH	postpartum hemorrhage
PPROM	preterm premature rupture of membranes
PROM	premature rupture of membranes
PTL	preterm labor
RDS	respiratory distress syndrome
ROM	rupture of membranes
SA	spontaneous abortion
SFH	symphysis fundal height
SVD	spontaneous vaginal delivery
TENS	transcutaneous electrical nerve stimulation
TPN	total parenteral nutrition
UTI	urinary tract infection
VBAC	vaginal birth after Cesarean

Umbilical Vessels

Always check the umbilical cord for 2 arteries and 1 vein: approximately 1/3 of babies with a single uterine artery will have another anomaly

Investigations

- **β-hCG:** peptide hormone composed of α and β subunits produced by placental trophoblastic cells – maintains the corpus luteum during pregnancy
 - positive in serum 9 d post-conception, positive in urine 28 d after first day of LMP
 - plasma levels double every 1-2 d, peak at 8-10 wk, then fall to a plateau until delivery
 - ♦ levels less than expected by dates suggest: ectopic pregnancy, abortion, or inaccurate dates
 - ♦ levels higher than expected suggest: multiple gestation, molar pregnancy, Trisomy 21, or inaccurate dates
- **U/S**
 - transvaginal
 - ♦ 5 wk: gestational sac visible
 - ♦ 6 wk: fetal pole seen
 - ♦ 7-8 wk: fetal heart tones visible
 - transabdominal
 - ♦ 6-8 wk: intrauterine pregnancy visible (β-hCG ≥6,500 mIU/mL)

β-hCG Rule of 10s

10 IU at time of missed menses
100,000 IU at 10 wk (peak)
10,000 IU at term

Trimesters

- T1 (first trimester): 0-12 wk
- T2 (second trimester): 12-28 wk
- T3 (third trimester): 28-40 wk
- Normal pregnancy term: 37-42 wk

Maternal Physiology

Table 1. Physiologic Changes During Pregnancy

Skin	Increased pigmentation of perineum and areola, chloasma (pigmentation changes under eyes and on bridge of nose), linea nigra (midline abdominal pigmentation) Other: spider angiomas, palmar erythema due to increased estrogen, striae gravidarum due to connective tissue changes
Cardiovascular	Hyperdynamic circulation Increased CO, HR, and blood volume Decreased BP due to decreased PVR Enlarging uterus compresses IVC and pelvic veins Decreased venous return leads to risk of hypotension Increased venous pressure leads to risk of varicose veins, hemorrhoids, leg edema
Hematologic	Hemodilution causes physiologic anemia and apparent decrease in hemoglobin and hematocrit Increased leukocyte count but impaired function leads to improvement in autoimmune diseases Gestational thrombocytopenia: mild (platelets >70,000/μL) and asymptomatic, normalizes within 2-12 wk following delivery Hypercoagulable state: increased risk of DVT and PE but also decreased bleeding at delivery
Respiratory	Increased incidence of nasal congestion and epistaxis Increased O ₂ consumption to meet increased metabolic requirements Elevated diaphragm (i.e. patient appears more "barrel-chested") Increased minute ventilation leads to decreased CO ₂ resulting in mild respiratory alkalosis that helps CO ₂ diffuse across the placenta from fetal to maternal circulation No change in VC and FEV ₁ Decreased TLC, FRC, and RV
Gastrointestinal	GERD due to increased intra-abdominal pressure and progesterone (causing decreased sphincter tone and delayed gastric emptying) Increased gallstones due to progesterone causing increased gallbladder stasis Constipation and hemorrhoids due to progesterone causing decreased GI motility
Genitourinary	Increased urinary frequency due to increased total urinary output Increased incidence of UTI and pyelonephritis due to urinary stasis (see Urinary Tract Infection, OB19) Glycosuria that can be physiologic especially in the 3rd trimester Ureters and renal pelvis dilation (R>L) due to progesterone-induced smooth muscle relaxation and uterine enlargement Increased CO and thus increased GFR leads to decreased creatinine (normal in pregnancy 0.4-0.5 mg/dL), uric acid, and BUN
Neurologic	Increased incidence of carpal tunnel syndrome and Bell's palsy
Endocrine	Thyroid: moderate enlargement and increased basal metabolic rate Increased total thyroxine and thyroxine binding globulin (TBG) Free thyroxine index and TSH levels are normal Adrenal: maternal cortisol rises throughout pregnancy (total and free) Calcium: decreased total maternal Ca ²⁺ due to decreased albumin Free ionized Ca ²⁺ (i.e. active) proportion remains the same due to parathyroid hormone (PTH), results in increased bone resorption and gut absorption, increased bone turnover (but no loss of bone density due to estrogen inhibition)

Prenatal Care

- provided by obstetrician, family doctor, midwife, or multidisciplinary team (based on patient preference and risk factors)
- Antenatal Records (province specific)

Preconception Counseling

- 3-8 wk GA is a critical period of organogenesis, so early preparation is vital
- **past medical history:** optimize medical illnesses and necessary medications prior to pregnancy (see *Medical Conditions in Pregnancy*, OB13, and *Medications in Pregnancy*, OB10)
- **supplementation**
 - folic acid: encourage diet rich in folic acid and supplement 8-12 wk preconception until end of T1 to prevent NTDs
 - ♦ 0.4-1 mg daily in all women; 5 mg if previous NTD, antiepileptic medications, DM, or BMI >35 kg/m²
 - iron supplementation, prenatal vitamins
- **risk modification**
 - lifestyle: balanced nutrition and physical fitness
 - medications: patients with chronic diseases should discuss whether their medications may be teratogenic prior to conception so they may be adjusted; it is not advised to stop medications abruptly when becoming pregnant
 - infection screening: rubella, HBsAg, VDRL, Pap smear, gonorrhea/chlamydia, HIV
 - genetic testing as appropriate for high risk groups (see *Prenatal Screening*, Table 2); consider genetics referral in known carriers, recurrent pregnancy loss/stillbirth, family members with developmental delay or birth anomalies
 - social: alcohol, smoking, drug use, domestic violence (see *Family Medicine*, FM12, FM10, FM28)

Initial Prenatal Visit

- usually within 12 wk of the first day of LMP or earlier if <20 or >35 yr old or other risk factors are present
- Antenatal Records are filled out on the first prenatal visit

History

- gestational age by dates from the first day of the LMP
- if LMP unreliable, get a dating ultrasound which could coincide with nuchal translucency at ~12 wks
- dates should change if T1 U/S is greater than 5 days in difference from LMP due date
 - 1st day of LMP + 7 d – 3 mo
 - e.g. LMP = 1 Apr 2013, EDC = 8 Jan 2014 (modify if cycle >28 d by adding number of d >28)
- history of present pregnancy (e.g. bleeding, N/V)
- history of all previous pregnancies
- past medical history, past gynecological history
- prescription and non-prescription medications
- family history: genetic disease, birth defects, multiple gestation
- social history: smoking, alcohol, drug use, domestic violence (see *Family Medicine*, FM10, FM12, FM28), consanguinity

Physical Exam

- complete exam to obtain baseline patient information
- BP and weight important for interpreting subsequent changes
- pelvic exam

Investigations

- blood work
 - CBC, blood group and type, Rh antibodies, infection screening as per preconception counseling
- urine R&M, C&S
 - screen for bacteriuria and proteinuria
- pelvic exam
 - Pap smear (only if required according to patient history and state screening guidelines), cervical culture for *N. gonorrhoeae* (GC) and *C. trachomatis*, vaginal swab for bacterial vaginosis (BV)

Family Doctors and Midwives to Consider OB Consultation if:

- Insulin-dependent GDM
- VBAC
- HTN
- Multiple gestation
- Malpresentation
- Active antepartum hemorrhage
- PTL/PPROM
- Failure to progress/descend
- Induction/augmentation if high risk
- Tears: 3rd or 4th degree
- Retained placenta

Note: Guidelines vary by institution

Advise all women capable of becoming pregnant to supplement their diet with 0.4 mg/d of folic acid (CTFPHC Grade II-2-A Evidence)

Sometimes GP is used to describe gravida and parity; in this case, parity is used to describe number of term and premature infants delivered

In history of previous pregnancies,

ALWAYS ask:

GTPAL
Year
Sex
Weight
Gestational age (GA)
Mode of delivery
Length of labor
Complications

Ask every woman about abuse – not just those whose situations raise suspicion of abuse AND ask as early as possible in pregnancy

Prenatal and genetic screening are voluntary and require proper counseling and informed consent before proceeding. HIV is done automatically in some states as opt-out testing, need to inform patient

Subsequent Prenatal Visits

Timing

- for uncomplicated pregnancies, q4-6wk until 28 wk, q2-3wk from 28 to 36 wk, and weekly from 36 wk until delivery

Assess at Every Visit

- record estimated GA
- history of present pregnancy: fetal movements, uterine bleeding, leaking, cramping
- physical exam: BP, weight gain, thyroid exam, SFH, Leopold's maneuvers (T3) for lie, position, and presentation of fetus
- investigations: urinalysis for glucosuria, proteinuria; fetal heart rate starting at 12 wk using Doppler U/S

Leopold's Maneuvers

- performed after 30-32 wk gestation
- first maneuver: to determine which fetal part is lying furthest away from the pelvic inlet
- second maneuver: to determine the location of the fetal back
- third maneuver: to determine which fetal part is lying above the pelvic inlet
- fourth maneuver: to locate the fetal brow

Figure 2. Leopold's maneuvers (T3)
Reprinted with permission from Essentials of Clinical Examination Handbook, 6th ed. Lincoln, McSheffrey, Tran, Wong

Symphysis Fundal Height (SFH)

- 12 wk: Uterine fundus at pubic symphysis
- 20 wk: Fundus at umbilicus, SFH should be within 2 cm of GA between 20-36 wk
- 37 wk: Fundus at sternum

Small for Dates

- Date miscalculation
- IUGR
- Fetal demise
- Oligohydramnios

Large for Dates

- Date miscalculation
- Multiple gestation
- Polyhydramnios
- LGA (familial, DM)
- Fibroids

Prenatal Screening and Diagnostic Tests

Screening Tests

- testing should only occur following counseling and with the informed consent from the patient

Table 2. High-Risk Population Screening Tests

Disease (Inheritance)	Population(s) at Risk	Screening Test(s)
Thalassemia (AR)	Mediterranean, South East Asian, Western Pacific, African, Middle Eastern, Caribbean, South American	CBC (MCV and MCH), Hb electrophoresis, or HPLC
Sickle Cell (AR)	African, Caribbean, Mediterranean, Middle Eastern, Indian, South American	CBC (MCV and MCH), Hb electrophoresis, or HPLC
Cystic Fibrosis (CF) (AR)	Mediterranean, Finnish, Caucasian, or FHx	CFTR gene DNA analysis
Tay Sachs Disease (AR)	Ashkenazi Jewish*, French Canadians, Cajun	Enzyme assay HEXA, or DNA analysis HEXA gene
Fragile X Syndrome (X-linked)	Family history – confirmed or suspected	DNA analysis: FMR-1 gene

AR = autosomal recessive; HEXA = hexosaminidase A; HPLC = high performance liquid chromatography
*If both partners are Ashkenazi Jewish, test for Canavan disease and Familial Dysautonomia (FD); if family history of a specific condition, look for carrier status: e.g. Gaucher, CF, Bloom syndrome, Niemann-Pick disease, etc. In all cases, if both partners positive, refer for genetic counseling

Table 3. Gestation-Dependent Screening Investigations

Gestational Age (wk)	Investigations	Details
8-12	Dating U/S, possible Pap smear, chlamydia/gonorrhea cultures, urine C&S, HIV, VDRL, HepBSAg, Rubella IgG, Parvovirus IgM or IgG if high risk (small child at home or daycare worker/primary teacher), Varicella IgG if no history of disease/immunization, CBC, blood group and screen	
10-12	CVS	
11-14	FTS IPS Part 1	Measures 1. Nuchal translucency on U/S 2. β -hCG 3. PAPP-A
11-14	Nuchal translucency U/S	
15-16 to term	Amniocentesis	
15-20	IPS Part 2	Measures 1. MSAFP 2. β -hCG 3. Unconjugated estrogen (estriol or μ E3) 4. Inhibin A
15-20	MSS (or MSAFP only for patients who did FTS earlier)	Measures 1. MSAFP 2. β -hCG 3. Unconjugated estrogen (estriol or μ E3)
18-20 to term	Fetal movements (quickening)	
18-20	U/S for dates, fetal growth, and anatomy assessment	
24-28	50 g OGCT	
28	Repeat CBC RhIG for all Rh negative women	
35-37	GBS screen	
6 wk postpartum	Discuss contraception, menses, breastfeeding, depression, mental health, support Physical exam: breast exam, pelvic exam including Pap smear	

Maternal serum screen is also referred to as Triple Screen; if Inhibin A is also tested, it is referred to as Quadruple Screen

Ideally testing for MSS and IPS Part 2 occur between 15-18 wk to give women more time to make decisions and move ahead with diagnostic testing should the resulting screen be positive

Routine T2 U/S at 18-22 wk Helps Determine

- Number of fetuses
- GA (if no prior U/S)
- Location of placenta
- Fetal anomalies

Ultrasound Screening

- dating ultrasound best done between 8-12 wk GA (most accurate form of pregnancy dating)
 - measurement of crown-rump length (margin of error \pm 5 d)
 - change EDC to U/S date if >5 d discrepancy from EDC based on LMP
- NTUS at 11-14 wk GA
 - measures the amount of fluid behind the neck of the fetus
 - early screen for Trisomy 21 (may also detect cardiac and other aneuploidies like Turner's syndrome)
 - NT measurement is necessary for the FTS and IPS Part 1
- fetal growth and anatomy ultrasound routinely done at 18-20 wk GA (margin of error \pm 10 d)
- earlier or subsequent ultrasounds performed when medically indicated

Table 4. Comparison of FTS, MSS, and IPS

FTS	MSS	IPS
11-14 wk	15-20 wk	Nuchal translucency on 12 wk U/S FTS at 11-14 wk MSS + inhibin A at 15-20 wk
Risk estimate for 1. Down syndrome (Trisomy 21): increased NT, increased β -hCG, decreased PAPP-A	Risk estimate for 1. oNTD: increased MSAFP (sensitivity 80-90%) 2. Trisomy 21: decreased MSAFP, increased β -hCG, decreased μ E3 (sensitivity 65%) 3. Trisomy 18: decreased MSAFP, decreased β -hCG, decreased μ E3 (sensitivity 80%)	Risk estimate for oNTD, Trisomy 21, Trisomy 18 Sensitivity ~85-90% 2% false positive rate Patients with positive screen should be offered U/S and/or amniocentesis or NIPT
Note: does not measure risk of open neural tube defect (oNTD) and should be combined with MSAFP at 16 wk Useful where patient wants results within the first trimester More accurate estimate of Down syndrome risk than MSS, sensitivity ~85% (when combined with age) 5% false positive rate Patients with positive screen should be offered CVS, amniocentesis, or NIPT (covered in some provinces, self-pay in others)	Only offered alone if patient missed the time window for IPS or FTS 8% baseline false positive rate for Trisomy 21, lower for oNTD and Trisomy 18 Patients with positive screen should be offered U/S, amniocentesis, or NIPT	

Note: In twins, FTS, MSS, and IPS are not applicable; screen with NT for chromosomal abnormalities and MSAFP for oNTDs

Diagnostic Tests

Indications

- maternal age >35 yr (increased risk of chromosomal anomalies)
- risk factors in current pregnancy
 - abnormal U/S
 - abnormal prenatal screen (IPS, FTS, or MSS)
- past history/family history of:
 - previous pregnancy with chromosomal anomaly or genetic disease
 - either parent a known carrier of a genetic disorder or balanced translocation
 - family history of chromosomal anomaly, genetic disorder, birth defect, or undiagnosed mental retardation
 - consanguinity
 - three or more spontaneous abortions

AMNIOCENTESIS

- U/S-guided transabdominal extraction of amniotic fluid

Indications

- identification of genetic anomalies (15-16 wk gestation) as per indications above
- assessment of fetal lung maturity (T3) via the L/S ratio (lecithin:sphingomyelin)
 - if >2:1, RDS is less likely to occur

Advantages

- also screens for oNTD (acetylcholinesterase and amniotic AFP) – 96% accurate
- in women >35 yr, the risk of chromosomal anomaly (1/180) is greater than the risk of miscarriage from the procedure
- more accurate genetic testing than CVS

Disadvantages

- 1/400 – 1/500 risk of spontaneous abortion
- results take 14-28 d; FISH can be done on chromosomes X, Y, 21, 13, 18 to give preliminary results in 48 h

CHORIONIC VILLUS SAMPLING

- biopsy of fetal-derived chorion using a transabdominal needle or transcervical catheter at 10-12 wk

Advantages

- enables pregnancy to be terminated earlier than with amniocentesis
- rapid karyotyping and biochemical assay within 48 h, including FISH analysis
- high sensitivity and specificity

Disadvantages

- 1-2% risk of spontaneous abortion
- does not screen for oNTD
- 1-2% incidence of genetic mosaicism “false negative” results

ISOIMMUNIZATION SCREENING

Definition

- isoimmunization: antibodies (Ab) produced against a specific RBC antigen (Ag) as a result of antigenic stimulation with RBC of another individual

Etiology

- maternal-fetal circulation normally separated by placental barrier, but sensitization can occur and can affect the current pregnancy, or more commonly, future pregnancies
- in pregnancy, anti-Rh Ab produced by a sensitized Rh-negative mother can lead to fetal hemolytic anemia
- overall risk of isoimmunization of an Rh-negative mother with an Rh-positive ABO-compatible infant is 16%
- sensitization routes
 - incompatible blood transfusions
 - previous fetal-maternal transplacental hemorrhage (e.g. ectopic pregnancy, abruption)
 - invasive procedures in pregnancy (e.g. prenatal diagnosis, cerclage, D&C)
 - any type of abortion
 - labor and delivery

NON-INVASIVE PRENATAL TESTING (NIPT)

- New non-invasive screening for Down syndrome in spontaneous singleton pregnancies
- Analyzes maternal blood for circulating cell free fetal DNA (ccfDNA) at 10 wk GA
- High sensitivity (98-99%), FP < 2%
- Disadvantages: less sensitive for Trisomy 18 and 13, does not screen for oNTD, not widely available

DDx of Increased MSAFP

- Incorrect GA
- > 1 fetus (e.g. twins)
- Fetal demise
- oNTD
- Abdominal wall defects (e.g. omphalocele)

DDx of Decreased MSAFP

- Incorrect GA
- Gestational trophoblastic neoplasia
- Missed abortion
- Chromosomal anomalies
- Maternal diabetes

Compared to CVS, amniocentesis has a higher accuracy of prenatal cytogenetic diagnosis (99.8% vs. 97.5%) and lower risk of spontaneous abortion (0.5% vs. 1-2%)

Risk Factors for Neural Tube Defects

GRIMM

Genetics: family history of NTD (risk of having second child with NTD is increased to 2-5%), consanguinity, chromosomal (characteristic of Trisomy 13, 18, and 21)

Race: European Caucasians > African Americans, 3-fold higher in Hispanics

Insufficient vitamins: zinc and folate

Maternal chronic disease (e.g. DM)

Maternal use of antiepileptic drugs

General population risk for NTD is 0.1%

Investigations

- routine screening with indirect Coombs test at first visit for blood group, Rh status, and antibodies
- Kleihauer-Betke test used to determine extent of fetomaternal hemorrhage by estimating volume of fetal blood volume that entered maternal circulation
- detailed U/S for hydrops fetalis

Prophylaxis

- exogenous Rh IgG (Rhogam® or WinRho®) binds to Rh antigens of fetal cells and prevents them from contacting maternal immune system
- Rhogam® (300 µg) given to all Rh negative and antibody screen negative women in the following scenarios
 - routinely at 28 wk GA (provides protection for ~12 wk)
 - within 72 h of the birth of an Rh positive fetus
 - with a positive Kleihauer-Betke test
 - with any invasive procedure in pregnancy (CVS, amniocentesis)
 - in ectopic pregnancy
 - with miscarriage or therapeutic abortion (only 50 µg required)
 - with an antepartum hemorrhage
- if Rh negative and Ab screen positive, follow mother with serial monthly Ab titres throughout pregnancy ± serial amniocentesis as needed (Rhogam® has no benefit)

Investigations

- MCA dopplers are done to assess degree of fetal anemia or if not available bilirubin is measured by serial amniocentesis to assess the severity of hemolysis
- cordocentesis for fetal Hb should be used cautiously (not first line)

Treatment

- falling biliary pigment warrants no intervention (usually indicative of either unaffected or mildly affected fetus)
- intrauterine transfusion of O-negative pRBCs may be required for severely affected fetus or early delivery of the fetus for exchange transfusion

Complications

- anti-Rh IgG can cross the placenta and cause fetal RBC hemolysis resulting in fetal anemia, CHF, edema, ascites
- severe cases can lead to fetal hydrops (edema in at least two fetal compartments due to fetal heart failure secondary to anemia) or erythroblastosis fetalis (moderate to severe immune-mediated hemolytic anemia)

GROUP B *STREPTOCOCCUS* SCREEN

Epidemiology

- 15-40% vaginal carrier rate

Risk Factors (for neonatal disease)

- GBS bacteriuria during current pregnancy even if treated
- previous infant with invasive GBS infection
- preterm labor <37 wk
- ruptured membranes >18 h before delivery
- intrapartum maternal temperature 100.4°F
- positive GBS screen during current pregnancy

Clinical Features

- not harmful to mother
- risk of vertical transmission (neonatal sepsis, meningitis or pneumonia, and death)

Investigations

- offer screening to all women at 35-37 wk with vaginal and anorectal swabs for C&S

Treatment

- treatment of maternal GBS at delivery decreases neonatal morbidity and mortality
- indications for antibiotic prophylaxis: positive GBS screen or GBS status unknown and one of the risk factors
- antibiotics for GBS prophylaxis
 - penicillin G 5 million units IV then 2.5 million units IV q4h until delivery
 - penicillin allergic but not at risk for anaphylaxis: cefazolin 2 g IV then 1 g q8h
 - penicillin allergic and at risk for anaphylaxis: vancomycin 1 g IV q12h until delivery
- if fever, broad spectrum antibiotic coverage is advised

Rh Antibody Titre

A positive titre ($\geq 1:16$) indicates an increased risk of fetal hemolytic anemia

Standard dose of 300 µg of Rhogam sufficient for 30 mL of fetal blood. Give additional 10 µg of Rhogam for every mL of fetal blood over 30 mL

Indications for Intrapartum Antibiotic GBS Prophylaxis

Centers for Disease Control and Prevention. Prevention of Perinatal Group B Streptococcal Disease. *MMWR* 2010;59(RR-10):14

- Previous infant with invasive GBS disease.
- GBS bacteriuria during any trimester of the current pregnancy.
- Positive GBS vaginal-rectal screening culture in late gestation during current pregnancy.
- Unknown GBS status at the onset of labor (culture not done, incomplete, or results unknown) and any of the following:
 - Delivery at <37 wk gestation.
 - Amniotic membrane rupture ≥ 18 h.
 - Intrapartum temperature $\geq 100.4^\circ\text{F}$ ($\geq 38.0^\circ\text{C}$).
 - Intrapartum nucleic-acid amplification test positive for GBS.

Counseling of the Pregnant Woman

Nutrition

- 3-4 servings of milk products daily (greater if multiple gestation)
- a daily caloric increase of ~100 cal/d in the 1st trimester, ~300 cal/d in the second and third trimesters and ~450 cal/d during lactation
- daily multivitamin should be continued in the 2nd trimester for women who do not consume an adequate diet; otherwise routine vitamin supplementation is not necessary (avoid excess vitamin A)
- nutrients important during pregnancy
 - folate: 0.4 mg/d for first 12 wk (5 mg/d if high risk)
 - ♦ supports maternal increase in blood volume, growth of maternal and fetal tissue, decreases incidence of neural tube defects
 - ♦ foods rich in folic acid include: spinach, lentils, chick peas, asparagus, broccoli, peas, Brussels sprouts, corn, and oranges
 - calcium: 1,200-1,500 mg/d
 - ♦ maintains integrity of maternal bones, skeletal development of fetus, breast milk production
 - vitamin D: 1,000 IU
 - ♦ promotes calcium absorption
 - iron: 0.8 mg/d in T1, 4-5 mg/d in T2, and >6 mg/d in T3
 - ♦ supports maternal increase in blood cell mass, supports fetal and placental tissue
 - ♦ required amounts exceed normal body stores and typical intake, and therefore need supplemental iron
 - ♦ iron is the only known nutrient for which requirements during pregnancy cannot be met by diet alone (see *Iron Deficiency Anemia*, OB13)
 - essential fatty acids – supports fetal neural and visual development
 - ♦ contained in vegetable oils, margarines, peanuts, fatty fish

Caffeine

- diuretic and stimulant that readily crosses placenta
- less than 300 mg/d is not thought to contribute to miscarriage or preterm birth (ACOG)
 - relationship between caffeine and IUGR is unknown (ACOG)
 - 1-2 cups/d is accepted as safe during pregnancy

Herbal Teas and Preparations

- not enough scientific information about safety of various herbs and herbal products to recommend their use during pregnancy
- some herbal teas can have toxic or pharmacological effects on the mother or fetus
- chamomiles have been reported to exhibit adverse effects on the uterus

Food Borne Illnesses

- microbiological contamination of food may occur through cross-contamination and/or improper food handling
 - listeriosis (*Listeria monocytogenes*) and toxoplasmosis (*Toxoplasma gondii*) are of concern during pregnancy
 - avoid consumption of raw meats, fish, poultry, raw eggs, and unpasteurized dairy products
 - avoid unpasteurized soft cheeses, deli meats, smoked salmon, and pates as they may be sources of *Listeria*
- chemical contamination of food
 - current guideline for mercury of 0.5 ppm in fish is not considered harmful for the general population, including pregnant women
 - consumption of top predator fish such as shark, swordfish, king mackerel, tilefish, and fresh/frozen tuna (not canned tuna) should be limited to one meal per month

Sources of Caffeine

- 5 oz cup coffee: 40-180 mg
- 5 oz brewed tea: 20-90 mg
- 12 oz cola: 46 mg
- Red Bull®: 67 mg
- Dark chocolate bar: 10 mg
- 8 oz hot chocolate: 5 mg

Herbal Teas Considered Safe in Moderation (2-3 cups/d)

- Citrus peel
- Ginger
- Lemon balm
- Linden flower – not with prior cardiac condition
- Orange peel
- Rose hip

Lifestyle

- exercise under physician guidance
- absolute contraindications
 - ruptured membranes, preterm labor, hypertensive disorders of pregnancy, incompetent cervix, IUGR, multiple gestations (>3), placenta previa after 28th wk, persistent 2nd or 3rd trimester bleeding, uncontrolled type 1 DM, uncontrolled thyroid disease, or other serious cardiovascular, respiratory, or systemic disorder

- relative contraindications
 - previous preterm birth, mild/moderate cardiovascular or respiratory disorder, anemia (Hb ≤ 10 g/dL), malnutrition or eating disorder, twin pregnancy after 28th wk, other significant medical conditions
- weight gain: optimal gain depends on pre-pregnancy BMI (varies from 6.8-18.2 kg)
- work: strenuous work, extended hours and shift work during pregnancy may be associated with greater risk of low birth weight, prematurity, and spontaneous abortion
- travel: not harmful, but stress related to travel may be associated with preterm labor
 - air travel is acceptable in second trimester; airline cutoff for travel is 36-38 wk gestation depending on the airline to avoid giving birth on the plane
- sexual intercourse: may continue, except in patients at risk for: abortion, preterm labor, or placenta previa; breast stimulation may induce uterine activity and is discouraged in high-risk patients near term
- smoking: assist/encourage to reduce or quit smoking
 - increased risk of: decreased birth weight, placenta previa/abruption, spontaneous abortion, preterm labor, stillbirth
- alcohol: no amount of alcohol is safe in pregnancy; encourage abstinence from alcohol during pregnancy; alcohol increases incidence of abortion, stillbirth, and congenital anomalies
 - fetal alcohol syndrome (see [Pediatrics, P24](#))
- cocaine: microcephaly, growth retardation, prematurity, abruptio placentae

Expected Weight Gain

BMI (kg/m ²)	Weight (kg)
< 19	12.7-18.2
19-25	11.3-15.9
> 25	6.8-11.3

General Rule: 1-3.5 kg/wk during T1, then 0.45 kg/wk until delivery

Medications

- most drugs cross the placenta to some extent
- very few drugs are teratogenic, but very few drugs have proven safety in pregnancy
- use any drug with caution and only if necessary
- analgesics: acetaminophen preferable to ASA or ibuprofen

Table 5. Documented Adverse Effects, Contraindicated

Contraindicated Medication	Adverse Effect
ACE inhibitors	Fetal renal defects, IUGR, oligohydramnios
tetracycline	Stains infant's teeth, may affect long bone development
retinoids (e.g. Accutane®)	CNS, craniofacial, cardiac, and thymic anomalies
DES (and other estrogenic or androgenic compounds)	Vaginal adenosis, adenocarcinoma, uterine malformation in females exposed to DES <i>in utero</i>
misoprostol	Mobius syndrome (congenital facial paralysis with or without limb defects, spontaneous abortion, preterm labor)

Table 6. Documented Adverse Effects, Weigh Benefits vs. Risks, and Consider Medication Change

Medication	Adverse Effect
phenytoin	Fetal hydantoin syndrome in 5-10% (IUGR, mental retardation, facial dysmorphism, congenital anomalies)
valproate	oNTD in 1%
carbamazepine	oNTD in 1-2%
lithium	Ebstein's cardiac anomaly, goiter, hyponatremia
warfarin	Increased incidence of spontaneous abortion, stillbirth, prematurity, IUGR, fetal warfarin syndrome (nasal hypoplasia, epiphyseal stippling, optic atrophy, mental retardation, intracranial hemorrhage)
erythromycin	Maternal liver damage (acute fatty liver)
sulpha drugs	Anti-folate properties, therefore theoretical risk in T1; risk of kernicterus in T3
chloramphenicol	Gray baby syndrome (fetal circulatory collapse 2° to toxic accumulation)

Drug Resources During Pregnancy and Breastfeeding

- Motherisk at the Hospital for Sick Children in Toronto: www.motherisk.org
- Hale T. Medications and mothers' milk, 11th ed. Pharmasoft Publishing, 2004

Immunizations

Intrapartum

- administration is dependent on the risk of infection vs. risk of immunization complications
- safe: tetanus toxoid, diphtheria, influenza, hepatitis B, pertussis
- avoid live vaccines (risk of placental and fetal infection): polio, measles/mumps/rubella, varicella
- contraindicated: rubella, oral typhoid

Postpartum

- rubella vaccine for all non-immune mothers
- hepatitis B vaccine should be given to infant within 12 h of birth if maternal status unknown or positive – follow-up doses at 1 and 6 mo
- human papillomavirus (HPV) vaccine – if meets criteria
- safe: tetanus toxoid, diphtheria, influenza, hepatitis B, pertussis

Radiation

- ionizing radiation exposure is considered teratogenic at high doses
 - if indicated for maternal health, should be done
- imaging not involving direct abdominal/pelvic high dosage is not associated with adverse effects
 - higher dosage to fetus: plain x-ray of lumbar spine/abdomen/pelvis, barium enema, CT abdomen, pelvis, lumbar spine
- most investigations involve minimal radiation exposure
- radioactive isotopes of iodine are contraindicated
- no known adverse effects from U/S or MRI (long-term effects of gadolinium unknown, avoid if possible)

Radiation in Pregnancy

- Necessary amount to cause miscarriage: >5 rads
- Necessary amount to cause malformations: >20-30 rads

Table 7. Approximate Fetal Doses from Common Diagnostic Procedures

Examination	Estimated Fetal Dose (rad)	Number of Exams Safe in Pregnancy
Plain Film		
Abdomen	0-14	35
Pelvis	0-11	45
Lumbar spine	0-17	29
Thoracic spine	0.009	555
Chest (2 views)	<0.001	5,000
CT		
Abdomen	0-8	6
Pelvis	2-5	2
Lumbar spine	0-24	20
Chest	0.006	833

Adapted from: Cohen-Kerem, et al. 2005 and Valentin 2000

Termination of Pregnancy

- see [Gynecology](#), GY20

Definition

- active termination of a pregnancy before fetal viability (usually <500 g or <20 wk GA)

Indications

- inability to carry a pregnancy to term due to medical or social reasons (including patient preference)

Management

- medical
 - <9 wk: methotrexate + misoprostol
 - >12 wk: prostaglandins (intra- or extra-amniotically or IM) or misoprostol
- surgical
 - <12 wk: dilatation + vacuum aspiration ± curettage
 - >12 wk: dilatation and evacuation, early induction of labor
 - common complications: pain or discomfort
 - less common complications: hemorrhage, perforation of uterus, laceration of cervix, risk of infertility, infection/endometritis, Asherman's syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), retained products of conception
- counseling
 - supportive and counseling services
 - future contraception and family planning services
 - ensure follow-up

CMA Policy (1988)

"Induced abortion should be uniformly available to all women in Canada" and "there should be no delay in the provision of abortion services"

Terminations are generally done until the stage of viability (~23.5 wk), although this varies depending on the provider

For prevention of pregnancy after rape, ensure appropriate access to emergency contraception (see [Gynecology](#), GY20)

Prenatal Fetal Monitoring

Fetal Movements

- patients will generally first notice fetal movement ("quickening") at 18-20 wk in primigravidas; can occur 1-2 wk earlier in multigravidas; can occur 1-2 wk later if placenta is implanted on the anterior wall of uterus
- if the patient is concerned about decreased fetal movement, she is counseled to choose a time when the fetus is normally active to count movements (usually recommended after 26 wk)
- all high risk women should be told to do FM counts
 - if there is a subjective decrease in fetal movement, try drinking juice, eating, changing position, or moving to a quiet room and count for 2 h; ≥ 6 movements in 2 h expected
 - if there are < 6 movement counts in 2 h, patient should present to labor and delivery triage

DDx of Decreased Fetal Movements

DASH

Death of fetus
Amniotic fluid decreased
Sleep cycle of fetus
Hunger/Thirst

NON-STRESS TEST

Definition

- FHR tracing ≥ 20 min using an external Doppler to assess FHR and its relationship to fetal movement (see *Fetal Monitoring in Labor*, OB33)

Indication

- any suggestion of uteroplacental insufficiency or suspected compromise in fetal well-being

Table 8. Classification of Antepartum Non-Stress Test

Parameter	Normal NST (Previously "Reactive")	Atypical NST (Previously "Non-Reactive")	Abnormal NST (Previously "Non-Reactive")
Baseline	110-160 bpm	100-110 bpm or > 160 bpm for < 30 min Rising baseline	Bradycardia < 100 bpm Tachycardia > 160 for > 30 min Erratic baseline
Variability	6-25 bpm (moderate) ≤ 5 (absent or minimal) for < 40 min	5 (absent or minimal) for 40-80 min	≤ 5 for 80 min Sinusoidal 25 bpm for > 10 min
Decelerations	None or occasional variable < 30 s	Variable decelerations 30-60 s duration	Variable decelerations > 60 s Late deceleration(s)
Accelerations in Term Fetus	2 accelerations with acme of ≥ 15 bpm, lasting 15 s over < 40 min of testing	2 accelerations with acme of ≥ 15 bpm, lasting 15 s in 40-80 min	< 2 accelerations with acme of ≥ 15 bpm, lasting 15 s in > 80 min
Accelerations in Preterm Fetus (< 32 wk)	> 2 accelerations with acme of > 10 bpm, lasting 10 s in < 40 min	< 2 accelerations with acme of > 10 bpm, lasting 10 s in 40-80 min	< 2 accelerations with acme of > 10 bpm, lasting 10 s in > 80 min
Action	FURTHER ASSESSMENT OPTIONAL, based on total clinical picture	FURTHER ASSESSMENT REQUIRED	URGENT ACTION REQUIRED An overall assessment of the situation and further investigation with U/S or BPP is required; some situations will require delivery

Adapted from: SOGC, Fetal Health Surveillance: Antepartum and Intrapartum Consensus Guideline, September 2007

Normal NST: 2 accels, > 15 bpm from baseline, lasting > 15 s in 20 min

Operating Characteristics

- false positive rate depends on duration; false negative rate = 0.2-0.3%

Interpretation

- normal: at least 2 accelerations of FHR > 15 bpm from the baseline lasting > 15 s, in 20 min
- abnormal: < 2 accelerations of FHR in 40 min
- if no observed accelerations or fetal movement in the first 20 min, stimulate fetus (fundal pressure, acoustic/vibratory stimulation) and continue monitoring for 30 min
- if NST abnormal, then perform BPP

BIOPHYSICAL PROFILE

Definition

- U/S assessment of the fetus \pm NST

Indications

- abnormal or atypical NST
- post-term pregnancy
- decreased fetal movement
- any other suggestion of fetal distress or uteroplacental insufficiency

Operating Characteristics

- false positive rate $\leq 30\%$, false negative rate = 0.1%

Table 9. Scoring of the BPP

Parameter	Reassuring (2 points)	Non-Reassuring (0 points)
AFV*	Fluid pocket of 2 cm in 2 axes	Oligohydramnios
Breathing	At least one episode of breathing lasting at least 30 s	No breathing
Limb Movement	Three discrete movements	Two or less
Fetal Tone	At least one episode of limb extension followed by flexion	No movement

*AFV is a marker of chronic hypoxia, all other parameters indicate acute hypoxia

Reassuring BPP (8/8)

LAMB

Limb extension + flexion

AFV 2 cm x 2 cm

Movement (3 discrete)

Breathing (one episode x 30 s)

Interpretation

- 8: perinatal mortality rate 1:1,000; repeat BPP as clinically indicated
- 6: perinatal mortality 31:1,000; repeat BPP in 24 h
- 0-4: perinatal mortality rate 200:1,000; deliver fetus if benefits of delivery outweigh risks

Medical Conditions in Pregnancy

Iron and Folate Deficiency Anemia

Table 10. Iron Deficiency and Folate Deficiency Anemia

	Iron Deficiency Anemia	Folate Deficiency Anemia
Etiology	See Hematology, H15	See Hematology, H25
Epidemiology	Responsible for 80% of causes of non-physiologic anemia during pregnancy	Incidence varies from 0.5-25% depending on region, population, diet
Clinical Features	See Hematology, H15	See Hematology, H25
Investigations	See Hematology, H15	See Hematology, H25
Management	Prevention (non-anemic): 30 mg elemental iron/d (met by most prenatal vitamins) Treatment (anemic): 30-120 mg elemental iron/d 325 mg ferrous fumarate = 106 mg elemental Fe^{2+} ; 325 mg ferrous sulfate = 65 mg elemental Fe^{2+} ; 325 mg ferrous gluconate = 36 mg elemental Fe^{2+} Polysaccharide-Iron Complex = 150 mg elemental Fe/capsule	Prevention: 0.4-1 mg folic acid PO daily for 1-3 mo preconceptually and throughout T1, or 5 mg folic acid per day with past history of oNTD, DM, or anti-epileptic medication use
Complications	Maternal: angina, CHF, infection, slower recuperation, preterm labor Fetal: decreased oxygen carrying capacity leading to fetal distress, IUGR, and low birth weight	Maternal: decreased blood volume, N/V, anorexia Fetal: neural tube defects in T1, low birth weight, prematurity
Notes	Mother needs 1 g of elemental iron per fetus; this amount exceeds normal stores + dietary intake Iron requirements increase during pregnancy due to fetal/placental growth (500 mg), increased maternal RBC mass (500 mg), and losses (200 mg) – more needed for multiple gestations	Minimum daily requirement is 0.4 mg Most often associated with iron deficiency anemia Folic acid is necessary for closure of neural tube during early fetal development (by day 28 of gestation)

Diabetes Mellitus

Classification of Diabetes Mellitus

- type 1 and type 2 DM (see [Endocrinology, E6](#))
- GDM: onset of DM during pregnancy

Etiology

- type 1 and type 2 DM
- GDM: usually around 24-28 wk GA, anti-insulin factors produced by placenta and high maternal cortisol levels create increased peripheral insulin resistance → higher fasting glucose → leading to GDM and/or exacerbating pre-existing DM

Epidemiology

- 2-4% of pregnancies are complicated by DM

MANAGEMENT

A. TYPE 1 and TYPE 2 DM

Preconception

- pre-plan and refer to high-risk clinic
- optimize glycemic control
- counsel patient re: potential risks and complications
- evaluate for diabetic retinopathy, neuropathy, CAD

Pregnancy

- if already on oral medication, generally switch to insulin therapy
 - continuing glyburide or metformin controversial
 - teratogenicity unknown for other oral anti-hyperglycemics
- tight glycemic control
 - insulin dosage may need to be adjusted in type 2 due to increased demand and increased insulin resistance
- monitor as for normal pregnancy plus initial 24 h urine protein and creatinine clearance, retinal exam, HbA1c
 - HbA1c: >140% of pre-pregnancy value associated with increased risk of spontaneous abortion and congenital malformations
- increased fetal surveillance (BPP, NST), consider fetal ECHO to look for cardiac abnormalities

Labor

- timing of delivery depends on fetal and maternal health and risk factors (i.e. must consider size of baby, lung maturity, maternal blood glucose, and blood pressure control)
- can wait for spontaneous labor if blood glucose well-controlled and BPP normal
- induce by 40 wk
- type of delivery
 - increased risk of cephalopelvic disproportion (CPD) and shoulder dystocia with babies >4,000 g (8.8 lbs)
 - elective C/S for predicted birthweight >4,500 g (9.9 lbs) (controversial)
- monitoring
 - during labor monitor blood glucose q1h with patient on insulin and dextrose drip
 - aim for blood glucose between 60-120 mg/dL to reduce the risk of neonatal hypoglycemia

Postpartum

- insulin requirements dramatically drop with expulsion of placenta (source of insulin antagonists)
- no insulin is required for 48-72 h postpartum in most type 1 DM
- monitor glucose q6h, restart insulin at two-thirds of pre-pregnancy dosage when glucose >144 mg/dL

B. GESTATIONAL DIABETES MELLITUS

Screening and Diagnosis

- all pregnant women between 24-28 wk GA (or at any stage if high risk)
- 2 screening options
 - 1-step screening with fasting 75 g OGTT; GDM if ≥ 1 of:
 - ♦ FPG ≥ 90 mg/dL
 - ♦ 1h PG ≥ 180 mg/dL
 - ♦ 2h PG ≥ 153 mg/dL
 - 2-step screening
 - ♦ Step 1: Perform a random nonfasting 50 g OGCT
 - 1h PG <140 mg/dL is normal
 - 1h PG ≥ 200 mg/dL is GDM
 - if 1h PG 140-200 mg/dL, proceed to Step 2
 - ♦ Step 2: Perform a fasting 75 g OGTT, GDM if ≥ 1 of:
 - FPG ≥ 95 mg/dL
 - 1h PG ≥ 190 mg/dL
 - 2h PG ≥ 162 mg/dL

Management

- first line is management through diet modification and increased physical activity
- initiate insulin therapy if glycemic targets not achieved within 2 wk of lifestyle modification alone
- glycemic targets: FPG <95 mg/dL, 1h PG <140 mg/dL, 2h PG <120 mg/dL

Post-prandial blood glucose values seem to be the most effective at determining the likelihood of macrosomia or other adverse pregnancy outcomes

Monitoring Glucose Levels

- Frequent measurements of blood glucose during pregnancy are advised for women with type 1 or 2 DM to help prevent or treat both hypoglycemia and hyperglycemia, and also improves neonatal outcome
- Aim for FPG ≤ 95 mg/dL, 1 h post prandial
- PG ≤ 140 mg/dL, 2 h post prandial PG ≤ 120 mg/dL
- Most women can be followed with monthly HbA1c determinations

Risk Factors for GDM

- Age >25 yr
- Obesity
- Ethnicity (Aboriginal, Hispanic, Asian, African)
- FHx of DM
- Previous history of GDM
- Previous child with birthweight >4.0 kg
- Polycystic ovarian syndrome
- Current use of glucocorticoids
- Essential HTN or pregnancy-related HTN

- use of oral agents can be used in pregnancy but is off-label and should be discussed with patient
- stop insulin and diabetic diet postpartum
- follow-up with 75 g OGTT 6 wk-6 mo postpartum

Prognosis

- most maternal and fetal complications are related to hyperglycemia and its effects

Long-Term Maternal Complications

- type 1 and type 2 DM: risk of progressive retinopathy and nephropathy
- GDM: 50% risk of developing type 2 DM in next 20 yr

Table 11. Complications of DM in Pregnancy

Maternal	Fetal
Obstetric <ul style="list-style-type: none"> • HTN/preeclampsia (especially if pre-existing nephropathy/proteinuria): insulin resistance is implicated in etiology of HTN • Polyhydramnios: maternal hyperglycemia leads to fetal hyperglycemia, which leads to fetal polyuria (a major source of amniotic fluid) 	Growth Abnormalities <ul style="list-style-type: none"> • Macrosomia: maternal hyperglycemia leads to fetal hyperinsulinism resulting in accelerated anabolism • IUGR: due to placental vascular insufficiency
Diabetic Emergencies <ul style="list-style-type: none"> • Hypoglycemia • Ketoacidosis • Diabetic coma 	Delayed Organ Maturity <ul style="list-style-type: none"> • Fetal lung immaturity: hyperglycemia interferes with surfactant synthesis (respiratory distress syndrome)
End-Organ Involvement or Deterioration (occur in type 1 DM and type 2 DM, not in GDM) <ul style="list-style-type: none"> • Retinopathy • Nephropathy 	Congenital Anomalies (occur in type 1 DM and type 2 DM, not in GDM) <ul style="list-style-type: none"> • 2-7x increased risk of cardiac (VSD), NTD, GU (cystic kidneys), GI (anal atresia), and MSK (sacral agenesis) anomalies due to hyperglycemia • Note: Pregnancies complicated by GDM do not manifest an increased risk of congenital anomalies because GDM develops after the critical period of organogenesis (in T1)
Other <ul style="list-style-type: none"> • Pyelonephritis/UTI: glucosuria provides a culture medium for <i>E. coli</i> and other bacteria • Increased incidence of spontaneous abortion (in type 1 DM and type 2 DM, not in GDM): related to pre-conception glycemic control 	Labor and Delivery <ul style="list-style-type: none"> • Preterm labor/prematurity: most commonly in patients with HTN/preeclampsia • Preterm labor is associated with poor glycemic control but the exact mechanism is unknown • Increased incidence of stillbirth • Birth trauma: due to macrosomia, can lead to difficult vaginal delivery and shoulder dystocia
	Neonatal <ul style="list-style-type: none"> • Hypoglycemia: due to pancreatic hyperplasia and excess insulin secretion in the neonate • Hyperbilirubinemia and jaundice: due to prematurity and polycythemia • Hypocalcemia: exact pathophysiology not understood, may be related to functional hypoparathyroidism • Polycythemia: hyperglycemia stimulates fetal erythropoietin production

Hypertension in Pregnancy

- hypertensive disorders of pregnancy are classified as either **pre-existing** or **gestational** HTN

PRE-EXISTING HYPERTENSION

Definition

- HTN (>140/90) prior to 20 wk GA, persisting >7 wk postpartum
- essential HTN is associated with an increased risk of gestational HTN, abruptio placentae, IUGR, and IUFD

GESTATIONAL HYPERTENSION

Definition

- sBP >140 or dBP >90 developing after 20th wk GA in a woman known to be normotensive before pregnancy

Risk Factors

- maternal factors
 - primigravida (80-90% of gestational HTN)
 - first conception with a new partner
 - PMHx or FHx of gestational HTN
 - DM, chronic HTN, or renal insufficiency
 - Antiphospholipid syndrome
 - extremes of maternal age (<18 or >35 yr)
- fetal factors
 - IUGR or oligohydramnios, GTN, multiple gestation, fetal hydrops
 - previous stillbirth or IUFD

Ominous Symptoms of HTN in Pregnancy
RUQ pain, headache, and visual disturbances

Clinical Evaluation of Hypertension in Pregnancy

- in general, clinical evaluation should include the mother and fetus
- **evaluation of mother**
 - body weight
 - central nervous system
 - ♦ presence and severity of headache
 - ♦ visual disturbances – blurring, scotomata
 - ♦ tremulousness, irritability, somnolence
 - ♦ hyperreflexia
 - hematologic
 - ♦ bleeding, petechiae
 - hepatic
 - ♦ RUQ or epigastric pain
 - ♦ severe N/V
 - renal
 - ♦ urine output and color
 - non-dependent edema (i.e. hands and face)
- **evaluation of fetus**
 - fetal movement
 - fetal heart rate tracing – NST
 - ultrasound for growth
 - BPP
 - Doppler flow studies

Laboratory Evaluation of Gestational Hypertension

- hemoglobin, platelets, blood film
- PTT, INR, fibrinogen – especially if surgery or regional anesthetics are planned
- ALT, AST, LDH, bilirubin
- proteinuria, creatinine, uric acid
- 24 h urine collection for total protein and creatinine clearance or spot urine protein:creatinine ratio

Complications

- maternal
 - liver and renal dysfunction
 - seizure
 - abruptio placentae
 - left ventricular failure/pulmonary edema
 - DIC (release of placental thromboplastin consumptive coagulopathy)
 - HELLP syndrome
 - ♦ treat with FFP infusion or plasma exchange
 - hemorrhagic stroke (50% of deaths)
- fetal (2° to placental insufficiency)
 - IUGR, prematurity, abruptio placentae, IUFD

Management

- target a BP of 130-155/80-105 in women without comorbidities or 130-139/80-89 in women with comorbidities
- for both pre-existing and gestational HTN, labetalol 100-400 mg PO bid-tid, nifedipine (PA tablets 10-20 mg PO bid-tid or XL preparation 20-60 mg PO daily), or α -methyldopa 250-500 mg PO tid-qid
- for severe HTN (BP >160/110), give one of
 - labetalol 20 mg IV then 20-80 mg IV q30min (max 300 mg)
 - nifedipine 5-10 mg capsule q30min
 - hydralazine 5 mg IV, repeat 5-10 mg IV q30min (max 20 mg IV)
- no ACE inhibitors, ARBs, diuretics, prazosin, or atenolol
- pre-existing HTN and gestational HTN without any deterioration can be followed until 37 wk then decide to induce shortly thereafter

PREECLAMPSIA

Definition

- pre-existing or gestational HTN with new onset proteinuria or adverse conditions

Risk Factors

- nulliparity
- preeclampsia in a previous pregnancy
- age >40 yr or <18 yr
- FHx of preeclampsia

I-A Evidence-Recommendation Highlights of SOGC Clinical Practice Guidelines Diagnosis, Evaluation, and Management of the Hypertensive Disorders of Pregnancy

J Obstet Gynaecol Can 2008;30:S1-48

- For BP measurement, Korotkoff phase V should be used to designate the dBp.
- For preeclampsia prevention among low-risk women with low dietary calcium intake (<600 mg/d), oral calcium supplementation of at least 1 g/d is recommended.
- For preeclampsia prevention among increased risk women, low-dose Aspirin® (75-100 mg/d) is recommended until delivery.
- Umbilical artery Doppler velocimetry should be part of the antenatal fetal surveillance in preeclampsia.
- Initial antihypertensive therapy for severe HTN (sBP >160 or dBp ≥110 mmHg) should be with labetalol, nifedipine, or hydralazine.
- Initial antihypertensive therapy for non-severe HTN (BP 140-159/90-109 mmHg) should be with methyldopa, β -blockers, or calcium channel blockers.
- Antenatal corticosteroids for fetal lung maturation should be considered for all women with preeclampsia before 34 wk gestation.
- In a planned vaginal delivery with an unfavorable cervix, cervical ripening should be used.
- Oxytocin 5 units IV or 10 units IM should be used as part of the management during the third stage of labor.
- MgSO_4 is the recommended first-line treatment for eclampsia.
- MgSO_4 is the recommended eclampsia prophylaxis in severe preeclampsia.

Hypertension in Pregnancy

Adverse Maternal Conditions

- sBP > 160 mmHg
- dBp > 100 mmHg
- HELLP
- Cerebral hemorrhage
- Renal dysfunction: oliguria <500 mL/d
- Left ventricular failure, pulmonary edema
- Placental abruption, DIC

Symptoms

- Abdominal pain, N/V
- Headaches, visual problems
- SOB, chest pain
- Eclampsia: convulsions

Adverse Fetal Conditions

- Intrauterine growth restriction
- Oligohydramnios
- Absent/reversed umbilical artery end diastolic flow

Can result in

- Fetal disability and/or death

- chronic HTN
- chronic renal disease
- antiphospholipid antibody syndrome or inherited thrombophilia
- vascular or connective tissue disease
- DM (pre-gestational and gestational)
- high BMI
- hydrops fetalis
- unexplained fetal growth restriction
- abruptio placentae
- there is a potential for further deterioration to severe preeclampsia as defined above
- the adverse conditions are many and include both maternal and fetal issues

Management

- management will depend on GA, possible threat of seizures (check reflexes)
- if stable and no adverse factors, may admit and follow, ± decide to deliver as approaching 34-36 wk (must weigh risks of fetal prematurity vs. risks of developing severe preeclampsia/eclampsia)
- for severe preeclampsia, stabilize and deliver
- if severe preeclampsia, during labor, increase maternal monitoring: hourly input and output, urine dip q12h, hourly neurological vitals, and increase fetal monitoring (continuous FHR monitoring)
- antihypertensive therapy
 - lowering BP decreases the risk of stroke
 - hydralazine 5-10 mg IV bolus over 5 min q15-30min as necessary
 - labetalol 20-50 mg IV q10min
 - 2nd line: nifedipine 10-20 mg PO q20-60min
- seizure prevention
 - MgSO₄
 - postpartum management
 - risk of seizure highest in first 24 h postpartum – continue MgSO₄ for 12-24 h after delivery
 - vitals q1h
 - consider HELLP syndrome in toxic patients
 - most return to a normotensive BP within 2 wk

ECLAMPSIA

Definition

- the occurrence of one or more generalized convulsions and/or coma in the setting of preeclampsia and in the absence of other neurologic conditions

Epidemiology

- an eclamptic seizure occurs in approximately 0.5% of mildly preeclamptic women and 2-3% of severely preeclamptic women

Risk Factors

- same as risk factors for preeclampsia

Clinical Manifestations

- eclampsia is a clinical diagnosis
- typically tonic-clonic and lasting 60-75 s
- one of the signs of an impending seizure is hyperreflexia
- symptoms that may occur before the seizure include persistent frontal or occipital headache, blurred vision, photophobia, right upper quadrant or epigastric pain, and altered mental status
- in up to one third of cases, there is no proteinuria or blood pressure is <140/90 mmHg prior to the seizure
- in general, women with typical eclamptic seizures who do not have focal neurologic deficits or prolonged coma do not require diagnostic evaluation including imaging

Management

- ABCs
- roll patient into LLD
- supplemental O₂ via face mask to treat hypoxemia due to hypoventilation during convulsive episode
- aggressive antihypertensive therapy for sustained diastolic pressures ≥105 mmHg or systolic blood pressures ≥160 mmHg with hydralazine or labetalol
- prevention of recurrent convulsions: to prevent further seizures and the possible complications of repeated seizure activity (e.g. rhabdomyolysis, metabolic acidosis, aspiration pneumonitis, etc.)
- MgSO₄ is now the drug of choice, with previously used agents including diazepam and phenytoin

Preeclampsia Investigations

- CBC
- Liver enzymes
- INR and aPTT
- Cr
- Uric acid
- LDH
- Albumin
- Bilirubin
- Urine (dip ± 24 h collection or protein/creatinine ratio)

HELLP Syndrome

- Hemolysis
- Elevated Liver enzymes
- Low Platelets

Differential Diagnosis of Cause for Seizure in a Pregnant Woman

- Stroke
- Hypertensive disease (hypertensive encephalopathy, pheochromocytoma)
- Space-occupying lesion of the CNS
- Metabolic disorders (hypoglycemia, SIADH)
- Infection (meningitis, encephalitis)
- Thrombotic thrombocytopenic purpura or thrombophilia
- Idiopathic epilepsy
- Use of illicit drugs
- Cerebral vasculitis

Note

Eclampsia prior to 20 wk of gestation is rare and should raise the possibility of an underlying molar pregnancy or antiphospholipid syndrome

MgSO₄ Toxicity

- Flushing
- Hyporeflexia
- Somnolence
- Respiratory and cardiac depression
- Weakness

Note: Increased risk of toxicity with concurrent calcium channel blocker use or renal disease

Treatment

- Stop MgSO₄
- Calcium gluconate 10% in 10 mL IV

- the definitive treatment of eclampsia is DELIVERY, irrespective of gestational age, to reduce the risk of maternal morbidity and mortality from complications of the disease
- mode of delivery is dependent on clinical situation and fetal-maternal condition

Nausea and Vomiting

Epidemiology

- affects 50-90% of pregnant women
- often limited to T1 but may persist

Management

- rule out other causes of N/V
- weigh frequently, assess level of hydration, test urine for ketones
- **non-pharmacological**
 - avoid mixing fluids and solids, frequent small meals
 - stop prenatal vitamins (folic acid must continue until >12 wk)
 - increase sleep/rest
 - ginger (maximum 1,000 mg/d)
 - acupuncture, acupressure
- **pharmacological**
 - first line: Diclectin® (10 mg doxylamine succinate with vitamin B₆) 4 tablets PO daily to maximum of 8 tablets
 - if no improvement, try dimenhydrinate (50-100 mg q4-6h PO), followed by hydroxyzine, pyridoxine, phenothiazine, or metoclopramide
 - vitamin B₆ lollipops
 - if patient dehydrated, assess fluid replacement needs and resuscitate accordingly
- **severe/refractory:**
 - consider homecare with IV fluids and parenteral anti-emetics, hospitalization

Hyperemesis Gravidarum

Definition

- intractable N/V, usually presents in T1 then diminishes; occasionally persists throughout pregnancy
- affects ~1% of pregnancies

Etiology

- multifactorial with hormonal, immunologic, and psychologic components
- rapidly rising β -hCG \pm estrogen levels may be implicated

Investigations

- rule out systemic causes: GI inflammation, pyelonephritis, thyrotoxicosis
- rule out obstetrical causes: multiple gestation, GTN, HELLP syndrome
- CBC, electrolytes, BUN, creatinine, LFTs, urinalysis
- ultrasound

Management

- thiamine supplementation may be indicated
- **non-pharmacological** (see *Nausea and Vomiting*)
- **pharmacological options**
 - Diclectin® (for dosage, see *Nausea and Vomiting*)
 - Dimenhydrinate can be safely used as an adjunct to Diclectin® (1 suppository bid or 25 mg PO qid)
 - other adjuncts: hydroxyzine, pyridoxine, phenothiazine, metoclopramide
 - also consider: ondansetron or methylprednisolone
 - if severe: admit to hospital, NPO initially then small frequent meals, correct hypovolemia, electrolyte disturbance, and ketosis, TPN (if very severe) to reverse catabolic state

Complications

- maternal
 - dehydration, electrolyte and acid-base disturbances
 - Mallory-Weiss tear
 - Wernicke's encephalopathy, if protracted course
 - death
- fetal: usually none, IUGR is 15x more common in women losing >5% of pre-pregnancy weight

Urinary Tract Infection

Etiology

- increased urinary stasis from mechanical and hormonal (progesterone) factors
- organisms include GBS as well as those that occur in non-pregnant women

Epidemiology

- most common medical complication of pregnancy
- asymptomatic bacteriuria in 2-7% of pregnant women, more frequently in multiparous women
- note: asymptomatic bacteriuria should be treated in pregnancy due to increased risk of pyelonephritis

Treat asymptomatic bacteriuria in pregnancy because of increased risk of progression to cystitis, pyelonephritis, and probable increased risk of preterm labor

Clinical Features

- may be asymptomatic
- dysuria, urgency, and frequency in cystitis
- fever, flank pain, and costovertebral angle tenderness in pyelonephritis

Investigations

- urinalysis, urine C&S
- cystoscopy, and renal function tests in recurrent infections

Management

- uncomplicated UTI
 - first line: amoxicillin (250-500 mg PO q8h x 7 d)
 - alternatives: nitrofurantoin (100 mg PO bid x 7 d)
 - follow with monthly urine cultures
- pyelonephritis
 - hospitalization and IV antibiotics

Prognosis

- complications if untreated: acute cystitis, pyelonephritis, and possible preterm labor
- recurrence is common

Infections During Pregnancy

Table 12. Infections During Pregnancy

Infection	Agent	Source of Transmission	Greatest Transmission Risk to Fetus	Effects on Fetus	Effects on Mother	Diagnosis	Management
Chicken Pox	Varicella zoster virus (herpes family)	To mom: direct, respiratory To baby: transplacental	13-30 wk GA, and 5 d pre- to 2 d post-delivery	Congenital varicella syndrome (limb aplasia, chorioretinitis, cataracts, cutaneous scars, cortical atrophy, IUGR, hydrops), preterm labor (prematurity)	Fever, malaise, vesicular pruritic lesions	Clinical, \pm vesicle fluid culture, \pm serology	VZIG for mother if exposed, decreases congenital varicella syndrome Note: do not administer vaccine during pregnancy (live attenuated)
*CMV	DNA virus (herpes family)	To mom: blood/organ transfusion, sexual contact To baby: transplacental, during delivery, breast milk	T1-T3	5-10% develop CNS involvement (mental retardation, cerebral calcification, hydrocephalus, microcephaly, deafness, chorioretinitis)	Asymptomatic or flu-like	Serologic screen; isolate virus from urine or secretion culture	No specific treatment; maintain good hygiene and avoid high risk situations
Erythema Infectiosum (Fifth Disease)	Parvovirus B19	To mom: respiratory, infected blood products To baby: transplacental	10-20 wk GA	Spontaneous abortion (SA), stillbirth, hydrops <i>in utero</i>	Flu-like, rash, arthritis; often asymptomatic	Serology, viral PCR, maternal AFP; if IgM present, follow fetus with U/S for hydrops	If hydrops occurs, consider fetal transfusion

Table 12. Infections During Pregnancy (continued)

Infection	Agent	Source of Transmission	Greatest Transmission Risk to Fetus	Effects on Fetus	Effects on Mother	Diagnosis	Management
Hepatitis B	DNA virus	To mom: blood, saliva, semen, vaginal secretions To baby: transplacental, breast milk	T3 10% vertical transmission if asymptomatic and HBsAg +ve; 85-90% if HBsAg and HBeAg +ve	Prematurity, low birth weight, neonatal death	Fever, N/V, fatigue, jaundice, elevated liver enzymes	Serologic screening for all pregnancies	Rx neonate with HBIG and vaccine (at birth, 1, 6 mo); 90% effective
*Herpes Simplex Virus	DNA virus	To mom: intimate mucocutaneous contact To baby: transplacental, during delivery	Delivery (if genital lesions present); less commonly <i>in utero</i>	Disseminated herpes (20%); CNS sequelae (35%); self-limited infection	Painful vesicular lesions	Clinical diagnosis	Acyclovir for symptomatic women, suppressive therapy at 36 wk controversial C/S if active genital lesions, even if remote from vulva
HIV	RNA retrovirus	To mom: blood, semen, vaginal secretions To baby: <i>in utero</i> , during delivery, breast milk	1/3 <i>in utero</i> , 1/3 at delivery, 1/3 breastfeeding	IUGR, preterm labor, PROM	See Infectious Diseases, ID29 	Serology, viral PCR All pregnant women are offered screening	Triple antiretroviral therapy decreases transmission to <1% Elective C/S: no previous antiviral Rx or monotherapy only, viral load unknown or >500 RNA copies/mL, unknown prenatal care, patient request
*Rubella	ssRNA togavirus	To mom: respiratory droplets (highly contagious) To baby: transplacental	T1	SA or congenital rubella syndrome (hearing loss, cataracts, CV lesions, MR, IUGR, hepatitis, CNS defects, osseous changes)	Rash (50%), fever, posterior auricular or occipital lymphadenopathy, arthralgia	Serologic testing; all pregnant women screened (immune if titre >1:16); infection if IgM present or >4x increase in IgG	No specific treatment; offer vaccine following pregnancy Do not administer during pregnancy (live attenuated)
Syphilis	Spirochete (<i>Treponema pallidum</i>)	To mom: sexual contact To baby: transplacental	T1-T3	Risk of preterm labor, multisystem involvement, fetal death	See Infectious Diseases, ID26 	VDRL screening for all pregnancies; if positive, requires confirmatory testing	Pen G 2.4 M U IM 1 dose if early syphilis, 3 doses if late syphilis, monitor VDRL monthly If Pen G allergic: Clindamycin 900 mg IV q8h
*Toxoplasmosis	Protozoa (<i>Toxoplasma gondii</i>)	To mom: raw meat, unpasteurized goat's milk, cat feces/urine To baby: transplacental	T3 (but most severe if infected in T1); only concern if primary infection during pregnancy	Congenital toxoplasmosis (chorioretinitis, hydrocephaly, intracranial calcification, MR, microcephaly) NB: 75% initially asymptomatic at birth	Majority subclinical; may have flu-like symptoms	IgM and IgG serology; PCR of amniotic fluid	Self-limiting in mother; spiramycin decreases fetal morbidity but not rate of transmission

* Indicates TORCH infection

Venous Thromboembolism

Epidemiology

- incidence 0.5-3/1,000 pregnancies occurring with approximately equal frequency in all three trimesters and postpartum

Risk Factors

- previous VTE, age >35, obesity, infection, bedrest/immobility, shock/dehydration, thrombophilias (see [Hematology, H33](#))

Table 13. Risk Factors for VTE Specific to Pregnancy

Hypercoagulability	Stasis	Endothelial
Increased factors: II, V, VII, VIII, IX, X, XII, fibrinogen Increased platelet aggregation Decreased protein S, tPA, factors XI, XIII	Increased resistance to activated protein C Antithrombin can be normal or reduced Increased venous distensibility Decreased venous tone 50% decrease in venous flow in lower extremity by T3 Uterus is mechanical impediment to venous return	Vascular damage at delivery (C/S or SVD) Uterine instrumentation Peripartum pelvic surgery

**Virchow's Triad for VTE**

- Hypercoagulable state
- Stasis
- Endothelial damage

Clinical Features

- most DVTs occur in the iliofemoral or calf veins with a predilection for the left leg
- signs of a pulmonary embolism are non-specific (as in non-pregnant women)
- unexplained spontaneous fetal loss

Investigations

- duplex venous Doppler sonography for DVT
- CXR and V/Q scan or spiral CT for PE

Management

- before initiating treatment, obtain a baseline CBC including platelets, and aPTT
- warfarin is contraindicated during pregnancy due to its potential teratogenic effects
- unfractionated heparin
 - bolus of 5,000 IU followed by an infusion of ~30,000 IU/24h
 - measure aPTT 6 h after the bolus
 - maintain aPTT at a therapeutic level (1.5-2x normal)
 - repeat q24h once therapeutic
 - heparin-induced thrombocytopenia (HIT) uncommon (3%) but serious complication
 - LMWH can also be used in pregnancy
- compression stockings
- poor evidence to support a recommendation for or against avoidance of prolonged sitting
- VTE prophylaxis
 - women on long-term anticoagulation: full therapeutic anticoagulation throughout pregnancy and for 6-12 wk postpartum
 - women with a non-active PMHx of VTE: unfractionated heparin regimens suggested
- routine VTE prophylaxis
 - insufficient evidence in pregnancy to recommend routine use of LMWH
 - current prophylaxis regimens for acquired thrombophilias (e.g. APS syndrome) include low dose Aspirin® in conjunction with prophylactic heparin

Bleeding in Pregnancy

First and Second Trimester Bleeding

Approach to the Patient with Bleeding in T1/T2

- **history**
 - risk factors for ectopic pregnancy (previous ectopic pregnancies, history of STD/PID, IUD use, previous pelvic surgery, smoking)
 - previous spontaneous abortion
 - recent trauma
 - characteristics of the bleeding (including any tissue passed)
 - characteristics of the pain (cramping pain suggests SA)
 - history of coagulopathy
 - gynecological/obstetric history
 - dizziness (significant blood loss, may be associated with ruptured ectopic)
 - fever (may be associated with septic abortion)
- **physical**
 - vitals (including orthostatic changes)
 - abdomen (SFH, tenderness, presence of contractions)
 - perineum (signs of trauma, genital lesions)
 - speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
 - pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness)

**Bleeding in Pregnancy Definitions**

- First trimester bleeding: vaginal bleeding within the first 12 wk
- Second trimester bleeding: <20 wk

**Differential Diagnosis**

- Physiologic bleeding: spotting, due to implantation of placenta – reassure and check serial β -hCGs
- Abortion (threatened, inevitable, incomplete, complete) (see Table 14)
- Abnormal pregnancy (ectopic, molar) (see [Gynecology](#), [Hydatidiform Mole](#) GY45)
- Trauma (post-coital or after pelvic exam)
- Genital lesion (e.g. cervical polyp, neoplasms)

Investigations

- β -hCG (lower than expected for GA in spontaneous abortion, ectopic pregnancy)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

Treatment

- IV resuscitation for hemorrhagic shock
- treat the underlying cause

Spontaneous Abortions

- see *Termination of Pregnancy*, OB11, for therapeutic abortions

Table 14. Classification of Spontaneous Abortions

Type	History	Clinical	Management (\pm Rhogam [®])
Threatened	Vaginal bleeding \pm cramping	Cervix closed and soft U/S shows viable fetus	Watch and wait <5% go on to abort
Inevitable	Increasing bleeding and cramps \pm rupture of membranes	Cervix closed until products start to expel, then external os opens U/S variable but usually nonviable fetus	a) Watch and wait b) Misoprostol 400-800 μ g PO/PV c) D&C \pm oxytocin
Incomplete	Extremely heavy bleeding and cramps \pm passage of tissue noticed	Cervix open U/S products of conception	a) Watch and wait b) Misoprostol 400-800 μ g PO/PV c) D&C \pm oxytocin
Complete	Bleeding and complete passage of sac and placenta	Cervix open U/S no products of conception	No D&C – expectant management
Missed	No bleeding (fetal death <i>in utero</i>)	Cervix closed U/S may show SGA, no fetal heart activity; nonviable fetus	a) Watch and wait b) Misoprostol 400-800 μ g PO/PV c) D&C \pm oxytocin
Recurrent	≥ 3 consecutive spontaneous abortions		Evaluate mechanical, genetic, environmental, and other risk factors
Septic	Contents of uterus infected – infrequent		D&C IV broad spectrum antibiotics

**Etiology of Recurrent Pregnancy Loss****MAKE ME**

Type	History
Mechanical	Uterine anomalies <ul style="list-style-type: none"> • Congenital (septate uterus) • Leiomyoma • Endometrial polyps • Intrauterine adhesions
Autoimmune	Immunologic Factors <ul style="list-style-type: none"> • Antiphospholipid syndrome (blood tests: lupus anticoagulant, anti-cardiolipin Ab, anti-$\beta 2$ glycoprotein-I)
Karyotype	<ul style="list-style-type: none"> • Aneuploidy • Chromosomal rearrangements • Check both parents • Young mother, ≥ 3 miscarriages, FHx miscarriage/stillbirth/malformation
Endocrine	Poorly controlled disease <ul style="list-style-type: none"> • Thyroid (associated with high antibody/hormone levels) • DM (secondary to hyperglycemia, maternal vascular disease) • PCOS
Maternal Infection	No infectious agent has been proven to cause recurrent pregnancy loss, though some cause sporadic loss (<i>Listeria</i> , toxoplasmosis, CMV, HSV)
Environment	Obesity, smoking, alcohol use, and caffeine consumption may contribute
Other	Prothrombotic conditions (i.e. thrombophilia)

**Management of Abortions**

- Always rule out an ectopic
- Always check Rh; if negative, give Rhogam[®]
- Always ensure patient is hemodynamically stable

Ectopic Pregnancy

Definition

- embryo implants outside of the endometrial cavity

Epidemiology

- 1/100 pregnancies
- fourth leading cause of maternal mortality, leading cause of death in first trimester
- increase in incidence over the last 3 decades
- three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)

Etiology

- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

**Clinical Features of Ectopic Pregnancy****4Ts and 1S**

Temperature $> 100.4^{\circ}\text{F}$ (20%)

Tenderness: abdominal (90%) \pm rebound (45%)

Tenderness on bimanual examination, cervical motion tenderness

Tissue: palpable adnexal mass (50%) (half have contralateral mass due to lutein cyst)

Signs of pregnancy (e.g. Chadwick's sign, Hegar's sign)

More than half of patients with ectopic pregnancy have no risk factors

Figure 3. Sites of ectopic pregnancy implantation

Ampullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1%)

Risk Factors

- previous ectopic pregnancy
- gynecologic
 - IUD use – increased risk of ectopic if pregnancy occurs
 - history of PID (especially infection with *C. trachomatis*), salpingitis
 - infertility
 - clomiphene citrate (for induction of ovulation)
- previous procedures
 - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
 - abdominal surgery for ruptured appendix, etc.
 - IVF pregnancies following ovulation induction (7% ectopic rate)
- smoking
- structural
 - uterine leiomyomas
 - adhesions
 - abnormal uterine anatomy (e.g. T-shaped uterus)

Investigations

- serial β -hCG levels; normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
 - rise of <20% of β -hCG is 100% predictive of a non-viable pregnancy
 - prolonged doubling time, plateau, or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
 - 85% of ectopic pregnancies demonstrate abnormal β -hCG doubling
- ultrasound
 - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
 - specific finding on transvaginal U/S is a tubal ring
- laparoscopy (for definitive diagnosis)

Treatment

- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical (laparoscopy)
 - linear salpingostomy if tube salvageable
 - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
 - 15% risk of persistent trophoblast; must monitor β -hCG titres weekly until they reach non-detectable levels
 - consider Rhogam® if Rh negative
 - may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.
- medical = methotrexate (for indications see Figure 4)
 - use 50 mg/m² body surface area; given in a single IM dose
 - this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)

DDx of Lower Abdominal Pain

- Urinary tract: UTI, kidney stones
- GI: diverticulitis, appendicitis
- Gyne: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

If Ectopic Pregnancy Ruptures

- Acute abdomen with increasing pain
- Abdominal distention
- Shock

- follow β -hCG levels weekly until β -hCG is non-detectable
 - ♦ plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
- 82-95% success rate but up to 25% will require a second dose
- tubal patency following methotrexate treatment approaches 80%

Prognosis

- 9% of maternal deaths during pregnancy
- 40-60% of patients will become pregnant again after surgery
- 10-20% will have subsequent ectopic pregnancy

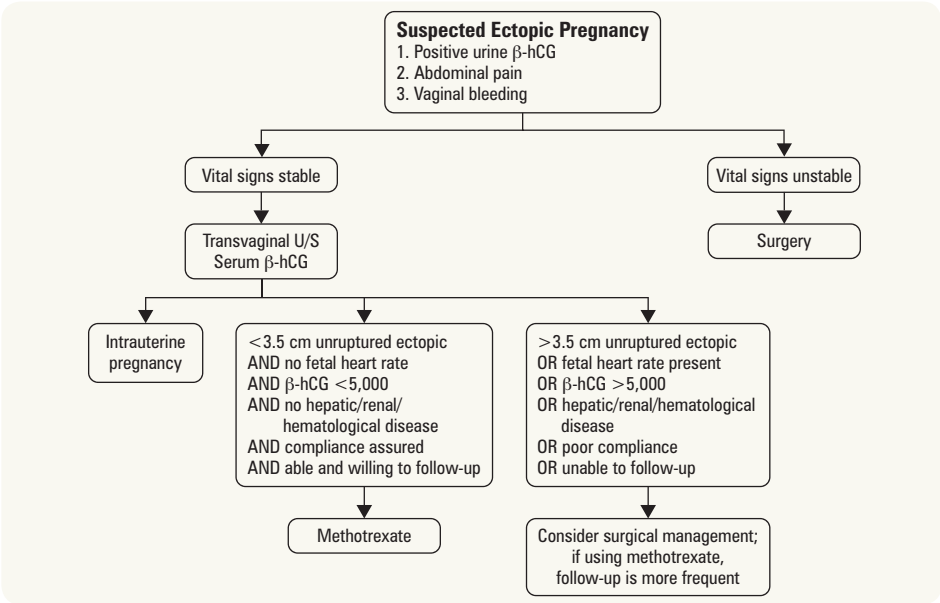

Figure 4. Algorithm for suspected ectopic pregnancy

Antepartum Hemorrhage

Definition

- vaginal bleeding from 20 wk to term

Differential Diagnosis

- bloody show (shedding of cervical mucous plug) – most common etiology in T3
- placenta previa
- abruptio placentae – most common pathological etiology in T3
- vasa previa
- cervical lesion (cervicitis, polyp, ectropion, cervical cancer)
- uterine rupture
- other: bleeding from bowel or bladder, placenta accreta, abnormal coagulation

Table 15. Comparison of Placenta Previa vs. Abruptio Placentae

	Placenta Previa	Abruptio Placentae
Definition	Abnormal location of the placenta near, partially, or completely over the internal cervical os	Premature separation of a normally implanted placenta after 20 wk GA
Etiology	Idiopathic	Idiopathic
Epidemiology	0.5-0.8% of all pregnancies	1-2% of all pregnancies
Risk Factors	<ul style="list-style-type: none">• History of placenta previa (4-8% recurrence risk)• Multiparity• Increased maternal age• Multiple gestation• Uterine tumor (e.g. fibroids) or other uterine anomalies• Uterine scar due to previous abortion, C/S, D&C, myomectomy	<ul style="list-style-type: none">• Previous abortion (recurrence rate 5-16%)• Maternal HTN (chronic or gestational HTN in 50% of abortions) or vascular disease• Cigarette smoking (> 1 pack/d), excessive alcohol consumption, cocaine• Multiparity and/or maternal age >35 yr• PPROM• Rapid decompression of a distended uterus (polyhydramnios, multiple gestation)• Uterine anomaly, fibroids• Trauma (e.g. motor vehicle collision, maternal battery)
Bleeding	PAINLESS	PAINFUL

Interventions for Tubal Ectopic Pregnancy
Cochrane DB Syst Rev 2007;1:CD000324
Study: Cochrane Review of randomized controlled trials comparing treatments in women with tubal ectopic pregnancy.
Patients: Women with a diagnosis of tubal ectopic pregnancy.
Intervention: Surgery (salpingectomy/salpingostomy by open surgery or by laparoscopy), medical treatment, and expectant management.
Main Outcome: Primary treatment success, defined as an uneventful decline in serum β -hCG to undetectable levels by the initial treatment.
Results: Intramuscular MTX therapy and salpingostomy yielded similar treatment success rates (82-95% for MTX therapy vs. 80-92% for salpingostomy).

Key Questions to Ask in Antepartum Hemorrhage

- How much bleeding?
- Are there contractions/cramping/pain?
- Description? Color, clotting, etc.

Levels of Abnormal Placental Invasion
Placenta Accreta: AT myometrium (most common)
Placenta Increta: INTO myometrium
Placenta Percreta: PASSES through myometrium

Placenta Previa

Definition

- placenta implanted in the lower segment of the uterus, presenting ahead of the leading pole of the fetus
- the distance of the placental edge from the internal os is described in “millimeters away” from the internal os or “millimeters of overlap” over the internal os
- greater than 20 millimeters of overlap over the internal os in the third trimester of pregnancy is highly predictive of the need for a C/S
- any degree of overlap after 35 wk is an indication for a C/S

Clinical Features

- PAINLESS bright red vaginal bleeding (recurrent), may be minimized and cease spontaneously, but can become catastrophic
- mean onset of bleeding is 30 wk GA, but onset depends on degree of previa
- **physical exam**
 - uterus soft and non-tender
 - presenting fetal part high or displaced
 - FHR usually normal
 - shock/anemia correspond to degree of apparent blood loss
- **complications**
 - fetal
 - ♦ perinatal mortality low but still higher than with a normal pregnancy
 - ♦ prematurity (bleeding often dictates early C/S)
 - ♦ intrauterine hypoxia (acute or IUGR)
 - ♦ fetal malpresentation
 - ♦ PPROM
 - ♦ risk of fetal blood loss from placenta, especially if incised during C/S
 - maternal
 - ♦ <1% maternal mortality
 - ♦ hemorrhage and hypovolemic shock, anemia, acute renal failure, pituitary necrosis (Sheehan syndrome)
 - ♦ placenta accreta – especially if previous uterine surgery, anterior placenta previa
 - ♦ hysterectomy

Do NOT perform a vaginal exam until placenta previa has been ruled out by U/S

Investigations

- transvaginal U/S is more accurate than transabdominal U/S at diagnosing placenta previa at any gestational age
- if the placenta lies between 20 mm of overlap and 20 mm away from the internal os after 26 wk regular transvaginal ultrasounds should be repeated at regular intervals – continued change in the placental location is likely

Kleihauer-Betke Test
Quantifies fetal cells in the maternal circulation

Management

- goal: keep pregnancy intrauterine until the risk of delivery < risk of continuing pregnancy
- stabilize and monitor
 - maternal stabilization: large bore IV with hydration, O₂ for hypotensive patients
 - maternal monitoring: vitals, urine output, blood loss, blood work (hematocrit, CBC, INR/PTT, platelets, fibrinogen, FDP, type and cross match)
 - electronic fetal monitoring
 - U/S assessment: when fetal and maternal condition permit, determine fetal viability, gestational age, and placental status/position
- Rhogam® if mother is Rh negative
 - Kleihauer-Betke test to determine extent of fetomaternal transfusion so that appropriate dose of Rhogam® can be given
- GA <37 wk and minimal bleeding: expectant management
 - admit to hospital
 - limited physical activity, no douches, enemas, or sexual intercourse
 - consider corticosteroids for fetal lung maturity
 - delivery when fetus is mature or hemorrhage dictates
- GA ≥37 wk, profuse bleeding, or L/S ratio is >2:1 – deliver by C/S

Abruptio Placentae

Clinical Features

- **classification**
 - total (fetal death inevitable) vs. partial
 - external/revealed/apparent: blood dissects downward toward cervix
 - internal/concealed (20%): blood dissects upward toward fetus
 - most are mixed
- **presentation**
 - **PAINFUL** (80%) vaginal bleeding (bleeding not always present if abruption is concealed), uterine tenderness, uterine contractions
 - pain: sudden onset, constant, localized to lower back and uterus
 - shock/anemia out of proportion to apparent blood loss
 - \pm fetal distress, fetal demise (15% present with demise), bloody amniotic fluid (fetal presentation typically normal)
 - \pm coagulopathy

Complications

- fetal complications: perinatal mortality 25-60%, prematurity, intrauterine hypoxia
- maternal complications: $<1\%$ maternal mortality, DIC (in 20% of abruptions), acute renal failure, anemia, hemorrhagic shock, pituitary necrosis (Sheehan syndrome), amniotic fluid embolus

Abruptio placentae is the most common cause of DIC in pregnancy

Investigations

- clinical diagnosis, U/S not sensitive for diagnosing abruption (sensitivity = 15%)

Management

- maternal stabilization: large bore IV with hydration, O₂ for hypotensive patients
- maternal monitoring: vitals, urine output, blood loss, blood work (hematocrit, CBC, PTT/PT, platelets, fibrinogen, FDP, type and cross match)
- EFM
- blood products on hand (red cells, platelets, cryoprecipitate) because of DIC risk
- Rhogam® if Rh negative
 - Kleihauer-Betke test may confirm abruption
- mild abruption
 - GA <37 wk: use serial Hct to assess concealed bleeding, deliver when fetus is mature or when hemorrhage dictates
 - GA ≥ 37 wk: stabilize and deliver
- moderate to severe abruption
 - hydrate and restore blood loss and correct coagulation defect if present
 - vaginal delivery if no contraindication and no evidence of fetal or maternal distress OR fetal demise
 - C/S if live fetus and fetal or maternal distress develops with fluid/blood replacement, labor fails to progress or if vaginal delivery otherwise contraindicated

Vasa Previa

Definition

- unprotected fetal vessels pass over the cervical os; associated with velamentous insertion of cord into membranes of placenta or succenturiate (accessory) lobe

Epidemiology

- 1 in 5,000 deliveries – higher in twin pregnancies

Clinical Features

- **PAINLESS** vaginal bleeding and fetal distress (tachy- to bradyarrhythmia)
- 50% perinatal mortality, increasing to 75% if membranes rupture (most infants die of exsanguination)

Investigations

- **Apt test** (NaOH mixed with the blood) can be done immediately to determine if the source of bleeding is fetal (supernatant turns pink) or maternal (supernatant turns yellow)
- **Wright stain** on blood smear and look for nucleated red blood cells (in cord, not maternal blood)

Management

- emergency C/S (since bleeding is from fetus, a small amount of blood loss can have catastrophic consequences)

Figure 5. Vasa previa

Multiple Gestation

Epidemiology

- incidence of twins is 1/80 and triplets 1/6,400 in North America
- 2/3 of twins are dizygotic (fraternal)
 - risk factors for dizygotic twins: IVF, increased maternal age, newly discontinued OCP, ethnicity (e.g. certain African regions)
- monozygous twinning occurs at a constant rate worldwide (1/250)
- determine zygosity by number of placentas, thickness of membranes, sex, blood type

Clinical Features

Table 16. Complications Associated with Multiple Gestation

Maternal	Uteroplacental	Fetal
Hyperemesis gravidarum	Increased PROM/PTL	Prematurity*
GDM	Polyhydramnios	IUGR
Gestational HTN	Placenta previa	Malpresentation
Anemia	Placental abruption	Congenital anomalies
Increased physiological stress on all systems	PPH (uterine atony)	Twin-twin transfusion
Increased compressive symptoms	Umbilical cord prolapse	Increased perinatal morbidity and mortality
C/S	Cord anomalies (velamentous insertion, 2 vessel cord)	Twin interlocking (twin A breech, twin B vertex)
		Single fetal demise

*Most common cause of perinatal mortality in multiple gestation

The Ps of Multiple Gestation Complications

- Increased rates of:
- Puking
 - Pallor (anemia)
 - Preeclampsia/PIH
 - Pressure (compressive symptoms)
 - PTL/PROM/PPROM
 - Polyhydramnios
 - Placenta previa/abruptio
 - PPH/APH
 - Prolonged labor
 - Cord Prolapse
 - Prematurity
 - Malpresentation
 - Perinatal morbidity and mortality
 - Parental distress
 - Postpartum depression

Management

- U/S determination of chorionicity must be done within first trimester (ideally 8-12 wk GA)
- increased antenatal surveillance
 - serial U/S q2-3wk from 28 wk GA to assess growth (uncomplicated diamniotic dichorionic)
 - increased frequency of ultrasounds in monochorionic diamniotic and monochorionic monoamniotic twins
 - Doppler flow studies weekly if discordant fetal growth (>30%)
 - BPP as needed
- may attempt vaginal delivery if twin A presents as vertex, otherwise C/S (40-50% of all twin deliveries, 15% of cases have twin A delivered vaginally and twin B delivered by C/S)
- mode of delivery depends on fetal weight, GA, presentation

Figure 6. Classification of twin pregnancies

*Indicates time of cleavage

Twin-Twin Transfusion Syndrome

Epidemiology

- 10% of monochorionic twins
- concern if >30% discordance in estimated fetal weight

Etiology

- arterial blood from donor twin passes through placenta into vein of recipient twin

Clinical Features

- donor twin: IUGR, hypovolemia, hypotension, anemia, oligohydramnios
- recipient twin: hypervolemia, HTN, CHF, polycythemia, edema, polyhydramnios, kernicterus in neonatal period

Investigations

- detected by U/S screening, Doppler flow analysis

Management

- therapeutic serial amniocentesis to decompress polyhydramnios of recipient twin and decrease pressure in cavity and on placenta
- intrauterine blood transfusion to donor twin if necessary
- laparoscopic occlusion of placental vessels

Growth Discrepancies

Intrauterine Growth Restriction

Definition

- infant weight <10th percentile for GA or <2,500 g

Etiology/Risk Factors

- maternal causes
 - malnutrition, smoking, drug abuse, alcoholism, cyanotic heart disease, type 1 DM, SLE, pulmonary insufficiency, previous IUGR
- maternal-fetal
 - any disease causing placental insufficiency
 - includes gestational HTN, chronic HTN, chronic renal insufficiency, gross placental morphological abnormalities (infarction, hemangiomas)
- fetal causes:
 - TORCH infections, multiple gestation, congenital anomalies

Clinical Features

- symmetric/type I (20%): occurs early in pregnancy
 - inadequate growth of head and body
 - head:abdomen ratio may be normal (>1 up to 32 wk; =1 at 32-34 wk; <1 after 34 wk GA)
 - usually associated with congenital anomalies or TORCH infections
- asymmetric/type II (80%): occurs late in pregnancy
 - brain is spared, therefore head:abdomen ratio increased
 - usually associated with placental insufficiency
 - more favorable prognosis than type I
- complications
 - prone to meconium aspiration, asphyxia, polycythemia, hypoglycemia, and mental retardation
 - greater risk of perinatal morbidity and mortality

Investigations

- SFH measurements at every antepartum visit
- if mother at high risk or SFH lags >2 cm behind GA
 - U/S for biparietal diameter, head and abdominal circumference, femur length, fetal weight, and AFV (decrease associated with IUGR)
 - \pm BPP
 - Doppler analysis of umbilical cord blood flow

Management

- prevention via risk modification prior to pregnancy is ideal
- modify controllable factors: smoking, alcohol, nutrition, and treat maternal illness
- bed rest in LLDP
- serial BPP (monitor fetal growth) and determine cause of IUGR, if possible
- delivery when extrauterine existence is less dangerous than continued intrauterine existence (abnormal function tests, absent growth, severe oligohydramnios) especially if GA >34 wk
- liberal use of C/S since IUGR fetus withstands labor poorly

TORCH

Toxoplasmosis
Others: e.g. syphilis
Rubella
CMV
HSV

- See Table 12, OB19

Differential Diagnosis of Incorrect Uterine Size for Dates

- Inaccurate dates
- Maternal: DM
- Maternal-fetal: polyhydramnios, oligohydramnios
- Fetal: abnormal karyotype, IUGR, macrosomia, fetal anomaly, abnormal lie, multiple gestation

Monitoring Fetal Growth with U/S

Done biweekly to show growth beyond the margin of error

Macrosomia

Definition

- infant weight >90th percentile for a particular GA or >4,000 g

Etiology/Risk Factors

- maternal obesity, GDM, past history of macrosomic infant, prolonged gestation, multiparity

Clinical Features

- increased risk of perinatal mortality
- CPD and birth injuries (shoulder dystocia, fetal bone fracture) more common
- complications of DM in labor (see Table 11, OB15)

Investigations

- serial SFH
- further investigations if mother at high risk or SFH >2 cm ahead of GA
- U/S predictors
 - polyhydramnios
 - third trimester AC >1.5 cm/wk
 - HC/AC ratio <10th percentile
 - FL/AC ratio <20th percentile

Management

- prophylactic C/S is a reasonable option where EFW >5,000 g in non-diabetic woman and EFW >4,500 g in diabetic woman
 - no evidence that prophylactic C/S improves outcomes
- early induction of labor is not recommended for non-diabetic mothers
- risks and benefits of early induction (risk of C/S vs. risk of dystocia) must be weighed in diabetic mothers, as current research is unclear

Polyhydramnios/Oligohydramnios

Table 17. Polyhydramnios and Oligohydramnios

	Polyhydramnios	Oligohydramnios
Definition	AFI >25 cm U/S: single deepest pocket >8 cm	AFI <5 cm U/S: single deepest pocket ≤2 cm
Etiology	Idiopathic most common Maternal: <ul style="list-style-type: none"> Type 1 DM: abnormalities of transchorionic flow Maternal-fetal: <ul style="list-style-type: none"> Chorioangiomas Multiple gestation Fetal hydrops (increased erythroblastosis) Fetal: <ul style="list-style-type: none"> Chromosomal anomaly (up to 2/3 of fetuses have severe polyhydramnios) Respiratory: cystic adenomatoid malformed lung CNS: anencephaly, hydrocephalus, meningocele GI: tracheoesophageal fistula, duodenal atresia, facial clefts (interfere with swallowing) 	Idiopathic most common Maternal: <ul style="list-style-type: none"> Uteroplacental insufficiency (preeclampsia, nephropathy) Medications (ACEI) Fetal: <ul style="list-style-type: none"> Congenital urinary tract anomalies (renal agenesis, obstruction, posterior urethral valves) Demise/chronic hypoxemia (blood shunt away from kidneys to perfuse brain) IUGR Ruptured membranes: prolonged amniotic fluid leak Amniotic fluid normally decreases after 35 wk
Epidemiology	Occur in 0.2-1.6% of all pregnancies	Occur in ~4.5% of all pregnancies Severe form in <0.7% Common in pregnancies >41 wk (~12%)
Clinical Features and Complications	Uterus large for dates, difficulty palpating fetal parts and hearing FHR Maternal complications: <ul style="list-style-type: none"> Pressure symptoms from overdistended uterus (dyspnea, edema, hydronephrosis) Obstetrical complications: <ul style="list-style-type: none"> Cord prolapse, placental abruption, malpresentation, preterm labor, uterine dysfunction, and PPH 	Uterus small for dates Fetal complications: <ul style="list-style-type: none"> 15-25% have fetal anomalies Amniotic fluid bands (T1) can lead to Potter's facies, limb deformities, abdominal wall defects Obstetrical complications: <ul style="list-style-type: none"> Cord compression Increased risk of adverse fetal outcomes Pulmonary hypoplasia (late-onset) Marker for infants who may not tolerate labor well

Table 17. Polyhydramnios and Oligohydramnios (continued)

	Polyhydramnios	Oligohydramnios
Management	Determine underlying cause: <ul style="list-style-type: none"> • Screen for maternal disease/infection • Complete fetal U/S evaluation Depends on severity: <ul style="list-style-type: none"> • Mild to moderate cases require no treatment • If severe, hospitalize and consider therapeutic amniocentesis 	Always warrants admission and investigation: <ul style="list-style-type: none"> • Rule out ROM • Fetal monitoring (NST, BPP) • U/S Doppler studies (umbilical cord and uterine artery) Maternal hydration with oral or IV fluids to help increase amniotic fluid Vesicoamniotic shunt: if etiology is related to fetal obstructive uropathy; however, pulmonary function may not be restored with restoration of amniotic fluid Injection of fluid via amniocentesis will improve condition for ~1 wk – may be most helpful for visualizing any associated fetal anomalies Consider delivery if term Amnio-infusion may be considered during labor via intra-uterine catheter
Prognosis	2-5 fold increase in risk of perinatal mortality	Poorer with early onset High mortality related to congenital malformations and pulmonary hypoplasia when diagnosed during T2

Normal Labor and Delivery

Definition of Labor

- true labor: regular, painful contractions of increasing intensity associated with progressive **dilatation** and **effacement** of cervix and descent of presenting part, or progression of station
 - preterm (>20 to <36+6 wk GA)
 - term (37-41+6 wk GA)
 - postterm (>42 wk GA)
- false labor: Braxton-Hicks contractions
 - irregular contractions, with unchanged intensity and long intervals, occur throughout pregnancy and not associated with any dilatation, effacement, or descent
 - often relieved by rest or sedation

The Cervix

- dilatation: latent phase: 0-3 cm; active phase: 4-10 cm
- effacement: thinning of the cervix by percentage or length of cervix (cm)
- consistency: firm vs. soft
- position: posterior vs. anterior
- application: contact between the cervix and presenting part (i.e. well or poorly applied)
- see Bishop score (Table 22, OB35)

The Fetus

- **fetal lie**
 - orientation of the long axis of the fetus with respect to the long axis of the uterus (longitudinal, transverse, oblique)
- **fetal presentation**
 - fetal part presenting at pelvic outlet
 - ♦ breech (complete, frank, footling) (see Figure 9, OB39)
 - ♦ cephalic (vertex, face, asynclitic)
 - ♦ transverse (shoulder)
 - ♦ compound (fetal extremity prolapses along with presenting part)
 - all except vertex are considered malpresentations (see *High Risk Labor and Delivery*, OB37)
- **fetal position**
 - position of presenting part of the fetus relative to the maternal pelvis
 - ♦ OA: most common presentation (“normal”) – left OA most common
 - ♦ OP: most rotate spontaneously to OA; may cause prolonged second stage of labor
 - ♦ OT: leads to arrest of dilatation
 - normally, fetal head enters maternal pelvis and engages in OT position
 - subsequently rotates to OA position (or OP in a small percentage of cases)

Maternal Triage Assessment

ID: Age, GPA, EDC, GA, GBS, Rh, Ser
CC

HPI: 4 key questions:

- Contractions: Since when, how close (q x min), how long (x s), how painful
- Bleeding: Since when, how much (pads), color (pink/mucous = show vs. brownish vs. bright red ± clots), pain?, last U/S, trauma/intercourse?
- Fluid (ROM): Since when, large gush vs. trickle, soaked pants?, clear vs. green vs. red?, continuous?
- FM: As much as usual?, When last movement?, Kick counts (lie still for 1-2 h, cold juice, feel FM – should have 6 movements in 2 h)

PregHx: Any complications (HTN, GDM, infections), IPS/FTS screening, last U/S (BPP score, growth/estimated fetal weight, position), last vaginal exam

POBHx: Every previous pregnancy and outcome: Year, SVD/CS/miscarriage/abortion, baby size, length of labor, use of vacuum or forceps, complications

PMHx, Meds, Allergies, SHx

O/E: Maternal vitals, fetal heart tracing (baseline, variability, presence of accelerations/decelerations), Leopold's, vaginal exam, U/S

Reference Point for Describing Fetal Position

- Occiput for cephalic presentation
- Sacrum for breech presentation
- Mentum for face presentation

- **attitude**
 - flexion/extension of fetal head relative to shoulders
 - ♦ brow presentation: head partially extended (requires C/S)
 - ♦ face presentation: head fully extended
 - mentum posterior always requires C/S, mentum anterior will deliver vaginally
- **station**
 - position of presenting part relative to ischial spines – determined by vaginal exam
 - ♦ at ischial spines = station 0 = engaged
 - ♦ -5 to -1 cm above ischial spines or
 - ♦ +1 to +5 cm below ischial spines
 - ♦ alternatively stations can be placed on a scale from -3 to +3

Figure 7. Fetal positions

**Course of Normal Labor**

Stage	Nulliparous	Multiparous
First	6-18 h	2-10 h
Second	30 min-3 h	5-30 min
Third	5-30 min	5-30 min

**Signs of Placental Separation**

- Gush of blood
- Lengthening of cord
- Uterus becomes globular
- Fundus rises

**Continuous Support for Women During Childbirth**

Cochrane DB Syst Rev 2011;16:CD003766

Study: Systematic review of 21 RCTs from 11 countries, 15,061 women in labor.**Intervention:** Continuous support during labor vs. usual care.**Outcome:** Effects on mothers and their babies.

Results: Continuous intrapartum support increased likelihood of shorter labor, spontaneous vaginal birth, decrease in analgesia use, and a decrease in dissatisfaction with childbirth experience. Greatest benefit when provider is not a health care professional. Continuous support was also associated with decreased likelihood to have a Cesarean or instrumental vaginal birth, regional analgesia, or a baby with a low 5 min APGAR score.

Four Stages of Labor

First Stage of Labor

- latent phase
 - uterine contractions typically infrequent and irregular
 - slow cervical dilatation (usually to 3-4 cm) and effacement
- active phase
 - rapid cervical dilatation to full dilatation (nulliparous ~1.2 cm/h, multiparous ~1.5 cm/h)
 - phase of maximum slope on cervical dilatation curve
 - painful, regular contractions q2-3min, lasting 45-60 s
 - contractions strongest at fundus, weakest at lower segment

Second Stage of Labor

- from full dilatation to delivery of the baby
- mother feels a desire to bear down and push with each contraction
- women may choose a comfortable position that enhances pushing efforts and delivery
 - upright (semi-sitting, squatting) and LLDP are supported in the literature
- progress measured by descent

Third Stage of Labor

- separation and expulsion of the placenta
- can last up to 30 min before intervention indicated
- start oxytocin IV drip, or give 10 U IM or 5 mg IV push after delivery of anterior shoulder in anticipation of placental delivery, otherwise give after delivery of placenta
- routine oxytocin administration in third stage of labor can reduce the risk of PPH by >40%

Fourth Stage of Labor

- first postpartum hour
- monitor vital signs and bleeding
- repair lacerations
- ensure uterus is contracted (palpate uterus and monitor uterine bleeding)
- inspect placenta for completeness and umbilical cord for presence of 2 arteries and 1 vein
- 3rd and 4th stages of labor most dangerous to the mother (i.e. hemorrhage)

The Cardinal Movements of the Fetus During Delivery

Figure 8. Cardinal movements of fetus during delivery

Adapted from illustration in Williams Obstetrics, 19th ed

Analgesic and Anesthetic Techniques in Labor and Birth

- pain or anxiety leads to high endogenous catecholamines, which produce a direct inhibitory effect on uterine contractility

Non-Pharmacologic Pain Relief Techniques

- reduction of painful stimuli
 - maternal movement, position change, counter-pressure, abdominal compression
- activation of peripheral sensory receptors
 - superficial heat and cold
 - immersion in water during labor
 - touch and massage, acupuncture, and acupressure
 - TENS
 - intradermal injection of sterile water
 - aromatherapy
- enhancement of descending inhibitory pathways
 - attention focusing and distraction
 - hypnosis
 - music and audio analgesia
 - biofeedback

Pharmacologic Methods (see [Anesthesia, A24](#))

- nitrous oxide (e.g. self-administered Entonox®)
- narcotics (usually combined with anti-emetic)
- pudendal nerve block
- perineal infiltration with local anesthetic
- regional anesthesia (epidural block, combined spinal-epidural, spinal)

Fetal Monitoring in Labor

- see online [Fetal Heart Rate Tutorial](#)

Vaginal Exam

- membrane status
- cervical effacement (thinning), dilatation, consistency, position, application
- fetal presenting part, position, station
- bony pelvis size and shape
- monitor progress of labor at regular intervals and document in a partogram

Intrapartum Fetal Monitoring

- intermittent fetal auscultation with Doppler device q15-30min for 1 min in first stage active phase following a contraction, q5min during second stage when pushing has begun
- continuous electronic FHR monitoring reserved for abnormal auscultation, prolonged labor, and labor which is induced or augmented, meconium present, multiple gestation/fetal complication
 - routine use of continuous electronic monitoring shown to lead to higher intervention rates and no improvement in outcome for the neonate
 - techniques for continuous monitoring include external (Doppler) vs. internal (fetal scalp electrode) monitoring
- fetal scalp sampling should be used in conjunction with electronic FHR monitoring and contraction monitoring (CTG) to resolve the interpretation of abnormal or atypical patterns

Electronic FHR Monitoring

- FHR measured by Doppler; contractions measured by tocometer
- described in terms of baseline FHR, variability (short-term, long-term), and periodicity (accelerations, decelerations)
- **Baseline FHR**
 - normal range is 110-160 bpm
 - parameter of fetal well-being vs. distress
- **Variability**
 - physiologic variability is a normal characteristic of FHR
 - variability is measured over a 15 min period and is described as: absent, minimal (<6 bpm), moderate (6-25 bpm), marked (>25 bpm)
 - normal variability indicates fetal acid-base status is acceptable
 - can only be assessed by electronic fetal monitoring (CTG)
 - variability decreases intermittently even in healthy fetus
 - see [Table 19, OB34](#)
- **Periodicity**
 - accelerations: increase of ≥ 15 bpm lasting ≥ 15 s, in response to fetal movement or uterine contraction (or ≥ 10 bpm lasting ≥ 10 s if <32 wk GA)
 - decelerations: 3 types, described in terms of shape, onset, depth, duration recovery, occurrence, and impact on baseline FHR and variability

Table 18. Factors Affecting Fetal Heart Rate

	Fetal Tachycardia (FHR >160)	Fetal Bradycardia (FHR <110)	Decreased Variability
Maternal Factors	Fever Hyperthyroidism Anemia	Hypothermia Hypotension Hypoglycemia	Infection Dehydration
Fetal Factors	Arrhythmia Anemia	Rapid descent Dysrhythmia Heart block	CNS anomalies Dysrhythmia Inactivity/sleep cycle, preterm fetus
Drugs	Sympathomimetics	β -blockers Anesthetics	Narcotics, sedatives Magnesium sulphate, β -blockers
Uteroplacental	Early hypoxia (abruption, HTN) Chorioamnionitis	Late hypoxia (abruption, HTN) Acute cord prolapse Hypercontractility	Hypoxia

Fetal Scalp Blood Sampling

- indicated when atypical or abnormal fetal heart rate is suggested by clinical parameters including heavy meconium or moderately to severely abnormal FHR patterns, including unexplained low variability, repetitive late decelerations, complex variable decelerations, fetal cardiac arrhythmias
 - pH ≥ 7.25 : normal, repeat if abnormal FHR persists
 - pH 7.21-7.24: repeat assessment in 30 min or consider delivery if rapid fall since last sample
 - pH ≤ 7.20 : indicates fetal acidosis, delivery is indicated

Continuous CTG as a Form of EFM for Fetal Assessment During Labor

Cochrane DB Syst Rev 2013;5:CD006066

Purpose: To examine the effectiveness of continuous electronic fetal monitoring or cardiotocography during labor.

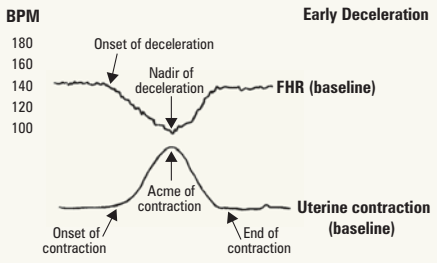

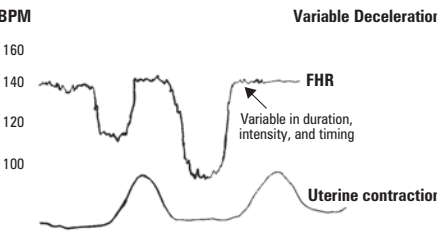

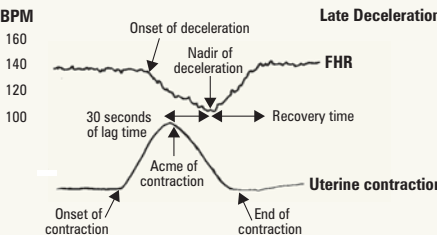

Selection Criteria: Randomized and quasi-randomized controlled trials comparing continuous CTG (with and without fetal blood sampling) to a) no fetal monitoring, b) intermittent auscultation, or c) intermittent CTG.

Results: 13 trials, 37,000 women. Continuous CTG compared with intermittent auscultation showed no difference in overall perinatal death rate or cerebral palsy rates. Nonetheless, neonatal seizures were halved (RR 0.50, 95% CI 0.31-0.80) and there was a significant increase in Cesarean sections with CTG (RR 1.63, 95% CI 1.29-2.07) and instrumental vaginal birth (RR 1.15, 95% CI 1.01-1.33).

Conclusion: Continuous CTG may reduce the incidence of neonatal seizures, but has no effect on cerebral palsy rates, infant mortality, or other measures of neonatal well-being. Continuous CTG was also associated with an increase in Cesarean sections and instrumental deliveries.

- contraindications
 - known or suspected fetal blood dyscrasia (hemophilia, von Willebrand disease)
 - active maternal infection (HIV, genital herpes)

Table 19. Comparison of Decelerations

Early Decelerations <ul style="list-style-type: none">• Uniform shape with onset early in contraction, returns to baseline by end of contraction, mirrors contraction• Gradual deceleration• Often repetitive; no effect on baseline FHR or variability• Benign, due to vagal response to head compression	
Variable Decelerations <ul style="list-style-type: none">• Variable in shape, onset, and duration• Most common type of periodicity seen during labor• Often with abrupt drop in FHR; usually no effect on baseline FHR or variability• Due to cord compression or, in second stage, forceful pushing with contractions	
Complicated Variable Decelerations <ul style="list-style-type: none">• To <70 bpm for >60 s• Loss of variability or decrease in baseline after deceleration• Biphasic deceleration• Slow return to baseline• Baseline tachycardia or bradycardia	
Late Decelerations <ul style="list-style-type: none">• Uniform shape with onset late in contraction, nadir after peak of contraction, and slow return to baseline• May cause decreased variability and change in baseline FHR• Due to fetal hypoxia and acidemia, maternal hypotension, or uterine hypertonus• Usually a sign of uteroplacental insufficiency (an ominous sign)	

Rule of 60s Suggesting Severe Variable Decelerations
Deceleration to <60 bpm
>60 bpm below baseline
>60 s in duration with slow return to baseline

Table 20. Classification of Intrapartum EFM Tracings

	Normal Tracing (Category 1)	Atypical Tracing* (Category 2)	Abnormal Tracing* (Category 3)
Baseline	110-160 bpm	Bradycardia 100-110 bpm Tachycardia >160 for 30-80 min Rising baseline	Bradycardia <100 bpm Tachycardia >160 bpm for >80 min Erratic baseline
Variability	6-25 bpm ≤5 bpm for <40 min	≤5 bpm for 40-80 min	<5 bpm for >80 min ≥25 bpm for >10 min
Decelerations	None Early decelerations Occasional uncomplicated variable decelerations	Repetitive (≥3) uncomplicated variable decelerations Occasional late decelerations Any prolonged deceleration 2-3 min	Repetitive (≥3) complicated variable decelerations Repetitive late decelerations Any prolonged deceleration >3 min
Accelerations	Accelerations spontaneous or during scalp stimulation	Absent with scalp stimulation	Nearly absent
Action	EFM may be interrupted for ≤30 min if mother/fetus stable	Further assessment required	Action required: review clinical situation, obtain scalp pH, prepare for possible delivery

Approach to the Management of Abnormal FHR
POISON – ER
Position (LLPD)
O₂ (100% by mask)
IV fluids (corrects maternal hypotension)
Fetal Scalp stimulation
Fetal Scalp electrode
Fetal Scalp pH
Stop Oxytocin
Notify MD

Vaginal Exam to rule out cord prolapse
Rule out fever, dehydration, drug effects, prematurity

• If above fails, consider C/S

Adapted from SOGC Guidelines, September 2008
*Previous classification was “reassuring” vs. “non-reassuring”, but distinction is now made between tracings that have some concerning changes but do not require immediate action (atypical) vs. those with major concerns requiring immediate intervention (abnormal)

Fetal Oxygenation

- uterine contractions during labor decrease uteroplacental blood flow, which results in reduced oxygen delivery to the fetus
- most fetuses tolerate this reduction in flow and have no adverse effects
- distribution of oxygen to the fetus depends on maternal, uteroplacental, and fetal factors

- **fetal response to hypoxia/asphyxia**
 - decreased movement, tone, and breathing activities
 - redistribution of fetal blood flow
 - ♦ increased flow to brain, heart, and adrenals
 - ♦ decreased flow to kidneys, lungs, gut, liver, and peripheral tissues
 - ♦ increase in blood pressure
 - transient fetal bradycardia followed by fetal tachycardia
 - anaerobic metabolism (decreased pH)

Table 21. Factors Affecting Fetal Oxygenation

Factor	Mechanism	Example
Maternal	Decreased maternal oxygen carrying capacity	Significant anemia (iron deficiency, hemoglobinopathies), carboxyhemoglobin (smokers)
	Decreased uterine blood flow	Hypotension (blood loss, sepsis), regional anesthesia, maternal positioning
	Chronic maternal conditions	Vasculopathies (SLE, type 1 DM, chronic HTN), antiphospholipid syndrome, cyanotic heart disease, COPD
Uteroplacental	Uterine hypertonus	Placental abruption, hyperstimulation secondary to oxytocin, prostaglandins, or normal labor
	Uteroplacental dysfunction	Placental abruption, placental infarction (dysfunction marked by IUGR, oligohydramnios, abnormal Doppler studies), chorioamnionitis, placental edema (DM, hydrops), placental senescence (post-dates)
Fetal	Cord compression	Oligohydramnios, cord prolapse or entanglement
	Decreased fetal oxygen carrying capacity	Significant anemia (isoimmunization, feto-maternal bleed), carboxyhemoglobin (exposure to smokers)

Induction of Labor

Definition

- artificial initiation of labor before its spontaneous onset for the purpose of delivery of the fetus and placenta

Prerequisites for Labor Induction

- capability for C/S if necessary
- maternal
 - short, thin, soft, anterior cervix with open os (“inducible” or “ripe”)
 - if cervix is not ripe, use prostaglandin vaginal insert (Cervidil®), prostaglandin gel (Prepidil®), or Foley catheter
- fetal
 - normal fetal heart tracing
 - cephalic presentation
 - adequate fetal monitoring available
- likelihood of success determined by Bishop score
 - cervix considered unfavorable if <6
 - cervix favorable if ≥6
 - score of 9-13 associated with high likelihood of vaginal delivery

Table 22. Bishop Score

Cervical Characteristic	0	1	2	3
Position	Posterior	Mid	Anterior	–
Consistency	Firm	Medium	Soft	–
Effacement (%)	0-30	40-50	60-70	≥80
Dilatation (cm)	0	1-2	3-4	≥5
Station of Fetal Head	-3	-2	-1, 0	+1, +2, +3

Indications

- post-dates pregnancy (generally >41 wk) = most common reason for induction
- maternal factors
 - DM = second most common reason for induction
 - gestational HTN
 - other maternal medical problems, e.g. renal or lung disease
- maternal-fetal factors
 - isoimmunization, PROM, chorioamnionitis, post-term pregnancy

Induction vs. Augmentation

Induction is the artificial initiation of labor

Augmentation promotes contractions when spontaneous contractions are inadequate

Induction is indicated when the risk of continuing pregnancy exceeds the risks associated with induced labor and delivery

Consider the Following Before Induction

- Indication for induction
- Contraindications
- GA
- Cervical favorability
- Fetal presentation
- Potential for CPD
- Fetal well-being/FHR
- Membrane status

- fetal factors
 - suspected fetal jeopardy as evidenced by biochemical or biophysical indications
 - fetal demise, IUGR

Risks

- failure to achieve labor and/or vaginal birth
- uterine hyperstimulation and fetal compromise
- maternal side effects to medications
- uterine atony and PPH
- uterine rupture

Contraindications

- maternal
 - prior classical or inverted T-incision or uterine surgery (e.g. myomectomy)
 - unstable maternal condition
 - active maternal genital herpes
 - invasive cervical carcinoma
 - pelvic structure deformities
- maternal-fetal
 - placenta previa or vasa previa
 - cord presentation
- fetal
 - fetal distress, malpresentation, preterm fetus without lung maturity

Evidence for Cervical Ripening Methods (SOGC Guidelines)

- Meta-analysis of five trials has concluded that the use of oxytocin to ripen the cervix is not effective
- Since the best dose and route of misoprostol for labor induction with a live fetus are not known and there are concerns regarding hyperstimulation, the use of misoprostol for induction of labor should be within clinical trials only (Level 1b evidence) or in cases of intrauterine fetal death to initiate labor

Intravaginal PGE2 (Cervidil®) Compared to Intravaginal Prostaglandin Gel

- 4 RCTs have compared the two with varying results, depending on the dosing regime of gel used.
- Theoretical advantages of Cervidil®:
- Insertion without a speculum
 - Slow, continuous release
 - Only one dose required
 - Ability to use oxytocin 30 min after removal
 - Ability to remove insert if required (i.e. excessive uterine activity)

Induction Methods

CERVICAL RIPENING

Definition

- use of medications or other means to soften, efface, and dilate the cervix to increase likelihood of induction success
- ripening of an unfavorable cervix (Bishop score <6) is warranted prior to induction of labor

Methods

- intravaginal prostaglandin PGE2 gel (Prostin® gel): long and closed cervix
 - recommended dosing interval of prostaglandin gel is every 6 to 12 h up to 3 doses
- intravaginal PGE2 (Cervidil®): long and closed cervix, may use if ROM
 - continuous release, can be removed if needed
 - controlled release PGE2
- Foley catheter placement to mechanically dilate the cervix

INDUCTION OF LABOR

Amniotomy

- artificial rupture of membranes (amniotomy) to stimulate prostaglandin synthesis and secretion; may try this as initial measure if cervix is dilated
- few studies address the value of amniotomy alone for induction of labor
- amniotomy plus intravenous oxytocin: more women delivered vaginally at 24 h than amniotomy alone (relative risk = 0.03) and had fewer instrumental vaginal deliveries (relative risk = 5.5)

Oxytocin

- oxytocin (Pitocin®): 10 U in 1L NS, run at 0.5-2 mU/min IV increasing by 1-2 mU/min q20-60min to a max of 36-48 mU/min
 - reduces rate of unsuccessful vaginal deliveries within 24 h when used alone (8.3% vs. 54%, RR 0.16)
 - ideal dosing regime of oxytocin is not known
 - current recommendations: use the minimum dose to achieve active labor and increase q30min as needed
 - reassessment should occur once a dose of 20 mU/min is reached
- potential complications
 - hyperstimulation/tetanic contraction (may cause fetal distress or rupture of uterus)
 - uterine muscle fatigue, uterine atony (may result in PPH)
 - vasopressin-like action causing anti-diuresis

Augmentation of Labor

- augmentation of labor is used to promote adequate contractions when spontaneous contractions are inadequate and cervical dilatation or descent of fetus fails to occur
- oxytocin (0.5-2 mU/min IV increasing by 1-2 mU/min q20-60min to a max of 36-48 mU/min)

Oxytocin $t_{1/2}$ = 3-5 min

High Risk Labor and Delivery

Preterm Labor

Definition

- labor occurring between 20 and 37 wk gestation

Etiology

- idiopathic (most common)
- maternal: infection (recurrent pyelonephritis, untreated bacteriuria, chorioamnionitis), genital infection (bacterial vaginosis is associated with a 2-fold increase in relative risk of preterm birth), HTN, DM, chronic illness, mechanical factors, previous obstetric, gynecological, and abdominal surgeries, socio-environmental (poor nutrition, smoking, drugs, alcohol, stress)
- maternal-fetal: PPRM (common), polyhydramnios, placenta previa, placental abruption, or placental insufficiency
- fetal: multiple gestation, congenital abnormalities of fetus, fetal hydrops
- uterine: incompetent cervix, excessive enlargement (hydramnios), malformations (leiomyomas, septate uterus)

Epidemiology

- preterm labor complicates about 10% of pregnancies

Risk Factors and Prediction of PTL

- maternal risk scoring using above etiologies fails to identify up to 70% of preterm deliveries and is therefore of limited use
- prior history of spontaneous PTL: most important risk factor
- prior history cervical excisions or mechanical dilatation
- cervical length: measured by transvaginal U/S (cervical length >30 mm has high negative predictive value for PTL before 34 wk)
- identification of bacterial vaginosis (Rx metronidazole) and ureaplasma urealyticum (Rx erythromycin) infections: routine screening not supported by current data but it is reasonable to screen high risk women
- fetal fibronectin: a glycoprotein in amniotic fluid and placental tissue functioning to maintain integrity of chorionic-decidual interface in asymptomatic women
 - positive if >50 ng/mL
 - in symptomatic women (i.e. preterm contractions), fetal fibronectin is most effectively combined with U/S detecting cervical length
 - if cervical length is not short and fetal fibronectin is negative, preterm labor is highly unlikely

Clinical Features

- regular contractions (2 in 10 min)
- cervix >2 cm dilated, 80% effaced, or documented change in cervix

Management

A. Initial

- transfer to appropriate facility if stable
- hydration (NS at 150 mL/h)
- bed rest in LLDP
- sedation (morphine)
- avoid repeated pelvic exams (increased infection risk)
- U/S examination of fetus (GA, BPP, position, placenta location, estimated fetal weight)
- prophylactic antibiotics; controversial but may help delay delivery, important to consider if PPRM

B. Suppression of Labor – Tocolysis

- does not inhibit preterm labor completely, but may buy time (used for <48 h) to allow for betamethasone valerate (Celestone®) and/or transfer to appropriate center for care of the premature infant
- requirements (all must be satisfied)
 - preterm labor
 - live, immature fetus, intact membranes, cervical dilatation of <4 cm
 - absence of maternal or fetal contraindications
- contraindications
 - maternal: bleeding (placenta previa or abruption), maternal disease (HTN, DM, heart disease), preeclampsia or eclampsia, chorioamnionitis
 - fetal: erythroblastosis fetalis, severe congenital anomalies, fetal distress/demise, IUGR, multiple gestation (relative)

Positive fetal fibronectin in cervicovaginal fluid (>50 ng/mL) at 24 wk gestation predicted spontaneous PTL at <34 wk with sensitivity of 23%, specificity of 97%, PPV of 25%, NPV of 96%

Tocolytics for Preterm Premature Rupture of Membranes

Cochrane DB Syst Rev 2014;2:CD007062

Purpose: To assess the potential benefits and harms of tocolysis in women with PPRM.

Selection Criteria: Pregnant women with singleton pregnancies and PPRM (23-36 wk and 6 d GA).

Results: 8 studies with 408 women total. Prophylactic tocolysis with PPRM was associated with increased overall latency, without additional benefits for maternal/neonatal outcomes. For women with PPRM before 34 wk, there was a significantly increased risk of chorioamnionitis in women who received tocolysis. Neonatal outcomes were not significantly different.

Conclusion: Although there are limitations to the studies, there is currently insufficient evidence to support tocolytic therapy for women with PPRM, as there was an increase in maternal chorioamnionitis without significant benefits to the infant.

- agents
 - calcium channel blockers: Nifedipine
 - 20 mg PO loading dose followed by 20 mg PO 90 min later
 - 20 mg can be continued q3-8h for 72 h or to a max of 180 mg
 - 10 mg PO q20min x 4 doses
 - prostaglandin synthesis inhibitors: Indomethacin
 - 1st line for early preterm labor (<30 wk GA) or polyhydramnios
 - 50-100 mg PO loading dose followed by 25 mg q4-6h
 - magnesium sulphate was previously used for tocolysis; currently, its primary use in obstetrics is limited to neuroprotection or prevention of eclampsia

C. Enhancement of Fetal Pulmonary Maturity

- betamethasone valerate (Celestone®) 12 mg IM q24h x 2 doses or dexamethasone 6 mg IM q12h x 4 doses
 - 28-34 wk GA: reduces incidence of RDS
 - 24-28 wk GA: reduces severity of RDS, overall mortality, and rate of IVH
 - specific maternal contraindications: active TB

D. Cervical Cerclage

- definition: placement of cervical sutures at the level of the internal os, usually at the end of the first trimester and removed in the third trimester
- indications: cervical incompetence (i.e. cervical dilation and effacement in the absence of increased uterine contractility)
 - emerging evidence indicates that progesterone suppositories are superior to cerclage in preventing preterm labor late in pregnancy
- diagnosis of cervical incompetence
 - obstetrical Hx: silent cervical dilation
 - ability of cervix to hold an inflated Foley catheter during a hysterosonogram
- proven benefit in the prevention of PTL in women with primary structural abnormality of the cervix (e.g. conization of the cervix, connective tissue disorders)

Prognosis

- prematurity is the leading cause of perinatal morbidity and mortality
- 30 wk or 1,500 g (3.3 lb) = 90% survival
- 33 wk or 2,000 g (4.4 lb) = 99% survival

Prevention of Preterm Labor

- preventative measures: good prenatal care, identify pregnancies at risk, treat silent vaginal infection or UTI, patient education
- transvaginal ultrasound of cervical length is recommended only for high-risk pregnancies

Cerclage for Short Cervix on Ultrasonography in Women With Singleton Gestations and Previous Preterm Birth

Obstet Gynecol 2011;117:663-671

Purpose: To determine if cerclage prevents preterm birth (<35 wk gestation) and perinatal mortality and morbidity among women with previous spontaneous preterm birth, asymptomatic singleton gestation, and short cervical length (<25 mm before 24 wk gestation) on transvaginal ultrasonography.

Methods: Meta-analysis of randomized trials identified using searches on MEDLINE, PUBMED, EMBASE, and the Cochrane Library.

Results: 5 trials included. Preterm birth was significantly lower among women receiving cerclage vs. those not (RR=0.70, 95% CI 0.55-0.89). Cerclage also significantly reduced preterm birth before 24, 28, 32, and 37 wk gestation. Perinatal mortality and morbidity were significantly lower in the cerclage group (RR=0.64, 95% CI 0.45-0.91).

Conclusions: Cerclage significantly prevents preterm birth and perinatal mortality and morbidity in this specific group of women.

Premature Rupture of Membranes

Definitions

- PROM or amniorrhexis: rupture of membranes prior to labor at any GA
- prolonged ROM: >24 h elapsed between rupture of membranes and onset of labor
- preterm ROM: ROM occurring before 37 wk gestation (associated with PTL)
- PPROM: rupture of membranes before 37 wk AND prior to onset of labor

Risk Factors

- maternal: multiparity, cervical incompetence, infection (cervicitis, vaginitis, STD, UTI), family history of PROM, low socioeconomic class/poor nutrition
- fetal: congenital anomaly, multiple gestation
- other risk factors associated with PTL

Clinical Features

- history of fluid gush or continued leakage

Investigations

- sterile speculum exam (avoid introduction of infection)
 - pooling of fluid in the posterior fornix
 - may observe fluid leaking out of cervix on cough/Valsalva ("cascade")
- nitrazine (amniotic fluid turns nitrazine paper blue)
 - low specificity as can be positive with blood, urine, or semen
- ferning (high salt in amniotic fluid evaporates, looks like ferns under microscope)
- U/S to rule out fetal anomalies, assess GA, and BPP

Membrane Status Determined by

- Pooling of fluid on speculum exam
- Increased pH of vaginal fluid (nitrazine test)
- Ferning of fluid under light microscopy
- Decreased AFW on U/S

L/S Ratio (Lecithin:Sphingomyelin Ratio)

Lecithin levels increase rapidly after 35 wk gestation, whereas sphingomyelin levels remain relatively constant. The L/S ratio is a measure of fetal lung maturity – less than 2:1 indicates pulmonary immaturity. Presence of blood or meconium in the amniotic fluid can affect the ratio

Management

- admit for expectant management and monitor vitals q4h, daily BPP and WBC count
- avoid introducing infection with examinations (do NOT do a bimanual exam)
- cultures (cervix for GC, lower vagina for GBS)
- assess fetal lung maturity by L/S ratio of amniotic fluid
 - consider administration of betamethasone valerate (Celestone®) to accelerate maturity if <32 wk and no evidence of infection
 - consider tocolysis for 48 h to permit administration of steroids if PPRM induces labor
- if not in labor or labor not indicated, consider antibiotics (controversial)
 - studies show broad spectrum coverage increases the time to onset of labor from PROM by 5-7 d with no increase in maternal or neonatal morbidity or mortality
- deliver urgently if evidence of fetal distress and/or chorioamnionitis

Table 23. PROM Management

Degree of Prematurity	Management
<24 wk	Consider termination (poor outcome due to pulmonary hypoplasia)
24-25 wk	Individual consideration with counseling of parents re: risks to preterm infants
26-34 wk	Expectant management as prematurity complications are significant
34-36 wk	"Gray zone" where risk of death from RDS and neonatal sepsis is the same
≥37 wk	Induction of labor since the risk of death from sepsis is greater than RDS

Prognosis

- varies with gestational age
- 90% of women with PROM at 28-34 wk GA go into spontaneous labor within 1 wk
- 50% of women with PROM at <26 wk GA go into spontaneous labor within 1 wk
- complications: cord prolapse, intrauterine infection (chorioamnionitis), premature delivery, limb contracture

Breech Presentation

Definition

- fetal buttocks or lower extremity is the presenting part as determined on U/S
- complete (10%): flexion at hips and knees
- frank (60%): flexion at hips, extension at knees
 - most common type of breech presentation
 - most common breech presentation to be delivered vaginally
- footling (30%): may be single or double with extension at hip(s) and knee(s) so that foot is the presenting part

Epidemiology

- occurs in 3-4% of pregnancies at term (25% before 28 wk)

Risk Factors

- maternal: pelvis (contracted), uterus (shape abnormalities, intrauterine tumors, fibroids), extrauterine tumors causing compression, grand multiparity
- maternal-fetal: placenta (previa), amniotic fluid (poly-/oligohydramnios)
- fetal: prematurity, multiple gestation, congenital malformations (found in 6% of breeches; 2-3% if in vertex presentations), abnormalities in fetal tone and movement, aneuploidy

Management

- ECV: repositioning of fetus within uterus under U/S guidance
 - overall success rate of 65%
 - criteria: singleton, unengaged presenting part, reactive NST
 - contraindications: previous T3 bleed, prior classical C/S, previous myomectomy, oligohydramnios, PROM, placenta previa, abnormal U/S, suspected IUGR, HTN, uteroplacental insufficiency, nuchal cord
 - risks: abruption, cord compression
 - method: tocometry, followed by ultrasound guided transabdominal manipulation of fetus with consistent fetal heart monitoring
 - if patient Rh negative, give Rhogam® prior to procedure
 - good prognostic factors (for a successful version)
 - ♦ multiparous, good fluid volume, small baby, skilled obstetrician
- pre- or early labor ultrasound to assess type of breech presentation, fetal growth, estimated weight, attitude of fetal head; if ultrasound unavailable, recommend C/S
- trial of labor and elective C/S should be presented as options with the risks and benefits outlined; obtain informed consent

A. Complete Breech

B. Frank Breech

C. Footling Breech

© Crista Mason 2004

Figure 9. Types of breech presentation

Criteria for Vaginal Breech Delivery

- Frank or complete breech, GA >36 wk
- EFW 2,500-3,800 g based on clinical and U/S assessment (5.5-8.5 lb)
- Fetal head flexed
- Continuous fetal monitoring
- 2 experienced obstetricians, assistant, and anesthesiologist present
- Ability to perform emergency C/S within 30 min if required

- method for vaginal breech delivery
 - encourage effective maternal pushing efforts
 - at delivery of after-coming head, assistant must apply suprapubic pressure to flex and engage fetal head
 - delivery can be spontaneous or assisted; avoid fetal traction
 - apply fetal manipulation only after spontaneous delivery to level of umbilicus
- C/S recommended if: the breech has not descended to the perineum in the second stage of labor after 2 h, in the absence of active pushing, or if vaginal delivery is not imminent after 1 h of active pushing
- contraindications to vaginal breech delivery
 - cord presentation
 - clinically inadequate maternal pelvis
 - fetal factors incompatible with vaginal delivery

Prognosis

- regardless of route of delivery, breech infants have lower birth weights and higher rates of perinatal mortality, congenital anomalies, abruption, and cord prolapse

Vaginal Birth After Cesarean (Trial of Labor After Cesarean)

- recommended after previous low transverse incision
- success rate varies with indication for previous C/S (generally 60-80%)
- risk of uterine rupture (<1% with low transverse incision)

Contraindications

- previous classical, inverted T, or unknown uterine incision, or complete transection of uterus (6% risk of rupture)
- history of hysterotomy or previous uterine rupture
- multiple gestation
- non-vertex presentation or placenta previa
- inadequate facilities or personnel for emergency C/S

Prolonged Pregnancy

Definition

- pregnancy beyond 42 wk GA

Epidemiology

- 41 wk GA: up to 27%
- 42 wk GA: 4-14%

Etiology

- most cases idiopathic
- anencephalic fetus with no pituitary gland
- placental sulfatase deficiency (X-linked recessive condition in 1/2,000-1/6,000 infants) – rare

Clinical Features

- postmaturity syndrome: 10-20% of post-term pregnancies (fetal weight loss, reduction in subcutaneous fat, scaling, dry skin from placental insufficiency, long thin body, open-eyed, alert and worried look, long nails, palms and soles wrinkled)
- with increasing GA, higher rates of: intrauterine infection, asphyxia, meconium aspiration syndrome, placental insufficiency, placental aging and infarction, macrosomia, dystocia, fetal distress, operative deliveries

Management

- GA 40-41 wk: expectant management
 - no evidence to support IOL or C/S unless other risk factors for morbidity are present (see prognosis)
- GA >41 wk: offer IOL if vaginal delivery is not contraindicated
 - IOL shown to decrease C/S, fetal heart rate changes, meconium staining, macrosomia, and death when compared with expectant management
- GA >41 wk and expectant management elected: serial fetal surveillance
 - fetal movement count by the mother
 - BPP q3-4d
 - If AFI is decreased, labor will be induced

Vaginal Delivery of Breech Presentation

SOGC Clinical Practice Guidelines 2009;226;557-566

Objective: To discuss risks and benefits of trial of labor vs. planned C/S, with selection criteria, management, and delivery techniques for trial of vaginal breech birth.

Evidence: Randomized trials, prospective cohort studies and select cohort studies from Medline search for long-term outcomes and epidemiology of vaginal breech delivery.

Summary: Higher risk of perinatal mortality and short-term neonatal morbidity can be associated with vaginal breech birth as compared to elective C/S. However, careful case selection (including term singleton breech fetuses and clinically adequate maternal pelvis) and labor management may achieve a similar safety level as elective C/S (~2 per 1,000 births perinatal mortality, ~2% short-term neonatal morbidity). Specific protocols for vaginal breech delivery should be followed: continuous fetal heart monitoring, assessment for adequate progress in labor, no induction of labor recommended, emergency C/S available, if required, and health care providers with requisite skills and experience. Informed consent for the preferred delivery method should be obtained.

VBAC

- Rate of VBAC ranges from 60-82%
- No significant difference in maternal deaths or hysterectomies between VBAC or C/S
- Uterine rupture more common in VBAC group
- Evidence regarding fetal outcome is lacking

Safety of vaginal birth after Cesarean section: A systematic review. *Obstet Gynecol* 2004;103:420-9

Prognosis

- if >42 wk, perinatal mortality 2-3x higher (due to progressive uteroplacental insufficiency)
- morbidity increased with HTN in pregnancy, DM, abruption, IUGR, and multiple gestation

Intrauterine Fetal Death

Definition

- fetal death *in utero* after 20 wk GA

Epidemiology

- 1% of pregnancies

Etiology

- 50% idiopathic
- 50% secondary to HTN, DM, erythroblastosis fetalis, congenital anomalies, umbilical cord or placental complications, intrauterine infection, APS

Clinical Features

- decreased perception of fetal movement by mother
- SFH and maternal weight not increasing
- absent fetal heart tones (not diagnostic)
- high MSAFP

Management

- diagnosis: absent cardiac activity and fetal movement on U/S required for diagnosis
- determine secondary cause
 - maternal: HbA1c, Kleihauer-Betke, VDRL, ANA, antibody screens, INR/PTT, serum/urine toxicology screens, cervical and vaginal cultures, TORCH screen
 - fetal: chromosomes, cord blood, skin biopsy, genetics evaluation, autopsy
 - placenta: pathology, bacterial cultures

Treatment

- induction of labor
- monitor for maternal coagulopathy (10% risk of DIC)
- parental psychological care as per hospital protocol
- comprehensive discussion within 3 mo about final investigation and post-mortem results, help make plans for future pregnancies

**DIC: Generalized Coagulation and Fibrinolysis Leading to Depletion of Coagulation Factors****Obstetrical Causes**

- Abruption
- Gestational HTN
- Fetal demise
- PPH

DIC-specific Blood Work

- Platelets
- aPTT and PT
- FDP
- Fibrinogen

Treatment

- Treat underlying cause
- Supportive
 - Fluids
 - Blood products
 - FFP, platelets, cryoprecipitate
- Consider anti-coagulation as VTE prophylaxis

Complications of Labor and Delivery

Meconium in Amniotic Fluid

Epidemiology

- present early in labor in 10% of pregnancies
- in general, meconium may be present in up to 25% of all labors; usually NOT associated with poor outcome, but extra care is required at time of delivery to avoid aspiration

Etiology

- likely cord compression ± uterine hypertonus
- may indicate undiagnosed breech
- increasing meconium during labor may be a sign of fetal distress

Features

- consistency and color
 - light yellow/green or dark green-black in color
 - may be watery or thicker

Treatment

- call respiratory therapy, neonatology, or pediatrics to delivery room
- oropharynx suctioning upon head expulsion or immediately after delivery if baby not breathing spontaneously (do NOT stimulate infant before)
- consider amnioinfusion of ~800 mL of IV NS over 50-80 min during active stage of labor and a maintenance dose of ~3 mL/min until delivery
- closely monitor FHR for signs of fetal distress

Dark green or black meconium is associated with lower APGARs and increased risk of meconium aspiration

Abnormal Progression of Labor (Dystocia)

Definition

- expected patterns of descent of the presenting part and cervical dilatation fail to occur in the appropriate time frame; can occur in all stages of labor
- during active phase: >4 h of <0.5 cm/h
- during 2nd phase: >1 h with no descent during active pushing

Etiology

- Power (leading cause): contractions (hypotonic, incoordinate), inadequate maternal expulsive efforts
- Passenger: fetal position, attitude, size, anomalies (hydrocephalus)
- Passage: pelvic structure (CPD), maternal soft tissue factors (tumors, full bladder or rectum, vaginal septum)
- Psyche: hormones released in response to stress may contribute to dystocia; psychological and physiological stress should be evaluated as part of the management once dystocia has been diagnosed

Management

- confirm diagnosis of labor (rule out false labor)
- search for factors of CPD
- diagnosed if adequate contractions measured by intrauterine pressure catheter (IUPC) with no descent/dilatation for >2 h
- management: if CPD ruled out, IV oxytocin augmentation \pm amniotomy

Risks of Dystocia

- inadequate progression of labor is associated with an increased incidence of:
 - maternal stress
 - maternal infection
 - postpartum hemorrhage
 - need for neonatal resuscitation

Shoulder Dystocia

Definition

- impaction of anterior shoulder of fetus against symphysis pubis after fetal head has been delivered
- life threatening emergency

Etiology/Epidemiology

- incidence 0.15-1.4% of deliveries
- occurs when breadth of shoulders is greater than biparietal diameter of the head

Risk Factors

- maternal: obesity, DM, multiparity
- fetal: prolonged gestation, macrosomia
- labor
 - prolonged 2nd stage
 - instrumental midpelvic delivery

Clinical Features

- "turtle sign": head delivered but retracts against inferior portion of pubic symphysis
- complications
 - chest compression by vagina or cord compression by pelvis can lead to hypoxia
 - brachial plexus injury (Erb's palsy: C5-C7; Klumpke's palsy: C8-T1)
 - ♦ 90% resolve within 6 mo
 - fetal fracture (clavicle, humerus, cervical spine)
 - maternal perineal injury, may result in PPH

Treatment

- goal: to displace anterior shoulder from behind symphysis pubis; follow a stepwise approach of maneuvers until goal achieved
- other options
 - cleidotomy (deliberate fracture of neonatal clavicle)
 - Zavanelli maneuver: replacement of fetus into uterine cavity and emergent C/S
 - symphysiotomy

Prognosis

- 1% risk of long-term disability for infant

Provided there are no contraindications, oxytocin is utilized to improve uterine contraction strength and/or frequency

© Bonnie Tang 2012

Figure 10. Types of pelvis

- 1/3 of protraction disorders develop into 2° arrest of dilatation due to CPD
- 2/3 of protraction disorders progress through labor to vaginal delivery

Umbilical Cord Prolapse

Definition

- descent of the cord to a level adjacent to or below the presenting part, causing cord compression between presenting part and pelvis

Etiology/Epidemiology

- increased incidence with prematurity/PROM, fetal malpresentation (~50% of cases), low-lying placenta, polyhydramnios, multiple gestation, CPD
- incidence: 0.17-0.63%

Clinical Features

- visible or palpable cord
- FHR changes (variable decelerations, bradycardia, or both)

Treatment

- emergency C/S
- O₂ to mother, monitor fetal heart
- alleviate pressure of the presenting part on the cord by placing digit in vagina (maintain this position until C/S)
- keep cord warm and moist by replacing it into the vagina ± applying warm saline soaks
- position mother in Trendelenburg or knee-to-chest position
- if fetal demise or too premature (<22 wk), allow labor and delivery

Approach to the Management of Shoulder Dystocia

ALARMER

Apply suprapubic pressure and ask for help

Legs in full flexion (McRobert's maneuver)

Anterior shoulder disimpaction (suprapubic pressure)

Release posterior shoulder by rotating it anteriorly with hand in the vagina under adequate anesthesia

Manual corkscrew i.e. rotate the fetus by the posterior shoulder until the anterior shoulder emerges from behind the maternal symphysis

Episiotomy

Rollover (on hands and knees)

*Note that suprapubic pressure and McRobert's maneuver together will resolve 90% of cases

Umbilical Cord Accident Causes

- Nuchal cord
 - Type A (looped)
 - Type B (hitched)
- Body loop
- Single artery
- True knot
- Torsion
- Velamentous
- Short cord <35 cm
- Long cord >80 cm

Maternal Mortality Causes

- Thromboembolism
- Cardiac event
- Suicide
- Sepsis
- Ectopic pregnancy
- HTN
- Amniotic fluid embolism
- Hemorrhage

Uterine Rupture

Etiology/Epidemiology

- associated with previous uterine scar (in 40% of cases), hyperstimulation with oxytocin, grand multiparity, and previous intrauterine manipulation
- generally occurs during labor, but can occur earlier with a classical incision
- 0.5-0.8% incidence, up to 12% with classical incision

Clinical Features

- prolonged fetal bradycardia – most common presentation
- acute onset abdominal pain
- hyper or hypotonic uterine contractions
- vaginal bleed

Risk Factors

- uterine scarring (i.e. previous uterine surgeries including Cesarean, perforation with D&C)
- excessive uterine stimulation (i.e. protracted labor, oxytocin)
- uterine trauma (i.e. operative equipment, ECV)
- multiparity
- uterine abnormalities

Treatment

- rule out placental abruption
- immediate delivery for fetal survival
- maternal stabilization (may require hysterectomy)

Complications

- maternal mortality 1-10%
- maternal hemorrhage, shock, DIC
- amniotic fluid embolus
- hysterectomy if uncontrollable hemorrhage
- fetal distress, associated with 50% fetal mortality

Amniotic Fluid Embolus

Definition

- amniotic fluid debris in maternal circulation triggering an anaphylactoid immunologic response

Etiology/Epidemiology

- rare intrapartum or immediate postpartum complication
- 60-80% maternal mortality rate, accounts for 10% of all maternal deaths
- leading cause of maternal death in induced abortions and miscarriages
- 1/8,000-1/80,000 births

Risk Factors

- placental abruption
- rapid labor
- multiparity
- uterine rupture
- uterine manipulation

Differential Diagnosis

- pulmonary embolus, drug-induced anaphylaxis, septic shock, eclampsia, HELLP syndrome, abruption, chronic coagulopathy

Clinical Features

- sudden onset of respiratory distress, cardiovascular collapse (hypotension, hypoxia), and coagulopathy
- seizure in 10%
- ARDS and left ventricular dysfunction seen in survivors

Management

- supportive measures (high flow O₂, ventilation support, fluid resuscitation, inotropic support, ± intubation), coagulopathy correction
- ICU admission

Chorioamnionitis

Definition

- infection of the chorion, amnion, and amniotic fluid typically due to ascending infection by organisms of normal vaginal flora

Etiology/Epidemiology

- incidence 1-5% of term pregnancies and up to 25% in preterm deliveries
- ascending from vagina
- predominant microorganisms include: GBS, *Bacteroides* and *Prevotella* species, *E. coli*, and anaerobic *Streptococcus*

Risk Factors

- prolonged ROM, long labor, multiple vaginal exams during labor, internal monitoring
- bacterial vaginosis and other vaginal infections

Clinical Features

- maternal fever, maternal or fetal tachycardia, uterine tenderness, foul and purulent cervical discharge

Investigations

- CBC: leukocytosis
- amniotic fluid: leukocytes or bacteria

Treatment

- IV antibiotics
 - ampicillin (2 g IV q6h) and gentamicin (1.5 mg/kg q8h)
 - anaerobic coverage (i.e. clindamycin if C/S)
- expedient delivery regardless of gestational age

Complications

- bacteremia of mother or fetus, wound infection if C/S, pelvic abscess, infant meningitis

Clinical Features of Chorioamnionitis

- Temperature
- Tachycardia (maternal or fetal)
- Tenderness (uterine)
- Foul discharge

Operative Obstetrics

Operative Vaginal Delivery

Definition

- forceps or vacuum extraction

Indications

- fetal
 - atypical or abnormal fetal heart rate tracing
 - consider if second stage is prolonged as this may be due to poor contractions or failure of fetal head to rotate
- maternal
 - need to avoid voluntary expulsive effort (e.g. cardiac/cerebrovascular disease)
 - exhaustion, lack of cooperation, and excessive analgesia may impair pushing effort

Forceps

Outlet Forceps Position

- head visible between labia in between contractions
- sagittal suture in or close to AP diameter
- rotation cannot exceed 45°

Low Forceps Position

- presenting part at station +2 or greater
- subdivided based on whether rotation less than or greater than 45 degrees

Mid Forceps Position

- presenting part below spines but above station +2
- rarely done

Types of Forceps

- Simpson or Tucker-McLane forceps for OA presentations
- Kielland (rotational) forceps when rotation of head required
- Piper forceps for breech

Vacuum Extraction

- traction instrument used as alternative to forceps delivery; aids maternal pushing

Table 24. Advantages and Disadvantages of Forceps vs. Vacuum Extraction

	Forceps	Vacuum Extraction
Advantages	Higher overall success rate for vaginal delivery Decreased incidence of fetal morbidity	Easier to apply Less anesthesia required Less maternal soft-tissue injury compared to forceps
Disadvantages	Greater incidence of maternal injury	Contraindicated if fetus at risk for coagulation defect Suitable only for vertex presentations Maternal pushing required Contraindicated in preterm delivery
Complications	Maternal: anesthesia risk, lacerations, injury to bladder, uterus, or bone, pelvic nerve damage, PPH, infections Fetal: fractures, facial nerve palsy, trauma to face/ scalp, intracerebral hemorrhage, cephalohematoma, cord compression	Increased incidence of cephalohematoma and retinal hemorrhages compared to forceps Subgaleal hemorrhage, subaponeurotic hemorrhage, soft tissue trauma

Lacerations

- first degree: involves skin and vaginal mucosa but not underlying fascia and muscle
- second degree: involves fascia and muscles of the perineal body but not the anal sphincter
- third degree: involves the anal sphincter but does not extend through it
- fourth degree: extends through the anal sphincter into the rectal mucosa

Prerequisites for Operative Vaginal Delivery

- ABCDEFGHIJK**
Anesthesia (adequate)
Bladder empty
Cervix fully dilated and effaced with ROM
Determine position of fetal head
Equipment ready (including facilities for emergent C/S)
Fontanelle (posterior fontanelle midway between thighs)
Gentle traction
Handle elevated
Incision (episiotomy)
Once Jaw visible remove forceps
Knowledgeable operator

Figure 11. Types of forceps

Limits for Trial of Vacuum

- After 3 pulls over 3 contractions with no progress
- After 3 pop-offs with no obvious cause
- 20 min and delivery is not imminent

Muscles of Perineal Body

- Superficial transverse perineal
- Bulbocavernous
- External anal sphincter

Episiotomy

Definition

- incision in the perineal body at the time of delivery
- essentially a controlled second degree laceration
- midline: incision through central tendinous portion of perineal body and insertions of superficial transverse perineal and bulbocavernosus muscle
 - better healing but increased risk of deep tear
- mediolateral: incision through bulbocavernosus, superficial transverse perineal muscle, and levator ani
 - reduced risk of extensive tear but poorer healing and more pain
 - easier to repair

Indications

- to relieve obstruction of the unyielding perineum
- instrumental delivery
- controversial between practitioners as to whether it is preferable to make a cut or let the perineum tear as needed
- current evidence suggests letting perineum tear and then repair as needed (restricted use)

Complications

- infection, hematoma, extension into anal musculature, or rectal mucosa, fistula formation, incontinence

Cesarean Delivery

Epidemiology

- incidence 20-25%

Indications

- maternal: obstruction, active herpetic lesion on vulva, invasive cervical cancer, previous uterine surgery, underlying maternal illness (eclampsia, HELLP syndrome, heart disease)
- maternal-fetal: failure to progress, placental abruption or previa, vasa previa
- fetal: abnormal fetal heart tracing, malpresentation, cord prolapse, certain congenital anomalies

Types of Cesarean Incisions

- skin
 - transverse (i.e. Pfannenstiel)
 - decreased exposure and slower entry
 - improved strength and cosmesis
 - vertical midline
 - rapid peritoneal entry and increased exposure
 - increased dehiscence
- uterine
 - low transverse (most common): in noncontractile segment
 - decreased chance for rupture in subsequent pregnancies
 - low vertical
 - used for very preterm infants, poorly developed maternal lower uterine segment
 - classical (rare): in thick, contractile segment
 - used for transverse lie, fetal anomaly, >2 fetuses, lower segment adhesions, obstructing fibroid, morbidly obese patients

Risks/Complications

- anesthesia
- hemorrhage (average blood loss ~1,000 cc)
- infection (UTI, wound, endometritis)
 - single dose prophylactic antibiotic should be used (e.g. cefazolin 1-2 g)
- injury to surrounding structures (bowel, bladder, ureter, uterus)
- thromboembolism
- increased recovery time/hospital stay
- maternal mortality (<0.1%)

Risk Factors for Primary and Subsequent Anal Sphincter Lacerations

Am J Obstet Gynecol 2007;196:344

Objective: Assess effects of pregnancy, delivery method, and parity on risk of primary and secondary anal sphincter laceration in women with 1st vaginal delivery (VD), VBAC, or 2nd VD.

Methods: Retrospective cohort study of all deliveries at one hospital from 1995-2002.

Conclusion: 20,674 live singleton deliveries were included. Women with first VD and VBAC both had OR 5.1 for laceration compared to 2nd VD. Forceps and midline episiotomy significantly increased risk of laceration for all 3 groups. Second stage of labour >2 h only increased risk for 1st VD. Factors that had no significant increase in risk: infant birth weight >3,500 g and vacuum delivery. Women with prior anal sphincter laceration are at 3x increased risk for subsequent sphincter laceration, compared with women with prior vaginal delivery without sphincter laceration.

Restrictive vs. Routine Episiotomies with Vaginal Births

Cochrane DB Syst Rev 2009;1:CD000081

Study: This systematic review and meta-analysis of 8 RCTs assessed the effects of restrictive (only done for fetal indications or if severe perineal trauma was judged to be imminent) and routine (liberally done to prevent any tear) use of episiotomy during vaginal birth.

Patients: Of the 2,709 patients in the routine episiotomy group, 2,035 (75%) women had episiotomies. In the restrictive episiotomy group, 776 (28%) of the 2,733 women had episiotomies.

Results: Restrictive episiotomies appear to have less severe perineal trauma (RR 0.67), less suturing (RR 0.71), and fewer healing complications at 7 d (RR 0.69) compared to routine episiotomies. There is no difference for pain measures, dyspareunia, urinary incontinence, and severe vaginal or perineal trauma, but there was an increased risk of anterior perineal trauma (RR 1.84) with restrictive episiotomy. Similar results were obtained when comparing restrictive vs. routine mediolateral vs. midline episiotomy.

Conclusions: Compared to routine use, restrictive use of episiotomy during vaginal delivery appears to be more beneficial.

Common OR Questions

7 Layers to Dissect

Skin, fatty layer, fascia, muscle separation (rectus abdominus), peritoneum, bladder flap, uterus

Layers of the Rectus Sheath

Above the arcuate line: external oblique, internal oblique, rectus abdominis, internal oblique, transversus abdominis
Below the arcuate line: external oblique, internal oblique, transversus abdominis, rectus abdominis

Name of the Obliterated Umbilical Ligament

Urachus

Puerperal Complications

- puerperium: 6 wk period of adjustment after pregnancy when pregnancy-induced anatomic and physiologic changes are reversed

Postpartum Hemorrhage

Definition

- loss of >500 mL of blood at the time of vaginal delivery, or >1,000 mL with C/S
- early – within first 24 h postpartum
- late – after 24 h but within first 6 wk

Epidemiology

- incidence 5-15%

Etiology (4 Ts)

1. Tone

- uterine atony
 - ♦ most common cause of PPH
 - ♦ avoid by giving oxytocin with delivery of the anterior shoulder or placenta
 - ♦ occurs within first 24 h
- due to
 - ♦ labor (prolonged, precipitous, induced, augmented)
 - ♦ uterus (infection, over-distention)
 - ♦ placenta (abruption, previa)
 - ♦ maternal factors (grand multiparity, gestational HTN)
 - ♦ halothane anesthesia

2. Tissue

- retained placental products
- retained blood clots in an atonic uterus
- gestational trophoblastic neoplasia

3. Trauma

- laceration (vagina, cervix, uterus), episiotomy, hematoma (vaginal, vulvar, retroperitoneal), uterine rupture, uterine inversion

4. Thrombin

- coagulopathy
 - ♦ most identified prior to delivery (low platelets increases risk)
 - ♦ includes hemophilia, DIC, Aspirin® use, ITP, TTP, vWD (most common)
 - ♦ therapeutic anti-coagulation

Uterine atony is the most common cause of PPH

DDx of Early PPH – 4 Ts

Tone (atony)

Tissue (retained placenta, clots)

Trauma (laceration, inversion)

Thrombin (coagulopathy)

DDx of Late PPH

Retained products

± endometritis

Sub-involution of uterus

Investigations

- assess degree of blood loss and shock by clinical exam
- explore uterus and lower genital tract for evidence of tone, tissue, or trauma
- may be helpful to observe red-topped tube of blood – no clot in 7-10 min indicates coagulation problem

Management

- ABCs
- 2 large bore IVs and crystalloids
- CBC, coagulation profile, cross and type 4 units pRBCs
- treat underlying cause

Medical Therapy

- oxytocin 20 U/L NS or RL IV continuous infusion
 - in addition can give 10 U IMM after delivery of the placenta
- methylergonavine maleate (ergotamine) 0.25 mg IM/IMM q5min up to 1.25 mg; can be given as IV bolus of 0.125 mg (may exacerbate HTN)
- carboprost (Hemabate®), a synthetic PGF-1 α analog 0.25 mg IM/IMM q15min to max 2 mg (major prostaglandin side effects and contraindicated in cardiovascular, pulmonary, renal, and hepatic dysfunction)
- misoprostol 600 μ g-1 g (side effect: pyrexia)
- tranexamic acid (Cyklokapron®) 1 g IV, an antifibrinolytic

Local Control

- bimanual compression: elevate the uterus and massage through patient's abdomen
- uterine packing (mesh with antibiotic treatment)
- Bakri Balloon for tamponade: may slow hemorrhage enough to allow time for correction of coagulopathy or for preparation of an OR

Surgical Therapy (Intractable PPH)

- D&C (beware of vigorous scraping which can lead to Asherman's syndrome)
- embolization of uterine artery or internal iliac artery by interventional radiologist
- laparotomy with bilateral ligation of uterine artery (may be effective), internal iliac artery (not proven), ovarian artery, or hypogastric artery
- hysterectomy last option with angiographic embolization if post-hysterectomy bleeding

Retained Placenta

Definition

- placenta undelivered after 30 min postpartum

Etiology

- placenta separated but not delivered
- abnormal placental implantation (placenta accreta, placenta increta, placenta percreta)

Risk Factors

- placenta previa, prior C/S, post-pregnancy curettage, prior manual placental removal, uterine infection

Clinical Features

- incomplete placenta removed
- risk of postpartum hemorrhage and infection

Investigations

- explore uterus
- assess degree of blood loss

Management

- 2 large bore IVs, type and screen
- Brant maneuver (firm traction on umbilical cord with one hand applying suprapubic pressure to avoid uterine inversion by holding uterus in place)
- oxytocin 10 IU in 20 mL NS into umbilical vein
- manual removal if above fails
- D&C if required

Uterine Inversion

**Definition**

- inversion of the uterus through cervix \pm vaginal introitus

Etiology/Epidemiology

- often iatrogenic (excess cord traction with fundal placenta)
- excessive use of uterine tocolytics
- more common in grand multiparous (lax uterine ligaments)
- 1/1,500-1/2,000 deliveries

Clinical Features

- can cause profound vasovagal response with vasodilation and hypovolemic shock
- shock may be disproportionate to maternal blood loss

Management

- urgent management essential, call anesthesia
- ABCs: initiate IV crystalloids
- can use tocolytic drug (see [Management of Preterm Labor, OB37](#)) or nitroglycerin IV to relax uterus and aid replacement
- replace uterus without removing placenta
- remove placenta manually and withdraw slowly
- IV oxytocin infusion (only after uterus replaced)
- re-explore uterus
- may require general anesthetic \pm laparotomy

Postpartum Pyrexia

Definition

- fever $>100.4^{\circ}\text{F}$ on any 2 of the first 10 d postpartum, except the first day

Etiology

- endometritis
- wound infection secondary to C/S
- mastitis/engorgement
- UTI
- atelectasis
- pneumonia

Investigations

- detailed history and physical exam, relevant cultures
- for endometritis: blood and genital cultures

Treatment

- depends on etiology
 - infection: empiric antibiotics, adjust when sensitivities available
 - endometritis: clindamycin + gentamycin IV
 - mastitis: cloxacillin or cephalixin
 - wound infection: cephalixin
 - DVT: anticoagulants
- prophylaxis against post-C/S endometritis: begin antibiotic immediately after cord clamping and administer only 1-3 doses – cefazolin is most common choice

Etiology of Postpartum Pyrexia

B-5W

Breast: engorgement, mastitis

Wind: atelectasis, pneumonia

Water: UTI

Wound: episiotomy, C/S site infection

Walking: DVT, thrombophlebitis

Womb: endometritis

ENDOMETRITIS

- definition: infection of uterine myometrium and parametrium
- clinical features: fever, chills, abdominal pain, uterine tenderness, foul-smelling discharge, or lochia
- treatment: depends on infection severity; oral antibiotics if well, IV with hospitalization in moderate to severe cases

Risk Factors for Endometritis

C/S, intrapartum chorioamnionitis, prolonged labor, prolonged ROM, multiple vaginal examinations

VENOUS THROMBOEMBOLISM

- see [Venous Thromboembolism](#), OB20

Mastitis

- definition: inflammation of mammary glands
- must rule out inflammatory carcinoma, as indicated
- differentiate from mammary duct ectasia: mammary duct(s) beneath nipple clogged and dilated \pm ductal inflammation \pm nipple discharge (thick, gray to green), often postmenopausal women

Table 25. Lactational vs. Non-Lactational Mastitis

	Lactational	Non-Lactational
Epidemiology	More common than non-lactational Often 2-3 wk postpartum	Periductal mastitis most common Mean age 32 yr
Etiology	<i>S. aureus</i>	May be sterile May be infected with <i>S. aureus</i> or other anaerobes Smoking is risk factor May be associated with mammary duct ectasia
Symptoms	Unilateral localized pain Tenderness Erythema	Subareolar pain May have subareolar mass Discharge (variable color) Nipple inversion
Treatment	Heat or ice packs Continued nursing/pumping Antibiotics (dicloxacillin/cephalexin) (Erythromycin if pen-allergic)	Broad-spectrum antibiotics and I&D Total duct excision (definitive)
Abscess	Fluctuant mass Purulent nipple discharge Fever, leukocytosis Discontinue nursing, IV antibiotics (nafcillin/oxacillin), I&D usually required	If mass does not resolve, FNA to exclude cancer and U/S to assess presence of abscess Treatment includes antibiotics, aspiration, or I&D (tends to recur) May develop mammary duct fistula A minority of non-lactational abscesses may occur peripherally in breast with no associated periductal mastitis (usually <i>S. aureus</i>)

Postpartum Mood Alterations

POSTPARTUM BLUES

- 85% of new mothers, onset day 3-10; extension of the “normal” hormonal changes and adjustment to a new baby
- self-limited, should resolve by 2 wk
- manifested by mood lability, depressed affect, increased sensitivity to criticism, tearfulness, fatigue, irritability, poor concentration/despondency

POSTPARTUM DEPRESSION

- definition: major depression occurring in a woman within 6 mo of childbirth
- epidemiology: 10-20%, risk of recurrence 50%
- risk factors
 - personal or family history of depression (including PPD)
 - prenatal depression or anxiety
 - stressful life situation
 - poor support system
 - unwanted pregnancy
 - colicky or sick infant
- clinical features: suspect if the “blues” last beyond 2 wk, or if the symptoms in the first two weeks are severe (e.g. extreme disinterest in the baby, suicidal or homicidal/infanticidal ideation)
- assessment: Edinburgh Postnatal Depression Scale or other
- treatment: antidepressants, psychotherapy, supportive care, ECT if refractory
- prognosis: interferes with bonding and attachment between mother and baby so it can have long-term effects

POSTPARTUM PSYCHOSIS

- definition: onset of psychotic symptoms over 24-72 h within first month postpartum, can present in the context of depression
- epidemiology: rare (0.2%)

Postpartum Care

Postpartum Office Visit at 6 Weeks

Care of Mother (The 10 Bs)

- Be careful: do not use douches or tampons for 4-6 wk post-delivery
- Be fit: encourage gradual increases in walking, Kegel exercises
- Birth control: assess for use of contraceptives; breastfeeding is NOT an effective method of birth control (see [Gynecology, GY16](#), for more detail about different contraceptive options postpartum)
- Bladder: assess for urinary incontinence, maintain high fluid intake
- Bleeding: (see [Lacerations, OB45](#)), 300 µg of RhIG should be given if Rh+ fetus and Rh- mother or extensive bleeding at delivery
- Blood pressure: especially if gestational HTN
- Blood tests: glucose, CBC (for anemia as sign of hematomas, retained placenta)
- Blues: (see [Postpartum Mood Alterations](#))
- Bowel: fluids and high-fiber foods, bulk laxatives; for hemorrhoids/perineal tenderness: pain meds, doughnut cushion, Sitz baths, ice compresses
- Breast and pelvic exam: watch for Staphylococcal or Streptococcal mastitis/abscess, ± Pap smear at 6 wk

Physiological Changes Postpartum

- uterus weight rapidly diminishes through catabolism, cervix loses its elasticity and regains firmness
 - should involute ~1 cm below umbilicus per day in first 4-5 d, reaches non-pregnant state in 4-6 wk postpartum
- ovulation resumes in ~45 d for non-lactating women and within 3-6 mo for lactating women
- lochia: normal vaginal discharge postpartum
 - decreases and changes in color from red (lochia rubra; presence of erythrocytes) → yellow (lochia serosa) → white (lochia alba; residual leukorrhea) over 3-6 wk
 - foul-smelling lochia suggests endometritis

The acronym “**BUBBLES**” for what to ask about when rounding on postpartum care. Modify this for C/S or vaginal delivery.

Baby care and breastfeeding (latch, amount)
Uterus – firm or boggy?
Bladder function – Voiding well? Dysuria?
Bowel function – Passing gas or stool? Constipated?
Lochia or discharge – Any blood?
Episiotomy/laceration/incision – Pain controlled?
Symptoms of VTE – Dyspnea? Calf pain?

Breastfeeding Problems

- inadequate milk: consider domperidone
- breast engorgement: cool compress, manual expression/pumping
- nipple pain: clean milk off nipple after feeds, moisture cream, topical steroid if needed
- mastitis: treat promptly (see *Postpartum Pyrexia*, OB49)
- inverted nipples: makes feeding difficult
- maternal medications: may require pediatric consultation (see *Breastfeeding and Drugs*)

Bladder Dysfunction

- pelvic floor prolapse can occur after vaginal delivery
- stress or urge urinary incontinence common
- increased risk with instrumental delivery or prolonged second stage
- conservative management: pelvic floor retraining with Kegel exercises, vaginal cones, or pessaries, lifestyle modifications (e.g. limit fluid, caffeine intake)
- surgical management: minimally invasive procedures (tension-free vaginal tape, transobturator tape, midurethral sling)

Puerperal Pain

- “after pains” common in first 3 d due to uterine contractions; encourage simple analgesia
- ice packs can be used on perineum if painful
- encourage regular analgesia and stool softener

Breastfeeding and Drugs

Table 26. Drug Safety During Breastfeeding

Safe During Breastfeeding	Contraindicated When Breastfeeding
Analgesics (e.g. acetaminophen, NSAIDs)	Chloramphenicol (bone marrow suppression)
Anticoagulants (e.g. heparin)	Sulphonamides (in G6PD deficiency, can lead to hemolysis)
Antidepressants (e.g. sertraline, fluoxetine, TCAs)	Nitrofurantoin (in G6PD deficiency, can lead to hemolysis)
Antiepileptics (e.g. phenytoin, carbamazepine, valproic acid)	Tetracycline
Antihistamines	Lithium
Antimicrobials (e.g. penicillins, aminoglycosides, cephalosporins)	Anti-neoplastics and immunosuppressants
β-adrenergics (e.g. propranolol, labetalol)	Psychotropic drugs (relative contraindication)
Insulin	
Steroids	
OCP (low dose) – although may decrease breast milk production	

Breastfeeding: Contraindicated Drugs

- BREAST**
- Bromocriptine/Benzodiazepines
 - Radioactive isotopes/Rizatriptan
 - Ergotamine/Ethosuximide
 - Amiodarone/Amphetamines
 - Stimulant laxatives/Sex hormones
 - Tetracycline/Tretinoin

Common Medications

Table 27. Common Medications

Drug Name (Brand Name)	Dosing Schedule	Indications/Comments
betamethasone valerate (Celestone®)	12 mg IM q24h x 2 doses	Enhancement of fetal pulmonary maturity for PTL
carboprost (Hemabate®)	0.25 mg IM/IMM q15min; max 2 mg	Treatment of uterine atony
cefazolin	2 g IV then 1 g q8h	GBS prophylaxis (penicillin allergic and not at risk for anaphylaxis)
clindamycin	900 mg IV q8h	GBS prophylaxis (penicillin allergic and at risk for anaphylaxis) Also used in endometritis
dexamethasone	6 mg IM q12h x 4 doses	Enhancement of fetal pulmonary maturity for PTL
dinoprostone (Cervidil®: PGE ₂ impregnated thread)	10 mg PV (remove after 12 h) max 3 doses	Induction of labor Advantage: can remove if uterine hyperstimulation
doxylamine succinate (Diclegis®)	2 tabs qhs + 1 tab qAM + 1 tab qPM max 8 tabs/d	Each tablet contains 10 mg doxylamine succinate with vitamin B ₆ Used for hyperemesis gravidarum
erythromycin	500 mg IV q6h	GBS prophylaxis (penicillin allergic and at risk for anaphylaxis)
folic acid	0.4-1 mg PO OD x 1-3 mo preconception and T1 5 mg PO OD with past Hx of NTD	Prevention of oNTD
methotrexate	50 mg/m ² IM or 50 mg PO x 1 dose	For ectopic pregnancy or medical abortion
ergotamine	0.25 mg IM or IV bolus 0.125 mg q5min up to 1.25 mg	Treatment of uterine atony
misoprostol (Cytotec®)	800-1000 µg PR x 1 dose 400 µg PO x 1 dose or 800 µg PV x 1 dose, 3-7 d after methotrexate	For treatment of PPH For medical abortion/retained products of conception Also used for NSAID-induced ulcers (warn patients of contraindications)
oxytocin (Pitocin®)	0.5-2.0 mU/min IV, or 10 U/L NS increase by 1-2 mU/min q20-60min max 36-48 mU/min 10 U IM at delivery of anterior shoulder and of placenta 20 U/L NS or RL IV continuous infusion	Augmentation of labor (also induction of labor) Prevention of uterine atony Treatment of uterine atony
Penicillin G	5 million U IV then 2.5 million U IV q4h until delivery	GBS prophylaxis
PGE ₂ gel (Prostin® gel)	0.5 mg PV q6-12h; max 3 doses	Induction of labor
Rh IgG (Rhogam®)	300 µg IM x 1 dose	Given to Rh negative women <ul style="list-style-type: none"> • Routinely at 28 wk GA • Within 72 h of birth of Rh +ve fetus • Positive Kleihauer-Betke test • With any invasive procedure in pregnancy • Ectopic pregnancy • Antepartum hemorrhage • Miscarriage or therapeutic abortion (dose: 50 µg IM only)

Common Discharge Medications

Oxycodone IR 5-10 mg PO q4-6h PRN
Docusate sodium 100 mg PO bid

Misoprostol (Cytotec®) is also indicated to protect against NSAID-induced gastric ulcers in non-pregnant individuals. The use of misoprostol for cytoprotection is contraindicated in pregnancy; warn female patients of this contraindication

Basic Anatomy Review

Figure 1. Anatomy of the eye

Figure 2. Layers of the retina

Figure 3. Tear drainage from the eye (lacrimal apparatus)

Differential Diagnoses of Common Presentations

Loss of Vision

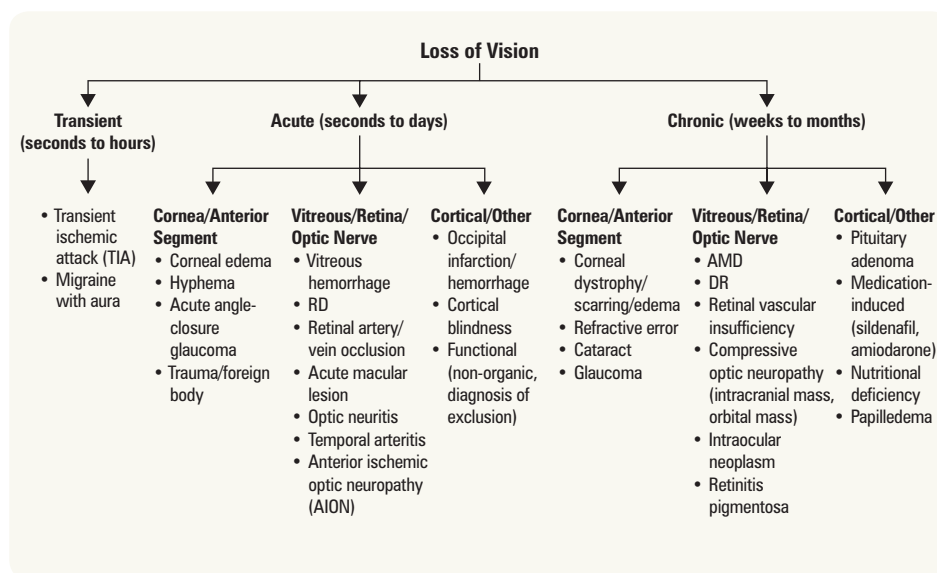

Figure 4. Loss of vision

Top 3 Differential Diagnosis of Acute Loss of Vision

- Trauma/foreign body
- Retinal artery/vein occlusion
- RD

Top 3 Differential Diagnosis of Chronic Loss of Vision Reversible

- Cataract
- Refractive error
- Corneal dystrophy

Irreversible

- AMD
- Glaucoma
- DR

Note: Anti-VEGF treatment for exudative AMD and diabetic macular edema may reverse some vision loss

Red Eye

- lids/orbit/lacrimal system
 - hordeolum/chalazion
 - blepharitis
 - entropion/ectropion
 - foreign body/laceration
 - dacryocystitis/dacryoadenitis
- conjunctiva/sclera
 - subconjunctival hemorrhage
 - conjunctivitis
 - dry eyes
 - pterygium
 - episcleritis/scleritis
 - preseptal/orbital cellulitis
- cornea
 - foreign body (including contact lens)
 - keratitis
 - abrasion, laceration
 - ulcer
- anterior chamber
 - anterior uveitis (iritis, iridocyclitis)
 - acute angle-closure glaucoma
 - hyphema (blood in anterior chamber)
 - hypopyon (pus in anterior chamber)
- other
 - trauma
 - post-operative
 - endophthalmitis

Ocular Pain

- differentiate from eye fatigue (asthenopia)
- herpes zoster prodrome
- trauma/foreign body
- keratitis
- corneal abrasion, corneal ulcer
- acute angle-closure glaucoma
- acute uveitis
- scleritis, episcleritis
- optic neuritis

Floaters

- age-related vitreous syneresis (shrinkage and collapse of vitreous gel)
- PVD
- vitreous hemorrhage
- retinal tear/detachment
- posterior uveitis

Flashes of Light (Photopsia)

- PVD
- retinal tear/detachment
- migraine with aura

Photophobia (Severe Light Sensitivity)

- corneal abrasion, corneal ulcer
- keratitis
- acute angle-closure glaucoma
- iritis
- meningitis, encephalitis
- migraine
- subarachnoid hemorrhage (SAH)

Diplopia (Double Vision)

- binocular diplopia (occurs with both eyes open, eliminated with occlusion of either eye)
 - strabismus, CN palsy (III, IV, VI) secondary to ischemia, DM, tumor, trauma, myasthenia gravis, muscle restriction/entrapment, thyroid ophthalmopathy, INO secondary to multiple sclerosis, brainstem infarct
- monocular diplopia (occurs with one eye open, remains with occlusion of unaffected eye)
 - refractive error, strands of mucus in tear film, keratoconus, cataracts, dislocated lens, peripheral iridotomy

Ocular Problems in the Elderly

- blepharitis
- ptosis
- entropion, ectropion
- dry eyes, epiphora (excessive tearing)
- presbyopia
- cataracts
- glaucoma
- AMD
- retinal artery/vein occlusion
- temporal arteritis (arteritic ischemic optic neuropathy)

Ocular Problems in the Contact Lens Wearer

- SPK from dry eyes
- solution hypersensitivity
- tight lens syndrome
- corneal abrasion
- giant papillary conjunctivitis/contact lens allergy
- sterile corneal infiltrates (immunologic)
- infected ulcers (*Pseudomonas*, *Acanthamoeba*)

Acute Painless Vision Loss

- vitreous hemorrhage
- retinal artery/vein occlusion
- RD
- AION
- optic neuritis
- amaurosis fugax

Table 1. Common Differential Diagnoses of Red Eye

	Conjunctivitis	Acute Iritis	Acute Angle-Closure Glaucoma	Keratitis (Corneal Abrasion/Ulcer)
Discharge	Bacteria: purulent Virus: serous Allergy: mucous	No	No	Profuse tearing
Pain	No	++ (tender globe)	+++ (nausea)	++ (on blinking)
Photophobia	No	+++	+	++
Blurred Vision	No	++	+++	Varies
Pupil	Normal	Smaller	Fixed in mid-dilation	Same or smaller
Injection	Conjunctiva with limbal pallor	Ciliary flush	Diffuse	Diffuse
Cornea	Normal	Keratic precipitates	Cloudy	Infiltrate, edema, epithelial defects
IOP	Normal	Varies	Increased markedly	Normal or increased
Anterior Chamber	Normal	+++ Cells and flare	Shallow	Cells and flare or normal
Other	Large, tender pre-auricular node(s) if viral	Posterior synechiae	Colored halos Nausea and vomiting	

Not every red eye has conjunctivitis

Ocular Emergencies

These require urgent consultation to an ophthalmologist for management

Sight Threatening

- lid/globe lacerations
- chemical burn
- corneal ulcer
- gonococcal conjunctivitis
- acute iritis
- acute angle-closure glaucoma
- CRAO
- intraocular foreign body
- RD (especially when macula threatened)
- endophthalmitis

Life Threatening

- proptosis (rule out cavernous sinus fistula or thrombosis)
- CN III palsy with dilated pupil (intracranial aneurysm or neoplastic lesion)
- papilledema (must rule out intracranial mass lesion)
- orbital cellulitis
- GCA
- leukocoria: white reflex (absent red reflex, must rule out retinoblastoma)

The Ocular Examination

Visual Acuity – Distance

- Snellen Acuity (Figure 5) = $\frac{\text{testing distance (usually 20 feet or 6 meters)}}{\text{smallest line patient can read on the chart}}$
 - e.g. 20/40 = what the patient can see at 20 feet (numerator), what a “normal” person can see at 40 feet (denominator)
- distance visual acuity should be tested with distance glasses on in order to obtain best corrected visual acuity
- testing hierarchy for low vision: Snellen acuity (20/x) → counting fingers at a given distance (CF) → hand motion (HM) → light perception with projection (LP with projection) → light perception (LP) → no light perception (NLP)
- legal blindness is BCVA that is $\leq 20/200$ in best eye

Example 1

SC
V 20/40 -1
20/80 +2 → 20/25 PH

Example 2

CC
V CF 3'
HM

Note: RIGHT EYE visual acuity always listed on top.

V Vision
SC Without correction
CC With correction
20/40 -1 All except one letter of 20/40
20/80 +2 All of 20/80 plus two letters of 20/70
PH Visual acuity with pinhole correction
CF Counting fingers
HM Hand motion

Figure 5. Ophthalmology nomenclature for VA

OD = oculus dexter = right eye
OS = oculus sinister = left eye
OU = oculus uterque = both eyes

Snellen visual acuity of 20/20 equates to “normal” vision

Normal Infant and Child Visual Acuity

- 6-12 mo: 20/120
- 1-2 yr: 20/80
- 2-4 yr: 20/20

Visual Acuity – Near

- use pocket vision chart (Rosenbaum Pocket Vision Screener)
- record Jaeger (J) or Point number and testing distance (usually 30 cm) e.g. J2 @ 30 cm
- conversion to distance VA possible (e.g. immobile patient, no distance chart available)

Visual Acuity for Infants, Children, Non-English Speakers, and Dysphasics

- newborns
 - VA cannot be tested
- 3 mo - 3 yr (can only assess visual function, not acuity)
 - test each eye for fixation symmetry using an interesting object
 - normal function noted as “CSM” = central, steady, and maintained
- 3 yr until alphabet known
 - pictures or letter cards/charts such as HOTV or Sheridan-Gardner test (children point to optotypes on a provided matching card)
 - tumbling “E” chart

Color Vision

- test with Ishihara pseudoisochromatic plates
- record number of correctly identified plates presented to each eye, specify incorrect plates
- important for testing optic nerve function (e.g. optic neuritis, chloroquine use, thyroid ophthalmopathy)
- note: red-green color blindness is sex-linked and occurs in 7-10% of males

VISUAL FIELDS

- test “visual fields by confrontation” (4 quadrants, each eye tested separately) for estimation of visual field loss
- accurate, quantifiable assessment with automated visual field testing (Humphrey or Goldmann) or Tangent Screen
- use Amsler grid (tested separately) to test for central or paracentral scotomas (island-like gaps in the vision) in patients with AMD

PUPILS

- use reduced room illumination with patient focusing on distant object to prevent “near reflex”
- examine pupils for shape, size, symmetry, and reactivity to light (both direct and consensual response)
- RAPD with swinging flashlight test
- test pupillary constriction portion of near reflex by bringing object close to patient’s nose
- “normal” pupil testing often noted as PERLA (pupils equal, round, and reactive to light and accommodation)

ANTERIOR CHAMBER DEPTH

- shine light tangentially from temporal side
- if >2/3 of nasal side of iris in shadow → shallow anterior chamber

The van Herick Method

- shine thin-angled slit beam onto the peripheral cornea of each eye
- estimate depth between the posterior surface of the cornea and the iris as a proportion of corneal thickness
- follow-up with gonioscopy for ratios $\leq 1/4$

Gonioscopy

- allows direct visualization of the angle structures
- angle considered open if trabecular meshwork, scleral spur, and iris processes are visualized
- angle considered narrow (occludable) if only *Schwalbe's* line or a small portion of the trabecular meshwork is seen

EXTRAOCULAR MUSCLES**Alignment**

- Hirschberg corneal reflex test
 - examine in primary position of gaze (i.e. straight ahead) with patient focusing on distant object
 - shine light into patient’s eyes from ~30 cm away
 - corneal light reflex should be symmetric and at the same position on each cornea
- strabismus testing as indicated (cover test, cover-uncover test, prism testing) (see *Strabismus*, OP38)

RIGHT EYE fields drawn on right side;
LEFT EYE fields drawn on left side
(as if seen through patient’s eyes).

CF Able to count fingers in specified quadrant with peripheral vision

Gross visual field deficit in specified quadrant using peripheral vision

Figure 6. Ophthalmology nomenclature for visual fields by confrontation

For patients with dark irides, test pupils using an ophthalmoscope focused on the red reflex. This will provide a better view than using a penlight

**Ocular Changes for Near Fixation**

- Eye convergence
- Pupil constriction
- Lens accommodation

**4 Ps of InsPection**

Pupil: shape, size, symmetry
Position: esotropia, exotropia, central
Ptoxis
Primary nystagmus

Figure 7. Estimation of anterior chamber depth

Movement

- examine movement of eyeball through six cardinal positions of gaze
- ask patient if diplopia is present in any position of gaze
- observe for horizontal, vertical, or rotatory nystagmus (rhythmic, oscillating movements of the eye)
- resolving horizontal nystagmus at end-gaze is usually normal
- see sidebar for cranial nerve innervation of extraocular muscles

Diplopia

- major symptom associated with dysfunction of extraocular muscles or abnormalities of the motor nerves innervating these muscles
- must determine whether diplopia is monocular or binocular
- determine whether diplopia was sudden onset (due to an acute event such as ischemia) or gradual (due to progressive process such as tumor or inflammation)
- with myasthenia gravis, diplopia and ptosis usually worsen on prolonged upgaze; can rule out with a Tensilon® test (see [Neurology, N38](#))
- if suspect compressive lesion (most commonly seen with CN III palsy with a blown pupil), need MRI and angiography to rule out aneurysm or tumor
- new-onset diplopia that disappears with occlusion of either eye (binocular diplopia) needs urgent referral while chronic binocular diplopia and monocular diplopia should be referred non-urgently

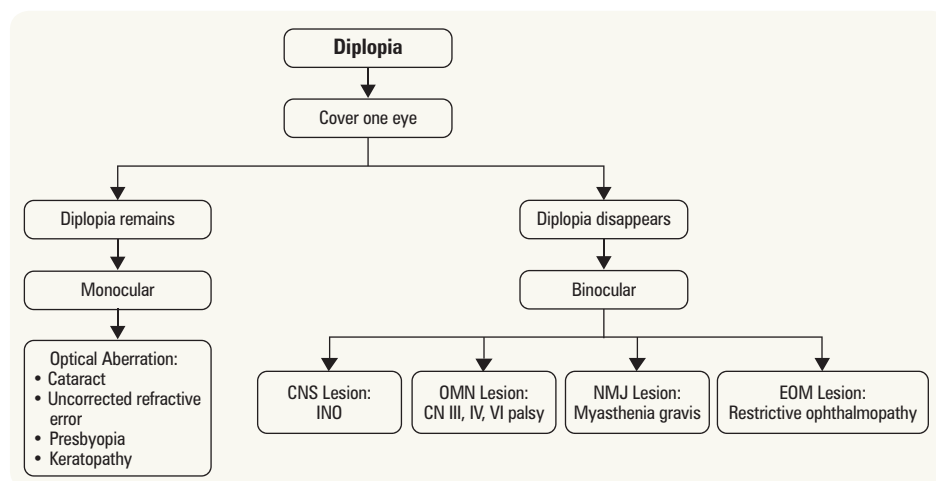

Figure 9. Diplopia

EXTERNAL EXAMINATION

- four Ls
 - lymph nodes (preauricular, submandibular)
 - lids
 - lashes
 - lacrimal system

SLIT-LAMP EXAMINATION

- systematically examine all structures of the anterior segment and anterior vitreous (for structures see [Figure 1](#))
- when necessary, use
 - fluorescein dye: stains Bowman's membrane in de-epithelialized cornea; dye appears green with cobalt blue filtered light
 - Rose Bengal dye: stains devitalized corneal epithelium
- special lenses (78 or 90 D) used with the slit-lamp allow a binocular, stereoscopic view of the fundus and vitreous

Figure 8. Diagnostic positions of gaze for isolated primary actions of extraocular muscles

Extraocular Muscle Innervations

LR6 SO4 AE3

Lateral Rectus via CN VI

Superior Oblique via CN IV

All Else via CN III (superior, medial, and inferior rectus, inferior oblique)

Aqueous Flare

- Resembles dust particles in a beam of light
- Results from protein leaking from blood vessels
- Distinguish from aqueous cells (individual cells in anterior chamber)

Note: RIGHT EYE drawn on the left, LEFT EYE drawn on the right (as if looking at patient's face)

LLL Lids, lashes, lacrimal
SC Sclera, conjunctiva
K Cornea
AC Anterior chamber
d+q Deep (not shallow) and quiet (no cells in AC)
NS Nuclear sclerosis (cataract)

Ⓝ D/M/V
(normal disc, macula, vessels)

C:D Cup : Disc ratio
x Fovea

Any abnormality or pathology is drawn on the sketch in the appropriate location, and is labelled (e.g. trichiasis, conjunctivitis/episcleritis/scleritis, corneal abrasion/ulcer, foreign body, etc.)

© Tobi Lam 2012

Figure 10. Slit-lamp examination note

TONOMETRY

- measurement of IOP
- normal range is 10-21 mmHg (average 15 mmHg)
- IOP has diurnal variation, so always record the time of day at which the measurement was taken
- commonly measured by
 - Goldmann Applanation Tonometry (GAT): gold standard, performed using the slit-lamp with special tip (prism)
 - Tono-Pen®: benefit is portability and use of disposable probe tips. Use when cornea is scarred/asymmetric (GAT inaccurate)
 - air puff (non-contact and least reliable)
- use topical anesthetic for GAT and Tono-Pen®

OPHTHALMOSCOPY/FUNDOSCOPY

- performed with
 - direct ophthalmoscope (monocular with small field of view, only posterior pole visualized)
 - slit-lamp with 78 or 90 D lens (binocular view, visualization to mid-periphery of retina)
 - indirect ophthalmoscopy with headlamp and 20 or 28 D lens (binocular view, visualization of entire retina to ora serrata/edge of retina)
- best performed with pupils dilated (for list of mydriatics and cycloplegics see Table 11, OP45)
 1. assess red reflex
 - ♦ light reflected off the retina produces a “red reflex” when viewed from ~1 foot away
 - ♦ anything that interferes with the passage of light will diminish the red reflex (e.g. large vitreous hemorrhage, cataract)
 2. examine the posterior segment of the eye (Figure 10)
 - ♦ vitreous
 - ♦ optic disc (color, C:D ratio, sharpness of disc margin)
 - ♦ macula (~2 disc diameters temporal to disc), fovea (foveal light reflex)
 - ♦ retinal vessels
 - ♦ retinal background
- contraindications to pupillary dilatation
 - shallow anterior chamber – can precipitate acute angle-closure glaucoma
 - iris-supported anterior chamber lens implant
 - potential neurologic abnormality requiring pupil evaluation
 - use caution with cardiovascular disease – mydriatics may cause tachycardia

Note: RIGHT EYE IOP always listed on top. Always include time.

Note method used to measure IOP (GAT, Tono-Pen®, airpuff).

Figure 11. Tonometry

**Central Corneal Thickness (CCT)**

Average CCT = 550 µm

By GAT, IOP is over-estimated with thick corneas and under-estimated with thin corneas

Desired Myers Pattern on GAT

Note: Thick Myers overestimate the IOP and are a result of excess fluorescein

**Quick Tips for Direct Ophthalmoscopy**

- Examine in a dark room
- Ask patient to focus on a distant object
- Match ophthalmoscope light aperture to size of pupil (i.e. smaller aperture for undilated eye)
- Use moderate light intensity
- Use your left/right eye and hand to examine patient's left/right eye respectively
- Get in close! Proximity to patient's eye is key. You may rest your hand on the patient's cheek

**Structures Responsible for Refractive Power**

- Cornea (2/3)
- Lens (1/3)

**Myopia****LMN**

Long globe

Myopic

Negative correction/Nearsighted

Optics

REFRACTION

- two techniques used
 - flash/streak retinoscopy: refractive error determined objectively by the examiner using lenses and retinoscope
 - manifest: subjective trial using loose lenses or a phoropter (device the patient looks through that is equipped with lenses)
- a typical lens prescription would contain
 - sphere power in D (measurement of refractive power of lens, equal to reciprocal of focal length in meters)
 - cylinder power in D to correct astigmatism (always positive value)
 - axis of cylinder in degrees
 - “add” (bifocal/progressive reading lens) for presbyopes
 - e.g. -1.50 + 1.00 x 120 degrees, add +2.00

REFRACTIVE EYE SURGERY

- permanently alters corneal refractive properties by ablating tissue to change curvature of the cornea
- used for correction of myopia, hyperopia, and astigmatism
- common types include PRK and LASIK (see *Surgical Ophthalmology*, OP44)
- potential risks/side-effects: infection, under/overcorrection, decreased night vision (nyctalopia), corneal haze, dry eyes, regression, complete sever of corneal flap (LASIK only)

Table 2. Optics

	Pathophysiology	Clinical Features	Treatment	Complications
Emmetropia	<ul style="list-style-type: none"> Image of distant objects focus exactly on the retina (Figure 12) 	<ul style="list-style-type: none"> No refractive error 		
Myopia	<ul style="list-style-type: none"> Globe too long relative for refractive mechanisms, or refractive mechanisms too strong Light rays from distant object focus in front of retina → blurring of (distance) vision (Figure 12) 	<ul style="list-style-type: none"> "Nearsightedness" Usually presents in 1st or 2nd decade, stabilizes in 2nd and 3rd decade; rarely begins after age 25 except in patients with DM or cataracts Blurring of distance vision; near vision usually unaffected Prevalence: 30-40% in U.S. population 	<ul style="list-style-type: none"> Correct with negative diopter/concave/"negative" lenses to diverge light rays Refractive eye surgery 	<ul style="list-style-type: none"> Retinal tear/detachment, macular hole, open angle glaucoma Other complications that are not prevented with refractive correction
Hyperopia	<ul style="list-style-type: none"> Globe too short relative to refractive mechanisms, or refractive mechanisms too weak Light rays from distant object focus behind retina → blurring of near ± distant vision (Figure 12) May be developmental or due to any etiology that shortens globe 	<ul style="list-style-type: none"> "Farsightedness" Youth: usually do not require glasses (still have sufficient accommodative ability to focus image on retina), but may develop accommodative esotropia (see <i>Strabismus</i>, OP38) 30s-40s: blurring of near vision due to decreased accommodation, may need reading glasses >50s: blurring of distance vision due to severely decreased accommodation 	<ul style="list-style-type: none"> When symptomatic, correct with positive diopter/convex/"plus" lenses to converge light rays Refractive eye surgery 	<ul style="list-style-type: none"> Angle-closure glaucoma, particularly later in life as lens enlarges
Astigmatism	<ul style="list-style-type: none"> Light rays not refracted uniformly in all meridians due to non-spherical surface of cornea or non-spherical lens (e.g. football-shaped) Two types: <ul style="list-style-type: none"> Regular – curvature uniformly different in meridians at right angles to each other Irregular – distorted cornea caused by injury, keratoconus (cone-shaped cornea), corneal scar, or severe dry eye 	<ul style="list-style-type: none"> Affects approximately 30% of population, with prevalence increasing with age Mild astigmatism unnoticeable Higher amounts of astigmatism may cause blurry vision, squinting, asthenopia, or headaches 	<ul style="list-style-type: none"> Correct with cylindrical lens (if regular), try contact lens (if irregular) Refractive eye surgery 	
Presbyopia	<ul style="list-style-type: none"> Normal aging process (>40 yr) Hardening/reduced deformability of lens results in decreased accommodative ability Accommodative power is 14D at age 10, diminishes to 3.5D by age 40 Near images cannot be focused onto the retina (focus is behind the retina as in hyperopia) 	<ul style="list-style-type: none"> If initially emmetropic, person begins to hold reading material farther away, but distance vision remains unaffected If initially myopic, person removes distance glasses to read If initially hyperopic, symptoms of presbyopia occur earlier 	<ul style="list-style-type: none"> Correct with positive diopter/convex/"plus" lenses for reading 	
Anisometropia	<ul style="list-style-type: none"> Difference in refractive errors between eyes 			<ul style="list-style-type: none"> Second most common cause of amblyopia in children

Figure 12. Emmetropia and refractive errors

Figure 13. Correction of refractive errors

Imaging Modalities

- **adaptive optics scanning laser ophthalmology – optical coherence tomography (SLO-OCT)**
 - combines the surface detail of confocal ophthalmoscopy with the internal detail of OCT
 - allows 3D OCT images, volume and area maps, and retinal thickness maps, at the resolution of living rods and cones
 - can visualize photoreceptors, nerve fibers and blood cells in retinal capillaries
- **CT, MRI**
 - orbital imaging, particularly in orbital trauma and neuro-ophthalmology
- **fluorescein angiography**
 - non-invasive evaluation of vascular pattern of the fundus
 - commonly used in AMD, DR, retinal vascular diseases
- **indocyanine green angiography**
 - uses infra-red light and intravenous ICG dye for imaging of choroidal structure
 - particularly useful to detect polypoidal vasculopathy (variant of AMD) more commonly present among Asian patients

- **HRT**
 - confocal scanning laser tomography of retinal nerve head and surrounding nerve fiber layer
 - used to assess extent of structural glaucomatous changes
- **OCT**
 - non-invasive, cross-sectional, high-resolution imaging of vitreous, retinal layers, optic nerve
 - commonly used to assess macular pathology/edema/holes/cysts, AMD progression, epi-retinal membrane, RD
- **anterior segment optical coherence tomography (AS-OCT)**
 - non-invasive, cross-sectional, high-resolution imaging of cornea, aqueous, iris and lens
- **perimetry**
 - quantitative evaluation of visual fields, used to screen for scotomas and monitor progression (e.g. in glaucoma)
- **ultrasonography**
 - evaluation of orbit in real-time. A-scans (one-dimensional), B-scans (two-dimensional), and Doppler are all used (e.g. large RDs, foreign bodies, monitoring intraocular tumors)

The Orbit

Globe Displacement

Table 3. Exophthalmos (Proptosis) and Enophthalmos

	Exophthalmos (Proptosis)	Enophthalmos
Definition	<ul style="list-style-type: none"> • Anterior displacement (protrusion) of the globe <ul style="list-style-type: none"> ▪ Exophthalmos generally refers to an endocrine etiology or protrusion of >18 mm (as measured by a Hertel exophthalmometer) ▪ Proptosis generally refers to other etiologies (e.g. cellulitis) or protrusion of <18 mm 	<ul style="list-style-type: none"> • Posterior displacement (retraction) of the globe
Investigations	<ul style="list-style-type: none"> • CT/MRI head/orbits, ultrasound orbits, thyroid function tests 	<ul style="list-style-type: none"> • CT/MRI orbits
Etiology	<ul style="list-style-type: none"> • Note: rule out pseudoexophthalmos (e.g. lid retraction) • Graves' disease (unilateral or bilateral, most common cause in adults) • Orbital cellulitis (unilateral, most common cause in children) • 1° or 2° orbital tumors • Orbital/retrobulbar hemorrhage • Cavernous sinus thrombosis or fistula 	<ul style="list-style-type: none"> • "Blow-out" fracture (see <i>Ocular Trauma</i>, OP42) • Orbital fat atrophy • Congenital abnormality • Metastatic disease

Preseptal Cellulitis

- infection of soft tissue anterior to orbital septum

Etiology

- usually follows periorbital trauma or dermal infection

Clinical Features

Treatment

- systemic antibiotics (suspect *H. influenzae* in children; *S. aureus* or *Streptococcus* in adults)
 - e.g. amoxicillin-clavulanic acid
- if severe or child <1 yr, treat as orbital cellulitis

Orbital Cellulitis

- **OCULAR and MEDICAL EMERGENCY**
- inflammation of orbital contents posterior to orbital septum
- common in children, elderly, and immunocompromised

Etiology

- usually secondary to sinus/facial/tooth infections or trauma, can also arise from preseptal cellulitis

Clinical Features

Treatment

- admit, blood cultures x2, orbital CT, IV antibiotics (ceftriaxone + vancomycin) for 1 wk
- surgical drainage of abscess with close follow-up, especially in children

Orbital cellulitis is life-threatening if untreated (mortality of 17-20% without antibiotic use); prompt diagnosis and treatment is essential

Complications

- optic nerve inflammation, cavernous sinus thrombosis, meningitis, and brain abscess with possible loss of vision, death

Table 4. Clinical Features of Preseptal and Orbital Cellulitis

Finding	Preseptal Cellulitis	Orbital Cellulitis
Fever	May be present	Present
Lid edema	Moderate to severe	Severe
Conjunctival injection	Absent	Present
Chemosis	Absent or mild	Marked
Proptosis	Absent	Present
Pain on eye movement	Absent	Present
Ocular mobility	Normal	Decreased
Vision	Normal	Diminished ± diplopia
RAPD	Absent	May be seen
Leukocytosis	Moderate	Marked
ESR	Normal or elevated	Elevated
Additional findings	Skin infection	Sinusitis, dental abscess

Role of Oral Corticosteroids in Orbital Cellulitis

Am J Ophthalmol 2013;156:178-183

Purpose: To evaluate the role of oral corticosteroids as an anti-inflammatory adjunct for the treatment of orbital cellulitis.

Study: RCT. Patients with acute onset (within 14 d) of orbital cellulitis with or without abscess. 21 patients total (7 patients in group 1: standard intravenous antibiotics; 14 patients in group 2: adjuvant steroids).

Results: Patients in group 2 showed earlier resolution of periorbital edema, conjunctival chemosis, pain, proptosis, and EOM deficits, including decreased duration of intravenous antibiotics and hospital stay ($p < 0.05$ for all).

Conclusion: The use of oral steroids as an adjunct to intravenous antibiotics for orbital cellulitis may decrease inflammatory symptoms with a low risk of worsening infection.

Lacrimal Apparatus

- tear film made up of three layers
 - outer oily layer (reduces evaporation): secreted by the Meibomian glands
 - middle watery layer (forms the bulk of the tear film): constant secretion from conjunctival glands and reflex secretion by lacrimal gland with ocular irritation or emotion
 - inner mucinous layer (aids with tear adherence to cornea): secreted by conjunctival goblet cells
- tears drain from the eyes through the upper and lower lacrimal puncta → superior and inferior canaliculi → lacrimal sac → nasolacrimal duct → nasal cavity behind inferior concha (Figure 3)

Dry Eye Syndrome (Keratoconjunctivitis Sicca)

Etiology

- aqueous-deficient (lacrimal pathology)
 - Sjögren syndrome (autoimmune etiology e.g. RA, SLE)
 - non-Sjögren syndrome (idiopathic age-related disease; lacrimal gland scarring e.g. trachoma; decreased secretion e.g. contact lenses, CN VII palsy, anticholinergics, antihistamines, diuretics, β -blockers)
- evaporative (normal lacrimal function, excessive evaporation of aqueous layer)
 - Meibomian gland dysfunction (posterior blepharitis)
 - vitamin A deficiency (xerophthalmia with goblet cell dysgenesis)
 - eyelid abnormalities e.g. ectropion, CN VII palsy (decreased blinking)
 - preserved topical ocular medications
 - contact lenses, allergic conjunctivitis
- overlap of mixed etiologies common

Clinical Features

- dry eyes, red eyes, foreign body sensation, blurred vision, tearing
- slit-lamp exam: decreased tear meniscus, decreased tear break-up time (normally should be 10 s), SPK

Investigations

- surface damage observed with fluorescein/Rose Bengal staining
- decreased distance in Schirmer's test

Complications

- erosions and scarring of cornea

Treatment

- medical: preservative-free artificial tears up to q1h and ointment at bedtime (preservative toxicity becomes significant if used more than q1h PRN)
 - for severe cases, cyclosporine ophthalmic emulsion 0.05% (Restasis®) can be used
- procedural: punctal occlusion (punctal plug insertion), lid taping, tarsorrhaphy (sew lids together) if severe
- treat underlying cause

Long-term use of artificial tears with preservatives should be avoided when treating dry eyes

Epiphora (Excessive Tearing)

Etiology

- emotion, pain
- environmental stressor (cold, wind, pollen, sleep deprivation)
- lid/lash malposition: ectropion, entropion, trichiasis
- inflammatory: conjunctivitis, uveitis, keratitis, corneal foreign body
- dry eyes (reflex tearing)
- lacrimal drainage obstruction (congenital failure of canalization, aging, rhinitis, dacryocystitis)
- paradoxical gustatory lacrimation reflex (crocodile tears)

Excessive tearing can be caused by dry eyes – if the tear quality is insufficient, “reflex tearing” may occur

Investigations

- using fluorescein dye, examine for punctal reflux by pressing on canaliculi
- Jones dye test: fluorescein placed in conjunctival cul-de-sac, and cotton applicator placed in nose to detect flow (i.e. rule out lacrimal drainage obstruction)

Treatment

- lid repair for ectropion or entropion
- eyelash removal for trichiasis
- punctal irrigation
- nasolacrimal duct probing (infants)
- tube placement: temporary (Crawford) or permanent (Jones)
- surgical: dacryocystorhinostomy (see *Surgical Ophthalmology*, OP44) – forming a new connection between the lacrimal sac and the nasal cavity

Dacryocystitis

- acute or chronic infection of the lacrimal sac
- most commonly due to obstruction of the nasolacrimal duct
- commonly associated with *S. aureus*, *S. pneumoniae*, *Pseudomonas* species

Clinical Features

- pain, swelling, redness over lacrimal sac at medial canthus
- epiphora, crusting, \pm fever
- digital pressure on the lacrimal sac may extrude pus through the punctum
- in the chronic form, epiphora may be the only symptom

Treatment

- warm compresses, nasal decongestants, systemic and topical antibiotics
- if chronic, obtain cultures by aspiration
- once infection resolves, consider dacryocystorhinostomy (see *Surgical Ophthalmology*, OP44)

Dacryoadenitis

- inflammation of the lacrimal gland (outer third of upper eyelid)
- acute causes: *S. aureus*, mumps, EBV, herpes zoster, *N. gonorrhoeae*
- chronic causes (often bilateral): lymphoma, leukemia, sarcoidosis, tuberculosis, thyroid ophthalmopathy

Clinical Features

- pain, swelling, tearing, discharge, redness of the outer region of the upper eyelid
- chronic form is more common and may present as painless enlargement of the lacrimal gland

Treatment

- supportive: warm compresses, oral NSAIDs
- systemic antibiotics if bacterial cause
- if chronic, treat underlying disorder

Lids and Lashes

Lid Swelling

Etiology

- commonly due to allergy, with shriveling of skin between episodes
- dependent edema on awakening (e.g. CHF, renal or hepatic failure)
- orbital venous congestion due to mass or cavernous sinus fistula
- dermatochalasis (loose skin due to aging or heredity)
- lid cellulitis, thyroid disease (e.g. myxedema), trauma, chemosis

Ptosis

- drooping of upper eyelid

Etiology

- aponeurotic: disinsertion or dehiscence of levator aponeurosis (most common)
 - associated with advancing age, trauma, surgery, pregnancy, chronic lid swelling
- mechanical
 - incomplete opening of eyelid due to mass or scarring
- neuromuscular
 - myasthenia gravis (neuromuscular palsy), myotonic dystrophy
 - CN III palsy
 - Horner's syndrome (see *Constricted Pupil*, Horner's Syndrome, OP32)
- congenital
- pseudoptosis (e.g. dermatochalasis, enophthalmos, contralateral exophthalmos)

Treatment

- surgery

Trichiasis

- eyelashes turned inwards
- may result from chronic inflammatory lid diseases (e.g. blepharitis), Stevens-Johnson syndrome, trauma, burns
- patient complains of red eye, foreign body sensation, tearing
- may result in corneal ulceration and scarring

Treatment

- topical lubrication, eyelash plucking, electrolysis, cryotherapy

Entropion

- lid margin turns in towards globe causing tearing, foreign body sensation, and red eye
- most commonly affects lower lid
- may cause abrasions with secondary corneal scarring

Etiology

- involutional (aging)
- cicatricial (herpes zoster, surgery, trauma, burns)
- orbicularis oculi muscle spasm
- congenital

Treatment

- lubricants, evert lid with tape, surgery

Testing for Entropion

Forced lid closure: Ask patient to tighten lid then open. In entropion, lid rolls inwards

Ectropion

- lid margin turns outward from globe causing tearing and possibly exposure keratitis

Etiology

- involutional (aging)
- paralytic (CN VII palsy)
- cicatricial (burns, trauma, surgery)
- mechanical (lid edema, tumor, herniated fat)
- congenital

Treatment

- topical lubrication, surgery

Testing for Ectropion

Snapback test: Pull eyelid inferiorly. In ectropion, lid remains away from globe

Hordeolum (Stye)

- acute inflammation of eyelid gland: either Meibomian glands (internal lid) or glands of Zeis (modified sweat gland) or Moll (modified sebaceous gland in external lid)
- infectious agent is usually *S. aureus*
- painful, red swelling of lid

Treatment

- warm compresses, lid care, gentle massage
- topical antibiotics (e.g. erythromycin ointment bid)
- usually resolves in 2-5 d

Chalazion

- chronic granulomatous inflammation of Meibomian gland often preceded by an internal hordeolum
- acute inflammatory signs are usually absent
- differential diagnosis: basal cell carcinoma, sebaceous cell adenoma, Meibomian gland carcinoma

Treatment

- warm compresses
- if no improvement after 1 mo, consider incision and curettage
- chronic recurrent lesion must be biopsied to rule out malignancy

Hordeolum vs. Chalazion

Hordeolums are due to an infectious etiology, whereas chalazions are granulomatous inflammation

Blepharitis

- inflammation of lid margins

Etiology

- two main types
 - staphylococcal (*S. aureus*): ulcerative, dry scales
 - seborrheic: no ulcers, greasy scales

Clinical Features

- itching, tearing, foreign body sensation
- thickened, red lid margins, crusting, discharge with pressure on lids (“toothpaste sign”)

Complications

- recurrent chalazia
- conjunctivitis
- keratitis (from poor tear film)
- corneal ulceration and neovascularization

Treatment

- warm compresses and lid scrubs with diluted “baby shampoo”
- topical or systemic antibiotics as needed
- if severe, ophthalmologist may prescribe a short course of topical corticosteroids

Xanthelasma

- eyelid xanthoma (lipid deposits in dermis of lids)
- appear as pale, slightly elevated yellowish plaques or streaks
- most commonly on the medial upper lids, often bilateral
- associated with hyperlipidemia (approximately 50% of patients)
- common in the elderly, more concerning in the young

Treatment

- excision for cosmesis only, commonly recurs

Conjunctiva

- thin, vascular mucous membrane/epithelium
- bulbar conjunctiva: lines sclera to limbus (junction between cornea and sclera)
- palpebral (tarsal) conjunctiva: lines inner surface of eyelid

Pinguecula

- yellow-white subepithelial deposit of hyaline and elastic tissue adjacent to the nasal or temporal limbus, sparing the cornea
- associated with sun and wind exposure, aging
- common, benign, sometimes enlarges slowly
- may be irritating due to abnormal tear film formation over the deposits
- surgery for cosmesis only
- irritative symptoms may be treated with lubricating drops

Pterygium

- fibrovascular triangular encroachment of epithelial tissue onto the cornea, usually nasally
- may induce astigmatism, decrease vision
- excision for chronic inflammation, threat to visual axis, cosmesis
- irritative symptoms may be treated with lubricating drops
- one-third recur after excision, lower recurrence with conjunctival autograft (5%)

Subconjunctival Hemorrhage

- blood beneath the conjunctiva, otherwise asymptomatic
- idiopathic or associated with trauma, Valsalva maneuver, bleeding disorders, HTN
- give reassurance if no other ocular findings, resolves spontaneously in 2-3 wk
- if recurrent, consider medical/hematologic workup

Conjunctivitis

Etiology

- infectious
 - bacterial, viral, chlamydial, fungal, parasitic
- non-infectious
 - allergic: atopic, seasonal, giant papillary conjunctivitis (contact lens wearers)
 - toxic: irritants, dust, smoke, irradiation
 - secondary to another disorder: dacryocystitis, dacryoadenitis, cellulitis, Kawasaki disease

Clinical Features

- red eye (conjunctival injection often with limbal pallor), chemosis, subepithelial infiltrates
- itching, foreign body sensation, tearing, discharge, crusting of lashes in the morning, lid edema
- preauricular and/or submandibular nodes
- follicles: pale lymphoid elevations of the conjunctiva
- papillae: fibrovascular elevations of the conjunctiva with central network of finely branching vessels (cobblestone appearance)

- Enlarged lymph nodes suggest infectious etiology, especially viral or chlamydial conjunctivitis
- Temporal conjunctival lymphatics drain to preauricular nodes, and nasal to submandibular nodes

- Follicles are usually seen in viral and chlamydial conjunctivitis
- Papillae are usually seen in allergic and bacterial conjunctivitis

ALLERGIC CONJUNCTIVITIS

Atopic

- associated with rhinitis, asthma, dermatitis, hay fever
- small papillae, chemosis, thickened and erythematous lids, corneal neovascularization
- seasonal (pollen, grasses, plant allergens)
- treatment: cool compresses, antihistamine, mast cell stabilizer (e.g. ketotifen, olopatadine)

Giant Papillary Conjunctivitis

- immune reaction to mucus debris on lenses in contact lens wearers
- large papillae form on superior palpebral conjunctiva
- treatment: clean, change or discontinue use of contact lens

Vernal Conjunctivitis

- large papillae (cobblestones) form on superior palpebral conjunctiva with corneal ulcers and keratitis
- seasonal (warm weather)
- occurs in children, lasts for 5-10 yr then resolves
- treatment: consider topical steroid, topical cyclosporine (by ophthalmologist)

VIRAL CONJUNCTIVITIS

- serous discharge, lid edema, follicles
- subepithelial corneal infiltrates
- may be associated with rhinorrhea
- preauricular node often palpable and tender
- initially unilateral, often progresses to the other eye
- mainly due to adenovirus – highly contagious for up to 12 d

Treatment

- cool compresses, topical lubrication
- usually self-limiting (7-12 d)
- proper hygiene is very important

Types of Discharge

- Allergic: mucoid
- Viral: watery
- Bacterial: purulent
- Chlamydial: mucopurulent

BACTERIAL CONJUNCTIVITIS

- purulent discharge, lid swelling, papillae, conjunctival injection, chemosis
- common agents include *S. aureus*, *S. pneumoniae*, *H. influenzae* and *M. catarrhalis*
- in neonates or if sexually active must consider *N. gonorrhoeae* (invades cornea to cause keratitis)
- *C. trachomatis* is the most common cause in neonates

Treatment

- topical broad-spectrum antibiotic
- systemic antibiotics if indicated, especially in neonates and children
- usually a self-limited course of 10-14 d if no treatment, 1-3 d with treatment

CHLAMYDIAL CONJUNCTIVITIS

- caused by *C. trachomatis*
- affects neonates (ophthalmia neonatorum) on day 3-5, sexually active individuals
- causes trachoma and inclusion conjunctivitis

Trachoma

- leading infectious cause of blindness in the world
- severe keratoconjunctivitis leads to corneal abrasion, ulceration, and scarring
- initially, follicles on superior palpebral conjunctiva
- treatment: topical and systemic tetracycline

Inclusion Conjunctivitis

- chronic conjunctivitis with follicles and subepithelial infiltrates
- most common cause of conjunctivitis in newborns
- prevention: topical erythromycin at birth
- treatment: topical and systemic tetracycline, doxycycline, or erythromycin

**Antibiotics vs. Placebo for Acute Bacterial Conjunctivitis**

Cochrane DB Syst Rev 2012;9:CD001211

Purpose: To assess the benefits and harms of antibiotic therapy in the management of acute bacterial conjunctivitis.

Criteria: RCTs with any form of antibiotic treatment compared with placebo including topical, systemic or combined (e.g. antibiotics and steroids) antibiotic treatments.

Results: 11 RCTs, 3,673 participants. Topical antibiotics improve early (2-5 d) clinical and microbiological remission rates (RR 1.36, 95% CI 1.15 to 1.61; RR 1.55; 95% CI 1.37-1.76) and benefit clinical remission and microbiological cure rates at a late time point (6-10 d) (RR 1.21, 95% CI 1.10-1.33; RR 1.37, 95% CI 1.24-1.52). By 6-10 days 41% of cases had resolved in the placebo group. No serious outcomes were reported in any group.

Conclusion: The use of antibiotic eye drops is associated with modestly improved rates of clinical and microbiological remission in comparison to placebo. Antibiotic eye drops should therefore be considered in order to speed the resolution of symptoms and infection although acute bacterial conjunctivitis is frequently self-limiting.

Sclera

- white fibrous outer protective coat of the eye, composed of irregularly distributed collagen bundles
- continuous with the cornea anteriorly and the dura of the optic nerve posteriorly
- episclera is a thin layer of vascularized tissue between the sclera and conjunctiva

Episcleritis

- immunologically mediated inflammation of episclera
- 1/3 bilateral; simple (80%) or nodular (20%)
- more frequent in women than men (3:1)

Etiology

- mostly idiopathic
- in 1/3 of cases, associated with collagen vascular diseases, infections (herpes zoster, herpes simplex, syphilis), inflammatory bowel disease, rosacea, atopy

Clinical Features

- usually asymptomatic; may have discomfort, heat sensation, red eye (often interpalpebral), rarely pain
- sectoral or diffuse injection of radially-directed vessels, chemosis, small mobile nodules
- blanches with topical phenylephrine (constricts superficial conjunctival vessels)

Treatment

- generally self limited, recurrent in 2/3 of cases
- topical steroid for 3-5 d if painful (prescribed and monitored by ophthalmologist)

To differentiate between episcleritis and scleritis, place a drop of phenylephrine 2.5% (Mydrin®; AK-Dilate®) in the affected eye. Re-examine the vascular pattern 10-15 min later; episcleral vessels should blanch, scleral vessels should not

Scleritis

- usually bilateral: diffuse, nodular, or necrotizing
- anterior scleritis: pain radiating to face, may cause scleral thinning, in some cases necrotizing
- posterior scleritis: rapidly progressive blindness, may cause exudative RD
- more common in women and elderly

Etiology

- may be a manifestation of systemic disease
- collagen vascular disease, e.g. SLE, RA, ankylosing spondylitis
- granulomatous, e.g. tuberculosis, sarcoidosis, syphilis
- metabolic, e.g. gout, thyrotoxicosis
- infectious, e.g. *S. aureus*, *S. pneumoniae*, *P. aeruginosa*, herpes zoster
- chemical or physical agents (e.g. thermal, alkali, or acid burns)
- idiopathic

Clinical Features

- severe pain, photophobia, red eye, decreased vision
- pain is best indicator of disease progression
- inflammation of scleral, episcleral, and conjunctival vessels
- may have anterior chamber cells and flare, corneal infiltrate, scleral thinning
- sclera may have a blue hue (best seen in natural light), due to rearranged scleral fibers
- scleral edema or thinning
- failure to blanch with topical phenylephrine

Treatment

- systemic NSAID or steroid (topical steroids are not effective)
- treat underlying etiology

Scleromalacia Perforans

- Asymptomatic anterior necrotizing scleritis without inflammation
- Strongly associated with RA
- May result in scleral thinning
- Traumatic perforation can easily occur – examine eye very gently

Learn the layers of the cornea

- A – Anterior epithelium
- B – Bowman's Membrane
- C – Corneal Stroma
- D – Dua's Layer, Descemet's Membrane
- E – Endothelium

A new corneal layer was discovered by H. Dua in 2013 and is characterized as a pre-Descemet's membrane

Foreign body behind lid may cause multiple vertical corneal epithelial abrasions due to blinking

Topical analgesics should only be used to facilitate examination. They should NEVER be used as treatment for any ocular problem

NEVER patch abrasion if patient wears contact lenses (prone to *Pseudomonas* infection)

Corneal abrasions from organic matter (e.g. twig, finger nail, etc.) have higher recurrence, even years later

Cornea

- function
 - transmission of light
 - refraction of light (2/3 of total refractive power of eye)
 - barrier against infection, foreign bodies
- transparency due to avascularity, uniform structure and deturgescence (relative dehydration)
- 6 layers (anterior to posterior): epithelium, Bowman's membrane, stroma, Dua's layer, Descemet's membrane, endothelium (dehydrates the cornea; dysfunction leads to corneal edema). A new corneal layer was discovered by H. Dua in 2013 is characterized as a pre-Descemet's membrane
- extensive sensory fiber network (V1 distribution); therefore abrasions and inflammation (keratitis) are very painful

Foreign Body

- foreign material in or on cornea
- may have associated rust ring if metallic
- patients may note tearing, photophobia, foreign body sensation, red eye
- signs include foreign body, conjunctival injection, epithelial defect that stains with fluorescein, corneal edema, anterior chamber cells/flare

Complications

- abrasion, infection, scarring, rust ring, secondary iritis

Treatment

- remove under magnification using local anesthetic and sterile needle or refer to ophthalmology (depending on depth and location)
- treat as per corneal abrasion

Corneal Abrasion

- epithelial defect usually due to trauma (e.g. fingernails, paper, twigs), contact lens (Figure 14)

Clinical Features (Table 5)

- pain, redness, tearing, photophobia, foreign body sensation
- de-epithelialized area stains with fluorescein dye
- pain relieved with topical anesthetic

Complications

- infection, ulceration, recurrent erosion, secondary iritis

Treatment

- topical antibiotic (drops or ointment)
- consider topical NSAID (caution due to risk of corneal melt with prolonged use), cycloplegic (relieves pain and photophobia by paralyzing ciliary muscle), patch
- most abrasions clear spontaneously within 24-48 h

Recurrent Erosions

- recurrent episodes of pain, photophobia, foreign body sensation with a spontaneous corneal epithelial defect
- usually occurs upon awakening
- associated with improper adherence of epithelial cells to the underlying basement membrane

Etiology

- previous traumatic corneal abrasion
- corneal dystrophy
- idiopathic

Treatment

- as for corneal abrasion until re-epithelialization occurs
- topical hypertonic saline ointment at bedtime for 3 mo, topical lubrication
- bandage contact lens, anterior stromal puncture or phototherapeutic keratectomy for chronic recurrences

Corneal Abrasion: To Patch or Not to Patch

Patching for corneal abrasion. *Cochrane DB Syst Rev* 2006;2:CD004764

Patching is not indicated for simple corneal abrasions, measuring <10 mm. There is no improvement in healing rates on days 1-3, no changes in reported pain and no difference in the use of antibiotics between the patch and non-patch groups

Corneal Ulcer

Etiology

- local necrosis of corneal tissue due to infection
- infection is usually bacterial, rarely viral, fungal, or protozoan (*Acanthamoeba*)
- secondary to corneal exposure, abrasion, foreign body, contact lens use (50% of ulcers)
- also associated with conjunctivitis, blepharitis, keratitis, vitamin A deficiency

Clinical Features

- pain, photophobia, tearing, foreign body sensation, decreased VA (if central ulcer)
- corneal opacity that necroses and forms an excavated ulcer with infiltrative base
- overlying corneal epithelial defect that stains with fluorescein
- may develop corneal edema, conjunctival injection, anterior chamber cells/flare, hypopyon, corneal hypoesthesia (in viral keratitis)
- bacterial ulcers may have purulent discharge, viral ulcers may have watery discharge

Complications

- decreased vision, corneal perforation, iritis, endophthalmitis

Investigations

- Seidel test: fluorescein drop on the cornea under cobalt blue filter is used to detect leaking penetrating lesions; any aqueous leaking will change dark orange dye to bright yellow-green at site of wound

Treatment

- urgent referral to ophthalmology
- culture prior to treatment
- topical antibiotics every hour
- must treat vigorously to avoid complications

Table 5. Corneal Abrasion vs. Corneal Ulcer

	Abrasion	Ulcer
Time Course	Acute (instantaneous)	Subacute (days)
History of Trauma	Yes	Not usually
Cornea	Clear	White, necrotic area
Iris Detail	Clear	Obscured
Corneal Thickness	Normal	May have crater defect/thinning
Extent of Lesion	Limited to epithelium	Extension into stroma

Herpes Simplex Keratitis

- usually HSV type 1 (90% of population are carriers)
- may be triggered by stress, fever, sun exposure, immunosuppression

Clinical Features

- pain, tearing, foreign body sensation, red eye, may have decreased vision, eyelid edema
- corneal hypoesthesia
- dendritic (thin and branching) lesion in epithelium that stains with fluorescein

Figure 14. Corneal abrasion vs. ulcer

Abrasion vs. Ulcer on Slit-Lamp

An abrasion appears clear while an ulcer is more opaque

Antiviral Treatment and Other Therapeutic Interventions for Herpes Simplex Virus Epithelial Keratitis

Cochrane DB Syst Rev 2010;12:CD002898

Rates of corneal re-epithelialization after acute HSV corneal epithelial keratitis are similar after treatment with trifluridine or acyclovir, and significantly better than after treatment with idoxuridine or vidarabine. Brivudine and ganciclovir are not inferior to acyclovir. Combining an antiviral agent with Interferon or corneal epithelial debridement did not improve outcomes overall, but did hasten corneal healing. Debridement with concomitant antiviral treatment was more effective than debridement alone.

Complications

- corneal scarring (can lead to loss of vision)
- chronic interstitial keratitis due to penetration of virus into stroma
- secondary iritis, secondary glaucoma

Treatment

- topical antiviral such as trifluridine, consider systemic antiviral such as acyclovir
- dendritic debridement
- NO STEROIDS initially – may exacerbate condition
- ophthalmologist must exercise caution if adding topical steroids for chronic keratitis or iritis

**Figure 15. Trigeminal distribution****Herpes Zoster**

- dermatitis of the forehead (CN V1 territory) may involve globe
- Hutchinson's sign: if tip of nose is involved (nasociliary branch of V1) then eye will be involved in approximately 75% of cases
- if no nasal involvement, eye is involved in 1/3 of patients

Clinical Features

- pain, tearing, photophobia, red eye
- corneal edema, pseudodendrite, SPK
- corneal hypoesthesia

Complications

- corneal keratitis, ulceration, perforation and scarring
- secondary iritis, secondary glaucoma, cataract
- muscle palsies (rare) due to CNS involvement
- occasionally severe post-herpetic neuralgia

Treatment

- oral antiviral (acyclovir, valacyclovir, or famciclovir) immediately
- topical steroids, cycloplegia as indicated for keratitis, iritis
- erythromycin ointment if conjunctival involvement

Steroid treatment for ocular disorders should only be prescribed and supervised by an ophthalmologist, as they can impair corneal healing and exacerbate herpetic keratitis

Keratoconus

- bilateral paracentral thinning and bulging (ectasia) of the cornea to form a conical shape
- usually sporadic, but associated with Down's syndrome, atopy, contact lens use (theorized to be related to chronic vigorous eye rubbing)
- associated with breaks in Descemet's and Bowman's membrane
- results in irregular astigmatism, scarring, stromal edema

Treatment

- attempt correction with spectacles or contact lens
- cross-linking treatment may halt or slow disease progression
- intrastromal corneal ring segments can help flatten the corneal cone
- penetrating keratoplasty (corneal transplant) 90% successful
- post-operative complications: endophthalmitis, graft rejection, graft failure, graft dehiscence

To detect keratoconus, look for bulging of the lower eyelid when the patient looks downward (Munson's sign)

Arcus Senilis

- hazy white ring in peripheral cornea, <2 mm wide, clearly separated from limbus
- common, bilateral, benign corneal degeneration due to lipid deposition, part of the aging process
- may be associated with hypercholesterolemia if age <40 yr, check lipid profile
- no associated visual symptoms, no complications, no treatment necessary

Kayser-Fleischer Ring

- brown-yellow-green pigmented ring in peripheral cornea, starting inferiorly
- due to deposition of copper pigment in Descemet's membrane
- associated with Wilson's disease
- no associated symptoms or complications of ring
- treat underlying disease

The Uveal Tract

- uveal tract (from anterior to posterior) = iris, ciliary body, choroid
- vascularized, pigmented middle layer of the eye, between the sclera and the retina

Uveitis

- uveal inflammation which may involve one, or all three parts of the tract
- idiopathic or associated with autoimmune, infectious, granulomatous, malignant causes
- should be managed by an optometrist or ophthalmologist
- anatomically classified as anterior uveitis, intermediate uveitis, posterior uveitis, or panuveitis based on primary site of inflammation

Figure 16. Conjunctival hyperemia vs. ciliary flush

Table 6. Anatomic Classification of Uveitis

	Anterior Uveitis (Iritis)	Intermediate Uveitis	Posterior Uveitis
Location	<ul style="list-style-type: none"> • Inflammation of iris, usually accompanied by cyclitis (inflammation of ciliary body), both = iridocyclitis • Usually unilateral 	<ul style="list-style-type: none"> • The vitreous is the major site of the inflammation 	<ul style="list-style-type: none"> • Inflammation of the choroid and/or retina
Etiology	 <ul style="list-style-type: none"> • Usually idiopathic • Connective tissue diseases (see Rheumatology, RH8) <ul style="list-style-type: none"> ▪ HLA-B27: reactive arthritis, ankylosing spondylitis, psoriatic arthritis, inflammatory bowel disease ▪ Non-HLA-B27: juvenile idiopathic arthritis • Infectious: syphilis, Lyme disease, toxoplasmosis, TB, HSV, herpes zoster • Other: sarcoidosis, trauma, large abrasion, post ocular surgery 	<ul style="list-style-type: none"> • Mostly idiopathic, secondary causes include sarcoidosis, Lyme disease, and multiple sclerosis 	<ul style="list-style-type: none"> • Bacterial: syphilis, tuberculosis • Viral: herpes simplex virus, CMV in AIDS • Fungal: histoplasmosis, candidiasis • Parasitic: toxoplasmosis (most common cause), toxocara • Immunosuppression may predispose to any of the above infections • Autoimmune: Behçet's disease (triad of oral ulcers, genital ulcers, and posterior uveitis) • Malignancies (masquerade syndrome): metastatic lesions, malignant melanoma
Clinical Features	<ul style="list-style-type: none"> • Photophobia (due to reactive spasm of inflamed iris muscle), ocular pain, tenderness of the globe, brow ache (ciliary muscle spasm), decreased VA (in severe cases with hypopyon), lacrimation • Ciliary flush (perilimbal conjunctival injection), miosis (spasm of sphincter muscle) • Anterior chamber "cells" (WBC in anterior chamber due to anterior segment inflammation) and "flare" (protein precipitates in anterior chamber secondary to inflammation), hypopyon (collection of neutrophilic exudates inferiorly in the anterior chamber) • Occasionally keratic precipitates (clumps of cells on corneal endothelium) • Iritis typically reduces IOP because ciliary body inflammation causes decreased aqueous production; however, severe iritis, or iritis from herpes simplex and zoster may cause an inflammatory glaucoma (trabeculitis) 	<ul style="list-style-type: none"> • Insidious onset of blurred vision, accompanied by vitreous floaters • Initial symptoms are usually unilateral but inflammatory changes are usually bilateral and asymmetric • Associated with anterior uveitis, most severe cases of secondary intermediate uveitis • Vitreous cells, condensations, and snowballs (vitreous aggregates of inflammatory cells) • Posterior segment 'snowbank' = gray-white fibrovascular plaque at the pars plana 	<ul style="list-style-type: none"> • Painless as choroid has no sensory innervation • Often no conjunctival or scleral injection present • Decreased VA • Floaters (debris and inflammatory cells) • Vitreous cells and opacities • Hypopyon formation
Complications	<ul style="list-style-type: none"> • Inflammatory glaucoma • Posterior synechiae <ul style="list-style-type: none"> ▪ Adhesions of posterior iris to anterior lens capsule ▪ Indicated by an irregularly shaped pupil ▪ If occurs 360°, entraps aqueous in posterior chamber, iris bows forward "iris bombé" → angle closure glaucoma • Peripheral anterior synechiae (rare): adhesions of iris to cornea → secondary angle closure glaucoma • Cataracts • Band keratopathy (with chronic iritis) <ul style="list-style-type: none"> ▪ Superficial corneal calcification keratopathy • Macular edema with chronic iritis 	<ul style="list-style-type: none"> • Cystoid macular edema (30% of cases), cataract, and glaucoma 	<ul style="list-style-type: none"> • Macular edema • Vitritis • Neovascularization • Visual field loss/scotoma
Treatment	<ul style="list-style-type: none"> • Mydriatics: dilate pupil to prevent formation of posterior synechiae and to decrease pain from ciliary spasm • Steroids: topical, sub-tenon, or systemic • Systemic analgesia • Extensive medical workup may be indicated to rule out secondary causes 	<ul style="list-style-type: none"> • Systemic or sub-tenon/intravitreal steroids and immunosuppressive agents • Vitrectomy, cryotherapy, or laser photocoagulation to the "snowbank" 	<ul style="list-style-type: none"> • Steroids: sub-tenon, intravitreal, or systemic if indicated (e.g. threat of vision loss)

Lens

- consists of an outer capsule surrounding a soft cortex and a firm inner nucleus

Cataracts

- any opacity of the lens, regardless of etiology
- most common cause of reversible blindness worldwide
- types: nuclear sclerosis, cortical, posterior subcapsular

Etiology

- acquired
 - age-related (over 90% of all cataracts)
 - cataract associated with systemic disease (may have juvenile onset)
 - ♦ DM
 - ♦ metabolic disorders (e.g. Wilson's disease, galactosemia, homocystinuria)
 - ♦ hypocalcemia
 - traumatic (may be rosette shaped)
 - intraocular inflammation (e.g. uveitis)
 - toxic (steroids, phenothiazines)
 - radiation
- congenital
 - high myopia
 - present with altered red reflex or leukocoria
 - treat promptly to prevent amblyopia

Clinical Features

- gradual, painless, progressive decrease in VA
- glare, dimness, halos around lights at night, monocular diplopia
- "second sight" phenomenon: patient is more myopic than previously noted, due to increased refractive power of the lens (in nuclear sclerosis only)
 - patient may read without previously needed reading glasses
- diagnose by slit-lamp exam, and by noting changes in red reflex using ophthalmoscope
- may impair view of retina during fundoscopy

Treatment

- medical: attempt correction of refractive error, no strong evidence suggesting benefit of vitamin supplementation
- surgical: definitive treatment
 - indications for surgery
 - ♦ to improve visual function in patients whose visual loss leads to functional impairment (no need to wait for "ripe" cataract, may postpone surgery as long as one eye has sufficient vision)
 - ♦ to aid management of other ocular disease (e.g. cataract that prevents adequate retinal exam or laser treatment of DR)
 - ♦ congenital or traumatic cataracts
 - phacoemulsification (phaco = lens)
 - ♦ most commonly used surgical technique (see *Surgical Ophthalmology*, OP44)
 - post-operative complications
 - ♦ RD, endophthalmitis, dislocated IOL, macular edema, glaucoma
 - ♦ with new foldable IOLs that have truncated edges, <10% of patients get posterior capsular opacification, which should be treated with YAG laser

Prognosis

- excellent if not complicated by other ocular disease

Dislocated Lens (Ectopia Lentis)

Etiology

- associated with Marfan's Syndrome, Ehlers-Danlos type VI, homocystinuria, syphilis, lens coloboma (congenital cleft due to failure of ocular adnexa to complete growth)
- traumatic

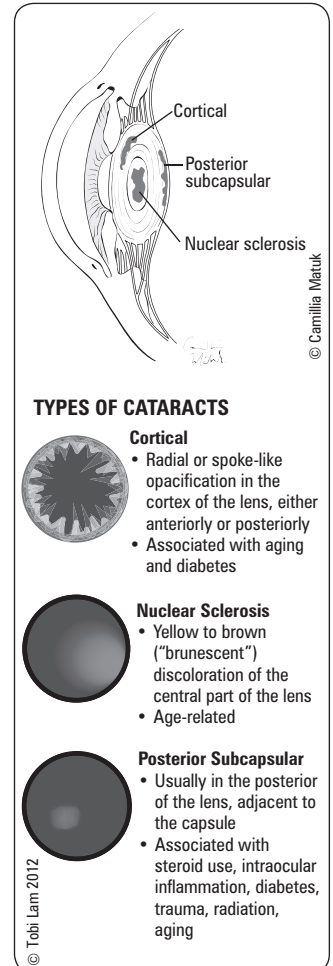

Figure 17. Types of cataracts

Clinical Features

- decreased VA
- may get unilateral diplopia
- iridodonesis (quivering of iris with movement)
- direct ophthalmoscopy may elicit abnormal red reflex

Complications

- cataract, glaucoma, uveitis

Treatment

- surgical correction \pm lens replacement

Vitreous

- clear gel (99% water plus collagen fibrils, glycosaminoglycans, and hyaluronic acid) that fills the posterior segment of eye
- normally adherent to optic disc, pars plana, and along major retinal blood vessels

Posterior Vitreous Detachment

Etiology

- central vitreous commonly shrinks and liquefies with age (syneresis)
- during syneresis, molecules that hold water condense causing vitreous floaters
- liquid vitreous moves between posterior vitreous gel and retina
- vitreous is peeled away and separates from the internal limiting membrane of the neurosensory retina posterior to the vitreous base

Clinical Features

- floaters, flashes of light

Complications

- traction at areas of abnormal vitreoretinal adhesions may cause retinal tears/detachment
- retinal tears/detachment may cause vitreous hemorrhage if bridging retinal blood vessel is torn
- complications more common in high myopes and following ocular trauma (blunt or perforating)

Treatment

- acute onset of PVD requires a dilated fundus exam to rule out retinal tears/detachment
- no specific treatment available for floaters/flashes of light

Floaters: "bugs", "cobwebs", or "spots" of vitreous condensation that change with eye position

Weiss Ring: formed by glial tissue around the optic disc that remains attached to the detached posterior vitreous

Although most floaters are benign, new or markedly increased floaters or flashes of light require a dilated fundus exam to rule out retinal tears/detachment

Vitreous Hemorrhage

- bleeding into the vitreous cavity

Etiology

- PDR
- retinal tear/detachment
- PVD
- retinal vein occlusion
- trauma

Clinical Features

- sudden loss of VA
- may be preceded by many floaters and/or flashes of light
- ophthalmoscopy: no red reflex if large hemorrhage, retina not visible due to blood in vitreous

Treatment

- ultrasound (B-scan) to rule out RD
- expectant: in non-urgent cases (e.g. no DRt), blood usually resorbs in 3-6 mo
- surgical: vitrectomy \pm RD repair \pm retinal endolaser to possible bleeding sites/vessels

Any time a vitreous or retinal hemorrhage is seen in a child, must rule out child abuse

Endophthalmitis and Vitritis

- intraocular infection: acute, subacute, or chronic

Etiology

- most commonly a post-operative complication; risk following cataract surgery is <0.1%
- also due to penetrating injury to eye (risk is 3-7%), endogenous spread, and intravitreal injections
- etiology usually bacterial, may be fungal

Clinical Features

- painful, red eye, photophobia, discharge
- severely reduced VA, lid edema, proptosis, corneal edema, anterior chamber cells/flare, hypopyon, reduced red reflex
- may have signs of a ruptured globe (severe subconjunctival hemorrhage, hyphema, decreased IOP, etc.)

Treatment (see *Ocular Trauma*, OP42)

- **OCULAR EMERGENCY:** presenting vision best indicates prognosis
- LP or worse: admission, immediate vitrectomy, and intravitreal antibiotics to prevent loss of vision
- HM or better: vitreous tap for culture and intravitreal antibiotics
- topical fortified antibiotics

Remember to inquire about tetanus status in post-traumatic endophthalmitis

Retina

- composed of two parts (Figure 2)
 - neurosensory retina: comprises 9 of the 10 retinal layers, including the photoreceptors and the ganglion cell layer
 - retinal pigmented epithelium (RPE) layer: external to neurosensory retina
- macula: rich in cones (for color vision); most sensitive area of retina; looks darker due to increase luteal pigment, lack of retinal vessels, and thinning of retina in this region; 15° temporal and slightly below the optic disc
- fovea: center of macula; responsible for acute, fine vision
- optic disc: slightly oval vertically, pinkish color with centrally depressed yellow cup (normal C:D is <0.5), retinal artery and vein pass through cup
- ora serrata: irregularly-shaped, anterior margin of the retina (can only be visualized with indirect ophthalmoscopy of the far peripheral retina, or through a Goldmann 3 mirror lens)

Figure 18. Retina

Central Retinal Artery Occlusion

Etiology

- emboli from carotid arteries or heart (e.g. arrhythmia, endocarditis, valvular disease)
- thrombus
- temporal arteritis

Clinical Features

- sudden, painless (except in GCA), severe monocular loss of vision
- RAPD
- patient may have experienced transient episodes in the past (amaurosis fugax)
- fundoscopy
 - "cherry-red spot"
 - retinal pallor
 - narrowed arterioles, boxcarring (segmentation of blood in arteries)
 - cotton wool spots (retinal infarcts)
 - cholesterol emboli (Hollenhorst plaques) – usually located at arteriole bifurcations
 - after ~6 wk cherry-red spot recedes and optic disc pallor becomes evident

Treatment

- **OCULAR EMERGENCY:** attempt to restore blood flow within 2 h
- the sooner the treatment = better prognosis (irreversible retinal damage if >90 min of complete CRAO)
 - massage the globe (compress eye with heel of hand for 10 s, release for 10 s, repeat for 5 min) to dislodge embolus
 - decrease IOP
 - ♦ topical β -blockers
 - ♦ inhaled oxygen-carbon dioxide mixture
 - ♦ IV acetazolamide
 - ♦ IV mannitol (draws fluid from eye)
 - ♦ drain aqueous fluid – anterior chamber paracentesis (carries risk of endophthalmitis)
 - treat underlying cause to prevent CRAO in other eye

Hallmark of CRAO

"Cherry-red spot" located at center of macula (visualization of unaffected highly vascular choroid through the thin fovea)

Treatment for a central retinal artery occlusion (CRAO) must be initiated within 2 h of symptom onset for any hope of restoring vision

Branch Retinal Artery Occlusion

- only part of the retina becomes ischemic resulting in a visual field loss
- more likely to be of embolic etiology than CRAO; need to search for source
- management: ocular massage to dislodge embolus if VA is affected

Central/Branch Retinal Vein Occlusion

- second most frequent “vascular” retinal disorder after DR
- usually a manifestation of a systemic disease (e.g. HTN, DM)
- thrombus occurs within the lumen of the blood vessel

Predisposing Factors

- arteriosclerotic vascular disease
- HTN
- DM
- glaucoma
- hyperviscosity (e.g. polycythemia rubra vera, sickle-cell disease, lymphoma, leukemia)
- drugs (e.g. oral contraceptive pill, diuretics)

Clinical Features

- painless, monocular, gradual or sudden visual loss
- \pm RAPD
- fundoscopy
 - “blood and thunder” appearance
 - diffuse retinal hemorrhages, cotton wool spots, venous engorgement, swollen optic disc, macular edema
- two fairly distinct groups
 - venous stasis/non-ischemic retinopathy
 - ♦ no RAPD, VA approximately 20/80
 - ♦ mild hemorrhage, few cotton wool spots
 - ♦ resolves spontaneously over weeks to months
 - ♦ may regain normal vision if macula intact
 - hemorrhagic/ischemic retinopathy
 - ♦ usually older patient with deficient arterial supply
 - ♦ RAPD, VA approximately 20/200, reduced peripheral vision
 - ♦ more hemorrhages, cotton wool spots, congestion
 - ♦ poor visual prognosis

Complications

- degeneration of RPE
- neovascularization of retina and iris (secondary rubeosis), leading to secondary glaucoma
- vitreous hemorrhage
- macular edema

Treatment

- no treatment available to restore vision in CRVO/BRVO
- treat underlying cause/contributing factor
- fluorescein angiography to determine extent of retinal non-perfusion (risk of neovascularization)
- retinal laser photocoagulation, or intravitreal anti-VEGF injection to reduce retinal or iris neovascularization and prevent neovascular glaucoma
- macular grid laser photocoagulation for the treatment of macular edema in BRVO, not CRVO, intravitreal or slow-release biodegradable corticosteroid, or anti-VEGF injection is effective in the treatment of macular edema in both CRVO and BRVO

Retinal Detachment

- cleavage in the plane between the neurosensory retina and the RPE
- three types
 - rhegmatogenous (most common)
 - ♦ caused by a tear or hole in the neurosensory retina, allowing fluid from the vitreous to pass into the subretinal space
 - ♦ tears may be caused by PVD, degenerative retinal changes, trauma, or iatrogenically
 - ♦ incidence increases with advancing age, in high myopes, and after ocular surgery/trauma
 - tractional
 - ♦ caused by traction (due to vitreal, epiretinal, or subretinal membrane) pulling the neurosensory retina away from the underlying RPE
 - ♦ found in conditions such as DR, CRVO, sickle cell disease, ROP, and ocular trauma
 - exudative
 - ♦ caused by damage to the RPE resulting in fluid accumulation in the subretinal space
 - ♦ main causes are intraocular tumors, posterior uveitis, central serous retinopathy

Efficacy and Safety of Widely Used Treatments for Macular Edema Secondary to Retinal Vein Occlusion: A Systematic Review

BMC Ophthalmol 2014;14:7

Purpose: To assess the efficacy of widely used treatments for macular oedema (MO) secondary to retinal vein occlusion (RVO). MO secondary to RVO can cause vision loss due to blockage of the central retinal vein (CRVO) or a branch retinal vein (BRVO).
Outcomes: Mean change in best corrected visual acuity (BCVA) from baseline and/or number of patients gaining at least 10 letters from baseline to 6 months or equivalent time point.

Results: 14 unique RCTs identified. Ranibizumab 0.5 mg produced greater improvements in BCVA at 6 mo compared to sham in BRVO (mean difference 11 letters; 95% CI 7.83-14.17) and CRVO (mean difference 14 letters; 95% CI 10.51-17.69). Improvements in BCVA were also observed with dexamethasone intravitreal implant (IVI) 0.7 mg compared with sham in patients with BRVO or CRVO (mean difference 2.5 letters; 95% CI 0.7-4.3). The difference was significant with BRVO alone, but not CRVO alone. At 36 mo in a large prospective RCT, a greater proportion of patients with BRVO gained >15 letters with laser therapy vs. no treatment (OR 3.16; 95% CI 1.25-8.00), whereas no difference was observed in a 9 mo end point smaller study. Three studies showed no benefit for laser therapy in CRVO.

Conclusions: Both ranibizumab and dexamethasone IVI show significant improvements over previously accepted standard of care (laser therapy) for the treatment of BRVO and CRVO.

The “blood and thunder” appearance on fundoscopy is very characteristic of a CRVO

There is an 8-10% risk of developing CRVO or BRVO in other eye

GENEVA Phase 3 Trials in BRVO and CRVO

Ophthalmology 2010;117:1134-1146

Randomized sham-controlled trial of dexamethasone intravitreal implant in patients with macular edema due to retinal vein occlusion.

Dexamethasone intravitreal implant reduces the risk of vision loss and improves the speed and incidence of visual improvement in eyes with macular edema 2° to BRVO and CRVO.

Superotemporal retina is the most common site for horseshoe tears

Clinical Features

- sudden onset
- flashes of light
 - due to mechanical stimulation of the retinal photoreceptors
- floaters
 - hazy spots in the line of vision which move with eye position, due to drops of blood from torn vessels bleeding into the vitreous
- curtain of blackness/peripheral field loss
 - darkness in one field of vision when the retina detaches in that area
- loss of central vision (if macula “off”)
- decreased IOP (usually 4-5 mmHg lower than the other, normal eye)
- ophthalmoscopy: detached retina is gray-white with surface blood vessels, loss of red reflex
- \pm RAPD

Treatment

- prophylactic: symptomatic tear (flashes or floaters) can be sealed off with laser/cryotherapy, with the goal of preventing progression to detachment
- therapeutic
 - rhegmatogenous
 - ♦ scleral buckle procedure (see *Surgical Ophthalmology*, OP44)
 - ♦ pneumatic retinopexy (see *Surgical Ophthalmology*, OP44)
 - ♦ both treatments above are used in combination with localization of retinal tears/holes and subsequent treatment with cryotherapy or laser to create adhesions between the RPE and the neurosensory retina
 - ♦ vitrectomy plus injection of gas or silicone oil in cases of recurrent detachment
 - tractional
 - ♦ vitrectomy \pm membrane removal/scleral buckling/injection of intraocular gas or silicone oil as necessary
 - exudative
 - ♦ treat underlying cause

Complications

- loss of vision, vitreous hemorrhage, recurrent RD
- a RD is an emergency, especially if the macula is still attached (macula “on”)
- prognosis for visual recovery varies inversely with the amount of time the retina is detached and whether the macula is attached or not

Retinitis Pigmentosa

- worldwide incidence between 1/3,500 and 1/7,000 people
- many forms of inheritance, most commonly autosomal recessive (60%)
- hereditary degenerative disease of the retina manifested by rod > cone photoreceptor degeneration and retinal atrophy

Clinical Features

- night blindness, decreased peripheral vision (“tunnel vision”), decreased central vision (macular changes), glare (from cataract)

Investigations

- fundoscopy: areas of “bone-spicule” pigment clumping in mid-periphery of retina, narrowed retinal arterioles, pale optic disc
- electrophysiological tests: electroretinography (ERG) and electrooculography (EOG) assist in diagnosis

Treatment

- no treatments available to reverse the condition; cataract extraction improves visual function; vitamin A and vitamin E supplementation can reduce progression of disease in some patients

Leber’s Congenital Amaurosis

- worldwide incidence 1/80,000
- inherited degeneration, autosomal recessive
- symptoms: resting nystagmus, sluggish or no pupillary response, severe vision loss/blindness
- diagnosis: 11 types, confirmed by genetic testing
- management: no treatments available to reverse the conditions for most forms; one form (LCA2) shown to be successfully treatable by gene replacement using adeno-associated virus

Vitamin A and Fish Oils for Retinitis Pigmentosa

Cochrane DB Syst Rev 2013;12:CD008428

Purpose: To determine the efficacy and safety of vitamin A and fish oils (docosahexaenoic acid [DHA]) in preventing the progression of RP.

Selection Criteria: RCTs evaluating the effectiveness of vitamin, fish oils, or both as a treatment for RP.

Results: 3 RCTs with 866 participants. No toxicity or adverse events reported. No trial reported a statistically significant benefit of vitamin supplementation on the progression of visual field loss or visual acuity loss. 2 of 3 trials reported a statistically significant difference in ERG amplitudes among some subgroups, but these findings have not been replicated or substantiated in other trials.

Conclusions: There is no clear evidence for benefit of treatment with vitamin A and/or DHA for RP when measuring mean change in visual fields and ERG amplitudes at one year and the mean change in visual acuity at 5 yr follow-up.

Triad of Retinitis Pigmentosa

APO

Arteriolar narrowing
Perivascular bony-spicule pigmentation
Optic disc pallor

Retinitis Pigmentosa Inherited Forms

- Autosomal recessive: most common
- Autosomal dominant: best prognosis
- X-linked: worst prognosis

Age-Dependent Effects of Gene Therapy for Leber’s Congenital Amaurosis: A Phase 1 Dose-Escalation Trial

Lancet 2009;374:1597-1605

Objective: To evaluate the effect of gene therapy on retinal and visual function among patients with Leber’s congenital amaurosis.

Methods: Phase 1 trial. Patients aged 8-44 (n=12) with RPE65-associated Leber’s congenital amaurosis received a single subretinal injection of adeno-associated virus (AAV) containing the gene encoding the protein needed for isomerohydrolase activity of the RPE (RPE65) (AAV2-hRPE65v2) in the worst eye at low, medium, or high dose. Patients were assessed before and after injections. Outcomes were subjective and objective measures of vision.

Results: AAV2-hRPE65v2 was tolerated. No serious adverse events were recorded. Visual improvement was noted for all patients. All patients reported improved vision in dimly lit environments. Visual fields improved in all patients. Pupillary light responses were increased by at least 2 log unit for all patients. Greatest visual improvement was noted in children.

Conclusion: AAV2-hRPE65v2 is safe and improves vision among patients with Leber’s congenital amaurosis.

Age-Related Macular Degeneration

- leading cause of irreversible blindness in the western world, associated with increasing age, usually bilateral
- 10% of people >65 yr old have some degree of AMD
- F>M
- degenerative changes are concentrated at the macula, thus only central vision is lost; peripheral vision (important for navigation) is maintained so patients can usually maintain an independent lifestyle

Classification

- **Non-Exudative/“Dry” (Non-Neovascular) AMD**
 - most common type of AMD (90% of cases)
 - slowly progressive loss of visual function
 - drusen: yellow-white deposits between the RPE and Bruch's membrane (area separating inner choroidal vessels from RPE)
 - RPE atrophy: coalescence of depigmented RPE, clumps of focal hyperpigmentation, or hypopigmentation
 - may progress to neovascular AMD
- **Exudative/“Wet” (Neovascular) AMD**
 - 10% of AMD, but 80% of AMD that results in severe visual loss
 - choroidal neovascularization: drusen predisposes to breaks in Bruch's membrane causing subsequent growth and proliferation of choroidal capillaries
 - may lead to serous detachment of overlying RPE and retina, hemorrhage and lipid precipitates into subretinal space
 - can also lead to an elevated subretinal mass due to fibrous metaplasia of hemorrhagic RD leads to disciform scarring and severe central visual loss

Risk Factors

- female
- increased age
- family history
- smoking
- Caucasian race
- blue irides

Clinical Features

- variable degree of progressive central visual loss
- metamorphopsia (distorted vision characterized by straight parallel lines appearing convergent or wavy) due to macular edema

Investigations

- Amsler grid: held at normal reading distance with glasses on, assesses macular function
- fluorescein angiography: assess the type and location of the choroidal neovascularization – pathologic new vessels leak dye

Treatment

- non-neovascular “dry” AMD
 - monitor, Amsler grid allows patients to check for metamorphopsia
 - low vision aids (e.g. magnifiers, closed-circuit television)
 - anti-oxidants, green leafy vegetables
 - sunglasses/visors
 - see Age-related Eye Disease Study (AREDS)
- neovascular “wet” AMD
 - see *Common Medications*, OP44
 - laser photocoagulation for neovascularization
 - 50% of choroidal neovascularization cannot be treated initially
 - no definitive treatment for disciform scarring
 - PDT with verteporfin (Visudyne®)
 - ♦ IV injection of verteporfin followed by low intensity laser to area of choroidal neovascularization
 - intravitreal injection of anti-VEGF
 - ♦ pegaptanib (Macugen®), ranibizumab (Lucentis®), bevacizumab (Avastin®) (see *VEGF Inhibitors*, OP45)

Age-Related Eye Disease Study (AREDS)

The Age-Related Eye Disease Research Group: A randomized, placebo-controlled, clinical trial of high-dose supplementation with vitamins C and E, β -carotene, and zinc for AMD and vision loss. AREDS Report No. 8. *Arch Ophthalmol* 2001;119:1417-1436

AREDS studied the effect of high-dose combination of vitamin C, vitamin E, β -carotene, and zinc in patients with and without AMD. Those who are already affected by AMD showed 19% decrease in risk of further visual loss, whereas high dose supplementation showed no benefit in patients with early or no AMD.

Age-Related Eye Disease Study 2 (AREDS2)

Lutein + zeaxanthin and omega-3 fatty acids for AMD: the Age-Related Eye Disease Study 2 (AREDS2) randomized clinical trial. *JAMA* 2013 May 15;309(19):2005-2015

Addition of lutein+zeaxanthin, DHA+EPA, or both to the AREDS formulation in primary analyses didn't reduce risk of progression to advanced AMD. However, because of the potential increased incidence of lung cancer in former smokers, lutein+zeaxanthin could be an appropriate carotenoid substitute in the AREDS formulation.

Wet AMD Lesions on Fluorescein Angiography

Classic: well-defined leakage
Occult: mottled or ill-defined leakage

Drusen vs. Exudate

Drusen: hyaline material secreted by RPE seen frequently in AMD typically in peri-macular region
Hard/Soft Exudates: lipid deposits in the retina associated with DR and HTN

Ranibizumab and Bevacizumab for Neovascular Age-Related Macular Degeneration

CATT Research Group. *NEJM* 2011;364:1897-1908

Study: A multicenter, single-blind, randomized control trial comparing the effects of ranibizumab and bevacizumab on visual acuity in patients with AMD.

Patients: 1,208 patients aged 50 or more with previously untreated AMD and visual acuity between 20/25 and 20/320.

Intervention: Intravitreal injections of ranibizumab vs. intravitreal injections of bevacizumab.

Results: The monthly use of either bevacizumab or ranibizumab results in the same visual acuity outcome. This finding holds true for the mean visual acuity and the proportion of patients who gain 15 letters, lose 15 letters, or remain stable. Equivalent visual-acuity outcomes were observed with both the monthly and the as-needed regimens of ranibizumab.

Conclusion: This study supports the use of either bevacizumab or ranibizumab for the treatment of neovascular AMD. The continued global use of intravitreal bevacizumab is an equally effective, low-cost alternative to ranibizumab.

Glaucoma

Definition

- progressive optic neuropathy involving characteristic structural changes to optic nerve head with associated visual field changes
- commonly associated with high IOP, but not required for diagnosis

Background

- aqueous is produced by the ciliary body and flows from the posterior chamber to the anterior chamber through the pupil, and drains into the episcleral veins via the trabecular meshwork and the Canal of Schlemm
- an isolated increase in IOP is termed OHT (or glaucoma suspect) and these patients should be followed for increased risk of developing glaucoma (10% if IOP 20-30 mmHg; 40% if IOP 30-40 mmHg; and most if IOP >40 mmHg)
- pressures >21 mmHg are more likely to be associated with glaucoma; however, up to 50% of patients with glaucoma do not have IOP >21 mmHg
- loss of peripheral vision most commonly precedes central loss
- sequence of events: gradual pressure rise → increased C:D ratio → visual field loss

Investigations

- medical and family history
- VA testing
- slit-lamp exam to assess anterior chamber depth
- ophthalmoscopy to assess the disc features
- tonometry by applanation or indentation to measure IOP
- visual field testing
- pachymetry to measure corneal thickness
- future follow-up includes optic disc examination, IOP measurement, and visual field testing to monitor course of disease

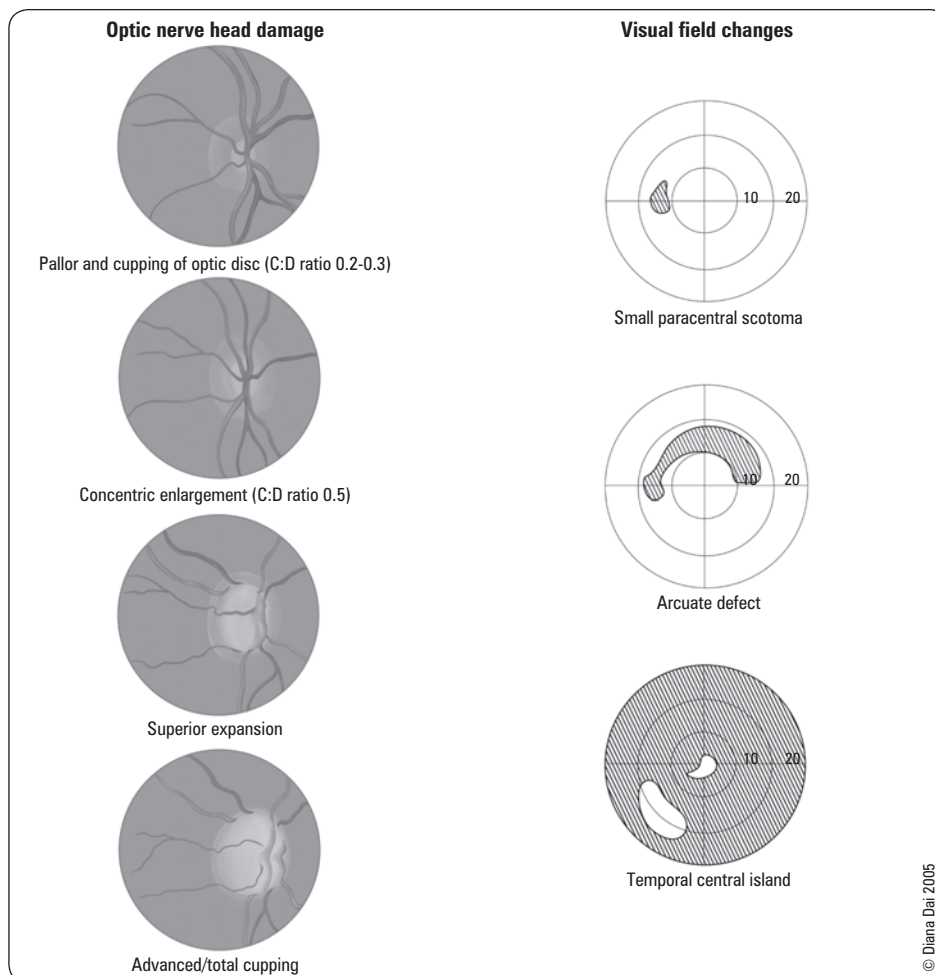

Figure 19. Glaucomatous damage

Ten Year Follow-Up of Age-Related Macular Degeneration in the Age-Related Eye Disease Study: AREDS Report No. 36

JAMA Ophthalmol 2014 Mar;132(3):272-7

Study: Randomized clinical trial.

Objective: To describe 10 year progression rates to intermediate or advanced AMD.

Patients: Age-related eye disease study (AREDS) participants were observed for an additional 5 years after RCT completion. Participants aged 55-80 yr with no AMD or AMD of varying severity (n = 4,757) were followed up in the AREDS trial for a median duration of 6.5 yr. When the trial ended, 3,549 of the 4,203 surviving participants were followed for 5 additional yr.

Intervention: Treatment with antioxidant vitamins and minerals.

Main Outcome: Development of varying stages of AMD and changes in visual acuity.

Results: The risk of progression to advanced AMD increased with increasing age (p=0.01) and severity of drusen. Women (p=0.005) and current smokers (p<0.001) were at increased risk of neovascular AMD. In the oldest participants with the most severe AMD status at baseline, the risks of developing neovascular AMD and central geographic atrophy by 10 yr were 48.1% and 26.0%, respectively. Similarly, rates of progression to large drusen increased with increasing severity of drusen at baseline, with 70.9% of participants with bilateral medium drusen progressing to large drusen and 13.8% to advanced AMD in 10 yr. Median visual acuity at 10 yr in eyes that had large drusen at baseline but never developed advanced AMD was 20/25; eyes that developed advanced AMD had a median visual acuity of 20/200.

Conclusion: The natural history of AMD demonstrates relentless loss of vision in persons who developed advanced AMD.

Figure 20. Aqueous flow and sites of potential resistance

Average IOP = 15 ± 3 mmHg

Normal C:D ≤ 0.4

Suspect glaucoma if C:D ratio >0.6, C:D ratio between eyes >0.2, or cup approaches disc margin

Primary Open-Angle Glaucoma

- most common form, >95% of all glaucoma cases
- due to obstruction of aqueous drainage within the trabecular meshwork and its drainage into the Canal of Schlemm
- insidious and asymptomatic, screening is critical for early detection

Major Risk Factors

- elevated IOP (>21 mmHg)
- age: prevalence at 40 yr is 1-2% and at 80 yr is 10%
- ethnicity: African descent
- familial (2-3x increased risk); polygenic

Minor Risk Factors

- myopia
- HTN
- DM
- hyperthyroidism (Graves' disease)
- chronic topical ophthalmic steroid use in steroid responders – yearly eye exams recommended if >4 wk of steroid use
- previous ocular trauma
- anemia/hemodynamic crisis (ask about blood transfusions in past)

Clinical Features

- asymptomatic initially
- insidious, painless, gradual rise in IOP due to restriction of aqueous outflow
- bilateral, but usually asymmetric
- earliest signs are optic disc changes
 - increased C:D ratio (vertical C:D >0.6)
 - significant C:D asymmetry between eyes (>0.2 difference)
 - thinning, notching of the neuroretinal rim
 - flame shaped disc hemorrhage
 - 360° of peripapillary atrophy
 - nerve fiber layer defect
 - large vessels become nasally displaced
- visual field loss
 - slow, progressive, irreversible loss of peripheral vision
 - paracentral defects, arcuate scotoma, and nasal step are characteristics (see Figure 19)
 - late loss of central vision if untreated

Treatment

- medical treatment: decrease IOP by increasing the drainage and/or decreasing the production of aqueous (see *Glaucoma Medications*, Table 12, OP45)
 - increase aqueous outflow
 - ♦ topical cholinergics
 - ♦ topical prostaglandin analogues
 - ♦ topical α -adrenergics
 - decrease aqueous production
 - ♦ topical β -blockers
 - ♦ topical and oral carbonic anhydrase inhibitor
 - ♦ topical α -adrenergics
- laser trabeculoplasty, cyclophotocoagulation in order to achieve selective destruction of ciliary body (for refractory cases)
- trabeculectomy (see *Surgical Ophthalmology*, OP44)
- serial optic nerve head examinations, IOP measurements, and visual field testing to monitor disease course

Open- and Closed-Angle Glaucoma

POAG

- Common (95%)
- Chronic course
- Painless eye without redness
- Moderately \uparrow IOP
- Normal cornea and pupil
- No N/V
- No halos around light

PACG

- Rare (5%)
- Acute onset
- Painful red eye
- Extremely \uparrow IOP
- Hazy cornea
- Mid-dilated pupil unreactive to light
- \pm N/V, abdominal pain
- Halos around light

Risk Factors for POAG

A FIAT

Age
Family history
IOP
African descent
Thin cornea

The Ocular HTN Treatment Study

Arch Ophthalmol-Chic 2002;120:701-713

Study: Randomized clinical trial.

Patients: 1,636 patients with no evidence of glaucomatous damage, aged 40–80 yr, and with IOP between 24–32 mmHg in one eye and between 21–32 mmHg in the other eye.

Intervention: Randomized to observation or treatment with commercially available topical ocular hypotensive medication.

Main Outcome: Development of visual field abnormality or optic disc deterioration attributed to POAG.

Results: Mean reduction in IOP in the medication group was $22.5\% \pm 9.9\%$ vs. $4.0\% \pm 11.6\%$ in the observation group. At 5 yr the probability of developing POAG was 4.4% in the medication group and 9.5% in the observation group ($p < 0.0001$).

Conclusions: Topical ocular hypotensive medication was effective in delaying or preventing the onset of POAG in individuals with elevated IOP.

Normal Tension Glaucoma

- POAG with IOP in normal range
- often found in women >60 but may occur earlier
- damage to optic nerve may be due to vascular insufficiency

Treatment

- treat reversible causes

Secondary Open Angle Glaucoma

- increased IOP secondary to ocular/systemic disorders that obstruct the trabecular meshwork
 - steroid-induced glaucoma
 - traumatic glaucoma
 - pigmentary dispersion syndrome
 - pseudoexfoliation syndrome

Primary Angle-Closure Glaucoma

- 5% of all glaucoma cases
- peripheral iris bows forward in an already susceptible eye with a shallow anterior chamber obstructing aqueous access to the trabecular meshwork
- sudden forward shift of the lens-iris diaphragm causes pupillary block, and results in inability of the aqueous to flow from the posterior chamber to the anterior chamber resulting in a sudden rise in IOP

Risk Factors

- hyperopia: small eye, big lens – large lens crowds the angle
- age >70 yr
- female
- family history
- more common in people of Asian and Inuit descent
- mature cataracts
- shallow anterior chamber
- pupil dilation (topical and systemic anticholinergics, stress, darkness)

Clinical Features

- red, painful eye = **RED FLAG**
- unilateral, but other eye increased risk
- decreased visual acuity, vision acutely blurred from corneal edema
- halos around lights
- nausea and vomiting, abdominal pain
- fixed, mid-dilated pupil
- corneal edema with conjunctival injection
- marked increase in IOP; may be noticeable even to palpation (>40 mmHg)
- shallow anterior chamber ± cells in anterior chamber

Complications

- irreversible loss of vision within hours to days if untreated
- permanent peripheral anterior synechiae, resulting in permanent angle closure

Treatment

- OCULAR EMERGENCY:** refer to ophthalmologist for acute angle closure glaucoma
 - laser iridotomy
 - aqueous suppressants and hyperosmotic agents
- medical treatment (see *Glaucoma Medications, Table 12, OP45*)
 - miotic drops (pilocarpine) to reverse pupillary block
 - decrease IOP
 - topical β -blockers
 - topical adrenergics
 - topical cholinergics
 - pilocarpine 1-4% q15min, up to q5min
 - systemic carbonic anhydrase inhibitors
 - IV acetazolamide 250-500 mg
 - systemic hyperosmotic agents
 - oral glycerine 1 g/kg
 - IV mannitol 1 g/kg

Secondary Angle-Closure Glaucoma

Uveitis

- inflamed iris adheres to lens (posterior synechiae)

Neovascular Glaucoma

- abnormal blood vessels develop on surface of iris (rubeosis iridis), in the angle, and within the trabecular meshwork
- due to retinal ischemia associated with PDR or CRVO
- treatment with laser therapy to retina reduces neovascular stimulus to iris vessels

Rule of Fours

1/4 of general population using topical steroid for 4 wk, 4 x/d will develop an increase in IOP

Collaborative Normal Tension Glaucoma Study

Curr Opin Ophthalmol 2003;14:86-90

Treatment aimed at lowering IOP by 30% in patients with normal tension glaucoma tends to reduce the rate of visual field loss. Due to variability in disease progression and a significant group that shows no visual field loss at 5 yr despite no treatment, further studies are needed to delineate which subgroups may benefit most from treatment.

Medical Interventions for Primary Open-Angle Glaucoma and Ocular HTN

Cochrane DB Syst Rev 2007;4:CD003167

Study: Cochrane systematic review of 26 trials and meta-analysis of 10 trials investigating the effectiveness of topical pharmacological therapies for POAG or OHT.

Patients: 4,979 participants randomized in 26 trials. Patients had OHT with IOP >21 mmHg or open angle glaucoma.

Intervention: Topical eye medications, including β -blockers, dorzolamide, brimonidine, pilocarpine, and epinephrine vs. each other and placebo.

Main Outcome: Reduction of progression or prevention of onset of visual field defects.

Results: Meta-analysis on all trials that tested drugs against placebo or untreated controls demonstrated that lowering IOP reduces incidence of glaucomatous visual field defects, with an odds ratio of 0.62 (95% CI 0.47-0.81). However, this result is of limited practical use since different therapies were pooled. No single drug demonstrated significant visual field protection. However, as a class, β -blockers showed borderline significance in reducing onset of glaucoma in patients with OHT when compared to placebo, with an OR of 0.67 (95% CI 0.45-1.00).

Conclusion: Lowering IOP can reduce progression of visual field defects in patients with OHT.

Pupils

- pupil size is determined by the balance between the sphincter muscle and the dilator muscle
- sphincter muscle is innervated by the parasympathetic nervous system
 - carried by CN III: pre- and post-ganglionic fibers synapse in ciliary ganglion, and use acetylcholine as the neurotransmitter
- dilator muscle is innervated by the sympathetic nervous system (SNS)
 - first order neuron = hypothalamus → brainstem → spinal cord
 - second order/preganglionic neuron = spinal cord → sympathetic trunk via internal carotid artery → superior cervical ganglion in neck
 - third order/postganglionic fibers originate in the superior cervical ganglion, neurotransmitter is noradrenaline
 - ♦ as a diagnostic test, 4-10% cocaine prevents the re-uptake of noradrenaline, and will cause dilation of normal pupil, but not one with loss of sympathetic innervation (Horner's Syndrome)
- see [Neurology](#), Figure 8, N6

5 Targets of Retinal Signals

- Pre-tectal nucleus (pupillary reflex/eye movements)
- Lateral geniculate body of thalamus
- Superior colliculus (eye movements)
- Suprachiasmatic nucleus (optokinetic)
- Accessory optic system (circadian rhythm)

Pupillary Light Reflex

- light shone directly into eye travels along optic nerve (CN II, afferent limb) → optic tracts → bilateral midbrain
- impulses enter bilaterally in midbrain via pretectal area and Edinger-Westphal nuclei
- nerve impulses then travel down CN III (efferent limb) bilaterally to reach the ciliary ganglia, and finally to the iris sphincter muscle, which results in the direct and consensual light reflexes

Pupil Abnormalities

Denervation Hypersensitivity

- when post-ganglionic fibers are damaged, the understimulated end-organ develops an excess of neuroreceptors and becomes hypersensitive
- postganglionic parasympathetic lesions (i.e. Adie's pupil)
 - pupil will constrict with 0.125% pilocarpine (cholinergic agonist), normal pupil will not
- postganglionic sympathetic lesions (this test is used to differentiate between pre- and post-ganglionic lesions in Horner's syndrome)
 - pupil will dilate with 0.125% adrenaline, normal pupil will not

Local Disorders of Iris

- posterior synechiae (adhesions between iris and lens) due to iritis can present as an abnormally shaped pupil
- ischemic damage (e.g. post-acute angle-closure glaucoma) usually occurs at 3 and 9 o'clock positions resulting in a vertically oval pupil that reacts poorly to light
- trauma (e.g. post-intraocular surgery)

Anisocoria

- unequal pupil size
- idiopathic/physiologic anisocoria
 - 20% of population
 - round, regular, <1 mm difference
 - pupils reactive to light and accommodation
 - responds normally to mydriatics/miotics
- post eye surgery
- see [Table 7](#) for other causes of anisocoria

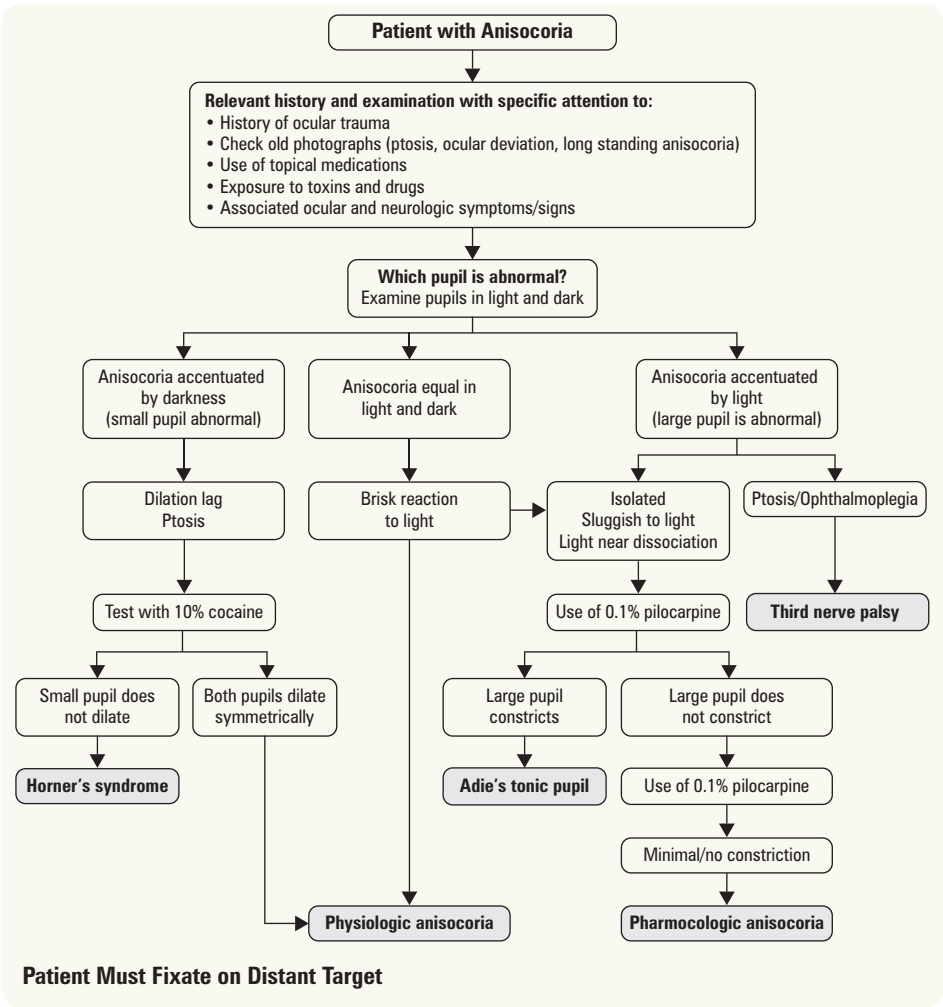

Figure 22. Approach to anisocoria
Reproduced with permission from: Kedar S, Biousse V, Newman NJ. *Approach to the patient with anisocoria*. In: UpToDate, Rose, BD (editor), UpToDate, Waltham, MA, 2011. Copyright 2011 UpToDate, Inc. For more information visit www.uptodate.com

Table 7. Summary of Conditions Causing Anisocoria

	Features	Site of Lesion	Light and Accommodation	Anisocoria	Mydriatics/Miotics	Effect of Pilocarpine
ABNORMAL MIOTIC PUPIL (impaired pupillary dilation)						
Argyll-Robertson Pupil	Irregular, usually bilateral	Midbrain	Poor in light; better to accommodation		Dilates/Constricts	
Horner's Syndrome	Round, unilateral, ptosis, anhydrosis, pseudoenophthalmos	Sympathetic system	Both brisk	Greater in dark	Dilates/Constricts	
ABNORMAL MYDRIATIC PUPIL (impaired pupillary constriction)						
Adie's Tonic Pupil	Irregular, larger in bright light	Ciliary ganglion	Poor in light, better to accommodation	Greater in light	Dilates/Constricts	Constricts (hypersensitivity to dilute pilocarpine)
CN III Palsy	Round	Superficial CN III	± fixed (acutely) at 7-9 mm	Greater in light	Dilates/Constricts	Constricts
Mydriatic Pupil	Round, uni- or bilateral	Iris sphincter	Fixed at 7-8 mm	Greater in light	No effect	Will not constrict

Dilated Pupil (Mydriasis)

Sympathetic Stimulation

- fight or flight response
- mydriatic drugs: epinephrine, dipivefrin (Propine®), phenylephrine

Parasympathetic Understimulation

- cycloplegics/mydriatics: atropine, tropicamide, cyclopentolate (parasympatholytic)
- CN III palsy
 - eye deviated down and out with ptosis present
 - etiology includes stroke, neoplasm, aneurysm, acute rise in ICP, DM (may spare pupil), trauma
 - CN III palsy will respond to drugs (e.g. pilocarpine), unlike a pupil dilated from medication (mydriatics)

Acute Angle-Closure Glaucoma

- fixed, mid-dilated pupil

Adie's Tonic Pupil

- 80% unilateral, F>M
- pupil is tonic or reacts poorly to light (both direct and consensual) but constricts with accommodation
- if decreased deep tendon reflexes may be Adie's syndrome
- caused by benign lesion in ciliary ganglion; results in denervation hypersensitivity of parasympathetically innervated constrictor muscle
 - dilute (0.125%) solution of pilocarpine will constrict tonic pupil but have no effect on normal pupil
- long-standing Adie's pupils are smaller than unaffected eye

Trauma

- damage to iris sphincter from blunt or penetrating trauma
- iris transillumination defects may be apparent using ophthalmoscope or slit-lamp
- pupil may be dilated (traumatic mydriasis) or irregularly shaped from tiny sphincter ruptures

Constricted Pupil (Miosis)

Senile Miosis

- decreased sympathetic stimulation with age

Parasympathetic Stimulation

- local or systemic medications such as:
 - cholinergic agents: pilocarpine, carbachol
 - cholinesterase inhibitor: phospholine iodide
 - opiates, barbiturates

Horner's Syndrome

- lesion in sympathetic pathway
- difference in pupil size greater in dim light, due to decreased innervation of adrenergics to iris dilator muscle
- associated with ptosis, anhidrosis of ipsilateral face/neck
- application of cocaine 4-10% (blocks reuptake of noradrenaline) to eye does not result in pupil dilation (vs. physiologic anisocoria), therefore confirms diagnosis
- hydroxyamphetamine 1% (stimulates noradrenaline release) will dilate pupil if central or preganglionic lesion, not postganglionic lesion
- postganglionic lesions result in denervation hypersensitivity, which will cause pupil to dilate with 0.125% adrenaline, whereas normal pupil will not
- causes: carotid or subclavian aneurysm, brainstem infarct, demyelinating disease, cervical or mediastinal tumor, Pancoast tumor, goiter, cervical lymphadenopathy, surgical sympathectomy, Lyme disease, cervical ribs, tabes dorsalis, cervical vertebral fractures

Iritis

- miotic pupil initially
- later, may be irregularly shaped pupil due to posterior synechiae
- later stages non-reactive to light

CN III palsy with pupillary involvement may be associated with a posterior communicating artery aneurysm

Figure 23. CN III lesions with and without mydriasis

Horner's MAP

Miosis
Anhidrosis
Ptosis

Argyll-Robertson Pupil

- both pupils irregular and <3 mm in diameter, ± ptosis
- does not respond to light stimulation
- responds to accommodation (light-near dissociation)
- suggestive of neurosyphilis or other conditions (DM, encephalitis, MS, chronic alcoholism, CNS degenerative diseases)

Other Causes

- optic neuritis, retinal lesions

**Argyll-Robertson Pupil****ARP-PRA**

Accommodation Reflex Present
Pupillary Reflex Absent

Cataracts never produce an RAPD

It is possible to have RAPD and normal vision at the same time, e.g. in damaged superior colliculus caused by thalamic hemorrhage

Differentiate RAPD from physiologic pupillary athetosis ("hippus"), which is rapid, rhythmic fluctuations of the pupil, with equal amplitude in both eyes

Relative Afferent Pupillary Defect

Figure 24. Relative afferent pupillary defect

- also known as Marcus Gunn pupil
- impairment of direct pupillary response to light, caused by a lesion in visual afferent (sensory) pathway anterior to optic chiasm
- differential diagnosis: large RD, BRAO, CRAO, CRVO, advanced glaucoma, optic nerve compression, optic neuritis (most common)
- does not occur with media opacity (e.g. corneal edema, cataracts)
- pupil reacts poorly to light and better to accommodation
- test: swinging flashlight
 - if light is shone in the affected eye, direct and consensual response to light is decreased
 - if light is shone in the unaffected eye, direct and consensual response to light is normal
 - if the light is moved quickly from the unaffected eye to the affected eye, "paradoxical" dilation of both pupils occurs
 - observe red reflex, especially in patients with dark irides
- if the defect is bilateral there is no RAPD, as dilation is measured relative to the other eye

Malignancies

- uncommon site for 1° malignancies
- eye usually affected secondarily by cancer or cancer treatments
- see *Retinoblastoma*, OP41

Lid Carcinoma

Etiology

- basal cell carcinoma (rodent ulcer) (90%)
 - spread via local invasion, rarely metastasizes
 - ulcerated center, indurated base with pearly rolled edges, telangiectasia
- squamous cell carcinoma (<5%)
 - spread via local invasion, may also spread to nodes and metastasize
 - ulceration, keratosis of lesion
- sebaceous cell carcinoma (1-5%)
 - often masquerades as chronic blepharitis or recurrent chalazion
 - highly invasive, metastasize
- Kaposi's sarcoma, malignant melanoma, Merkel cell tumor, metastatic tumor

Treatment

- incisional or excisional biopsies
- may require cryotherapy, radiotherapy, chemotherapy, immunotherapy
- surgical reconstruction

Malignant Melanoma

- most common 1° intraocular malignancy in adults
- more prevalent in Caucasians
- arise from uveal tract, 90% choroidal melanoma
- hepatic metastases predominate

Treatment

- imaging to investigate spread
- depending on the size of the tumor, either radiotherapy, enucleation, limited surgery

Metastases

- most common intraocular malignancy in adults
- most commonly from breast and lung in adults, neuroblastoma in children
- usually infiltrate the choroid, but may also affect the optic nerve or extraocular muscles
- may present with decreased or distorted vision, irregularly shaped pupil, iritis, hyphema

Treatment

- local radiation, chemotherapy
- enucleation if blind, painful eye

Ocular Manifestations of Systemic Disease

HIV/AIDS

- up to 75% of patients with AIDS have ocular manifestations

External Ocular Signs

- Kaposi's sarcoma
 - secondary to human herpes virus 8 (HHV-8), affects conjunctiva of lid or globe
 - numerous vascular skin malignancies
 - differential diagnosis: subconjunctival hemorrhage (non-clearing), hemangioma
- multiple molluscum contagiosum
- herpes simplex keratitis
- herpes zoster keratitis

Retina

- HIV retinopathy (most common)
 - cotton wool spots in >50% of HIV patients
 - intraretinal hemorrhage
- CMV retinitis
 - ocular opportunistic infection that develops in late stages of HIV when severely immunocompromised (CD4 count ≤ 50)
 - a necrotizing retinitis, with retinal hemorrhage and vasculitis, “brushfire” or “pizza pie” appearance
 - presents with scotomas (macular involvement and RD, blurred vision, and floaters)
 - untreated infection will progress to other eye in 4-6 wk
 - treatment: virostatic agents (e.g. gancyclovir or foscarnet) via IV or intravitreal injection
- necrotizing retinitis
 - from herpes simplex virus, herpes zoster, toxoplasmosis
- disseminated choroiditis
 - *Pneumocystis carinii*, *Mycobacterium avium intracellulare*, *Candida*

Other Systemic Infections

- herpes zoster
 - see *Herpes Zoster*, OP19
- candidal endophthalmitis
 - fluffy, white-yellow, superficial retinal infiltrate that may eventually result in vitritis
 - may present with inflammation of the anterior chamber
 - treatment: systemic amphotericin B, oral fluconazole
- toxoplasmosis
 - focal, gray-yellow-white, chorioretinal lesions with surrounding vasculitis and vitreous infiltration (vitreous cells)
 - can be congenital (transplacental) or acquired (caused by *Toxoplasma gondii* protozoa transmitted through raw meat and cat feces)
 - congenital form more often causes visual impairment (more likely to involve the macula)
 - treatment: pyrimethamine, sulfonamide, folinic acid, or clindamycin. Consider adding steroids if severe inflammation (vitritis, macular or optic nerve involvement)

Diabetes Mellitus

- see *Endocrinology*, E6
- most common cause of blindness in young people in North America
- consider DM if unexplained retinopathy, cataract, extraocular muscle palsy, optic neuropathy, sudden change in refractive error
- loss of vision due to
 - progressive microangiopathy leading to macular edema
 - progressive DR \rightarrow neovascularization \rightarrow traction \rightarrow RD and vitreous hemorrhage
 - rubeosis iridis (neovascularization of the iris) leading to neovascular glaucoma (poor prognosis)
 - macular ischemia

Macular edema is the most common cause of visual loss in patients with background DR

DIABETIC RETINOPATHY

Background

- altered vascular permeability (loss of pericytes, breakdown of blood-retinal barrier, thickening of basement membrane)
- predisposition to retinal vessel obstruction (CRAO, CRVO, and BRVO)

Classification

- **non-proliferative:** increased vascular permeability and retinal ischemia
 - microaneurysms
 - dot and blot hemorrhages
 - hard exudates (lipid deposits), non-specific for DR
 - macular edema
- **advanced non-proliferative (or pre-proliferative)**
 - non-proliferative findings plus
 - ♦ venous beading (in ≥ 2 of 4 retinal quadrants)
 - ♦ intraretinal microvascular anomalies (IRMA) in 1 of 4 retinal quadrants
 - IRMA: dilated, leaky vessels within the retina
 - ♦ cotton wool spots (nerve fiber layer infarcts)
- **proliferative**
 - 5% of patients with DM will reach this stage

Presence of DR in:

Type 1 DM

- 25% after 5 yr
- 60% after 10 yr
- >80% after 15 yr

Type 2 DM

- 20% at time of diagnosis
- 60% after 20 yr

Expanded 2 Year Follow-Up of Ranibizumab Plus Prompt or Deferred Laser or Triamcinolone Plus Prompt Laser for Diabetic Macular Edema
Ophthalmology 2011;118:609-614
 Ranibizumab (Lucentis®) with prompt or deferred laser is more effective than intravitreal corticosteroid injections + laser or laser alone with sustained efficacy up to 24 mo.

- neovascularization of iris, disc, retina to vitreous
 - neovascularization of iris (rubeosis iridis) can lead to neovascular glaucoma
 - vitreous hemorrhage from bleeding, fragile new vessels, fibrous tissue can contract causing tractional RD
- high risk of severe visual loss secondary to vitreous hemorrhage, RD

Screening Guidelines for Diabetic Retinopathy

- type 1 DM
 - screen for retinopathy beginning annually 5 yr after disease onset
 - annual screening indicated for all patients over 12 yr and/or entering puberty
- type 2 DM
 - initial examination at time of diagnosis, then annually
- pregnancy
 - ocular exam in 1st trimester, close follow-up throughout as pregnancy can exacerbate DR
 - gestational diabetics are not at risk for DR

Treatment

- Diabetic Control and Complications Trial (DCCT)
 - tight control of blood sugar decreases frequency and severity of microvascular complications
- blood pressure control
- focal laser for clinically significant macular edema, intravitreal injection of corticosteroid or anti-VEGF for foveal involved diabetic macular edema
- panretinal laser photocoagulation for PDR: reduces neovascularization, hence reducing the angiogenic stimulus from ischemic retina by decreasing retinal metabolic demand → reduces risk of blindness
- vitrectomy for non-clearing vitreous hemorrhage and RD in PDR
- vitrectomy before vitreous hemorrhage does not improve the visual prognosis

Lens Changes

- earlier onset of senile nuclear sclerosis and cortical cataract
- may get hyperglycemic cataract, due to sorbitol accumulation (rare)
- changes in blood glucose levels (poor control) can suddenly cause refractive changes by 3-4 diopters

Extraocular Muscle Palsy

- usually CN III infarct
- pupil usually spared in diabetic CN III palsy, but ptosis is observed
- may involve CN IV and VI
- usually recover within few months

Optic Neuropathy

- visual acuity loss due to infarction of optic disc/nerve

Figure 25. DM vs. HTN retinopathy

Clinically significant macular edema is defined as thickening of the retina at or within 500 μ m of the center of the macula

Effects of Medical Therapies on Retinopathy Progression in Type 2 DM

NEJM 2010;363:233-244

Purpose: To determine whether or not intensive glycemic control, combination therapy for dyslipidemia, and intensive blood-pressure control may limit the progression of DR in persons with type 2 DM.

Methods: RCT with 10,251 participants with type 2 DM at high risk of cardiovascular disease. Intensive or standard treatment for glycemia (glycated hemoglobin level $<6.0\%$ or $7.0\text{--}7.9\%$), dyslipidemia (160 mg daily fenofibrate plus simvastatin or placebo plus simvastatin), or systolic blood-pressure control (target <120 or <140 mm Hg).

Results: Rates of progression of DR at 4 yr were 7.3% with intensive glycemia treatment vs. 10.4% with standard therapy (OR 0.67; 95% CI 0.51-0.87); 6.5% with fenofibrate for intensive dyslipidemia therapy vs. 10.2% with placebo (OR 0.60; 95% CI 0.42-0.87) and 10.4% with intensive blood-pressure therapy vs. 8.8% with standard therapy (OR 1.23; 95% CI 0.84-1.79).

Conclusions: Intensive glycemic control and intensive combination treatment of dyslipidemia, but not intensive blood-pressure control, reduced the rate of DR.

Early Treatment Diabetic Retinopathy Study

ETDRS Reports No. 1-24. Various Journals, 1985-1999

Study: Randomized clinical trial.

Objective: To evaluate argon laser photocoagulation and aspirin treatment in the management of patients with nonproliferative or early PDR.

Patients: Men and women between the ages of 18 and 70 yr with moderate or severe nonproliferative DR or mild PDR in both eyes, with no previous photocoagulation treatment, and with visual acuity of 20/40 or better (20/200 or better if macular edema is present) were eligible for this study.

Intervention: All study patients had one eye randomly assigned to immediate photocoagulation and the other eye to deferral of photocoagulation until high-risk proliferative retinopathy developed. The trial use of aspirin therapy was based on clinical observation and on aspirin's possible mechanisms of action.

Results: A total of 3,711 patients were recruited to be followed for a minimum of 4 yr to provide long-term information on the risks and benefits of the treatments under study. The study demonstrated that focal photocoagulation for macular edema reduces the risk of moderate visual loss and should be considered for eyes with clinically significant macular edema. Scatter photocoagulation reduces the risk of severe visual loss. The ETDRS does not support scatter treatment before the severe non-proliferative stage of DR. Aspirin treatment (650 mg/day) does not alter progression of DR.

Conclusion: Before current treatments, the prognosis for patients with PDR was blindness within 5 yr for $>50\%$ of patients. Rates of blindness in ETDRS patients following the development of proliferative retinopathy are remarkably lower.

Hypertension

- retinopathy is the most common ocular manifestation
- chronic HTN retinopathy: arteriovenous (AV) nicking, blot retinal hemorrhages, microaneurysms, cotton wool spots
- acute HTN retinopathy: retinal arteriolar spasm, superficial retinal hemorrhage, cotton wool spots, optic disc edema

Table 8. Keith-Wagener-Barker Classification

Group 1	Mild arterial narrowing
Group 2	Obvious arterial narrowing with focal irregularities
Group 3	Group 2 characteristics plus: Cotton wool spots Hemorrhage and/or exudate
Group 4	Group 3 plus papilledema

Multiple Sclerosis

- see [Neurology, N52](#)

Clinical Features

- blurred vision and decreased color vision: secondary to optic neuritis
- central scotoma: due to damage to papillomacular bundle of retinal nerve fibers
- diplopia: secondary to INO
- RAPD, ptosis, nystagmus, uveitis, optic atrophy, optic neuritis
- white matter demyelinating lesions of optic nerve on MRI

Treatment

- IV steroids with taper to oral form for optic neuritis
 - DO NOT treat with oral steroids in isolation as this increases likelihood of eventual development of MS

Corticosteroids for Treating Optic Neuritis

Cochrane DB Syst Rev 2012;4:CD001430

Purpose: To assess the effects of corticosteroids on visual recovery in patients with acute optic neuritis.

Results/Conclusions: 6 RCTs, 750 participants. Follow-up at 6 mo or 1 yr. There is no conclusive evidence of benefit with respect to recovery to normal visual acuity, visual field, or contrast sensitivity with either intravenous or oral corticosteroids at the doses evaluated in included trials.

TIA/Amaurosis Fugax

- sudden, transient blindness from intermittent vascular compromise
- ipsilateral carotid most frequent embolic source
- typically monocular, lasting <5-10 min
- Hollenhorst plaques (glistening microemboli seen at branch points of retinal arterioles)

Graves' Disease

- ophthalmopathy occurs despite control of thyroid gland status
- ocular manifestations occur secondary to sympathetic overdrive and/or specific inflammatory infiltrate of the orbital tissue

Clinical

- initial inflammatory phase is followed by a quiescent cicatricial phase

Treatment

- treat hyperthyroidism
- monitor for corneal exposure and maintain corneal hydration
- manage diplopia, proptosis and compressive optic neuropathy with one or a combination of:
 - steroids (during acute phase)
 - orbital bony decompression
 - external beam radiation of the orbit
- consider strabismus and/or eyelid surgical procedures once acute phase subsides

The most common cause of unilateral or bilateral proptosis in adults is Graves' disease

Progression of Signs and Symptoms of Graves' Ophthalmopathy

NO SPECS

No signs/symptoms

Only signs (lid retraction, lid lag)

Soft tissue swelling (periorbital edema)

Proptosis (exophthalmos)

Extraocular muscle weakness (causing diplopia)

Corneal exposure

Sight loss

Connective Tissue Disorders

- RA, juvenile idiopathic arthritis, SLE, Sjögren syndrome, ankylosing spondylitis, polyarteritis nodosa
- most common ocular manifestation: dry eyes (keratoconjunctivitis sicca)

Giant Cell Arteritis/Temporal Arteritis

- see [Rheumatology](#), R17

Clinical

- more common in women >60 yr
- abrupt monocular loss of vision, pain over the temporal artery, jaw claudication, scalp tenderness, constitutional symptoms, and past medical history of polymyalgia rheumatica
- ischemic optic atrophy
 - 50% lose vision in other eye if untreated

Diagnosis

- temporal artery biopsy + increased ESR (ESR can be normal, but likely 80-100 in first hour), CRP
- if biopsy of one side is negative, biopsy the other side

Treatment

- high dose corticosteroid to relieve pain and prevent further ischemic episodes
- if diagnosis of GCA is suspected clinically: start treatment + perform temporal artery biopsy to confirm diagnosis within 2 wk of initial presentation (**DO NOT WAIT TO TREAT**)

ESR in Temporal Arteritis

Males > age/2
Females > (age + 10)/2

Does this Patient have Temporal Arteritis?

JAMA 2002;287:92-101

Rule in: jaw claudication and diplopia on history, temporal artery beading, prominence of the artery and tenderness over the artery on exam.

Rule out: no temporal artery abnormalities on exam, normal ESR.

Sarcoidosis

- granulomatous uveitis with large "mutton fat" keratitic precipitates and posterior synechiae
- neurosarcoidosis: optic neuropathy, oculomotor abnormalities, visual field loss

Treatment

- steroids and mydriatics

Pediatric Ophthalmology

Strabismus

- ocular misalignment in one or both eyes, found in 3% of children
- object not visualized simultaneously by fovea of each eye
- terms used to describe strabismus depend upon
 - direction of deviation relative to the fixating eye
 - conditions under which it presents: 'latent', 'manifest' misalignment
 - change with the position of gaze: 'comitant' (usually nonparalytic), 'incomitant' (usually occurs with paralytic or restrictive strabismus)
- often presents with parental concern about a wandering eye, crossing eye, or poor vision
- elicit a detailed family history of strabismus, amblyopia, type of eyeglasses and history of wear, extraocular muscle surgery or other eye surgery, and genetic diseases to identify children at higher risk
- distinguish from pseudostrabismus (prominent epicanthal folds, hypertelorism, markedly positive or negative angle κ)
- complications: amblyopia, cosmesis

HETEROTROPIA

- manifest deviation
- deviation not corrected by the fusion mechanism (i.e. deviation is apparent when the patient is using both eyes)

Types

- exo- (lateral deviation), eso- (medial deviation)
- hyper- (upward deviation), hypo- (downward deviation)
- esotropia = "crossed-eyes"; exotropia = "wall-eyed"

Differentiate from Pseudostrabismus

- prominent epicanthal folds: give appearance of esotropia but Hirschberg test is normal, more common in Asians
- markedly elevated angle κ (the angle formed by the pupillary axis and the visual axis at the center of the pupil)
 - caused by the failure of optical axis of the eye and the visual axis to coincide
 - a small positive (up to 5°) angle κ is physiologic
 - a large positive angle κ (nasally deviated fovea) simulates eso-appearance
 - a large negative angle κ (temporally deviated fovea) gives an exo-appearance

Strabismus in children under 4 mo of age sometimes resolves, particularly if the deviation is intermittent, variable, or measures <40 prism diopters

Tests

- Hirschberg test (corneal light reflex): positive if the light reflex on both corneas is asymmetrical
 - light reflex lateral to central cornea indicates esodeviation; light reflex medial to central cornea indicates exodeviation
 - false positives occur if visual axis and anatomic pupillary axis of the eye are not aligned (angle κ)
- cover test
- the deviation can be quantified using prisms

HETEROPHORIA

- latent deviation
- deviation corrected in the binocular state by the fusion mechanism (i.e. deviation not seen when patient is focusing with both eyes)
- Hirschberg test will be normal (light reflexes symmetrical)
- very common – majority are asymptomatic
- may be exacerbated or become manifest with asthenopia (eye strain, fatigue)

Tests

- cover-uncover test
- alternate cover test
 - alternating the cover between both eyes reveals the total deviation, both latent and manifest
 - maintain cover over one eye for 2-3 s before rapidly shifting to other eye

All children with strabismus and/or possible reduced vision require prompt referral to an ophthalmologist

Figure 26. Cover and cover-uncover tests for detection of tropias and phorias

Table 9. Paralytic vs. Non-Paralytic Strabismus

Clinical Characteristics	Paralytic Strabismus	Nonparalytic Strabismus
Definition	Incomitant strabismus	Concomitant strabismus
Onset	Often sudden but may be gradual or congenital	Usually gradual or shortly after birth; rarely sudden
Age of Onset	Any age; most often acquired	Usually during infancy
Etiology	Reduction or restriction in range of eye movements due to: <ul style="list-style-type: none"> • Neural (CN III, IV, VI): ischemia (e.g. DM), MS, aneurysm, brain tumor, trauma • Muscular: myasthenia gravis (neuromuscular junction pathology), Graves' disease • Structural: restriction or entrapment of extraocular muscles due to orbital inflammation, tumor, fracture of the orbital wall 	Develops early in childhood No restriction in range of eye movements Monocular, alternating, or intermittent
Diplopia	Common	Uncommon; image from the misaligned eye is suppressed (see <i>Amblyopia</i> , OP40)
Visual Acuity in Other Eye	Usually unaffected in the other eye, unless CN II is involved	Deviated eye may become amblyopic if not treated when the child is young Amblyopia treatment rarely successful after age 8-10 yr Amblyopia usually does not develop if child has alternating strabismus or intermittency, which allows neural pathways for both eyes to develop
Possibility of Amblyopia	Uncommon	Common
Neurologic Findings or Systemic Disease	May be present	Usually absent

Accommodative Esotropia

- normal response to approaching object is the triad of the near reflex: convergence, accommodation and miosis
- hyperopes must constantly accommodate – excessive accommodation can lead to esotropia in young children via over-activation of the near reflex
- average age of onset is 2.5 yr
- usually reversible with correction of refractive error

Non-accommodative Esotropia

- accounts for 50% of childhood strabismus
- most are idiopathic
- may be due to monocular visual impairment (e.g. cataract, corneal scarring, anisometropia, retinoblastoma) or divergence insufficiency (ocular misalignment that is greater at distance fixation than at near fixation)

Amblyopia

**Definition**

- a neurodevelopmental visual disorder with unilateral (or less commonly, bilateral) reduction of best corrected visual acuity that cannot be attributed only and directly to the effect of a structural abnormality of the eye. It is caused by abnormal visual experience early in life and cannot be remedied immediately by spectacle glasses alone
- in approximately half of the cases, amblyopia is secondary to strabismus (mainly esotropia). Other causes may include uncorrected refractive errors, anisometropia (asymmetric refractive errors), and concomitant structural ocular problems

Detection

- “Holler Test”: young child upset if good eye is covered
- quantitative visual acuity by age 3-4 yr using picture charts and/or matching game (Sheridan-Gardiner), testing each eye separately
- amblyopia treatment less successful after age 8-10 yr, but a trial should be given no matter what age
- prognosis: 90% will have good vision restored and maintained if treated <4 yr old

Etiology and Management

- strabismus
 - correct with glasses for accommodative esotropia (50% of children experience relief of their esotropia with glasses and will not require surgery)
 - occlusion of unaffected eye forces brain to use previously strabismic eye; aims to bring vision in previously suppressed eye to normal before surgery
 - surgery: recession (weakening) – moving muscle insertion further back on the globe; or resection (strengthening) – shortening the muscle
 - botulinum toxin for single muscle weakening
 - after ocular alignment is restored (glasses, surgery, botulinum toxin), patching is frequently necessary to maintain vision until approximately age 8 yr
- anisometropia
 - amblyopia usually in the more hyperopic eye
 - the more emmetropic (normal refraction) eye receives a clear image while the less emmetropic eye receives a blurred image; input from the blurred eye is cortically suppressed and visual pathway fails to develop normally
 - treat with glasses to correct refractive error
 - patching is required if visual acuity difference persists after 4-8 wk of using glasses
- deprivation amblyopia
 - occlusion due to ptosis, cataract, retinoblastoma, corneal opacity
 - occlusion amblyopia: prolonged patching of good eye may cause it to become amblyopic

Occlusion Therapy

- patching the good eye to force the brain to use the non-dominant eye and redevelop its vision
- atropine cycloplegic drops to impair accommodation and blur vision of the better seeing eye

Risks

- permanent loss of vision in the affected eye
- possibility of injury to ‘remaining’ good eye
 - safety glasses or polycarbonate lenses recommended if visual acuity in worse eye is <20/50
- loss of stereopsis

Leukocoria

- white reflex (red reflex is absent)

Differential Diagnosis

- cataract
- retinoblastoma
- retinal coloboma
- ROP
- persistent hyperplastic primary vitreous
- Coat's disease (exudative retinal telangiectasis)
- toxocariasis
- RD

Retinoblastoma

- most common primary intraocular malignancy in children
- incidence: 1/15,000; sporadic or genetic transmission; screening of siblings/offspring essential
- unilateral or bilateral (in 1/3 of cases)
- malignant – direct or hematogenous spread
- diagnosis
 - often presents with leukocoria or strabismus
 - U/S or CT scan may demonstrate calcified mass (present in most cases)

Treatment

- radiotherapy, chemotherapy combined with laser, cryopexy, and/or enucleation

Retinopathy of Prematurity

- vasoproliferative retinopathy that is a major cause of blindness in the developed world

Risk Factors

- non-black race (black infants have lower risk of developing ROP)
- low gestational age, birth weight <1500 g
- high oxygen exposure after birth

Classification (ROP Staging)

- stage 1: faint demarcation line at the junction between the vascularized and avascular retina
- stage 2: elevated ridge
- stage 3: extra-retinal fibrovascular tissue extending into vitreous
- stage 4: partial RD (4A: macula “on”, 4B: macula “off”)
- stage 5: total RD
- plus (+) disease: dilatation and tortuosity of retinal vessels
- threshold disease: stage 3+ in zones 1 or 2 with 5 continuous or 8 cumulative clock hours of ROP involvement

Treatment

- threshold disease is treated with cryotherapy or laser (laser is now the standard treatment, with better refractive outcome), off label anti-VEGF intravitreal injections
- ROP beyond threshold level is either watched carefully (usually stage 4A) or treated with vitrectomy/scleral buckle

Prognosis

- higher incidence of myopia among ROP infants, even if treated successfully
- stage 4B and 5 have poor prognosis for visual outcome despite treatment

Nasolacrimal System Defects

- congenital obstruction of the nasolacrimal duct (failure of canalization), usually occurs at 1-2 mo of age
- epiphora, crusting, discharge, recurrent conjunctivitis
- can have reflux of mucopurulent material from lacrimal punctum when pressure is applied over lacrimal sac
- treatment: massage over lacrimal sac at medial corner of eyelid
- vast majority spontaneously resolve in 9-12 mo, otherwise consider referral for duct probing

Retinal Zones

- Zone I: circle with radius twice the distance from the disc to the macula (most difficult to treat)
- Zone II: annulus from zone I to nasal extent of retina (nasal ora serrata)
- Zone III: remaining retina

Figure 27. Zones of the retina in ROP

Efficacy of Intravitreal Bevacizumab for Stage 3+ Retinopathy of Prematurity (ROP)

NEJM 2011;364:603-615

Study: Randomized controlled clinical trial.

Patients: 150 infants born at gestational age ≤30 wk and birth weight ≤1500 g.

Intervention: Randomized to conventional laser therapy or intravitreal bevacizumab monotherapy.

Main Outcome: Recurrence of ROP in one or both eyes requiring retreatment before 54 wk postmenstrual age.

Results: ROP recurrence was lower in the bevacizumab group (6 of 140 eyes [4%]) vs. the laser-therapy group (32 of 146 eyes [22%]) ($p=0.002$). A significant treatment effect was found for zone I ROP ($p=0.003$).

Conclusions: Intravitreal bevacizumab monotherapy is beneficial for infants with zone I state 3+ ROP and allows continued development of peripheral retinal vessels following treatment.

Ophthalmia Neonatorum

- newborn conjunctivitis in first month of life
- causes
 - toxic: silver nitrate, erythromycin
 - infectious: bacterial (e.g. *N. gonorrhoeae* – most common, *C. trachomatis*), herpes simplex virus
- diagnose using stains and cultures
- treatment: systemic antibiotics with possible hospitalization if infectious etiology
- topical prophylaxis, most commonly with erythromycin (or silver nitrate), is required by law at birth

Gonococcal infection is the most serious threat to sight as it can rapidly penetrate corneal epithelium, causing corneal ulceration

Congenital Glaucoma

- due to inadequate development of the filtering mechanism of the anterior chamber angle

Clinical Features

- cloudy cornea, increased IOP
- photophobia, epiphora
- buphthalmos (large cornea, “ox eye”, secondary to increased IOP), blepharospasm

Treatment

- filtration surgery is required soon after birth to prevent blindness

Epiphora in children – rule out congenital glaucoma!

Ocular Trauma

Blunt Trauma

- caused by blunt object such as fist, squash ball
- history: injury, ocular history, drug allergy, tetanus status
- exam: VA first, pupil size and reaction, EOM (diplopia), external and slit-lamp exam, ophthalmoscopy
- if VA normal or slightly reduced, globe less likely to be perforated
- if VA reduced may be perforated globe, corneal abrasion, lens dislocation, retinal tear
- bone fractures
 - blow out fracture: restricted EOM, diplopia, enophthalmos (sunken eye)
 - ethmoid fracture: subcutaneous emphysema of lid
- lids: swelling, laceration, emphysema
- conjunctiva: subconjunctival hemorrhage
- cornea: abrasion – detect with fluorescein staining and cobalt blue filter using slit-lamp or ophthalmoscope
- anterior chamber: assess depth, hyphema, hypopyon
- iris: prolapse, iritis
- lens: cataract, dislocation
- retinal tear/detachment

Always test VA first – medicolegal protection

Refer if You Observe Any of These Signs

- Decreased VA
- Shallow anterior chamber
- Hyphema
- Abnormal pupil
- Ocular misalignment
- Retinal damage

Management of Suspected Globe Rupture

CAN'T forget
CT orbits
Ancef (cefazolin) ± **A**minoglycoside IV
NPO
Tetanus status

Post-Traumatic Infectious Endophthalmitis

- Surv Ophthalmol* 2011;56:214-251
- Delayed primary repair (>24 h after open globe injury) increases risk for post-traumatic endophthalmitis in the absence of an intraocular foreign body (IOFB).
 - If IOFB present, early vitrectomy and IOFB removal must be performed within 24 h of injury.
 - Extreme pain with hypopyon and vitritis indicate endophthalmitis until proven otherwise, and samples must be obtained.
 - Treat with empirical intravitreal and intravenous antibiotic guided by nature of trauma, and adjust based on culture.

Penetrating Trauma

- include ruptured globe ± prolapsed iris, intraocular foreign body
- rule out intraocular foreign body, especially if history of “metal striking metal”, orbit CT
- **OCULAR EMERGENCY**: initial management - REFER IMMEDIATELY
 - ABCs
 - don't press on eye globe!
 - don't check IOP if possibility of globe rupture
 - check vision, diplopia
 - apply rigid eye shield to minimize further trauma
 - keep head elevated 30-45° to keep IOP down
 - keep NPO
 - tetanus status
 - give IV antibiotics
 - ♦ selecting appropriate agents depends on the mechanism of injury; gram positive bacteria are more commonly involved than gram negatives; retained intraocular foreign objects increase the risk of infections with *Bacillus* species, whereas exposure to vegetable matter increased the risk of a fungal etiology

Hyphema

- blood in anterior chamber often due to damage to root of the iris
- may occur with blunt trauma

Treatment

- refer to ophthalmology
 - shield and bedrest x 5 d or as determined by ophthalmologist
 - sleep with head upright
- may need surgical drainage if hyphema persists or if re-bleed

Complications

- risk of re-bleed highest on days 2-5, resulting in secondary glaucoma, corneal staining, and iris necrosis
- never prescribe Aspirin®, as it increases the risk of a re-bleed

Shaken Baby Syndrome

Syndrome of findings characterized by absence of external signs of abuse with respiratory arrest, seizures, or coma. Ocular exam findings are important diagnostically for Shaken Baby Syndrome. These findings include extensive retinal and vitreous hemorrhages that occur during the shaking process and are extremely rare in accidental trauma. A detailed fundoscopic exam or an ophthalmology referral should be conducted for all infants in whom abuse is suspected.

Blow-Out Fracture

- see [Plastic Surgery, PL31](#)
- blunt trauma causing fracture of orbital floor and herniation of orbital contents into maxillary sinus
- orbital rim remains intact
- inferior rectus and/or inferior oblique muscles may be incarcerated at fracture site
- infraorbital nerve courses along the floor of the orbit and may be damaged

Clinical Features

- pain and nausea at time of injury
- diplopia, restriction of EOM
- infraorbital and upper lip paresthesia (CN V2)
- enophthalmos (sunken eye), periorbital ecchymoses

Investigations

- plain films: Waters' view and lateral
- CT: anteroposterior and coronal view of orbits

Treatment

- refrain from coughing, blowing nose
- systemic antibiotics may be indicated
- surgery if fracture >50% orbital floor, diplopia not improving, or enophthalmos >2 mm
- may delay surgery if the diplopia improves

Classic Signs of Blow-Out

- Enophthalmos
- Decreased upgaze (IR trapped)
- Cheek anesthetized (infraorbital nerve trapped)

Chemical Burns

- alkali burns have a worse prognosis than acid burns because acids coagulate tissue and inhibit further corneal penetration
- poor prognosis if cornea opaque, likely irreversible stromal damage
- even with a clear cornea initially, alkali burns can progress for weeks (thus, very guarded prognosis)

Treatment

- immediately irrigate at site of accident with water or buffered solution
 - IV drip for at least 20-30 min with eyelids retracted in emergency department
 - swab upper and lower fornices to remove possible particulate matter
- do not attempt to neutralize because the heat produced by the reaction will damage the cornea
- cycloplegic drops to decrease iris spasm (pain) and prevent secondary glaucoma (due to posterior synechiae formation)
- topical antibiotics and patching
- topical steroids (by ophthalmologist) to decrease inflammation, use for <2 wk (in the case of a persistent epithelial defect)

Fluorescein lights up alkali so you can detect it and assess whether it has been removed

Surgical Ophthalmology

- **dacryocystorhinostomy (DCR)**: excision of bone covering the nasolacrimal sac to restore tear drainage
- **LASIK (laser-assisted *in situ* keratomileusis)**: a microkeratome is used to create a corneal flap followed by laser remodeling of the stroma to correct refractive error
- **trabeculectomy**: creation of a new outflow tract from anterior chamber to under conjunctiva; fibrosis prevented with mitomycin C or 5-FU injection during surgery
- **phacoemulsification (cataract extraction)**: the use of ultrasonic waves to break up and aspirate a cataract followed by replacement with an artificial lens implant
- **femtosecond laser-assisted cataract surgery**: uses focused ultrashort pulses (10^{-15} of a second) to perform photodissection in achieving capsulorrhexis and lens fragmentation
- **vitrectomy**: the use of small gauge trochars to enter the posterior segment and remove vitreous; commonly used to treat vitreous hemorrhage and RD
- **pneumatic retinopexy**: intraocular injection of air or an expandable gas in order to tamponade a retinal break for repair of RD
- **scleral buckle**: a silicone band is secured on the outside of the globe that indents the eye wall, thereby relieving vitreous traction on the retina around any tears/holes and allowing the tears/holes to remain sealed for repair of RD
- **minimally invasive glaucoma surgery (MIGS)**: implantation of IOP lowering drainage devices (e.g. iStent) through an ab interno microincisional approach during cataract surgery.

Ocular Drug Toxicity

Table 10. Drugs with Ocular Toxicity

Amiodarone	Corneal microdeposits and superficial keratopathy (vortex keratopathy) Rare: ischemic optic neuropathy
Atropine, benzotropine	Pupillary dilation (risk of angle closure glaucoma)
Bisphosphonates (Fosamax®, Actonel®)	Inflammatory eye disease (iritis, scleritis, episcleritis)
Chloroquine, hydroxychloroquine	Bull's eye maculopathy Vortex keratopathy
Chlorpromazine	Anterior subcapsular cataract
Contraceptive pills	Decreased tolerance to contact lenses Migraine Optic neuritis Central vein occlusion, benign increase intracranial pressure
Digitalis	Yellow vision Blurred vision
Ethambutol	Optic neuropathy
Haloperidol (Haldol®)	Oculogyric crises Blurred vision
Indomethacin	Superficial keratopathy
Interferon	Retinal hemorrhages and cotton wool spots
Isoniazid	Optic neuropathy
Nalidixic acid	Papilledema
Steroids	Posterior subcapsular cataracts Glaucoma Papilledema (systemic steroids) Increased severity of HSV infections (geographic ulcers) Predisposition to fungal infections
Sulphonamides, NSAIDs	Stevens-Johnson syndrome
Tamsulosin (Flomax®)	Intraoperative Floppy Iris Syndrome, which can complicate cataract surgery
Tetracycline	Papilledema (associated with pseudotumor cerebri)
Thioridazine	Pigmentary degeneration of retina
Vigabatrin	Retinal deposition with macular sparing, peripheral visual field loss
Vitamin A intoxication	Papilledema
Vitamin D intoxication	Band keratopathy

Common Medications

TOPICAL OCULAR DIAGNOSTIC DRUGS

Fluorescein Dye

- water soluble orange-yellow dye
- green under cobalt blue light (ophthalmoscope or slit-lamp)
- absorbed in areas of epithelial loss (ulcer or abrasion)
- also stains mucus and contact lenses

Rose Bengal Stain

- stains devitalized epithelial cells and mucus

Anesthetics

- e.g. proparacaine HCl 0.5%, tetracaine 0.5%
- indications: removal of foreign body and sutures, tonometry, examination of painful cornea
- toxic to corneal epithelium (inhibit mitosis and migration) and can lead to corneal ulceration and scarring with prolonged use, therefore **NEVER** prescribe

Mydriatics

- dilate pupils
- two classes
 - cholinergic blocking (e.g. tropicamide – Mydracil®)
 - ♦ dilation plus cycloplegia (loss of accommodation) by paralysis of iris sphincter and the ciliary body
 - ♦ indications: refraction, ophthalmoscopy, therapy for iritis
 - adrenergic stimulating (e.g. phenylephrine HCl 2.5%)
 - ♦ stimulate pupillary dilator muscles, no effect on accommodation
 - ♦ usually used with tropicamide for additive effects
 - ♦ side effects: HTN, tachycardia, arrhythmias

Table 11. Mydriatic Cycloplegic Drugs and Duration of Action

Drugs	Duration of Action
Tropicamide (Mydracil®) 0.5%, 1%	4-5 h
Cyclopentolate HCl 0.5%, 1%	3-6 h
Homatropine HBr 1%, 2%	3-7 d
Atropine sulfate 0.5%, 1%	1-2 wk
Scopolamine HBr 0.25%, 5%	1-2 wk

GLAUCOMA MEDICATIONS**Table 12. Glaucoma Medications**

Drug Category	Dose	Effect	Comment/Side Effects
α-Agonist Non-selective <ul style="list-style-type: none"> • epinephrine HCl 1% (Epifrin®) • dipivalyl epinephrine 0.1% (Propine®) α₂-selective <ul style="list-style-type: none"> • brimonidine 0.2% (Alphagan®) • apraclonidine 0.5% (Iopidine®) 	1 gtt OS/OD bid/tid	1. Non-selective: ↓ aqueous production + ↑ TM outflow 2. Selective: ↓ aqueous production + ↑ uveoscleral outflow	1. Non-selective: mydriasis, macular edema, tachycardia 2. Selective: contact allergy, hypotension in children
β-Blocker Non-selective <ul style="list-style-type: none"> • timolol (Timoptic®) • levobunolol (Betagan®) β₁-selective <ul style="list-style-type: none"> • betaxolol (Betoptic®) 	1 gtt OS/OD qd/bid	↓ aqueous production	Bronchospasm (caution in asthma/COPD) ↑ CHF Bradycardia Hypotension Depression Heart block Impotence
Carbonic Anhydrase Inhibitor <ul style="list-style-type: none"> • dorzolamide (Trusopt®) • brinzolamide (Azopt®) • oral: acetazolamide (Diamox®), methazolamide (Neptazane®) 	1 gtt OS/OD tid Diamox®: 500 mg PO bid	↓ aqueous production	Must ask about sulfa allergy Generally local side effects with topical preparations Oral: diuresis, fatigue, paresthesias, GI upset, etc.
Parasympathomimetic (cholinergic stimulating) <ul style="list-style-type: none"> • pilocarpine (Pilopine®) • carbachol 	1-2 gtts OS/OD tid/qid	↑ TM outflow	Miosis ↓ night vision ↑ GI motility Brow ache Headache ↓ heart rate
Prostaglandin Analogues <ul style="list-style-type: none"> • latanoprost (Xalatan®) • bimatoprost (Lumigan®) 	1 gtt OS/OD qhs	↑ uveoscleral outflow (uveoscleral responsible for 20% of drainage)	Iris color change Periocular skin pigmentation Lash growth Conjunctival hyperemia

Cosopt® = timolol + dorzolamide; Combigan® = timolol + brimonidine; gtt = drop, gtts = drops

WET AGE-RELATED MACULAR DEGENERATION MEDICATIONS**VEGF Inhibitors**

- block VEGF which prevents ocular angiogenesis and further development of choroidal neovascularization
- administered via intravitreal injections
- pegaptanib (Macugen®) is a selective anti-VEGF targeting VEGF isoform 165 (no longer widely used)

- ranibizumab (Lucentis®) is a non-selective anti-VEGF agent
- aflibercept (Eylea®) is an VEGF “trap” agent that binds VEGF-A and placental growth factor
- bevacizumab (Avastin®) is another non-selective anti-VEGF agent but is only FDA approved for metastatic breast cancer, colorectal cancer, and non-small cell lung cancer; therefore, its ophthalmologic use is off-label

TOPICAL OCULAR THERAPEUTIC DRUGS

NSAIDs

- used for less serious chronic inflammatory conditions
- e.g. ketorolac (Acular®), diclofenac (Voltaren®), nepafenac (Nevanac®) drops

Anti-Histamines

- used to relieve red and itchy eye, often in combination with decongestants
- sodium cromoglycate – stabilizes membranes

Decongestants

- weak adrenergic stimulating drugs (vasoconstrictor)
- e.g. naphazoline, phenylephrine
- rebound vasodilation with overuse; rarely can precipitate angle closure glaucoma

Antibiotics

- indications: bacterial conjunctivitis, keratitis, or blepharitis
- commonly as topical drops or ointments, may give systemically
- e.g. sulfonamide (sodium sulfacetamide, sulfisoxazole), gentamicin (Garamycin®), erythromycin, tetracycline, bacitracin, polymyxin B, fluoroquinolones (ciprofloxacin [Ciloxan®], ofloxacin [Ocuflox®], moxifloxacin [Vigamox®], gatifloxacin [Zymar®])

Corticosteroids

- e.g. fluorometholone (FML®), betamethasone, dexamethasone (Maxidex®), prednisolone (Pred Forte® 1%), rimexolone (Vexol®), loteprednol etabonate 0.5% (Lotamax®)
- primary care physicians should avoid prescribing topical corticosteroids due to risk of glaucoma, cataracts, and reactivation of HSV keratitis
- complications
 - potentiates HSV keratitis and fungal keratitis as well as masks symptoms
 - increased IOP, more rapidly in steroid responders (within weeks)
 - posterior subcapsular cataract (within months)

Differential Diagnosis of Joint Pain

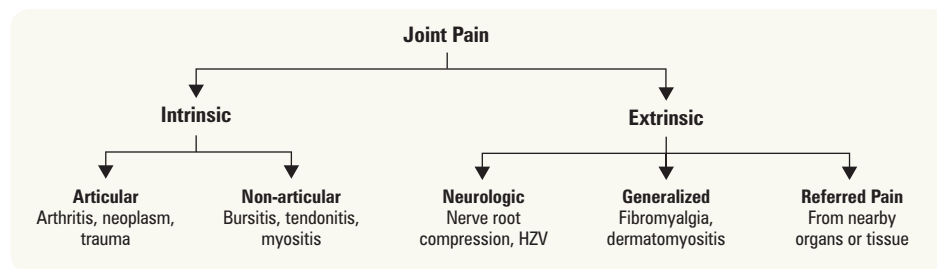

Figure 4. Intrinsic vs. extrinsic joint pain

Fractures – General Principles

Fracture Description

1. Integrity of Skin/Soft Tissue

- closed: skin/soft tissue over and near fracture is intact
- open: skin/soft tissue over and near fracture is lacerated or abraded, fracture exposed to outside environment
 - signs: continuous bleeding from puncture site or fat droplets in blood are suggestive of an open fracture

2. Location

- epiphyseal: end of bone, forming part of the adjacent joint
- metaphyseal: the flared portion of the bone at the ends of the shaft
- diaphyseal: the shaft of a long bone (proximal, middle, distal)
- physis: growth plate

3. Orientation/Fracture Pattern

- transverse: fracture line perpendicular to long axis of bone; result of direct high energy force
- oblique: angular fracture line; result of angular or rotational force
- butterfly: fracture site fragment which looks like a butterfly
- segmental: a separate segment of bone bordered by fracture lines; result of high energy force
- spiral: complex, multi-planar fracture line; result of rotational force, low energy
- comminuted/multi-fragmentary: >2 fracture fragments
- intra-articular: fracture line crosses articular cartilage and enters joint
- avulsion: tendon or ligament tears/pulls off bone fragment; often in children, high energy
- compression/impacted: impaction of bone; typical sites are vertebrae or proximal tibia
- torus: a buckle fracture of one cortex, often in children (see Figure 51, OR39)
- greenstick: an incomplete fracture of one cortex, often in children (see Figure 51, OR39)
- pathologic: fracture through bone weakened by disease/tumor

4. Displacement

- nondisplaced: fracture fragments are in anatomic alignment
- displaced: fracture fragments are not in anatomic alignment
- distracted: fracture fragments are separated by a gap (opposite of impacted)
- impacted: fracture fragments are compressed, resulting in shortened bone
- angulated: direction of fracture apex, e.g. varus/valgus
- translated/shifted: percentage of overlapping bone at fracture site
- rotated: fracture fragment rotated about long axis of bone

Figure 6. Fracture types

Management of Fractures

- ABCs, primary survey and secondary survey (ATLS protocol)
 - rule out other fractures/injuries
 - rule out open fracture (see sidebar, OR6)
- AMPLE history: Allergies, Medications, Past medical history, Last meal, Events surrounding injury
 - consider pathologic fracture with history of only minor trauma
- analgesia
- imaging
- splint extremity

Figure 5. Schematic diagram of the long bone

X-Ray Rule of 2s

- 2 sides = bilateral
- 2 views = AP + lateral
- 2 joints = joint above + below
- 2 times = before + after reduction

Varus/Valgus Angulation

- Varus** = Apex away from midline
- Valgus** = Apex toward midline

Displacement

- Refers to position of the distal fragment relative to the proximal fragment

Quick Nerve Exam

- "Thumbs Up": PIN (Radial Nerve)
- "OK Sign": AIN (Median Nerve)
- "Spread Fingers": Ulnar Nerve

Reasons for Splinting

- Pain control
- Reduces further damage to vessels, nerves, and skin
- Decreases risk of inadvertently converting closed to open fracture
- Facilitates patient transport

1. obtain the reduction (for appropriate IV sedation see Table 28, OR47)
 - closed reduction
 - ♦ apply traction in the long axis of the limb
 - ♦ reverse the mechanism that produced the fracture
 - ♦ reduce with IV sedation and muscle relaxation (fluoroscopy can be used if available)
 - indications for open reduction
 - ♦ “NO CAST”
 - ♦ other indications include
 - failed closed reduction
 - not able to cast or apply traction due to site (e.g. hip fracture)
 - pathologic fractures
 - potential for improved function with ORIF
 - ALWAYS re-check NVS after reduction and obtain post-reduction x-ray
2. maintain the reduction
 - external stabilization: splints, casts, traction, external fixator
 - internal stabilization: percutaneous pinning, extramedullary fixation (screws, plates, wires), IM fixation (rods)
 - follow-up: evaluate bone healing
3. rehabilitate to regain function and avoid joint stiffness

Indications for Open Reduction

NO CAST

Non-union

Open fracture

Neurovascular Compromise

Intra-Articular fracture

Salter-Harris 3,4,5

PolyTrauma

Figure 7. Heterotopic ossification of femoral diaphysis after femur fracture and IM nailing

Heterotopic Ossification

The formation of bone in abnormal locations (e.g. in muscle), secondary to pathology

Avascular Necrosis

Ischemia to bone due to disrupted blood supply; commonly in bones covered by cartilage or with distal to proximal blood supply

Fracture Blister

Formation of vesicles or bullae that occur on edematous skin overlying a fractured bone

Fracture Healing

Normal Healing

Weeks 0-3	Hematoma, macrophages surround fracture site
Weeks 3-6	Osteoclasts remove sharp edges, callus forms within hematoma
Weeks 6-12	Bone forms within the callus, bridging fragments
Months 6-12	Cortical gap is bridged by bone
Years 1-2	Normal architecture is achieved through remodelling

Figure 8. Stages of bone healing

Evaluation of Healing: Tests of Union

- clinical: no longer tender to palpation or stressing on physical exam
- x-ray: trabeculae cross fracture site, visible callus bridging site on at least 3 of 4 cortices

General Fracture Complications

Table 2. General Fracture Complications

	Early	Late
Local	Compartment syndrome Neurological injury Vascular injury Infection Implant failure Fracture blisters	Mal-/non-union AVN Osteomyelitis HO Post-traumatic OA Joint stiffness/adhesive capsulitis CRPS type I/RSD
Systemic	Sepsis DVT PE ARDS secondary to fat embolism Hemorrhagic shock	

Articular Cartilage

Properties

- 2-4 mm layer covering ends of articulating bones, provides nearly frictionless surface
- avascular (nutrition from synovial fluid), aneural, alymphatic
- composed of: collagen (90% is type II; gives tensile strength), water, proteoglycans (gives compressive strength), and chondrocytes

ARTICULAR CARTILAGE DEFECTS

Etiology

- overt trauma, repetitive minor trauma (such as patellar maltracking); common sports injury
- degenerative conditions such as early stage OA or osteochondritis dissecans

Clinical Features

- similar to symptoms of OA (joint line pain with possible effusion, etc.)
- often have predisposing factors, such as ligament injury, malalignment of the joint (varus/valgus), obesity, bone deficiency (AVN, osteochondritis dissecans, ganglion bone cysts), inflammatory arthropathy, and familial osteoarthritis
- may have symptoms of locking or catching related to the torn/displaced cartilage

Investigations

- x-ray (to rule out bony defects and check alignment)
- MRI
- diagnostic arthroscopy (treatment is often guided by what is seen during arthroscopy)

Table 3. Outerbridge Classification of Chondral Defects

Grade	Chondral Damage
I	Softening and swelling of cartilage
II	Fragmentation and fissuring <1/2" in diameter
III	Fragmentation and fissuring >1/2" in diameter
IV	Erosion of cartilage down to bone

Treatment

- individualized; must take into account patient factors (age, skeletal maturity, activity level, etc.) and defect factors (Outerbridge classification, subchondral bone involvement, etc.)
- non-operative: rest, NSAIDs, bracing
- operative: microfracture, osteochondral grafting (autograft or allograft), autologous chondrocyte implantation

Orthopedic X-Ray Imaging

General Principles

- x-ray 1 joint above and 1 below
- obtain at least 2 orthogonal views ± specialized views

Table 4. Orthopedic X-Ray Imaging

Site	Injury	X-Ray Views
Shoulder	Anterior dislocation	AP
	Posterior dislocation	Axillary ± stress view with 10 lb in hand
	AC	Trans-scapular
	Frozen shoulder	Zanca view (10-15 cephalic tilt)
Arm	Humerus #	AP
		Lateral
		Trans-scapular
		Axillary
Elbow/Forearm	Supracondylar #	AP
	Radial head #	Lateral
	Monteggia #	
	Night stick #	
	Galeazzi #	
Wrist	Colles' #	AP
	Smith #	Lateral
	Scaphoid #	Scaphoid (wrist extension and ulnar deviation x 2 wk)
Pelvis	Pelvic #	AP pelvis
		Inlet and outlet views
		Judet views (obturator and iliac oblique for acetabular #)
Hip	Femoral head/neck #	AP
	Intertrochanteric #	Lateral
	Arthritis	Frog-leg lateral
	SCFE	Dunn
	FAI	

CRPS/RSD

An exaggerated response to an insult in the extremities; characterized by symptoms of hyperalgesia and allodynia, with signs of autonomic dysfunction (temperature asymmetry, mottling, hair or nail changes)

Table 4. Orthopedic X-Ray Imaging (continued)

Site	Injury	X-Ray Views
Knee	Knee dislocation	AP standing, lateral
	Femur/tibia #	Skyline – tangential view with knees flexed at 45° to see patellofemoral joint
	Patella #	
	Patella dislocation	
	Patella femoral syndrome	
	Tibia shaft #	
Ankle	Ankle #	AP
		Lateral
		Mortise view: ankle at 15° of internal rotation
Foot	Talar #	AP
	Calcaneal #	Lateral
Spine	Compression #	AP spine
	Burst #	AP odontoid
	Cervical spine #	Lateral
		Oblique
		Swimmer's view: lateral view with arm abducted 180° to evaluate C7-T1 junction if lateral view is inadequate
		Lateral flexion/extension view: evaluate subluxation of cervical vertebrae

Orthopedic Emergencies

Trauma Patient Workup

Etiology

- high energy trauma, e.g. MVC, fall from height
- may be associated with spinal injuries or life-threatening visceral injuries

Clinical Presentation

- local swelling, tenderness, deformity of the limbs, and instability of the pelvis or spine
- decreased level of consciousness, hypotension/hypovolemia
- consider involvement of EtOH or other substances

Investigations

- trauma survey (see [Emergency Medicine, ER5](#))
- x-rays: lateral cervical spine, AP chest, AP pelvis, AP and lateral of all bones suspected to be injured
- other views of pelvis: AP, inlet, and outlet; Judet views for acetabular fracture (for classification of pelvic fractures see [Table 19, OR26](#))

Treatment

- ABCDEs and initiate resuscitation for life threatening injuries
- assess genitourinary injury (rectal exam/vaginal exam mandatory)
- external or internal fixation of all fractures
- DVT prophylaxis

Complications

- **hemorrhage – life threatening** (may produce signs and symptoms of hypovolemic shock)
- fat embolism syndrome (SOB, hypoxemia, petechial rash, thrombocytopenia, and neurological symptoms)
- venous thrombosis – DVT and PE
- bladder/urethral/bowel injury
- neurological damage
- persistent pain/stiffness/limp/weakness in affected extremities
- post-traumatic OA of joints with intra-articular fractures
- sepsis if missed open fracture

Open Fractures

Definition

- fractured bone and hematoma in communication with the external environment

Emergency Measures

- removal of obvious foreign material
- irrigate with normal saline if grossly contaminated

Buck's Traction

A system of weights, pulleys, and ropes that are attached to the end of a patient's bed exerting a longitudinal force on the distal end of a fracture, improving its length, alignment, and rotation

Orthopedic Emergencies

VON CHOP

Vascular compromise

Open fracture

Neurological compromise/cauda equina syndrome

Compartment syndrome

Hip dislocation

Osteomyelitis/septic arthritis

Unstable Pelvic fracture

Antibiotics for Preventing Infection in Open Limb Fractures

Cochrane DB Syst Rev 2004;1:CD003764

Purpose: To review the evidence regarding the effectiveness of antibiotics in the initial treatment of open fractures of the limbs.

Methods: Randomized or quasi randomized controlled trials comparing antibiotic treatment with placebo or no treatment in preventing acute wound infection were identified and reviewed. Data were extracted and pooled for analysis.

Results: Eight studies (n=1,106) were reviewed. The use of antibiotics had a protective effect against early infection compared with no antibiotics or placebo (RRR=0.43, 95% CI 0.29, 0.65; ARR=0.07, 95% CI 0.03=0.10).

Conclusions: Antibiotics reduce the incidence of early infections in open fractures of the limbs.

33% of patients with open fractures have multiple injuries

- cover wound with sterile dressings
- immediate IV antibiotics
- tetanus toxoid or immunoglobulin as needed
- reduce and splint fracture
- NPO and prepare for OR (blood work, consent, ECG, CXR)
 - operative irrigation and debridement within 6-8 h to decrease risk of infection
 - traumatic wound often left open to drain but vacuum-assisted closure dressing may be used
 - re-examine with repeat I&D in 48 h

Table 5. Gustilo Classification of Open Fractures

Gustilo Grade	Length of Open Wound	Description	Prophylactic Antibiotic Regimen
I	<1 cm	Minimal contamination and soft tissue injury Simple or minimally comminuted fracture	First generation cephalosporin (cefazolin) for 3 d If allergy use fluoroquinolone If MRSA positive use vancomycin
II	1-10 cm	Moderate contamination Soft tissue injury	First generation cephalosporin (cefazolin) for 3 d plus Gram-negative coverage (gentamicin) for at least 3 d
III*	>10 cm	IIIA: Extensive soft tissue injury with adequate ability of soft tissue to cover wound IIIB: Extensive soft tissue injury with periosteal stripping and bone exposure; inadequate soft tissue to cover wound IIIC: Vascular injury/compromise	As per Grade II For soil contamination, penicillin is added for clostridial coverage

*Any high energy, comminuted fracture, shot gun, farmyard/soil/water contamination, exposure to oral flora, or fracture >8 h old is immediately classified as Grade III

Controversies in Initial Management of Open Fractures

Scand J Surg 2014;103(2):132-137

Study: Literature review examining the initial management of open fractures. 40 studies included.

Findings:

- A first generation cephalosporin (or clindamycin) should be administered upon arrival. In general, 24 h of antibiotics after each debridement is sufficient to reduce infection rates.
- Although cultures are taken from delayed (>24 h) or infected injuries, it may not be necessary to routinely take post-debridement cultures in open fractures.
- Open fractures should be debrided as soon as possible although the "6-hr rule" is not generally valid.
- Wounds should be closed within 7 d once soft tissue has stabilized and all non-viable tissue removed.
- Negative pressure wound therapy (NPWT) has been shown to decrease infection rates in open fractures.

Cauda Equina Syndrome

- see [Neurosurgery](#), NS26

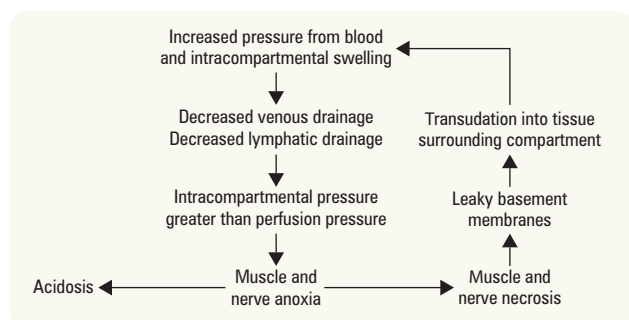

Compartment Syndrome

Definition

- increased interstitial pressure in an anatomical compartment (forearm, calf) where muscle and tissue are bounded by fascia and bone (fibro-osseous compartment) with little room for expansion
- interstitial pressure exceeds capillary perfusion pressure leading to muscle necrosis (in 4-6 h) and eventually nerve necrosis

Etiology

- intracompartmental: fracture (particularly tibial shaft fractures, pediatric supracondylar fractures, and forearm fractures), crush injury, ischemia-reperfusion injury
- extracompartmental: constrictive dressing (circumferential cast, poor positioning during surgery), circumferential burn

**Figure 9. Pathogenesis of compartment syndrome**

Clinical Features

- pain with active contraction of compartment
- pain with passive stretch
- swollen, tense compartment
- suspicious history
- 5 Ps: late sign – do not wait for these to develop to make the diagnosis!

Cauda equina syndrome is a surgical emergency

5 Ps of Compartment Syndrome

Pain: out of proportion for injury and not relieved by analgesics

- Increased pain with passive stretch of compartment muscles (most specific sign)

Pallor: late finding

Paresthesia

Paralysis: late finding

Pulselessness: late finding

Investigations

- usually not necessary as compartment syndrome is a clinical diagnosis
- in children or unconscious patients where clinical exam is unreliable, compartment pressure monitoring with catheter AFTER clinical diagnosis is made (normal = 0 mmHg; elevated ≥ 30 mmHg or ≤ 30 mmHg of diastolic BP)

Treatment

- non-operative
 - remove constrictive dressings (casts, splints), elevate limb at the level of the heart
- operative
 - urgent fasciotomy
 - 48-72 h post-operative: wound closure \pm necrotic tissue debridement

Complications

- rhabdomyolysis, renal failure secondary to myoglobinuria
- Volkmann's ischemic contracture: ischemic necrosis of muscle, followed by secondary fibrosis and finally calcification; especially following supracondylar fracture of humerus

Most important sign is increased pain with passive stretch. Most important symptom is pain out of proportion to injury

Rapid progression of signs and symptoms (over hours) necessitates need for serial examinations

**Plain Film Findings of Osteomyelitis**

- Soft tissue swelling
- Lytic bone destruction*
- Periosteal reaction (formation of new bone, especially in response to #)*

*Generally not seen on plain films until 10-12 d after onset of infection

Acute osteomyelitis is a medical emergency which requires an early diagnosis and appropriate antimicrobial and surgical treatment

Osteomyelitis

Etiology

- most commonly caused by *Staphylococcus aureus*
- mechanism of spread: hematogenous (most common) vs. direct-inoculation vs. contiguous focus
- risk factors: recent trauma/surgery, immunocompromised patients, DM, IV drug use, poor vascular supply, peripheral neuropathy

Clinical Presentation

- symptoms: pain and fever
- on exam: erythema, tenderness, edema common \pm abscess/draining sinus tract; impaired function/WB

Diagnosis

- see [Medical Imaging, MI24](#)
- workup includes: WBC and diff, ESR, CRP, blood culture, aspirate culture/bone biopsy

Table 6. Treatment of Osteomyelitis

Acute Osteomyelitis	Chronic Osteomyelitis
IV antibiotics 4-6 wk; started empirically and adjusted after obtaining blood and aspirate cultures \pm surgery (I&D) for abscess or significant involvement \pm hardware removal (if present)	Surgical debridement Antibiotics: both local (e.g. antibiotic beads) and systemic (IV)

Septic Joint

Etiology

- most commonly caused by *Staphylococcus aureus* in adults
- consider coagulase-negative *Staphylococcus* in patients with prior joint replacement
- consider *Neisseria gonorrhoeae* in sexually active adults and newborns
- most common route of infection is hematogenous
- risk factors: age >80 yr, DM, RA, prosthetic joint, recent joint surgery, skin infection/ulcer, IV drug use, alcoholism, previous intra-articular corticosteroid injection

Clinical Presentation

- inability/refusal to bear weight, localized joint pain, erythema, warmth, swelling, pain on active and passive ROM, \pm fever

Investigations

- x-ray (to rule out fracture, tumor, metabolic bone disease), ESR, CRP, WBC, blood cultures
- joint aspirate: WBC $>80,000$ with $>90\%$ neutrophils, protein level >4.4 mg/dL, joint glucose level \ll blood glucose level, no crystals, positive Gram stain results
- listen for heart murmur (to reduce suspicion of infective endocarditis, use Duke Criteria)

Treatment

- IV antibiotics, empiric therapy (based on age and risk factors), adjust following joint aspirate C&S results
- for small joints: needle aspiration, serial if necessary until sterile
- for major joints such as knee, hip, or shoulder: urgent decompression and surgical drainage

**Plain Film Findings in a Septic Joint**

- Early (0-3 d): usually normal; may show soft-tissue swelling or joint space widening from localized edema
- Late (4-6 d): joint space narrowing and destruction of cartilage

Serial C-reactive protein (CRP) can be used to monitor response to therapy

Shoulder

Shoulder Dislocation

Prognosis

- recurrence rate depends on age of first dislocation: <20 yr = 65-95%; 20-40 yr = 60-70%; >40 yr = 2-4%

Specific Complications

- rotator cuff or capsular tear, shoulder stiffness
- injury to axillary nerve/artery, brachial plexus
- recurrent/unreduced dislocation (most common complication)

Investigations

- anterior dislocation x-rays (AP, trans-scapular, axillary views)
- posterior dislocation x-rays (AP, trans-scapular, axillary) or CT scan

Table 7. Anterior and Posterior Shoulder Dislocation

	Anterior Shoulder Dislocation (>90%)	Posterior Shoulder Dislocation (5%)
MECHANISM	Abducted arm is externally rotated/hyperextended, or blow to posterior shoulder Involuntary, usually traumatic; voluntary, atraumatic	Adducted, internally rotated, flexed arm FOOSH 3 Es (epileptic seizure, EtOH, electrocution) Blow to anterior shoulder
CLINICAL FEATURES		
Symptoms	Pain, arm slightly abducted and externally rotated with inability to internally rotate	Pain, arm is held in adduction and internal rotation; external rotation is blocked
Shoulder Exam	<p>"Squared off" shoulder</p> <p>Positive apprehension test: patient looks apprehensive with gentle shoulder abduction and external rotation to 90° since humeral head is pushed anteriorly and recreates feeling of anterior dislocation (see Figure 13)</p> <p>Positive relocation test: a posteriorly directed force applied during the apprehension test relieves apprehension since anterior subluxation is prevented</p> <p>Positive sulcus sign: presence of subacromial indentation with distal traction on humerus indicates inferior shoulder instability (see Figure 13)</p>	<p>Anterior shoulder flattening, prominent coracoid, palpable mass posterior to shoulder</p> <p>Positive posterior apprehension ("jerk") test: with patient supine, flex elbow 90° and adduct, internally rotate the arm while applying a posterior force to the shoulder; patient will "jerk" back with the sensation of subluxation (see Figure 13)</p> <p>Note: the posterior apprehension test is used to test for recurrent posterior instability, NOT for acute injury</p>
Neurovascular Exam Including	<p>Axillary nerve: sensory patch over deltoid and deltoid contraction</p> <p>Musculocutaneous nerve: sensory patch on lateral forearm and biceps contraction</p>	Full neurovascular exam as per anterior shoulder dislocation
RADIOGRAPHIC FINDINGS		
Axillary View	Humeral head is anterior	Humeral head is posterior
Trans-scapular 'Y' View	Humeral head is anterior to the center of the "Mercedes-Benz" sign	Humeral head is posterior to center of "Mercedes-Benz" sign
AP View	Sub-coracoid lie of the humeral head is most common	Partial vacancy of glenoid fossa (vacant glenoid sign) and >6 mm space between anterior glenoid rim and humeral head (positive rim sign), humeral head may resemble a lightbulb due to internal rotation (lightbulb sign)
Hill-Sachs and Bony Bankart Lesions	<p>± Hill-Sachs lesion: compression fracture of posterior humeral head due to forceful impaction of an anteriorly dislocated humeral head against the glenoid rim (see Figure 12)</p> <p>± bony Bankart lesion: avulsion of the anterior glenoid labrum (with attached bone fragments) from the glenoid rim (see Figure 12)</p>	<p>± reverse Hill-Sachs lesion (75% of cases): divot in anterior humeral head</p> <p>± reverse bony Bankart lesion: avulsion of the posterior glenoid labrum from the bony glenoid rim</p>

There are 4 Joints in the Shoulder:
glenohumeral, AC, sternoclavicular (SC), scapulothoracic

Shoulder passive ROM: abduction – 180°, adduction – 45°, flexion – 180°, extension – 45°, int. rotation – level of T4, ext. rotation – 40-45°

Factors Causing Shoulder Instability

- Shallow glenoid
- Loose capsule
- Ligamentous laxity

Frequency of Dislocations:

- Anterior shoulder > Posterior shoulder

The glenohumeral joint is the most commonly dislocated joint in the body since stability is sacrificed for motion

Figure 10. Shoulder joints

Posterior Shoulder Dislocation

Up to 60-80% are missed on initial presentation due to poor physical exam and radiographs

Figure 11. Mercedes-Benz

Table 7. Anterior and Posterior Shoulder Dislocation (continued)

	Anterior Shoulder Dislocation (>90%)	Posterior Shoulder Dislocation (5%)
TREATMENT	<p>Closed reduction with IV sedation and muscle relaxation</p> <p>Traction-countertraction: assistant stabilizes torso with a folded sheet wrapped across the chest while the surgeon applies gentle steady traction</p> <p>Stimson: while patient lies prone with arm hanging over table edge, hang a 5 lb weight on wrist for 15-20 min</p> <p>Hippocratic method: place heel into patient's axilla and apply traction to arm</p> <p>Cunningham's method: low risk, low pain; if not successful try above methods</p> <p>Obtain post-reduction x-rays</p> <p>Check post-reduction NVS</p> <p>Sling x 3 wk (avoid abduction and external rotation), followed by shoulder rehabilitation (dynamic stabilizer strengthening)</p>	<p>Closed reduction with sedation and muscle relaxation</p> <p>Inferior traction on a flexed elbow with pressure on the back of the humeral head</p> <p>Obtain post-reduction x-rays</p> <p>Check post-reduction NVS</p> <p>Sling in abduction and external rotation x 3 wk, followed by shoulder rehabilitation (dynamic stabilizer strengthening)</p>

**Figure 12. Posterior view of anterior dislocation causing Hill-Sachs and Bankart lesions****Figure 13. Shoulder maneuvers**

Rotator Cuff Disease

- rotator cuff consists of 4 muscles that act to stabilize humeral head within the glenoid fossa

Table 8. Rotator Cuff Muscles

Muscle	Muscle Attachments		Nerve Supply	Muscle Function
	Proximal	Distal		
Supraspinatus	Scapula	Greater tuberosity of humerus	Suprascapular nerve	Abduction
Infraspinatus	Scapula	Greater tuberosity of humerus	Suprascapular nerve	External rotation
Teres Minor	Scapula	Greater tuberosity of humerus	Axillary nerve	External rotation
Subscapularis	Scapula	Lesser tuberosity of humerus	Subscapular nerve	Internal rotation and adduction

SPECTRUM OF DISEASE: IMPINGEMENT, TENDONITIS, MICRO OR MACRO TEARS

Etiology

- impingement: "painful arc syndrome", compression of rotator cuff tendons (primarily supraspinatus) and subacromial bursa between the head of the humerus and the undersurface of acromion, AC joint, and CA ligament
 - leads to bursitis, tendonitis, and if left untreated, can lead to rotator cuff thinning and tear

**Figure 14. Muscles of the rotator cuff**

- anything that leads to a narrow subacromial space
 - glenohumeral muscle weakness leading to abnormal motion of humeral head
 - scapular muscle weakness leading to abnormal motion of acromion
 - acromial abnormalities such as congenital narrow space or osteophyte formation

Clinical Features

- night pain and difficulty sleeping on affected side
- pain worse with active motion; passive movement generally permitted
- weakness and loss of ROM especially between 90°-130° (e.g. trouble with overhead activities)
- tenderness to palpation over greater tuberosity
- rule out bicep tendinosis: Speed and Yergason's tests; SLAP lesion: O'Brien's test

Table 9. Rotator Cuff Special Tests

Test	Examination	Positive Test
Jobe's Test	Supraspinatus: place the shoulder in 90° of abduction and 30° of forward flexion and internally rotate the arm so that the thumb is pointing toward the floor	Weakness with active resistance suggests a supraspinatus tear
Lift-off Test	Subscapularis: internally rotate arm so dorsal surface of hand rests on lower back; patient instructed to actively lift hand away from back against examiner resistance (use Belly Press Test if too painful)	Inability to actively lift hand away from back suggests a subscapularis tear
Posterior-Cuff Test	Infraspinatus and teres minor: arm positioned at patient's side in 90° of flexion; patient instructed to externally rotate arm against the resistance of the examiner	Weakness with active resistance suggests posterior cuff tear
Neer's Test	Rotator cuff impingement: passive shoulder flexion	Pain elicited between 130-170° suggests impingement
Hawkins-Kennedy Test	Rotator cuff impingement: shoulder flexion to 90° and passive internal rotation	Pain with internal rotation suggests impingement
Painful Arc Test	Rotator cuff tendinopathy: patient instructed to actively abduct the shoulder	Pain with abduction >90° suggests tendinopathy

Rotator Cuff Muscles

Supraspinatus
Infraspinatus
Teres minor
Subscapularis

Screening Out Rotator Cuff Tears

- No night pain (SN 87.7%)
- No painful arc (SN 97.5%)
- No impingement signs (SN 97.2%)
- No weakness

Returning to the bedside: Using the history and physical examination to identify rotator cuff tears
JAM Geri Soc 2000;48:1633-1637

Ruling in Rotator Cuff Tears – 98% probability of rotator cuff tear if all 3 of the following are present:

- Supraspinatus weakness
- External rotation weakness
- Positive impingement sign(s)

Diagnosis of rotator cuff tears. *Lancet* 2001; 357:769-770

Does this Patient with Shoulder Pain have Rotator Cuff Disease? The Rational Clinical Examination Systematic Review

JAMA 2013;310:837-847

Study: 5 studies of sufficient quality including 30-203 shoulders and a prevalence of RCD ranging from 33-81%.

Results/Conclusions: Among pain provocation tests, a positive painful arc test had the greatest specificity and sensitivity (SP 81%, SN 71%). Among strength tests, a positive external rotation lag test and internal rotation lag test were the most accurate for full-thickness tears (SP 47%, SN 94%; SP 97%, SN 83% respectively). The internal rotation lag test was therefore also the most accurate for identifying patients without a full-thickness tear. A positive drop arm test is helpful to identify patients with RCD (SN 24%, SP 93%).

Figure 15. Rotator cuff tests

Investigations

- x-rays: AP view may show high riding humerus relative to glenoid, evidence of chronic tendonitis
- MRI: coronal/sagittal oblique and axial orientations are useful for assessing full/partial tears and tendinopathy ± arthrogram: geysers sign (injected dye leaks out of joint through rotator cuff tear)
- arthrogram: see full thickness tear, difficult to assess partial thickness tears

Treatment and Prognosis

- mild ("wear")
 - treatment is non-operative (physiotherapy, NSAIDs)
- moderate ("tear")
 - non-operative treatment ± steroid injection
- severe ("repair")
 - impingement that is refractory to 2-3 mo physiotherapy and 1-2 injections
 - may require arthroscopic or surgical repair, i.e. acromioplasty, rotator cuff repair

Acromioclavicular Joint Pathology

- 2 main ligaments attach clavicle to scapula: AC and CC ligaments

Mechanism

- fall onto shoulder with adducted arm (fall onto tip of shoulder)

Clinical Features

- palpate step deformity between distal clavicle and acromion (with dislocation)
- pain with adduction of shoulder and/or palpation over AC joint
- limited ROM

Pneumothorax or pulmonary contusion are potential complications of severe AC joint dislocation

Investigations

- x-rays: AP, Zanca view (10-15° cephalic tilt), axillary ± stress views (10 lb weight in patient's hand)

Treatment

- non-operative (**most common**): sling 1-3 wk, ice, analgesia, rehabilitation
- operative
 - indications: AC and CC ligaments are both torn and/or clavicle displaced posteriorly
 - procedure: number of different approaches involving AC/CC ligament reconstruction or screw/hook plate insertion

Table 10. Rockwood Classification of Acromioclavicular Joint Separation

Grade	Features	Treatment
I	Joint sprain, absence of complete tear of either ligament	Non-operative
II	Complete tear of AC ligament, incomplete tear of CC ligament, without marked elevation of lateral clavicular head	Non-operative
III	Complete tear of AC and CC ligaments, >5 mm elevation at AC joint, superior aspect of acromion is below the inferior aspect of the clavicle	Most non-operative, operative if laborer or high level athlete Will heal with step deformity, although most fully functional in 4-6 mo
IV-VI	Based on the anatomical structure the displaced clavicle is in proximity with	Operative in most cases

Clavicle Fracture

- incidence: proximal (5%), middle (80%), or distal (15%) third of clavicle
- common in children (unites rapidly without complications)

Mechanism

- fall on shoulder (87%), direct trauma to clavicle (7%), FOOSH (6%)

Clinical Features

- pain and tenting of skin
- arm is clasped to chest to splint shoulder and prevent movement

Treatment

- evaluate NVS of entire upper limb

Associated Injuries with Clavicle Fractures

- Up to 9% of clavicle fractures are associated with other fractures (most commonly rib fractures)
- Majority of brachial plexus injuries are associated with proximal third fractures

- medial and middle third clavicle fractures
 - figure-of-eight sling x 1-2 wk
 - early ROM and strengthening once pain subsides
 - if ends overlap >2 cm consider ORIF
- distal third clavicle fractures
 - undisplaced (with ligaments intact): sling x 1-2 wk
 - displaced (CC ligament injury): ORIF

Specific Complications (see *General Fracture Complications*, OR6)

- cosmetic bump usually only complication
- shoulder stiffness, weakness with repetitive activity
- pneumothorax, brachial plexus injuries, and subclavian vessel (all very rare)

Frozen Shoulder (Adhesive Capsulitis)

Definition

- disorder characterized by progressive pain and stiffness of the shoulder usually resolving spontaneously after 18 mo

Mechanism

- primary adhesive capsulitis
 - idiopathic, usually associated with DM
 - usually resolves spontaneously in 9-18 mo
- secondary adhesive capsulitis
 - due to prolonged immobilization
 - shoulder-hand syndrome: CRPS/RSD characterized by arm and shoulder pain, decreased motion, and diffuse swelling
 - following MI, stroke, shoulder trauma
 - poorer outcomes

Clinical Features

- gradual onset (wk to mo) of diffuse shoulder pain with:
 - decreased active AND passive ROM
 - pain worse at night and often prevents sleeping on affected side
 - increased stiffness as pain subsides: continues for 6-12 mo after pain has disappeared

Investigations

- x-rays may be normal, or may show demineralization from disease

Treatment

- Freezing Phase
 - active and passive ROM (physiotherapy)
 - ♦ NSAIDs and steroid injections if limited by pain
- Thawing Phase
 - manipulation under anesthesia and early physiotherapy
 - ♦ arthroscopy for debridement/decompression

Conditions Associated with an Increased Incidence of Adhesive Capsulitis:

- Prolonged immobilization (most significant)
- Female gender
- Age >49 yr
- DM (5x)
- Cervical disc disease
- Hyperthyroidism
- Stroke
- Myocardial infarction
- Trauma and surgery

Humerus

Proximal Humeral Fracture

Mechanism

- young: high energy trauma (MVC)
- elderly: FOOSH from standing height in osteoporotic individuals

Clinical Features

- proximal humeral tenderness, deformity with severe fracture, swelling, painful ROM, bruising extends down arm later

Investigations

- test axillary nerve function (deltoid contraction and skin over deltoid)
- x-rays: AP, trans-scapular, axillary are essential
- CT scan: to evaluate for articular involvement and fracture displacement

Classification

- Neer classification is based on 4 fracture fragments (see *Neer Classification* sidebar, OR16)
- displaced: displacement >1 cm and/or angulation >45°

Figure 16. Fractures of the proximal humerus

- the Neer system regards displacement, not the fracture line, as meeting criteria for a 'part' in the classification scheme
- \pm dislocated/subluxed: humeral head dislocated/subluxed from glenoid

Treatment

- treat osteoporosis if needed
- non-operative
 - nondisplaced - broad arm sling immobilization begin ROM in 7-10 d to prevent stiffness
 - minimally displaced - closed reduction with sling immobilization x 2 wk, gentle ROM
- operative
 - ORIF (anatomic neck fractures, displaced, associated dislocated glenohumeral joint)
 - hemiarthroplasty may be necessary, especially in elderly

Specific Complications (see *General Fracture Complications*, OR6)

- AVN, axillary nerve palsy, malunion, post-traumatic arthritis

Anatomic neck fractures disrupt blood supply to the humeral head and AVN of the humeral head may ensue

Neer Classification

Based on 4 parts of humerus

- Greater Tuberosity
- Lesser Tuberosity
- Humeral Head
- Shaft

One-part fracture: any of the 4 parts with none displaced

Two-part fracture: any of the 4 parts with 1 displaced

Three-part fracture: displaced fracture of surgical neck + displaced greater tuberosity or lesser tuberosity

Four-part fracture: displaced fracture of surgical neck + both tuberosities

70-80% of proximal humeral fractures are non-displaced and managed non-operatively; of displaced fractures, 20% are two-part, 5% are three-part, and <1% are four-part

Acceptable Humeral Shaft Deformities for Non-Operative Treatment

- <20° anterior angulation
- <30° varus angulation
- <3 cm of shortening

Risk of radial nerve and brachial artery injury

Three Joints at the Elbow

- Humeroradial joint
- Humeroulnar joint
- Radioulnar joint

Figure 17. X-ray of transverse displaced supracondylar fracture of humerus with elbow dislocation

Normal carrying angle of elbow is ~10° of valgus

Humeral Shaft Fracture

Mechanism

- direct blows/MVC (most common), FOOSH, twisting injuries, metastases (in elderly)

Clinical Features

- pain, swelling, \pm shortening, motion/crepitus at fracture site
- must test radial nerve function before and after treatment: look for drop wrist, sensory impairment dorsum of hand

Investigations

- x-rays: AP and lateral radiographs of the humerus including the shoulder and elbow joints

Treatment

- in general, humeral shaft fractures are treated non-operatively
- non-operative (**most common**)
 - \pm reduction; can accept deformity due to compensatory ROM of shoulder
 - hanging cast (weight of arm in cast provides traction across fracture site) with collar and cuff sling immobilization until swelling subsides, then Sarmiento functional brace, followed by ROM
- operative
 - indications: open fracture, neurovascular injury, unacceptable fracture alignment, polytrauma, segmental fracture, pathological fracture, "floating elbow" (simultaneous unstable humeral and forearm fractures), intra-articular
 - ORIF: plating (most common), IM rod insertion, external fixation

Specific Complications (see *General Fracture Complications*, OR6)

- radial nerve palsy: expect spontaneous recovery in 3-4 mo, otherwise send for EMG
- non-union: most frequently seen in middle 1/3
- decreased ROM
- compartment syndrome

Elbow

Supracondylar Fracture

- most common in pediatric population (peak age ~7 yr old), rarely seen in adults
- fracture of the distal 1/3 of humerus just proximal to capitulum and trochlea, usually transverse
- AIN injury commonly associated with extension type

Mechanism

- >96% are extension injuries via FOOSH (e.g. fall off monkey bars); <4% are flexion injuries

Clinical Features

- pain, swelling, point tenderness
- neurovascular injury: assess median and radial nerves, radial artery (check radial pulse)

Investigations

- x-rays: AP, lateral of elbow
- disruption of anterior humeral line suggests supracondylar fracture

Treatment

- reduction indications: evidence of arterial obstruction, unacceptable angulation, displaced (>50%)
- non-operative
 - nondisplaced: long arm plaster slab in 90° flexion x 3 wk
- operative
 - indications: displaced, vascular injury, open fracture
 - requires percutaneous pinning followed by limb cast with elbow flexed <90°
 - in adults, ORIF is necessary

Specific Complications (see *General Fracture Complications*, OR6)

- stiffness is most common
- brachial artery injury (kinking can occur if displaced fracture), median or ulnar nerve injury, compartment syndrome (leads to Volkmann's ischemic contracture), malalignment cubitus varus (distal fragment tilted into varus)

**Terrible Triad**

- Radial head fracture
- Coronoid fracture
- Elbow dislocation

**Figure 18. X-ray of fat pad sign****Mason Class 2 Radial Head Fracture**

CT reconstruction provides the best detail and ability to appreciate the anatomic orientation of the fracture pattern, enhancing surgical planning and prognosis

To avoid stiffness do not immobilize elbow joint > 2-3 wk

Radial Head Fracture

- a common fracture of the upper limb in young adults

Mechanism

- FOOSH with elbow extended and forearm pronated

Clinical Features

- marked local tenderness on palpation over radial head (lateral elbow)
- decreased ROM at elbow, mechanical block to forearm pronation and supination
- pain on pronation/supination

Investigations

- x-ray: enlarged anterior fat pad ("sail sign") or the presence of a posterior fat pad indicates effusion which could occur with occult radial head fractures

Table 11. Classification and Treatment of Radial Head Fractures

Mason Class	Radiographic Description	Treatment
1	Nondisplaced fracture	Elbow slab or sling x 3-5 d with early ROM
2	Displaced fracture	ORIF if: angulation >30°, involves ≥1/3 of the radial head, or if ≥3 mm of joint incongruity exists
3	Comminuted fracture	Radial head excision ± prosthesis
4	Comminuted fracture with posterior elbow dislocation	Radial head excision ± prosthesis

Specific Complications (see *General Fracture Complications*, OR6)

- myositis ossificans
- recurrent instability (if MCL injured and radial head excised)

**Figure 19. Lateral view of elbow****Elbow Dislocation**

The radio-capitellar line refers to an imaginary line along the longitudinal axis of the radius that passes through the center of the capitellum regardless of the degree of elbow flexion; if the radio-capitellar line does not pass through the center of the capitellum a dislocation should be suspected

The anterior humeral line refers to an imaginary line drawn along the anterior surface of the humeral cortex that passes through the middle third of the capitellum when extended inferiorly. In subtle supracondylar fractures the anterior humeral line is disrupted, typically passing through the anterior third of the capitellum

Olecranon Fracture

Mechanism

- direct trauma to posterior aspect of elbow (fall onto the point of the elbow)

Clinical Features

- ± loss of active extension due to avulsion of triceps tendon

Investigations

- x-rays: AP + lateral (require true lateral to determine fracture pattern)

Treatment

- non-displaced (<2 mm, stable): cast x 3 wk (elbow in 90° flexion) then gentle ROM
- displaced: ORIF (plate and screws or tension band wiring) and early ROM if stable

Elbow Dislocation

- third most common joint dislocation after shoulder and patella
- usually the radius and ulna are dislocated together, or the radius head dislocates and the ulna remains ("Monteggia")
- anterior capsule and collateral ligaments disrupted

Mechanism

- elbow hyperextension via FOOSH or valgus/supination stress during elbow flexion
- usually the radius and ulna are dislocated together, or the radius head dislocates and the ulna remains ("Monteggia")
- 90% are posterior/posterolateral, anterior are rare and usually devastating

Clinical Features

- elbow pain, swelling, deformity
- flexion contracture
- ± absent radial or ulnar pulses

Treatment

- assess NVS before reduction: brachial artery, median and ulnar nerves (can become entrapped during manipulation)
- closed reduction under conscious sedation (post-reduction x-rays required)
- Parvin's method: patient lies prone with arm hanging down; apply gentle traction downwards on wrist, as olecranon slips distally, gently lift up the arm at elbow to reduce joint
- long-arm splint with forearm in neutral rotation and elbow in 90° flexion
- early ROM (<2 wk)

Specific Complications (see *General Fracture Complications*, OR6)

- stiffness (loss of extension), intra-articular loose body, neurovascular injury (ulnar nerve, median nerve, brachial artery), radial head fracture
- recurrent instability uncommon

Epicondylitis

- lateral epicondylitis = "tennis elbow", inflammation of the common extensor tendon as it originates from the lateral epicondyle
- medial epicondylitis = "golfer's elbow", inflammation of the common flexor tendon as it originates from the medial epicondyle

Mechanism

- repeated or sustained contraction of the forearm muscles/chronic overuse

Clinical Features

- point tenderness over humeral epicondyle and/or distal to it
- pain upon resisted wrist extension (lateral epicondylitis) or wrist flexion (medial epicondylitis)
- generally a self-limited condition, but may take 6-18 mo to resolve

Treatment

- rest, ice, NSAIDs
- use brace/strap
- physiotherapy, stretching, and strengthening
- corticosteroid injection
- surgery: percutaneous or open release of common tendon from epicondyle (only after 6-12 mo of conservative therapy)

Tennis Elbow = lateral epicondylitis; pain associated with extension of wrist

**Elbow Joint Injection**

Inject at the center of the triangle formed by the lateral epicondyle, radial head, and olecranon

Forearm

Radius and Ulna Fracture

Mechanism

- commonly a FOOSH or high-energy direct blow
- fractures usually accompanied by displacement due to high force

Investigations

- x-ray: 1) AP and lateral of forearm; 2) AP, lateral, oblique of elbow and wrist
- CT if fracture is close to joint

Treatment

- goal is anatomic reduction since imperfect alignment significantly limits forearm pronation and supination
- ORIF with plates and screws; closed reduction with immobilization usually yields poor results for displaced forearm fractures (except in children)

Complications (see *General Fracture Complications*, OR6)

- soft tissue contracture resulting in limited forearm rotation – surgical release of tissue may be warranted

In all isolated ulna fractures, assess proximal radius to rule out a Monteggia fracture

**Bado Type Classification of Monteggia Fractures**

Based on the direction of displacement of the dislocated radial head, generally the same direction as the apex of the ulnar fracture

Type I: anterior dislocation of radial head (60%)

Type II: posterior dislocation of radial head (15%)

Type III: lateral dislocation of radial head (20%)

Type IV – combined: proximal fracture of the ulna and radius, dislocation of the radial head in any direction (<5%)

Monteggia Fracture

- more common and better prognosis in the pediatric age group when compared to adults

Definition

- fracture of the proximal ulna with radial head dislocation and proximal radioulnar joint injury

Mechanism

- direct blow on the posterior aspect of the forearm
- hyperpronation
- fall on the hyperextended elbow

Clinical Features

- decreased rotation of forearm \pm palpable lump at the radial head
- ulna angled apex anterior and radial head dislocated anteriorly (rarely the reverse deformity occurs)

Treatment

- adults: ORIF of ulna with indirect radius reduction in 90% of patients
- splint and early post-operative ROM if elbow completely stable, otherwise immobilization in plaster with elbow flexed for 6 wk
- pediatrics: attempt closed reduction and immobilization in plaster with elbow flexed for Bado Type I-III, surgery for Type IV

Specific Complications (see *General Fracture Complications*, OR6)

- PIN: most common nerve injury; observe for 3 mo as most resolve spontaneously
- radial head instability/redislocation
- radioulnar synostosis

Figure 20. Monteggia fracture

Figure 21. Nightstick fracture

Figure 22. Galeazzi fracture

Nightstick Fracture

Definition

- isolated fracture of ulna without dislocation of radial head

Mechanism

- direct blow to forearm (e.g. holding arm up to protect face)

Treatment

- non-displaced: below elbow cast (x 10 d) followed by forearm brace (~8 wk)
- displaced: ORIF if $>50\%$ shaft displacement or $>10^\circ$ angulation

Galeazzi Fracture

Definition

- fracture of the distal radial shaft with disruption of the DRUJ
- most commonly in the distal 1/3 of radius near junction of metaphysis/diaphysis
- 3x more common than Monteggia fracture

Mechanism

- hand FOOSH with axial loading of pronated forearm

Investigations

- x-rays
 - shortening of distal radius >5 mm relative to the distal ulna
 - widening of the DRUJ space on AP
 - dislocation of radius with respect to ulna on true lateral

Treatment

- ORIF of radius; afterwards assess DRUJ stability by balloting distal ulna relative to distal radius
- if DRUJ is stable and reducible, splint for 10-14 d with early ROM encouraged
- if DRUJ is unstable, ORIF or percutaneous pinning with long arm cast in supination x 6 wk

For all isolated radius fractures assess DRUJ to rule out a Galeazzi fracture

Wrist

Colles' Fracture

Definition

- extra-articular transverse distal radius fracture (~2 cm proximal to the radiocarpal joint) with dorsal displacement ± ulnar styloid fracture

Epidemiology

- most common fracture in those >40 yr, especially in women and those with osteoporotic bone

Mechanism

- FOOSH

Clinical Features

- "dinner fork" deformity
- swelling, ecchymoses, tenderness

Investigations

- x-ray: AP and lateral wrist

Treatment

- goal is to restore radial height, radial inclination (22°), volar tilt (11°) as well as DRUJ stability and useful forearm rotation
- closed reduction (think opposite of the deformity):
 - hematoma block (sterile prep and drape, local anesthetic injection directly into fracture site) or conscious sedation
 - closed reduction: 1) traction with extension (exaggerate injury), 2) traction with ulnar deviation, pronation, flexion (of distal fragment – not at wrist)
 - dorsal slab/below elbow cast for 5-6 wk
 - x-ray x 1 wk for 3 wk and at cessation of immobilization to ensure reduction is maintained
- obtain post-reduction films immediately; repeat reduction if necessary, consider external fixation or ORIF if failure of adequate closed reduction

Figure 23. Colles' fracture and associated bony deformity

Smith's Fracture

Definition

- volar displacement of the distal radius (i.e. reverse Colles' fracture)

Mechanism

- fall onto the back of the flexed hand

Treatment

- usually unstable and needs ORIF
- if patient is poor operative candidate, may attempt non-operative treatment
- closed reduction with hematoma block (reduction opposite of Colles')
- long-arm cast in supination x 6 wk

Complications of Wrist Fractures

- most common complications are poor grip strength, stiffness, and radial shortening
- distal radius fractures in individuals <40 yr of age are usually highly comminuted and are likely to require ORIF
- 80% have normal function in 6-12 mo

Table 12. Early and Late Complications of Wrist Fractures

Early	Late
Difficult reduction ± loss of reduction	Malunion, radial shortening
Compartment syndrome	Painful wrist secondary to ulnar prominence
Extensor pollicis longus tendon rupture	Frozen shoulder ("shoulder-hand syndrome")
Acute carpal tunnel syndrome	Post-traumatic arthritis
Finger swelling with venous block	Carpal tunnel syndrome
Complications of a tight cast/splint	CRPS/RSD

Figure 24. Normal wrist angles + wrist angles in Colles' fracture
Note the relative shortening of the radius relative to the ulna on AP view in Colles' fracture

Scaphoid Fracture

Epidemiology

- common in young men; not common in children or in patients beyond middle age
- most common carpal bone injured
- may be associated with other carpal or wrist injuries (e.g. Colles' fracture)

Mechanism

- FOOSH: impaction of scaphoid on distal radius, most commonly resulting in a transverse fracture through the waist (65%), distal (10%), or proximal (25%) scaphoid

Clinical Features

- pain with wrist movement
- tenderness in the anatomical "snuff box", over scaphoid tubercle, and pain with long axis compression into scaphoid
- usually nondisplaced

Investigations

- x-ray: PA, lateral, scaphoid views with wrist extension and ulnar deviation x 2 wk
- \pm CT or MRI
- bone scan rarely used
- **note:** a fracture may not be radiologically evident up to 2 wk after acute injury, so if a patient complains of wrist pain and has anatomical snuff box tenderness but a negative x-ray, treat as if positive for a scaphoid fracture and repeat x-ray 2 wk later to rule out a fracture; if x-ray still negative order CT or MRI

Treatment

- early treatment critical for improving outcomes
- non-displaced (<1 mm displacement/ $<15^\circ$ angulation): long-arm thumb spica cast x 4 wk then short arm cast until radiographic evidence of healing is seen (2-3 mo)
- displaced: ORIF with headless/countersink compression screw is the mainstay treatment, or percutaneous K-wire fixation (uncommon)

Specific Complications (see *General Fracture Complications*, OR6)

- most common: non-union/mal-union (use bone graft from iliac crest or distal radius with fixation to heal)
- AVN of the proximal fragment
- delayed union (recommend surgical fixation)

Prognosis

- fractures of the proximal third of the scaphoid have 70% rate of non-union or AVN
- waist fractures have healing rates of 80-90%
- distal third fractures have healing rates close to 100%

ORIF Colles' Fracture if Post-Reduction Demonstrates:

- Radial shortening >3 mm or,
- Dorsal tilt $>10^\circ$ or,
- Intra-articular displacement/step-off >2 mm

Figure 25. Carpal bones

Scaphoid Fracture Special Tests

Tender snuff box: 100% sensitivity, but 29% specific as positive with many other injuries of radial aspect of wrist with FOOSH

Figure 26. ORIF left scaphoid

The proximal pole of the scaphoid receives as much as 100% of its arterial blood supply from the radial artery that enters at the distal pole. A fracture through the proximal third disrupts this blood supply and results in a high incidence of AVN/non-union

Spine

Figure 27. Schematic diagram of vertebral anatomy

Adapted from: Moore KL, Agur AMR. *Essential Clinical Anatomy*, 3rd ed. Philadelphia: Lippincott Williams and Wilkins, 2007; 274

Fractures of the Spine

- see [Neurosurgery, NS32](#)

Table 13. Fracture Type and Column Involvement

Fracture Type	Column Failure	Stable/Unstable	Mechanism
Compression	Anterior	Stable	Compression
Burst	Anterior, middle	± Unstable	High-energy axial loading + flexion
Fracture-Dislocation	Anterior, middle, posterior	Unstable	Significant force applied to spine (flexion, extension, distraction, rotation, shear or axial load)
Flexion-Distriction	Middle, posterior	± Unstable	MVC (lap belt only) causing flexion and distraction (Chance fracture)

Cervical Spine

General Principles

- C1 (atlas): no vertebral body, no spinous process
- C2 (axis): odontoid = dens
- 7 cervical vertebrae; 8 cervical nerve roots
- nerve root exits above vertebra (i.e. C4 nerve root exits above C4 vertebra), C8 nerve root exits below C7 vertebra
- radiculopathy = impingement of nerve root
- myelopathy = impingement of spinal cord

Special Testing

- compression test: pressure on head worsens radicular pain
- distraction test: traction on head relieves radicular symptoms
- Valsalva test: Valsalva maneuver increases intrathecal pressure and causes radicular pain

Table 14. Cervical Radiculopathy/Neuropathy

Root	C5	C6	C7	C8
Motor	Deltoid Biceps Wrist extension	Biceps Brachioradialis	Triceps Wrist flexion Finger extension	Interossei Digital flexors
Sensory	Axillary nerve (patch over lateral deltoid)	Thumb and index finger	Middle finger	Ring and little finger
Reflex	Biceps	Biceps Brachioradialis	Triceps	Finger jerk

X-Rays for C-Spine

- AP spine: alignment
- AP odontoid: atlantoaxial articulation
- lateral
 - vertebral alignment: posterior vertebral bodies should be aligned (translation >3.5 mm is abnormal)
 - angulation: between adjacent vertebral bodies (>11° is abnormal)
 - disc or facet joint widening
 - anterior soft tissue space (at C3 should be ≤3 mm; at C4 should be ≤8-10 mm)
- oblique: evaluate pedicles and intervertebral foramen
- ± swimmer's view: lateral view with arm abducted 180° to evaluate C7-T1 junction if lateral view is inadequate
- ± lateral flexion/extension view: evaluate subluxation of cervical vertebrae

Differential Diagnosis of C-Spine Pain

- neck muscle strain, cervical spondylosis, cervical stenosis, RA (spondylitis), traumatic injury, whiplash, myofascial pain syndrome

C-SPINE INJURY

- see [Neurosurgery, NS33](#)

Thoracolumbar Spine

General Principles

- spinal cord terminates at conus medullaris (L1)
- individual nerve roots exit below pedicle of vertebra (i.e. L4 nerve root exits below L4 pedicle)

Compression

Burst

Fracture-dislocation

Figure 28. Compression, burst, and dislocation fractures

Canadian Cervical Spine Rule Compared with Computed Tomography: A Prospective Analysis

J Trauma 2011;71:352-355

Study: 3,201 blunt trauma patients screened with CCS. All patients received complete C-spine CT.

Results: 192 patients with C-spine fracture and 3,009 without fracture on CT. The sensitivity of CCS was 100% (192/192) and specificity 0.6% (18/3009) with a PPV of 6.03% (192/3182) and NPV of 100% (18/18).

Conclusions: CCS is very sensitive but not specific to determine the need for subsequent radiographic evaluation after blunt trauma.

C-Spine X-Ray in Trauma

Must see C7-T1

Canadian C-Spine Rule

Used to guide imaging for alert (GCS = 15) and stable patients with suspected C-spine injury

Obtain radiography if:

- Age ≥65
- Paresthesia in the extremities
- Inability to rotate neck >45° to the left and right
- Dangerous mechanism of injury (e.g. high speed MVC, fall from elevation >5 ft, etc.)

Canadian CT Head and C-Spine (CCC) Study Group. Canadian C-Spine Rule Study for alert and stable trauma patients. I. Background and rationale. *CJEM* 2002;4:84-90

Special Tests

- straight leg raise: passive lifting of leg (30-70°) reproduces radicular symptoms of pain radiating down posterior/lateral leg to knee ± into foot
- Lasegue maneuver: dorsiflexion of foot during straight leg raise makes symptoms worse or, if leg is less elevated, dorsiflexion will bring on symptoms
- femoral stretch test: with patient prone, flexing the knee of the affected side and passively extending the hip results in radicular symptoms of unilateral pain in lumbar region, buttock, or posterior thigh

Table 15. Lumbar Radiculopathy/Neuropathy

Root	L4	L5	S1
Motor	Quadriceps (knee extension + hip adduction) Tibialis anterior (ankle inversion + dorsiflexion)	Extensor hallucis longus Gluteus medius (hip abduction)	Peroneus longus + brevis (ankle eversion) Gastrocnemius + soleus (plantar flexion)
Sensory	Medial malleolus	1st dorsal webspace and lateral leg	Lateral foot
Reflex	Knee (patellar)	Medial hamstring*	Ankle (Achilles)
Test	Femoral stretch	Straight leg raise	Straight leg raise

*Unreliable

Differential Diagnosis of Back Pain

1. mechanical or nerve compression (>90%)
 - degenerative (disc, facet, ligament)
 - peripheral nerve compression (disc herniation)
 - spinal stenosis (congenital, osteophyte, central disc)
 - cauda equina syndrome
2. others (<10%)
 - neoplastic (primary, metastatic, multiple myeloma)
 - infectious (osteomyelitis, TB)
 - metabolic (osteoporosis)
 - traumatic fracture (compression, distraction, translation, rotation)
 - spondyloarthropathies (ankylosing spondylitis)
 - referred (aorta, renal, ureter, pancreas)

DEGENERATIVE DISC DISEASE

- loss of vertebral disc height with age results in:
 - bulging and tears of annulus fibrosus
 - change in alignment of facet joints
 - osteophyte formation
- can cause back-dominant pain
- management
 - non-operative
 - ♦ staying active with modified activity
 - ♦ back strengthening
 - ♦ NSAIDs
 - ♦ do not treat with opioids; no proven efficacy of spinal traction or manipulation
 - operative – rarely indicated
 - ♦ decompression ± fusion
 - ♦ no difference in outcome between non-operative and surgical management at 2 yr

Table 16. Types of Low Back Pain

	Mechanical Back Pain		Direct Nerve Root Compression	
	Disc Origin	Facet Origin	Spinal Stenosis	Root Compression
Pain Dominance	Back	Back	Leg	Leg
Aggravation	Flexion	Extension, standing, walking	Exercise, extension, walking, standing	Flexion
Onset	Gradual	More sudden	Congenital or acquired	Acute leg ± back pain
Duration	Long (wk, mo)	Shorter (d, wk)	Acute or chronic history (wk to mo)	Short episodes Attacks (min)
Treatment	Relief of strain, exercise	Relief of strain, exercise	Relief of strain, exercise	Relief of strain, exercise + surgical decompression if progressive or severe deficit

All trauma patients with suspected C-spine injury require immediate immobilization of C-spine at scene of accident with spine board, C-collar, and sandbags

Cauda equina syndrome and ruptured aortic aneurysms are causes of low back pain that are considered surgical emergencies

Red Flags for

BACK PAIN

Bowel or bladder dysfunction
Anesthesia (saddle)
Constitutional symptoms/malignancy
Chronic disease
Paresthesias
Age > 50 yr
IV drug use
Neuromotor deficits

Figure 29. Disc herniation causing nerve root compression

SPINAL STENOSIS

- definition: narrowing of spinal canal <10 mm
- etiology: congenital (idiopathic, osteopetrosis, achondroplasia) or acquired (degenerative, iatrogenic – post spinal surgery, ankylosing spondylosis, Paget’s disease, trauma)
- clinical features
 - ± bilateral back and leg pain
 - neurogenic claudication
 - ± motor weakness
 - normal back flexion; difficulty with back extension
- investigations: CT/MRI reveals narrowing of spinal canal, but gold standard = CT myelogram
- treatment
 - non-operative: vigorous physiotherapy (flexion exercises, stretch/strength exercises), NSAIDs, lumbar epidural steroids
 - operative: decompression surgery if conservative methods failed >6 mo

Table 17. Differentiating Claudication

	Neurogenic	Vascular
Aggravation	With standing or exercise Walking distance variable	Walking set distance
Alleviation	Change in position (usually flexion, sitting, lying down)	Stop walking
Time	Relief in ~10 min	Relief in ~2 min
Character	Neurogenic ± neurological deficit	Muscular cramping

Neurogenic claudication is position dependent; vascular claudication is exercise dependent

MRI abnormalities (e.g. spinal stenosis, disc herniation) are quite common in both asymptomatic and symptomatic individuals and are not necessarily an indication for intervention without clinical correlation

Sciatica

- Most common symptom of radiculopathy (L4-S3)
- Leg dominant, constant, burning pain
- Pain radiates down leg ± foot
- Most common cause = disc herniation

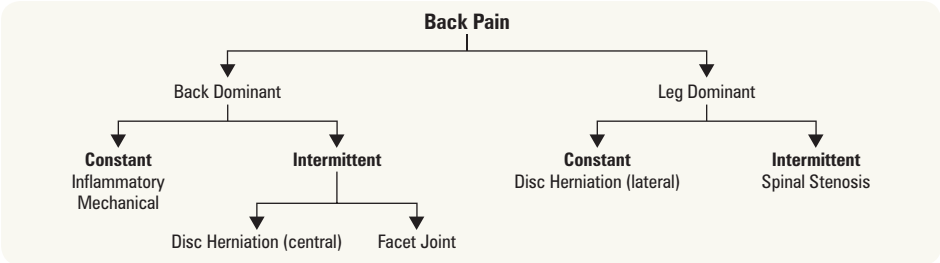

Figure 30. Approach to back pain

MECHANICAL BACK PAIN

- definition: back pain NOT due to prolapsed disc or any other clearly defined pathology
- clinical features
 - dull backache aggravated by activity
 - morning stiffness
 - no neurological signs
- treatment: symptomatic (analgesics, physiotherapy)
- prognosis: symptoms may resolve in 4-6 wk, others become chronic

LUMBAR DISC HERNIATION

- definition: tear in annulus fibrosus allows protrusion of nucleus pulposus causing either a central, posterolateral, or lateral disc herniation, most commonly at L5-S1 > L4-5 > L3-4
- etiology: usually a history of flexion-type injury
- clinical features
 - back dominant pain (central herniation) or leg dominant pain (lateral herniation)
 - tenderness between spinous processes at affected level
 - muscle spasm ± loss of normal lumbar lordosis
 - neurological disturbance is segmental and varies with level of central herniation
 - ♦ motor weakness (L4, L5, S1)
 - ♦ diminished reflexes (L4, S1)
 - ♦ diminished sensation (L4, L5, S1)
 - positive straight leg raise
 - positive Lasegue test
 - bowel or bladder symptoms, decreased rectal tone suggests cauda equina syndrome due to central disc herniation – surgical emergency
- investigations: MRI, consider a post-void residual volume to check for urinary retention; post-void >100 mL should heighten suspicion for cauda equine syndrome
- treatment

Figure 31. Spondylolysis, spondylolisthesis

Figure 32. “Scottie dog” fracture

- symptomatic
 - ♦ extension protocol (physiotherapy)
 - ♦ NSAIDs
- 90% resolve in 3 mo; surgical discectomy reserved for progressive neurological deficit, failure of symptoms to resolve within 3 mo, or cauda equina syndrome due to central disc herniation

SPONDYLOLYSIS

- definition: defect in the pars interarticularis with no movement of the vertebral bodies
- etiology
 - trauma: gymnasts, weightlifters, backpackers, loggers, laborers
- clinical features: activity-related back pain, pain with unilateral extension (Michelis' test)
- investigations
 - oblique x-ray: "collar" break in the "Scottie dog's" neck
 - bone scan
 - CT scan
- treatment: activity restriction, brace, stretching exercise

SPONDYLOLISTHESIS

- definition: defect in pars interarticularis causing a forward slip of one vertebra on another usually at L5-S1, less commonly at L4-5
- etiology: congenital (children), degenerative (adults), traumatic, pathological, teratogenic
- clinical features: lower back pain radiating to buttocks

Table 18. Classification and Treatment of Spondylolisthesis

Class	Percentage of Slip	Treatment
1	0-25%	Symptomatic operative fusion only for intractable pain
2	25-50	Same as above
3	50-75	Decompression for spondylolisthesis and spinal fusion
4	75-100	Same as above
5	>100	Same as above

Specific Complications

- may present as cauda equina syndrome due to roots being stretched over the edge of L5 or sacrum

Figure 33. Pelvic columns

Possible Radiological Findings:

- Pubic rami fractures: superior/inferior
- Pubic symphysis diastasis: common in AP compression (N=5 mm)
- Sacral fractures: common in lateral compression
- SI joint diastasis: common in AP compression (N=1-4 mm)
- Disrupted anterior column (iliopectineal line) or posterior column (ilioischial line)
- "Teardrop" displacement: acetabular fracture
- Iliac, ischial avulsion fractures
- Displacement of the major fragment: superior (VS), open book (APC), bucket handle (LC)

Pelvis

Pelvic Fracture

Mechanism

- young: high energy trauma, either direct or by force transmitted longitudinally through the femur
- elderly: fall from standing height, low energy trauma
- lateral compression (most common), vertical shear, or anteroposterior compression fractures

Clinical Features

- local swelling, tenderness
- deformity of lower extremity
- pelvic instability

Investigations

- x-ray: AP pelvis, inlet and outlet views, Judet views (obturator and iliac oblique for acetabular fracture)
 - 6 cardinal radiographic lines of the acetabulum: ilioischial line, iliopectineal line, tear drop, roof, posterior rim, anterior rim
- CT scan useful for evaluating posterior pelvic injury and acetabular fracture

**Type A
Stable Avulsion Fracture**

**Type B
Open Book**

**Type C
Unstable Vertical Fracture**

Figure 34. Illustration of the Tile classification of pelvic fractures

Classification

Table 19. Tile Classification of Pelvic Fractures (see Figure 34)

Type	Stability	Description
A	Rotationally stable Vertically stable	A1: fracture not involving pelvic ring A2: minimally displaced fracture of pelvic ring (e.g. ramus fracture)
B	Rotationally unstable Vertically stable	B1: open book B2: lateral compression – ipsilateral B3: lateral compression – contralateral
C	Rotationally unstable Vertically unstable	C1: unilateral C2: bilateral C3: associated acetabular fracture

Treatment

- ABCDEs
- assess genitourinary injury (rectal exam, vaginal exam, hematuria, blood at urethral meatus)
 - if involved, the fracture is considered an open fracture
- stable fractures: non-operative treatment, protected weight bearing
- emergency management
 - IV fluids/blood
 - pelvic binder/sheeting
 - external fixation vs. emergent angiography/embolization
 - \pm laparotomy (if FAST/DPL positive)
- indications for operative treatment
 - unstable pelvic ring injury
 - disruption of anterior and posterior SI ligament
 - symphysis diastasis >2.5 cm
 - vertical instability of the posterior pelvis

Specific Complications

 (see *General Fracture Complications*, OR6)

- hemorrhage (life-threatening)
- injury to rectum or urogenital structures
- obstetrical difficulties, sexual and voiding dysfunction
- persistent SI joint pain
- post-traumatic arthritis of the hip with acetabular fractures
- high risk of DVT/PE

Hip

Hip Dislocation

- full trauma survey (see *Emergency Medicine, Initial Patient Assessment/Management*, ER2)
- examine for neurovascular injury PRIOR to open or closed reduction
- reduce hip dislocations ASAP (ideally within 6 h) to decrease risk of AVN of the femoral head
- hip precautions (no extreme hip flexion, adduction, internal or external rotation) for 6 wk post-reduction
- see *Hip Dislocation after Total Hip Arthroplasty*, OR28

ANTERIOR HIP DISLOCATION

- mechanism: posteriorly directed blow to knee with hip widely abducted
- clinical features: shortened, abducted, externally rotated limb
- treatment
 - closed reduction under conscious sedation/GA
 - post-reduction CT to assess joint congruity

POSTERIOR HIP DISLOCATION

- most frequent type of hip dislocation
- mechanism: severe force to knee with hip flexed and adducted
 - e.g. knee into dashboard in MVC
- clinical features: shortened, adducted, internally rotated limb
- treatment
 - closed reduction under conscious sedation/GA only if associated femoral neck fracture
 - ORIF if unstable, intra-articular fragments or posterior wall fracture
 - post-reduction CT to assess joint congruity and fractures
 - if reduction is unstable, put in traction x 4-6 wk

Up to 50% of patients with hip dislocations suffer fractures elsewhere at the time of injury

Rochester Method to Reduce Dislocations

- Patient lying supine with hip and knee flexed on injured side
- Surgeon stands on patient's injured side
- Surgeon passes one arm under patient's flexed knee, reaching to place that hand on patient's other knee (thus supporting patient's injured leg)
- With other hand, surgeon grasps patient's ankle on injured side, applying traction, while assistant stabilizes pelvis
- Reduction via traction, internal rotation, then external rotation once femoral head clears acetabular rim

Figure 35. Rochester method

CENTRAL HIP DISLOCATION (rare)

- traumatic injury where femoral head is pushed medially through acetabulum

COMPLICATIONS FOR ALL HIP DISLOCATIONS

- post-traumatic OA
- AVN of femoral head
- fracture of femoral head, neck, or shaft
- sciatic nerve palsy in 25% (10% permanent)
- HO
- thromboembolism – DVT/PE

Hip Fracture

General Features

- acute onset of hip pain
- unable to weight-bear
- shortened and externally rotated leg
- painful ROM

Figure 36. Subcapital, intertrochanteric, subtrochanteric fractures

Table 20. Overview of Hip Fractures

Fracture Type	Definition	Mechanism	Special Clinical Features	Investigations	Treatment	Complications
Femoral Neck (Subcapital)	Intracapsular (See <i>Garden Classification</i> , Table 21)	Young: MVC, fall from height Elderly: fall from standing, rotational force	Same as general	X-ray: AP hip, AP pelvis, cross table lateral hip		DVT, non-union, AVN
Intertrochanteric Stable: intact posteromedial cortex Unstable: non-intact posteromedial cortex	Extracapsular fracture including the greater and lesser trochanters and transitional bone between the neck and shaft	Same as femoral neck fracture Direct or indirect force transmitted to the intertrochanteric area	Ecchymosis at back of upper thigh	X-ray: AP pelvis, AP/lateral hip	Closed reduction under fluoroscopy then dynamic hip screw or IM nail	DVT, varus displacement of proximal fragment, malrotation, non-union, failure of fixation device
Subtrochanteric	Fracture begins at or below the lesser trochanter and involves the proximal femoral shaft	Young: high energy trauma Elderly: osteopenic bone + fall, pathological fracture	Ecchymosis at back of upper thigh	X-ray: AP pelvis, AP/lateral hip and femur	Closed/open under fluoroscopy then plate fixation or IM nail	Malalignment, non-union, wound infection

Table 21. Garden Classification of Femoral Neck Fractures

Type	Displacement	Extent	Alignment	Trabeculae	Treatment
I	None	"Incomplete"	Valgus or neutral	Malaligned	Internal fixation to prevent displacement (valgus impacted fracture)
II	None	Complete	Neutral	Aligned	Internal fixation to prevent displacement
III	Some	Complete	Varus	Malaligned	Young: ORIF Elderly: hemi-/total hip arthroplasty
IV	Complete	Complete	Varus	Aligned	Young: ORIF Elderly: hemi-/total hip arthroplasty

**X-Ray Features of Subcapital Hip Fractures**

- Disruption of Shenton's line (a radiographic line drawn along the upper margin of the obturator foramen, extending along the inferomedial side of the femoral neck)
- Altered neck-shaft angle (normal is 120-130°)

**DVT Prophylaxis in Hip Fractures**

LMWH (i.e. enoxaparin 40 mg SC bid), fondaparinux, low dose heparin on admission, do not give <12 h before surgery

**AVN of Femoral Head**

- Distal to proximal blood supply along femoral neck to head (medial and lateral femoral circumflex arteries)
- Susceptible to AVN if blood supply disrupted
- Etiology: femoral neck fracture, chronic systemic steroid use, SCFE, Legg-Calvé-Perthes, SLE, RA

Figure 37. Garden classification of femoral neck fractures

Arthritis of the Hip

Etiology

- OA, inflammatory arthritis, post-traumatic arthritis, late effects of congenital hip disorders, or septic arthritis

Clinical Features

- pain (groin, medial thigh) and stiffness aggravated by activity
- morning stiffness >1 h, multiple joint swelling, hand nodules (RA)
- decreased ROM (internal rotation is lost first)
- crepitus
- \pm fixed flexion contracture leading to apparent limb shortening (Thomas test)
- \pm Trendelenberg sign

Investigations

- x-ray
 - OA: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes
 - RA: osteopenia, erosion, joint space narrowing, subchondral cysts, symmetric joint space narrowing
- blood work: ANA, RF

Treatment

- non-operative: weight reduction, activity modification, physiotherapy, analgesics, walking aids
- operative: realign = osteotomy; replace = arthroplasty; fuse = arthrodesis
- complications with arthroplasty: component loosening, dislocation, HO, thromboembolism, infection, neurovascular injury, limb length discrepancy
- arthroplasty is standard of care in most patients with hip arthritis

DVT Prophylaxis in Elective THA
(continue 10-35 d post-operative)
Fondaparinux, low molecular weight heparin, or coumadin

Hip Dislocation after Total Hip Arthroplasty

Etiology

- THA that is unstable when hip is flexed, adducted and internally rotated, or extended and externally rotated (avoid flexing hip >90° or crossing legs for ~6 wk after surgery)

Epidemiology

- occurs in 1-4% of primary THA and 10-16% of revision THAs
- risk factors: neurological impairment, post-traumatic arthritis, revision surgery, substance abuse

Treatment

- external abduction splint to prevent hip adduction
- constrained acetabular component for recurrent dislocation if no issue with position of acetabular/femoral implants + knee immobilizer

Complications

- sciatic nerve palsy in 25% (10% permanent)
- HO

Figure 38. Distal femoral fractures

Femur

Femoral Diaphysis Fracture

Mechanism

- high energy trauma (MVC, fall from height, gunshot wound)
- in children, can result from low energy trauma (spiral fracture)

Clinical Features

- shortened, externally rotated leg (if fracture displaced)
- inability to weight-bear
- often open injury, always a Gustilo III (see Table 5, OR9)

Investigations

- AP pelvis, AP/lateral hip, femur, knee

Complications

- hemorrhage requiring transfusion
- fat embolism leading to ARDS
- extensive soft tissue damage
- ipsilateral hip dislocation/fracture (2-6%)
- nerve injury

Treatment

- stabilize patient
- immobilize leg
- ORIF with anterograde or retrograde IM nail, external fixator for unstable patients, open fractures, or highly vascular areas, or plate and screws for open growth plates within 24 h
- early mobilization and strengthening

It is important to rule out ipsilateral femoral neck fracture as they occur in 2-6% of femoral diaphysis fractures and are reportedly missed in 19-31% of cases

Distal Femoral Fracture

Mechanism

- direct high energy force or axial loading
- three types in addition to classification as intra-articular or extra-articular

Clinical Features

- extreme pain
- knee effusion (hemarthrosis)
- shortened, externally rotated leg if displaced
- neurovascular deficits can occur with displaced fracture

Treatment

- ORIF if displaced or intra-articular; may choose to manage non-operatively if nondisplaced or incomplete fracture
- early mobilization and strengthening

Complications (see *General Fracture Complications*, OR6)

- femoral artery tear
- popliteal artery injury
- nerve injury
- extensive soft tissue injury
- angulation deformities

Figure 39. Diagram of the right tibial plateau

Knee

Evaluation of Knee

Common Complaints

- general orthopedic history
- also inquire about common knee symptoms
 - locking: mechanical block to extension
 - ♦ torn meniscus/loose body in joint
 - pseudo-locking: limited ROM without mechanical block
 - ♦ effusion, muscle spasm after injury, arthritis
 - painful clicking (audible)
 - ♦ torn meniscus
 - giving way: instability
 - ♦ cruciate ligament or meniscal tear, patellar dislocation

Special Tests of the Knee

- **anterior and posterior drawer tests**
 - demonstrate ACL and PCL, respectively
 - ♦ knee flexed at 90°, foot immobilized, hamstrings released
 - ♦ if able to sublux tibia anteriorly (anterior drawer test), then ACL may be torn
 - ♦ if able to sublux tibia posteriorly (posterior drawer test), then PCL may be torn
 - ♦ anterior drawer test for ACL: 3.8 positive likelihood ratio, 0.30 negative likelihood ratio
- **Lachmann test**
 - demonstrates torn ACL
 - hold knee in 10-20° flexion, stabilizing the femur
 - try to sublux tibia anteriorly on femur
 - similar to anterior drawer test, more reliable due to less muscular stabilization
 - for ACL: 25.0 positive likelihood ratio, 0.1 negative likelihood ratio
- **Thessaly test**
 - demonstrates meniscal tear
 - patient stands flat footed on one leg while the examiner provides his or her hands for balance. The patient then flexes the knee to 20° and rotates the femur on the tibia medially and laterally three times while maintaining the 20° flexion
 - positive for a meniscal tear if the patient experiences medial or lateral joint line discomfort
 - for medial meniscus: 29.67 positive likelihood ratio, 0.11 negative likelihood ratio
 - for lateral meniscus: 23.0 positive likelihood ratio, 0.083 negative likelihood ratio
- **posterior sag sign**
 - demonstrates torn PCL
 - may give a false positive anterior draw sign
 - flex knees and hips to 90°, hold ankles and knees
 - view from the lateral aspect
 - if one tibia sags posteriorly compared to the other, its PCL is torn
- **pivot shift sign**
 - demonstrates torn ACL
 - start with the knee in extension
 - internally rotate foot, slowly flex knee while palpating and applying a valgus force
 - normal knee will flex smoothly
 - if incompetent ACL, tibia will sublux anteriorly on femur at start of maneuver. During flexion, the tibia will reduce and externally rotate about the femur (the "pivot")
 - reverse pivot shift (start in flexion, externally rotate, apply valgus and extend knee) suggests torn PCL
 - composite assessment for ACL: 25.0 positive likelihood ratio, 0.04 negative likelihood ratio
 - composite assessment for PCL: 21.0 positive likelihood ratio, 0.05 negative likelihood ratio
- **collateral ligament stress test**
 - palpate ligament for "opening" of joint space while testing
 - with knee in full extension, apply valgus force to test MCL, apply varus force to test LCL
 - repeat tests with knee in 20° flexion to relax joint capsule
 - opening only in 20° flexion due to MCL damage only
 - opening in 20° of flexion and full extension is due to MCL, cruciate, and joint capsule damage
- **tests for meniscal tear**
 - joint line tenderness
 - ♦ joint line pain when palpated
 - ♦ palpate one side at a time and watch patient's eyes
 - for meniscal tear: 0.9 positive likelihood ratio, 1.1 negative likelihood ratio
 - crouch compression test
 - ♦ joint line pain when squatting (anterior pain suggests patellofemoral pathology)

Figure 40. Knee ligament and anatomy

6 Degrees of Freedom of the Knee

- Flexion and extension
- External and internal rotation
- Varus and valgus angulation
- Anterior and posterior glide
- Medial and lateral shift
- Compression and distraction

On physical exam of the knee, do not forget to evaluate the hip

Figure 41. Anterior and posterior drawer test

Figure 42. McMurray test

- McMurray's test useful collaborative information
 - with knee in flexion, palpate joint line for painful "pop/click"
 - internally rotate foot, varus stress, and extend knee to test lateral meniscus
 - externally rotate foot, valgus stress, and extend knee to test medial meniscus
 - for meniscal tear: 1.3 positive likelihood ratio, 0.8 negative likelihood ratio
- composite assessment for meniscal tears: 2.7 positive likelihood ratio, 0.4 negative likelihood ratio

X-Rays

- AP standing, lateral
- skyline: tangential view with knees flexed at 45° to see patellofemoral joint
- 3-foot standing view: useful in evaluating leg length and varus/valgus alignment
- Ottawa Knee Rules (see [Emergency Medicine, ER17](#))

Knee History

CLIPS

Clicking
Locking
Instability
Pain (location)
Swelling

Physical exam difficult in acute knee injuries; immobilize leg and re-examine in 1 wk

Cruciate Ligament Tears

- ACL tear much more common than PCL tear

Table 22. Comparison of ACL and PCL Injuries

	Anterior Cruciate Ligament	Posterior Cruciate Ligament
Anatomy	From medial wall of lateral femoral condyle to the anteromedial and posterolateral intercondyloid eminence of the tibial plateau	Lateral wall of medial femoral condyle to posterior intercondyloid eminence of the tibial plateau
Mechanism	Sudden deceleration Hyperextension and internal rotation of tibia on femur (i.e. "plant and turn")	Sudden posterior displacement of tibia when knee is flexed or hyperextended (e.g. dashboard MVC injury)
History	Audible "pop" Immediate swelling Knee "giving way" Inability to continue activity	Audible "pop" Immediate swelling Pain with push off Cannot descend stairs
Physical	Effusion (hemarthrosis) Posterolateral joint line tenderness Positive anterior drawer Positive Lachmann Pivot shift Test for MCL, meniscal injuries	Effusion (hemarthrosis) Anteromedial joint line tenderness Positive posterior drawer Reverse pivot shift Other ligamentous, bony injuries
Treatment	Stable knee with minimal functional impairment: immobilization 2-4 wk with early ROM and strengthening High demand lifestyle: ligament reconstruction	Unstable knee or young person/high-demand lifestyle: ligament reconstruction Posterior sag

Figure 43. T1 MRI of torn ACL and PCL

Collateral Ligament Tears

Mechanism

- valgus force to knee = MCL tear
- varus force to knee = LCL tear

Clinical Features

- swelling/effusion
- tenderness above and below joint line medially (MCL) or laterally (LCL)
- joint laxity with varus or valgus force to knee
 - laxity with endpoint suggests partial tear
 - laxity with no endpoint suggests a complete tear
- test for other injuries (e.g. O'Donoghue's unhappy triad), common peroneal nerve injury

Treatment

- partial tear: immobilization x 2-4 wk with early ROM and strengthening
- complete tear: immobilization at 30° flexion
- multiple ligamentous injuries: surgical repair of ligaments

Partial ligamentous tears are much more painful than complete ligamentous tears

O'Donoghue's Unhappy Triad

- ACL rupture
- MCL rupture
- Meniscal damage (medial and/or lateral)

Meniscal Tears

- medial tear much more common than lateral tear

Mechanism

- twisting force on knee when it is partially flexed (e.g. stepping down and turning)
- requires moderate trauma in young person but only mild trauma in elderly due to degeneration

Clinical Features

- immediate pain, difficulty weight-bearing, instability, and clicking
- increased pain with squatting and/or twisting
- effusion (hemarthrosis) with insidious onset (24-48 h after injury)
- joint line tenderness medially or laterally
- locking of knee (if portion of meniscus mechanically obstructing extension)

Investigations

- MRI, arthroscopy

Treatment

- if not locked: ROM and strengthening (NSAIDs)
- if locked or failed above: arthroscopic repair/partial meniscectomy

Tissue Sources for ACL Reconstruction

- Hamstring
- Middle 1/3 patellar tendon (bone-patellar-bone)
- Allograft (e.g. cadaver)

ACL tear more common than PCL tear
MCL tear more common than LCL tear

Quadriceps/Patellar Tendon Rupture

Mechanism

- sudden forceful contraction of quadriceps during an attempt to stop
- more common in obese patients and those with pre-existing degenerative changes in tendon
 - DM, SLE, RA, steroid use, renal failure on dialysis

Clinical Features

- inability to extend knee or weight-bear
- possible audible “pop”
- patella in lower or higher position with palpable gap above or below patella respectively
- may have an effusion

Investigations

- ask patient to straight leg raise
- knee x-ray to rule out patellar fracture
- lateral view: patella alta with patella tendon rupture, patella baja (infera) with quadriceps tendon rupture

Treatment

- non-operative treatment for incomplete tears with preserved extension of knee
- surgical repair of tendon indicated for complete ruptures
- early surgical repair: better outcomes compared with delayed repair (>6 wk post injury)
- delayed repair complicated by quadriceps contracture, patella migration, and adhesions

Patella alta = high riding patella
Patella baja (infera) = low riding patella

Dislocated Knee

Mechanism

- high energy trauma
- by definition, caused by tears of multiple ligaments

Clinical Features

- classified by relation of tibia with respect to femur
 - anterior, posterior, lateral, medial, rotary
- knee instability
- effusion
- pain
- ischemic limb

Investigations

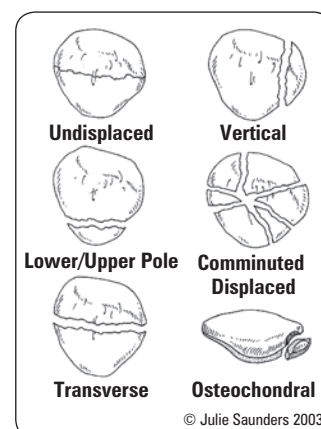

- x-rays: AP, lateral, skyline
 - associated radiographic findings include tibial plateau fracture dislocations, proximal fibular fractures, and avulsion of fibular head
- ankle brachial index (abnormal if <0.9)
- arteriogram or CT angiogram if abnormal vascular exam (such as abnormal pedal pulses)

Treatment

- urgent closed reduction
 - complicated by interposed soft tissue
- assessment of peroneal nerve, tibial artery, and ligamentous injuries
- repair of associated injuries; also may need decompressive fasciotomy especially if vascular repair undertaken
- knee immobilization x 6-8 wk

Specific Complications

- high incidence of associated injuries
 - popliteal artery tear
 - peroneal nerve injury
 - capsular tear
- chronic: instability, stiffness, post-traumatic arthritis

© Julie Saunders 2003

Figure 44. Types of patellar fractures**Complications**

- Symptomatic wiring
- Loss of reduction
- Osteonecrosis (proximal fragment)
- Hardware failure
- Knee stiffness
- Nonunion
- Infection

**Patellar Open Reduction and Internal Fixation**

- Longitudinal midline excision over patella
- Longitudinal cannulated screws with tension-band wiring fixation
- Preserve patellar bone
- Antibiotic, debridement, early fixation in open fracture

© Michael Corrin 2005

Figure 45. Q-angle

The angle between a vertical line through the patella and tibial tuberosity and a line from the ASIS to the middle patella. The larger the angle the greater the amount of lateral force on the knee (normal $<20^\circ$)

Patella

Patellar Fracture

Mechanism

- direct blow to the patella: fall, MVC (dashboard)
- indirect trauma by sudden flexion of knee against contracted quadriceps

Clinical Features

- marked tenderness
- inability to extend knee or straight leg raise
- proximal displacement of patella
- patellar deformity
- \pm effusion/hemarthrosis

Investigations

- x-rays: AP, lateral, skyline
- do not confuse with bipartite patella: congenitally unfused ossification centers with smooth margins on x-ray at superolateral corner

Treatment

- goal: restore extensor mechanism with maximal articular congruency
- non-displaced (step-off $<2-3$ mm and fracture gap $<1-4$ mm)
 - straight leg immobilization 1-4 wk with hinged knee brace, weight bearing as tolerated
 - progress in flexion after 2-3 wk
 - physiotherapy: quadriceps strengthening when pain has subsided
- displaced: ORIF (>2 mm)
- comminuted: ORIF; may require partial/complete patellectomy
- disrupted extensor mechanism: ORIF

Patellar Dislocation

Mechanism

- usually a non-contact twisting injury
- lateral displacement of patella after contraction of quadriceps at the start of knee flexion in an almost straight knee joint
- direct blow, e.g. knee/helmet to knee collision

Risk Factors

- young, female
- obesity
- high-riding patella (patella alta)
- knock-knees (genu valgus)
- Q-angle (quadriceps angle) $\geq 20^\circ$
- shallow intercondylar groove
- weak vastus medialis
- tight lateral retinaculum
- ligamentous laxity (Ehlers-Danlos)

Clinical Features

- knee catches or gives way with walking
- severe pain, tenderness anteromedially from rupture of capsule
- weak knee extension or inability to extend leg unless patella reduced

- positive patellar apprehension test
 - passive lateral translation results in guarding and patient apprehension
- often recurrent, self-reducing
- concomitant MCL injury

Investigations

- x-rays: AP, lateral, skyline view of patella
 - check for fracture of medial patella (most common) and lateral femoral condyle

Treatment

- non-operative first
 - non-operative
 - NSAIDs, activity modification, and physical therapy
 - short-term immobilization for comfort then 6 wk controlled motion
 - progressive weight bearing and isometric quadriceps strengthening
- if recurrent or if loose bodies present
 - surgical tightening of medial capsule and release of lateral retinaculum, possible tibial tuberosity transfer, or proximal tibial osteotomy

Patellofemoral Syndrome (Chondromalacia Patellae)

Mechanism

- softening, erosion and fragmentation of articular cartilage, predominantly medial aspect of patella
- commonly seen in active young females

Predisposing Factors

- malalignment causing patellar maltracking (Q angle $\geq 20^\circ$, genu valgus)
- post-trauma
- deformity of patella or femoral groove
- recurrent patellar dislocation, ligamentous laxity
- excessive knee strain (athletes)

Clinical Features

- deep, aching anterior knee pain
 - exacerbated by prolonged sitting (theatre sign), strenuous athletic activities, stair climbing, squatting or kneeling
- insidious onset and vague in nature
- sensation of instability, pseudolocking
- pain with extension against resistance through terminal 30-40°
- pain with compression of patella with knee ROM
- swelling rare, minimal if present
- palpable crepitus

Investigations

- x-rays: AP, lateral, skyline

Treatment

- non-operative
 - continue non-impact activities; rest and rehabilitation
 - NSAIDs
 - physiotherapy: vastus medialis and core strengthening
- surgical with refractory patients
 - tibial tubercle elevation
 - arthroscopic shaving/debridement
 - lateral release of retinaculum

Pain with firm compression of patella into medial femoral groove is pathognomonic of patellofemoral syndrome

Tibia

Tibial Plateau Fracture

Mechanism

- varus/valgus load \pm axial loading (e.g. fall from height)
- femoral condyles driven into proximal tibia
- can result from minor trauma in osteoporotics

Clinical Features

- frequency: lateral > medial
- medial fractures require higher energy – often have concomitant vascular injuries
- knee effusion
- inability to bear weight
- swelling
- associated with compartment syndrome

Classification

- Schatzker classification

Investigations

- x-rays: AP, lateral, oblique
- CT: pre-operative planning, identify articular depression and comminution

Treatment

Approach #1 (based on amount of depression seen on x-ray)	If depression on x-ray is <3 mm: Straight leg immobilization x 4-6 wk with progressive ROM weight bearing
	If depression is >3 mm: ORIF often requiring bone grafting to elevate depressed fragment
Approach #2 (based on varus/valgus instability)	If minimal varus/valgus instability (<15°): Straight leg immobilization x 4-6 wk with progressive ROM weight bearing
	If significant varus/valgus instability (>15°): ORIF often requiring bone grafting to elevate depressed fragment

Specific Complications (see *General Fracture Complications*, OR6)

- ligamentous injuries
- meniscal lesions
- AVN
- infection
- OA

Tibial Shaft Fracture

Mechanism

- low energy pattern: torsional injury
- high energy: including MVC, falls, sporting injuries

Clinical Features

- open vs. closed
- amount of displacement
- NVS
- most commonly fractured long bone
- most common open fracture

Investigations

- x-rays: AP, lateral, skyline
 - full length, plus knee and ankle

Treatment

- closed minimally displaced: straight leg cast x 4 wk, functional brace after
 - displaced: ORIF with reamed IM nail, plate and screws, or external fixator
- open
 - antibiotics, I&D
 - external fixation or IM nail
 - vascularized coverage of soft tissue defects (often heal poorly)

Specific Complications (see *General Fracture Complications*, OR6)

- high incidence of neurovascular injury and compartment syndrome
- poor soft tissue coverage (critical to outcome)

Schatzker Classification

Type	Description
I	Involvement of lateral plateau split fracture
II	Lateral split-depressed fracture
III	Involvement of lateral plateau: pure depression fracture
IV	Medial plateau fracture
V	Bicondylar plateau fracture
VI	Bicondylar with metaphyseal/diaphyseal involvement

Tibial shaft fractures have high incidence of compartment syndrome and are often associated with soft tissue injuries

Figure 46. Tibial shaft fracture treated with IM nail and screws

Low Molecular Weight Heparin for Prevention of Venous Thromboembolism in Patients with Lower-Leg Immobilization

Cochrane DB Syst Rev 2014;4:CD006681

Purpose: To evaluate the effectiveness of LMWH as VTE prophylaxis in patients with lower-leg immobilization in an ambulant setting.

Selection Criteria: RCTs and CCTs comparing LMWH to no prophylaxis or placebo in patients immobilized with a plaster cast or brace.

Results/Conclusions: 6 RCTs, 1,490 patients. Incidence of VTE was 4.3-40% in patients immobilized for >1 wk without thromboprophylaxis or with placebo. With daily LMWH subcutaneous injections, incidence was 0-37% (OR 0.49, 95% CI 0.34-0.72). There were no reports of heparin-induced thrombocytopenia. The use of LMWH in outpatients with lower-leg immobilization significantly reduces the number of VTE events.

Ankle

Evaluation of Ankle and Foot Complaints

Special Tests

- anterior drawer: examiner attempts to displace the foot anteriorly against a fixed tibia
- talar tilt: foot is stressed in inversion and angle of talar rotation is evaluated by x-ray

X-Ray

- AP, lateral
- mortise view: ankle at 15° of internal rotation
 - gives true view of ankle joint
 - joint space should be symmetric with no talar tilt
- Ottawa Ankle Rules should guide use of x-ray; nearly 100% sensitivity
- ± CT to better characterize fractures

Ottawa Ankle Rules (see [Emergency Medicine, ER17](#))

X-rays are only required if:

Pain in the malleolar zone AND bony tenderness over the posterior aspect of the medial or lateral malleolus OR inability to weight bear both immediately after injury and in the ER

Ankle Fracture

Mechanism

- pattern of fracture depends on the position of the ankle when trauma occurs
- generally involves
 - ipsilateral ligamentous tears or transverse bony avulsion
 - contralateral shear fractures (oblique or spiral)
- classification systems
 - Danis-Weber
 - Lauge-Hansen: based on foot's position and motion relative to leg

Danis-Weber Classification

- based on level of fibular fracture relative to syndesmosis
- **Type A** (infra-syndesmotom)
 - pure inversion injury
 - avulsion of lateral malleolus below plafond or torn calcaneofibular ligament
 - ± shear fracture of medial malleolus
- **Type B** (trans-syndesmotom)
 - external rotation and eversion (most common)
 - ± avulsion of medial malleolus or rupture of deltoid ligament
 - spiral fracture of lateral malleolus starting at plafond
- **Type C** (supra-syndesmotom)
 - pure external rotation
 - avulsion of medial malleolus or torn deltoid ligament
 - ± posterior malleolus avulsion with posterior tibio-fibular ligament
 - fibular fracture is above plafond (called Maisonneuve fracture if at proximal fibula)
 - frequently tears syndesmosis

Treatment

- undisplaced: NWB below knee cast
- indications for ORIF
 - any fracture-dislocation: restore vascularity, minimize articular injury, reduce pain and skin pressure
 - most of type B, and all of type C
 - trimalleolar (medial, posterior, lateral) fractures
 - talar tilt >10°
 - medial clear space on x-ray greater than superior clear space
 - open fracture/open joint injury
- high incidence of post-traumatic arthritis
- wrinkle test: skin shows wrinkles, to determine if soft tissue swelling has resolved to an extent to reduce complications

Figure 47. Ring principle of the ankle and Danis-Weber classification

Ligamentous Injuries

- see [Figure 48](#) for ankle ligaments

Medial Ligament Complex (deltoid ligament)

- eversion injury
- usually avulses medial or posterior malleolus and strains syndesmosis

With a history of trauma from axial loading of lower limb always consider spinal injuries, femoral neck, tibial plateau, and talar/calcaneal fractures

Lateral Ligament Complex (Anterior Talofibular, Calcaneofibular, Posterior Talofibular)

- inversion injury, >90% of all ankle sprains
- ATF most commonly and severely injured if ankle is plantar flexed
- swelling and tenderness anterior to lateral malleolus
- ++ ecchymoses
- positive ankle anterior drawer
- may have significant medial talar tilt on inversion stress x-ray

Treatment

- microscopic tear (Grade I)
 - rest, ice, compression, elevation (RICE)
- macroscopic tear (Grade II)
 - strap ankle in dorsiflexion and eversion x 4-6 wk
 - physiotherapy: strengthening and proprioceptive retraining
- complete tear (Grade III)
 - below knee walking cast x 4-6 wk
 - physiotherapy: strengthening and proprioceptive retraining
 - surgical intervention may be required if chronic symptomatic instability develops

Figure 48. Ankle ligament complexes

Foot

Talar Fracture

Mechanism

- axial loading or hyperdorsiflexion (MVC, fall from height)
- 60% of talus covered by articular cartilage
- talar neck is most common fracture of talus (50%)
- tenuous blood supply runs distal to proximal along talar neck
 - high risk of AVN with displaced fractures

Investigations

- x-rays: AP, lateral, Canale view
- CT to better characterize fracture
- MRI can clearly define extent of AVN

Treatment

- undisplaced: NWB below knee cast x 20-24 wk
- displaced: ORIF (high rate of nonunion, AVN)
- neck fracture: Pin (nondisplaced) or ORIF

Calcaneal Fracture

Mechanism

- high energy, axial loading: fall from height onto heels
- 10% of fractures associated with compression fractures of thoracic or lumbar spine (rule out spine injury)
- 75% intra-articular and 10% are bilateral

Physical Exam

- marked swelling, bruising on heel/sole
- wider, shortened, flatter heel when viewed from behind
- varus heel

Investigations

- x-rays: AP, lateral, oblique (Broden's view)
- loss of Bohler's angle
- CT: gold-standard, assess intra-articular extension

Treatment

- closed vs. open reduction is controversial
- NWB cast x 3 mo with early ROM and strengthening

Calcaneal Fracture Treatment Principles

- Avoid wound complications (10-25%)
- Restore articular congruity
- Restore normal calcaneal width and height
- Maximum functional recovery may take longer than 12 mo

Achilles Tendonitis

Mechanism

- chronic inflammation from activity or poor-fitting footwear
- may also develop heel bumps (retrocalcaneobursitis)

Physical Exam

- pain, stiffness, and crepitus with ROM
- thickened tendon, palpable bump

Treatment

- rest, NSAIDs, shoe wear modification
- heel sleeves and pads are mainstay of non-operative treatment
- gentle gastrocnemius-soleus stretching, eccentric training with physical therapy, deep tissue calf massage
- orthotics, open back shoes
- shockwave therapy in chronic tendonitis
- DO NOT inject steroids (risk of tendon rupture)

Achilles Tendon Rupture

Mechanism

- loading activity, stop-and-go sports (e.g. squash, tennis, basketball)
- secondary to chronic tendonitis, steroid injection

Clinical Features

- audible pop, sudden pain with push off movement
- sensation of being kicked in heel when trying to plantar flex
- palpable gap
- apprehensive toe off when walking
- weak plantar flexion strength
- Thompson test: with patient prone, plantar flexion when calf is squeezed by examiner
 - no passive plantar flexion is positive test = ruptured tendon

Treatment

- low demand or elderly: cast foot in plantar flexion (to relax tendon) x 8-12 wk
- high demand: surgical repair, then cast as above x 6-8 wk

Complications of Achilles Tendon Rupture

- Infection
- Sural nerve injury
- Rerupture: surgical repair decreases likelihood of rerupture compared to non-operative management

The most common site of Achilles tendon rupture is 2-6 cm from its insertion where the blood supply is the poorest

Plantar Fasciitis (Heel Spur Syndrome)

Mechanism

- repetitive strain injury causing microtears and inflammation of plantar fascia
- common in athletes (especially runners, dancers)
- also associated with obesity, DM, seronegative and seropositive arthritis

Clinical Features

- insidious onset of heel pain, pain when getting out of bed and stiffness
- intense pain when walking from rest that subsides as patient continues to walk, worse at end of day with prolonged standing
- swelling, tenderness over sole
- greatest at medial calcaneal tubercle and 1-2 cm distal along plantar fascia
- pain with toe dorsiflexion (stretches fascia)

Investigations

- plain radiographs to rule out fractures
- often see bony exostoses (heel spurs) at insertion of fascia into medial calcaneal tubercle
- spur is secondary to inflammation, not the cause of pain

Treatment

- pain control and stretching programs are first line
- rest, ice, NSAIDs, steroid injection
- physiotherapy: Achilles tendon and plantar fascia stretching, extracorporeal shockwave therapy
- orthotics with heel cup
 - to counteract pronation and disperse heel strike forces
- endoscopic surgical release of fascia in refractory cases
 - spur removal is not required

Figure 49. X-ray of bony heel spur

Bunions (Hallux Valgus)

Mechanism

- valgus alignment on 1st MTP (hallux valgus) causes eccentric pull of extensor and intrinsic muscles
- many associated deformities in foot from altered mechanics
- reactive exostosis forms with thickening of the skin creating a bunion
- most often associated with poor-fitting footwear (high heel and narrow toe box)
- can be hereditary (70% have family history)
- 10x more frequent in women

Clinical Features

- painful bursa over medial eminence of 1st MT head
- pronation (rotation inward) of great toe
- numbness over medial aspect of great toe

Investigations

- x-ray: standing AP/lateral/sesamoid view, NWB oblique

Treatment

- indications: painful corn or bunion, overriding 2nd toe
- non-operative first line
 - properly fitted shoes (low heel) and toe spacer
- surgical: goal is to restore normal anatomy, not cosmetic reasons alone
 - osteotomy with realignment of 1st MTP joint (Chevron Procedure)
 - arthrodesis

Figure 50. Hallux valgus

Metatarsal Fracture

- as with the hand, 1st, 4th, 5th MT are relatively mobile, while the 2nd and 3rd are fixed
- use Ottawa Foot Rules to determine need for x-ray

Table 23. Types of Metatarsal Fractures

Fracture Type	Mechanism	Clinical	Treatment
Avulsion of Base of 5th MT	Sudden inversion followed by contraction of peroneus brevis	Tender base of 5th MT	Requires ORIF if displaced
Midshaft 5th MT (Jones Fracture)	Stress injury	Painful shaft of 5th MT	*NWB BK cast x 6 wk ORIF if athlete
Shaft 2nd, 3rd MT (March Fracture)	Stress injury	Painful shaft of 2nd or 3rd MT	Symptomatic
1st MT	Trauma	Painful 1st MT	ORIF if displaced otherwise *NWB BK cast x 3 wk then walking cast x 2 wk
Tarso-MT Fracture – Dislocation (Lisfranc Fracture)	Fall onto plantar flexed foot or direct crush injury	Shortened forefoot prominent base	ORIF

*NWB BK = Non weight bearing, below knee

Ottawa Ankle and Foot Rules (see [Emergency Medicine, ER17](#))

X-rays only required if:

Pain in the midfoot zone AND bony tenderness over the navicular or base of the fifth metatarsal OR inability to weight bear both immediately after injury and in the ER

Greenstick fractures are easy to reduce but can redisplace while in cast due to intact periosteum

Pediatric Orthopedics

Fractures in Children

- type of fracture
 - thicker, more active periosteum results in pediatric specific fractures: greenstick (one cortex), torus (i.e. 'buckle', impacted cortex) and plastic (bowing)
 - distal radius fracture most common in children (phalanges second), the majority are treated with closed reduction and casting
 - adults fracture through both cortices
- epiphyseal growth plate
 - weaker part of bone, susceptible to fractures
 - plate often mistaken for fracture on x-ray and vice versa (x-ray opposite limb for comparison), especially in elbow
 - tensile strength of bone < ligaments in children, therefore clinician must be confident that fracture and/or growth plate injury have been ruled out before diagnosing a sprain
 - intra-articular fractures have worse consequences in children because they usually involve the growth plate

Figure 51. Greenstick (left) and torus (right) fractures

- anatomic reduction
 - gold standard with adults
 - may cause limb length discrepancy in children (overgrowth)
 - accept greater angular deformity in children (remodeling minimizes deformity)
- time to heal
 - shorter in children
- always be aware of the possibility of child abuse
 - make sure stated mechanism compatible with injury
 - high index of suspicion with fractures in non-ambulating children (<1 yr); look for other signs, including x-ray evidence of healing fractures at different sites and different stages of healing

Ossification Centers of the Elbow

CRITOE

Capitellum: 1 yr
 Radial head: 4 yr
 Internal (medial) epicondyle: 6 yr
 Trochlea: 8 yr
 Olecranon: 10 yr
 External (lateral) epicondyle: 12 yr
 (\pm 1 yr)

Stress Fractures

Mechanism

- insufficiency fracture
 - stress applied to a weak or structurally deficient bone
- fatigue fracture
 - repetitive, excessive force applied to normal bone
- most common in adolescent athletes
- tibia is most common site

Diagnosis and Treatment

- localized pain and tenderness over the involved bone
- plain films may not show fracture for 2 wk
- bone scan positive in 12-15 d
- treatment is rest from strenuous activities to allow remodeling (can take several months)

Evaluation of the Limping Child

- see [Pediatrics](#), P93

Epiphyseal Injury

Table 24. Salter-Harris Classification of Epiphyseal Injury

SALT(E)R-Harris Type	Description	Treatment
I (Straight through; Stable)	Transverse through growth plate	Closed reduction and cast immobilization (except SCFE – ORIF); heals well, 95% do not affect growth
II (Above)	Through metaphysis and along growth plate	Closed reduction and cast if anatomic; otherwise ORIF
III (Low)*	Through epiphysis to plate and along growth plate	Anatomic reduction by ORIF to prevent growth arrest, avoid fixation across growth plate
IV (Through and through)*	Through epiphysis and metaphysis	Closed reduction and cast if anatomic; otherwise ORIF
V (Ram)*	Crush injury of growth plate	High incidence of growth arrest; no specific treatment

* Types III – IV are more likely to cause growth arrest and progressive deformity

Slipped Capital Femoral Epiphysis

- type I Salter-Harris epiphyseal injury at proximal hip
- most common adolescent hip disorder, peak incidence at pubertal growth spurt
- risk factors: male, obese (#1 factor), hypothyroid (risk of bilateral involvement)

Etiology

- multifactorial
 - genetic: autosomal dominant, blacks > caucasians
 - cartilaginous physis hypertrophies too rapidly under growth hormone effects
 - sex hormone secretion, which stabilizes physis, has not yet begun
 - overweight: mechanical stress
 - trauma: causes acute slip

In SCFE, bilateral involvement occurs in about 25%

Figure 52. Salter-Harris classification

© Kimberly Chin

Ages 10-14, below associated with hypothyroidism**Clinical Features**

- acute: sudden, severe pain with limp
- chronic (typically): groin and anterior thigh pain, may present with knee pain
 - positive Trendelenburg sign on affected side, due to weakened gluteal muscles
- tender over joint capsule
- restricted internal rotation, abduction, flexion
 - Whitman's sign: obligatory external rotation during passive flexion of hip
- clinical classification: stable vs. unstable (provides prognostic information)
 - unstable means patient cannot ambulate even with crutches

Investigations

- x-rays: AP, frog-leg, lateral radiographs both hips
 - posterior and medial slip
 - disruption of Klein's line
 - AP view may be normal or show widened/lucent growth plate compared with opposite side

Treatment and Complications

- mild/moderate slip: stabilize physis with pins in current position
- severe slip: ORIF or pin physis without reduction and osteotomy after epiphyseal fusion
- complications: AVN (roughly half of unstable hips), chondrolysis (loss of articular cartilage, resulting in narrowing of joint space), pin penetration, premature OA, loss of ROM

**SCFE – Klein's Line**

On AP view, line drawn along superolateral border of femoral neck should cross at least a portion of the femoral epiphysis. If it does not, suspect SCFE

Developmental Dysplasia of the Hip

- most common orthopedic disorder in newborns
- due to ligamentous laxity, muscular underdevelopment, and abnormal shallow slope of acetabular roof
- spectrum of conditions that lead to hip subluxation and dislocation
 - dislocated femoral head completely out of acetabulum
 - dislocatable head in socket
 - head subluxates out of joint when provoked
 - dysplastic acetabulum, more shallow and more vertical than normal
- painless (if painful suspect septic dislocation)

Physical Exam

- diagnosis is clinical
 - limited abduction of the flexed hip (<50-60°)
 - affected leg shortening results in asymmetry in skin folds and gluteal muscles, wide perineum
 - Barlow's test (for dislocatable hip)
 - ♦ flex hips and knees to 90° and grasp thigh
 - ♦ fully adduct hips, push posteriorly to try to dislocate hips
 - Ortolani's test (for dislocated hip)
 - ♦ initial position as above but try to reduce hip with fingertips during abduction
 - ♦ positive test: palpable clunk is felt (not heard) if hip is reduced
 - Galeazzi's sign
 - ♦ knees at unequal heights when hips and knees flexed
 - ♦ dislocated hip on side of lower knee
 - ♦ difficult test if child <1 yr
 - ♦ Trendelenburg test and gait useful if older (>2 yr)

Investigations

- U/S in first few months to view cartilage (bone is not calcified in newborns until 4-6 mo)
- follow up radiograph after 3 mo
- x-ray signs: false acetabulum, acetabular index >25°, broken Shenton's line, femoral neck above Hilgenreiner's line, ossification center outside of inner lower quadrant (quadrants formed by intersection of Hilgenreiner's and Perkin's line)

Treatment and Complications

- 0-6 mo: reduce hip using Pavlik harness to maintain abduction and flexion
- 6-18 mo: reduction under GA, hip spica cast x 2-3 mo (if Pavlik harness fails)
- >18 mo: open reduction; pelvic and/or femoral osteotomy
- complications
 - redislocation, inadequate reduction, stiffness
 - AVN of femoral head

Figure 53. Barlow's test (checks if hips are dislocatable) **and Ortolani's test** (checks if hips are dislocated)

**5 Fs that Predispose to Developmental Dysplasia of the Hip**

Family history
Female
Frank breech
First born
LeFt hip

Legg-Calvé-Perthes Disease (Coxa Plana)

- idiopathic AVN of femoral head, presents at 4-8 yr of age
- etiology unknown, 12% bilateral, M>F = 5:1, 1/1,200
- associations
 - family history
 - low birth weight
 - abnormal pregnancy/delivery
 - ADHD in 33% of cases, delayed bone age in 89%
- key features
 - AVN of proximal femoral epiphysis, abnormal growth of the physis, and eventual remodelling of regenerated bone

Clinical Features

- child with antalgic limp ± pain
- intermittent knee, hip, groin, or thigh pain
- flexion contracture (stiff hip): decreased internal rotation and abduction of hip

Investigations

- x-rays: AP pelvis, frog leg laterals
 - may be negative early (if high index of suspicion, move to bone scan or MRI)
 - eventually, characteristic collapse of femoral head (diagnostic)

Treatment

- goal is to preserve ROM and keep femoral head contained in acetabulum
- physiotherapy: ROM exercises
- brace in flexion and abduction x 2-3 yr (controversial)
- femoral or pelvic osteotomy (>8 yr of age or severe)
 - prognosis better in males, <5 yr, <50% of femoral head involved, abduction >30°
- 60% of involved hips do not require operative intervention
- Natural history is early onset OA and decreased ROM

Children diagnosed with coxa plana
<6 yr of age have improved prognosis

Most common in adolescent athletes,
especially jumping/sprinting sports

Osgood-Schlatter Disease

Mechanism

- repetitive tensile stress on insertion of patellar tendon over the tibial tuberosity causes minor avulsion at the site and subsequent inflammatory reaction (tibial tubercle apophysitis)

Clinical Features

- tender lump over tibial tuberosity
- pain on resisted leg extension
- anterior knee pain exacerbated by jumping or kneeling, relieved by rest

Investigations

- x-rays: lateral knee: fragmentation of the tibial tubercle, ± ossicles in patellar tendon

Treatment

- benign, self-limited condition, does not resolve until growth halts
- may restrict activities such as basketball or cycling
- NSIADS, rest, flexibility, isometric strengthening exercises

Congenital Talipes Equinovarus (Club Foot)

Etiology

- intrinsic causes (neurologic, muscular, or connective tissue diseases) vs. extrinsic (intrauterine growth restriction), may be idiopathic, neurogenic, or syndrome-associated
- fixed deformity
- 3 parts to deformity
 - talipes: talus is inverted and internally rotated
 - equinus: ankle is plantar flexed
 - varus: heel and forefoot are in varus (supinated)
- 1-2/1,000 newborns, 50% bilateral, occurrence M>F, severity F>M

Physical Exam

- examine hips for associated DDH
- examine knees for deformity
- examine back for dysraphism (unfused vertebral bodies)

Figure 54. The club foot – depicting the gross and bony deformity

Treatment

- correct deformities in the following order (Ponseti Technique; 90% success rate)
 - forefoot adduction, ankle inversion, equinus
 - ♦ change strapping/cast q1-2wk
 - surgical release in refractory case (rare)
 - ♦ delayed until 3-4 mo of age
- 3 yr recurrence rate = 5-10%
- mild recurrence common; affected foot is permanently smaller/stiffer than normal foot with calf muscle atrophy

Scoliosis screening is not recommended in Canada (Griegel A, et al. 2010; Health Canada, 1994)

Scoliosis

Definition

- lateral curvature of spine with vertebral rotation

Epidemiology

- age: 10-14 yr
- more frequent and more severe in females

Etiology

- idiopathic: most common (90%)
- congenital: vertebrae fail to form or segment
- neuromuscular: UMN or LMN lesion, myopathy
- postural: leg length discrepancy, muscle spasm
- other: osteochondrodystrophies, neoplastic, traumatic

Clinical Features

- \pm back pain
- 1° curve where several vertebrae affected
- 2° curves above and below fixed 1° curve to try and maintain normal position of head and pelvis
- asymmetric shoulder height when bent forward
- Adam's test: rib hump when bent forward
- prominent scapulae, creased flank, asymmetric pelvis
- associated posterior midline skin lesions in neuromuscular scolioses
 - café-au-lait spots, dimples, neurofibromas
 - axillary freckling, hemangiomas, hair patches
- associated pes cavus or leg atrophy
- apparent leg length discrepancy

X-Rays

- 3-foot standing, AP, lateral
 - measure curvature: Cobb angle
 - may have associated kyphosis

Treatment

- based on Cobb angle
 - $<25^\circ$: observe for changes with serial radiographs
 - $>25^\circ$ or progressive: bracing (many types) that halt/slow curve progression but do NOT reverse deformity
 - $>45^\circ$, cosmetically unacceptable or respiratory problems: surgical correction (spinal fusion)

Figure 55. Cobb angle – used to monitor the progression of the scoliotic curve

In structural or fixed scoliosis, bending forwards makes the curve more obvious

Postural scoliosis can be corrected by correcting the underlying problem

Red Flags

- Persistent skeletal pain
- Localized tenderness
- Spontaneous fracture
- Enlarging mass/soft tissue swelling

Bone Tumors

- primary bone tumors are rare after 3rd decade
- metastases to bone are relatively common after 3rd decade

Table 25. Distinguishing Benign from Malignant Bone Lesions on X-ray

Benign	Malignant
No periosteal reaction	Acute periosteal reaction <ul style="list-style-type: none"> • Codman's triangle • "Onion skin" • "Sunburst"
Thick endosteal reaction	Broad border between lesion and normal bone
Well developed bone formation	Varied bone formation
Intraosseous and even calcification	Extraosseous and irregular calcification

Adapted from: Buckholtz RW, Heckman JD. Rockwood and Green's Fractures in Adults. Volume 1. Philadelphia: Lippincott Williams & Wilkins, 2001; 558

Figure 56. Codman's triangle – a radiographic finding in malignancy, where the partially ossified periosteum is lifted off the cortex by neoplastic tissue

Diagnosis

- pain, swelling, tenderness, rarely regional adenopathy
- routine x-ray findings
 - location (which bone, diaphysis, metaphysis, epiphysis)
 - size
 - lytic/lucent vs. sclerotic
 - involvement (cortex, medulla, soft tissue)
 - matrix (radiolucent, radiodense or calcified)
 - periosteal reaction
 - margin (geographic vs. permeative)
 - any pathological fracture
 - soft tissue swelling
- malignancy is suggested by rapid growth, warmth, tenderness, lack of sharp definition
- staging should include
 - blood work including liver enzymes
 - CT chest
 - bone scan
 - bone biopsy
 - ♦ should be referred to specialized center prior to biopsy
 - ♦ classified into benign, benign aggressive, and malignant
 - MRI of affected bone

Benign Active Bone Tumors

BONE-FORMING TUMORS

Osteoid Osteoma

- peak incidence in 2nd and 3rd decades, M:F = 2:1 (young males)
- proximal femur and tibia diaphysis most common locations
- not known to metastasize
- radiographic findings: small, round radiolucent nidus (<1 cm) surrounded by dense sclerotic bone ("bull's-eye")
- symptoms: produces severe intermittent pain from prostaglandin secretion and COX1/2 expression, mostly at night (diurnal prostaglandin production), thus is characteristically relieved by NSAIDs
- treatment: NSAIDs for night pain; surgical resection of nidus

FIBROUS LESIONS

Fibrous Cortical Defect

- occur in as many as 35% of children, peak incidence between 2-20 yr old, higher prevalence in males
- femur and proximal tibia most common locations, 50% of patients have multiple defects usually bilateral, symmetrical
- radiographic findings: diagnostic, metaphyseal eccentric 'bubbly' lytic lesion near physis; thin smooth/lobulated well-defined sclerotic margin
- treatment: most lesions resolve spontaneously

Osteochondroma

- 2nd and 3rd decades, M:F = 1.8:1
- most common of all benign bone tumors – 45%
- metaphysis of long bone near tendon attachment sites (usually distal femur, proximal tibia, or proximal humerus)
 - radiographic findings: cartilage-capped bony spur on surface of bone ("mushroom" on x-ray)
 - may be multiple (hereditary, autosomal dominant form) – higher risk of malignant change
- generally very slow growing and asymptomatic unless impinging on neurovascular structure ('painless mass')
 - growth usually ceases when skeletal maturity is reached
- malignant degeneration occurs in 1-2% (becomes painful or rapidly grows)

Enchondroma

- 2nd and 3rd decades
- 60% occur in the small tubular bones of the hand and foot; others in femur (20%), humerus, ribs
- benign cartilaginous growth, an abnormality of chondroblasts, develops in medullary cavity
 - single/multiple enlarged rarefied areas in tubular bones
 - lytic lesion with sharp margination and central calcification

Figure 57. T1 MRI of femoral enchondroma

Figure 58. X-ray of aneurysmal bone cyst. Note the aggressive destruction of bone

- malignant degeneration to chondrosarcoma occurs in 1-2% (pain in absence of pathologic fracture is an important clue)
- not known to metastasize

CYSTIC LESIONS

Unicameral/Solitary Bone Cyst

- most common cystic lesion
- children and young adults, peak incidence during first 2 decades, M:F = 2:1
- proximal humerus and femur most common
- symptoms: asymptomatic, or local pain; complete pathological fracture (50% presentations) or incidental detection
- radiographic findings: lytic translucent area on metaphyseal side of growth plate, cortex thinned/expanded; well defined lesion
- treatment: aspiration followed by steroid injection; curettage ± bone graft indicated if re-fracture likely

Benign Aggressive Bone Tumors

Giant Cell Tumors/Aneurysmal Bone Cyst/Osteoblastoma

- affects patients of skeletal maturity, peak 3rd decade
- osteoblastoma: found in the distal femur, proximal tibia, distal radius, sacrum, tarsal bones, spinae
- giant cell tumor: pulmonary metastases in 3%
- aneurysmal bone cysts: either solid with fibrous/granular tissue, or blood-filled
- radiographic findings
 - giant cell tumor: eccentric lytic lesions, in epiphyses adjacent to subchondral bone; may break through cortex; T2 MRI enhances fluid within lesion (hyper-intense signal)
 - aneurysmal bone cyst: expanded with honeycomb shape
 - osteoblastoma: often nonspecific; calcified central nidus (>2 cm) with radiolucent halo and sclerosis
- symptoms: local tenderness and swelling, pain may be progressive (giant cell tumors), ± symptoms of nerve root compression (osteoblastoma)
- 15% recur within 2 yr of surgery

Treatment

- intralesional curettage + bone graft or cement
- wide local excision of expendable bones

Figure 59. X-ray of osteosarcoma of distal femur

Malignant Bone Tumors

Table 26. Most Common Malignant Tumor Types for Age

Age	Tumor
<1	Neuroblastoma
1-10	Ewing's of tubular bones
10-30	Osteosarcoma, Ewing's of flat bones
30-40	Reticulum cell sarcoma, fibrosarcoma, periosteal osteosarcoma, malignant giant cell tumor, lymphoma
>40	Metastatic carcinoma, multiple myeloma, chondrosarcoma

Osteosarcoma

- most frequently diagnosed in 2nd decade of life (60%), 2nd most common primary malignancy in adults
- history of Paget's disease (elderly patients), previous radiation treatment
- predilection for sites of rapid growth: distal femur (45%), proximal tibia (20%), and proximal humerus (15%)
 - invasive, variable histology; frequent metastases without treatment (lung most common)
- painful symptoms: progressive pain, night pain, poorly defined swelling, decreased ROM
- radiographic findings:
 - characteristic periosteal reaction: Codman's triangle (see Figure 56) or "sunburst" spicule formation (tumor extension into periosteum)
 - destructive lesion in metaphysis may cross epiphyseal plate
- management: complete resection (limb salvage, rarely amputation), neo-adjuvant chemo; bone scan – rule out skeletal metastases, CT chest – rule out pulmonary metastases
- prognosis: 70% (high-grade); 90% (low-grade)

Figure 60. X-ray of femoral chondrosarcoma

Chondrosarcoma (see [Figure 60](#))

- primary (2/3 cases)
 - patient >40 yr; previous normal bone expands into cortex to give pain, pathological fracture, flecks of calcification
- secondary (1/3 cases)
 - malignant degeneration of pre-existing cartilage tumor such as enchondroma or osteochondroma
 - younger age group and better prognosis than primary chondrosarcoma
- symptoms: progressive pain, uncommonly palpable mass
- radiographic findings: in medullary cavity, irregular “popcorn” calcification
- treatment: unresponsive to chemotherapy, treat with aggressive surgical resection + reconstruction; regular follow-up x-rays of resection site and chest
- prognosis: 10 yr survival 90% low-grade, 20-40% high-grade

Ewing's Sarcoma

- most occur between 5-25 yr old
- florid periosteal reaction in metaphyses of long bone with diaphyseal extension
- metastases frequent without treatment
- signs/symptoms: presents with pain, mild fever, erythema and swelling, anemia, increased WBC, ESR, LDH (mimics an infection)
- radiographic findings: moth-eaten appearance with periosteal lamellated pattern (“onion-skinning”)
- treatment: resection, chemotherapy, radiation
- prognosis – 70%, worst prognostic factor is distant metastases

Multiple Myeloma

- most common primary malignant tumor of bone in adults (~43%)
- 90% occur in people >40 yr old, M:F = 2:1, African-Americans (twice as common)
- signs/symptoms: bone pain (cardinal early symptom), compression/pathological fractures, renal failure, nephritis, high incidence of infections (e.g. pyelonephritis/pneumonia), systemic (weakness, weight loss, anorexia)
- labs: anemia, thrombocytopenia, increased ESR, hypercalcemia
- radiographic findings: multiple, “punched-out” well-demarcated lesions, no surrounding sclerosis, marked bone expansion
- diagnosis
 - serum/urine immunoelectrophoresis (monoclonal gammopathy)
 - CT-guided biopsy of lytic lesions at multiple bony sites
- treatment: chemotherapy, bisphosphonates, radiation, surgery for symptomatic lesions or impending fractures – debulking, internal fixation
- prognosis: most 3 yr after diagnosis
- see [Hematology, H49](#)

Bone Metastases

- 2/3 from breast or prostate; also consider thyroid, lung, kidney
- usually osteolytic; prostate occasionally osteoblastic
- bone scan for MSK involvement, MRI for spinal involvement may be helpful
- stabilization of impending fractures
 - internal fixation, IM rods
 - bone cement

Table 27. Mirel's Criteria for Impending Fracture Risk and Prophylactic Internal Fixation

Variable	Number Assigned		
	1	2	3
Site	Upper arm	Lower extremity	Peritrochanteric
Pain	Mild	Moderate	Severe
Lesion	Blastic	Mixed	Lytic
Size	< 1/3 bone diameter	1/3-2/3 diameter	> 2/3 diameter

**Signs of Hypercalcemia**

"Bones, Stones, Moans, Groans,
Psychiatric overtones"

CNS: headache, confusion, irritability,
blurred vision

GI: N/V, abdominal pain, constipation,
weight loss

MSK: fatigue, weakness, unsteady gait,
bone and joint pain

GU: nocturia, polydipsia, polyuria, UTIs

**Most Common Tumors
Metastatic to Bone****BLT with a Kosher Pickle**

Breast
Lung
Thyroid
Kidney
Prostate

Common Medications

Table 28. Common Medications

Drug Name	Dosing Schedule	Indications	Comments
cefazolin (Ancef®)	1-2 g IV q8h	Prophylactically before orthopedic surgery	First generation cephalosporin; do not use with penicillin allergy
heparin	5000 IU SC q12h	To prevent venous thrombosis and pulmonary emboli	Monitor platelets, follow PTT which should rise 1.5-2x
LMWH			
dalteparin (Fragmin®)	5000 IU SC OD	DVT prophylaxis especially in hip and knee surgery	Fixed dose, no monitoring, improved bioavailability, increased bleeding rates
enoxaparin (Lovenox®)	30-40 mg SC bid		
fondaparinux (Arixtra®)	2.5 mg SC OD		
midazolam (Versed®)	0.02-0.04 mg/kg IV	Conscious sedation for short procedures	Medication used during fracture reduction – monitor for respiratory depression
fentanyl (Sublimaze®)	0.5-3 µg/kg IV	Conscious sedation for short procedures	Short acting anesthetic used in conjunction with midazolam (Versed®)
triamcinolone (Aristocort®) – an injectable steroid	0.5-1 mL of 25 mg/mL	Suspension (injected into inflamed joint or bursa); amount varies by joint size	Potent anti-inflammatory effect; increased pain for 24 h, rarely causes fat necrosis and skin depigmentation
naproxen (Aleve®, Naprosyn®)	250-500 mg bid	Pain due to inflammation, arthritis, soft tissue injury	NSAID, may cause gastric erosion and bleeding
misoprostol (Cytotec®)	200 µg qid	Prophylaxis of HO after THA	Use with indomethacin
indomethacin (Indocid®)	25 mg PO tid	Prophylaxis of HO after THA	Use with misoprostol
ibuprofen (Advil®, Motrin®)	200-400 mg tid	Pain (including post-operative), inflammation (including arthritis)	NSAID, may cause gastric erosion and bleeding
propofol (Diprivan®)	1-2 mg/kg IV maintenance 0.5 mg/kg	Conscious sedation for short procedures	Short acting anesthetic often used in conjunction with fentanyl (Sublimaze®)

Basic Anatomy Review

Ear

Figure 1. Surface anatomy of the external ear; anatomy of ear

Figure 2. Normal appearance of right tympanic membrane on otoscopy

Nose

Figure 3. Nasal anatomy

Figure 4. Nasal septum and its arterial supply (see *Epistaxis*, OT27 for detailed blood supply)

Figure 5. Anatomy of the four paranasal sinuses: maxillary, ethmoid, sphenoid, and frontal

Reprinted from: Dhillon RS, East CA. Ear, Nose and Throat and Head and Neck Surgery, 2nd ed. Copyright 1999, with permission from Elsevier

Throat

Figure 6. Anatomy of a normal larynx; superior view of larynx on indirect laryngoscopy

Drainage into Nasal Cavity

- **Superior meatus:** sphenoid (via sphenothmoidal recess), posterior ethmoid sinuses
- **Middle meatus:** frontal, maxillary, anterior ethmoid sinuses
- **Inferior meatus:** nasolacrimal duct

- **Nasopharynx:** skull base to soft palate
- **Oropharynx:** soft palate to hyoid bone
- **Laryngopharynx:** hyoid bone to inferior border cricoid cartilage

Head and Neck

Figure 7. Extratemporal segment of facial nerve
Branches of facial nerve (in order from superior to inferior)
 To Zanzibar By Motor Car

Figure 8. Blood supply to the face
Branches of the external carotid artery (in order from inferior to superior)
 Some Angry Lady Figured Out PMS

Figure 9. Anatomy of the neck

Anatomical Triangles of the Neck

Anterior triangle:

- bounded by anterior border of SCM, midline of neck, and lower border of mandible
- divided into
 - **submental triangle:** bounded by both anterior bellies of digastric and hyoid bone
 - **digastric triangle:** bounded by anterior and posterior bellies of digastric, and inferior border of mandible
 - **carotid triangle:** bounded by sternocleidomastoid, anterior belly of omohyoid, and posterior belly of digastric
 - ♦ contains: tail of parotid, submandibular gland, hypoglossal nerve, carotid bifurcation, and lymph nodes

Posterior triangle

- bounded by posterior border of sternocleidomastoid, anterior border of trapezius, and middle third of clavicle
- divided into
 - **occipital triangle:** superior to posterior belly of the omohyoid
 - **subclavian triangle:** inferior to posterior belly of omohyoid
- contains: spinal accessory nerve and lymph nodes

Table 1. Lymphatic Drainage of Nodal Groups and Anatomical Triangles of Neck

Nodal Group/Level	Location	Drainage
1. Suboccipital (S)	Base of skull, posterior	Posterior scalp
2. Retroauricular (R)	Superficial to mastoid process	Scalp, temporal region, external auditory meatus, posterior pinna
3. Parotid-preauricular (P)	Anterior to ear	External auditory meatus, anterior pinna, soft tissue of frontal and temporal regions, root of nose, eyelids, palpebral conjunctiva
4. Submental (Level IA)	(Midline) Anterior bellies of digastric muscles, tip of mandible, and hyoid bone	Floor of mouth, anterior tongue, anterior mandibular alveolar ridge, lower lip
5. Submandibular (Level IB)	Anterior belly of digastric muscle, stylohyoid muscle, body of mandible	Oral cavity, anterior nasal cavity, soft tissues of the mid-face, submandibular gland
6. Upper jugular (Levels IIA and IIB)	Skull base to inferior border of hyoid bone along SCM muscle	Oral cavity, nasal cavity, naso/oro/hypopharynx, larynx, parotid glands
7. Middle jugular (Level III)	Inferior border of hyoid bone to inferior border of cricoid cartilage along SCM muscle	Oral cavity, naso/oro/hypopharynx, larynx
8. Lower jugular* (Level IV)	Inferior border of cricoid cartilage to clavicle along SCM muscle	Hypopharynx, thyroid, cervical esophagus, larynx
9. Posterior triangle** (Levels VA and VB)	Posterior border of SCM, anterior border of trapezius, from skull base to clavicle	Nasopharynx and oropharynx, cutaneous structures of the posterior scalp and neck
10. Anterior compartment*** (Level VI)	(Midline) Hyoid bone to suprasternal notch between the common carotid arteries	Thyroid gland, glottic and subglottic larynx, apex of piriform sinus, cervical esophagus

*Virchow node: left lower jugular (level IV) supraclavicular node

**Includes some supraclavicular nodes

***Includes pretracheal, precricoid, paratracheal, and perithyroidal nodes

Paired Parasympathetic Ganglia of the Head and Neck

- **Ciliary:** pupillary constriction
- **Pterygopalatine:** lacrimal gland, nasal mucosa
- **Submandibular:** submandibular, sublingual glands
- **Otic:** parotid gland

Function of Facial Nerve

"Ears, Tears, Face, Taste"

Ears: stapedius muscle

Tears: lacrimation (lacrimal gland) and salivation (parotid)

Face: muscles of facial expression

Taste: sensory anterior 2/3 of tongue (via chorda tympani)

- **Left-sided** enlargement of a supraclavicular node (Virchow's node) may indicate an abdominal malignancy
- **Right-sided** enlargement may indicate malignancy of the mediastinum, lungs, or esophagus
- **Occipital and/or posterior auricular node** enlargement may indicate rubella

4 Strap Muscles of the Neck

- Thyrohyoid
- Omohyoid
- Sternohyoid
- Sternothyroid

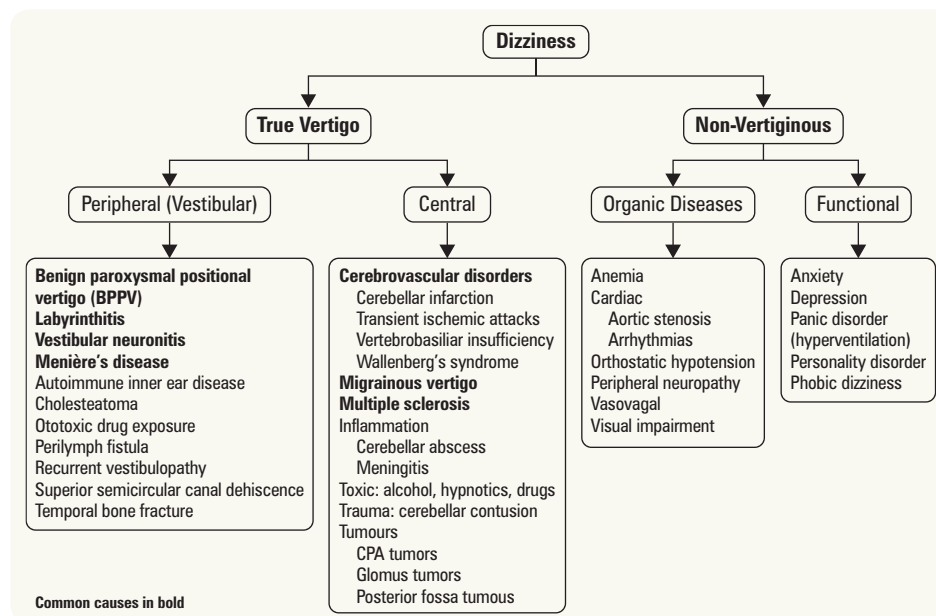

Figure 10. Anatomy of the thyroid gland

Differential Diagnoses of Common Presenting Problems

Dizziness

True nystagmus and vertigo caused by a peripheral lesion will never last longer than a couple of weeks because of compensation. Central lesions do not compensate, hence nystagmus and vertigo will persist

5 "D's of Vertebrobasilar Insufficiency

Drop attacks
Diplopia
Dysarthria
Dizziness
Dysphagia

Figure 11. Differential diagnosis of dizziness

Otalgia

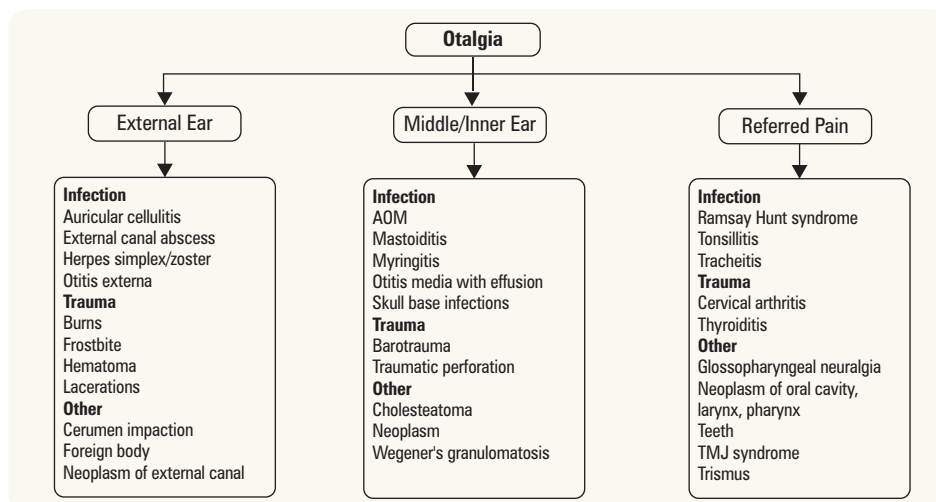

Figure 12. Differential diagnosis of otalgia

Hearing Loss

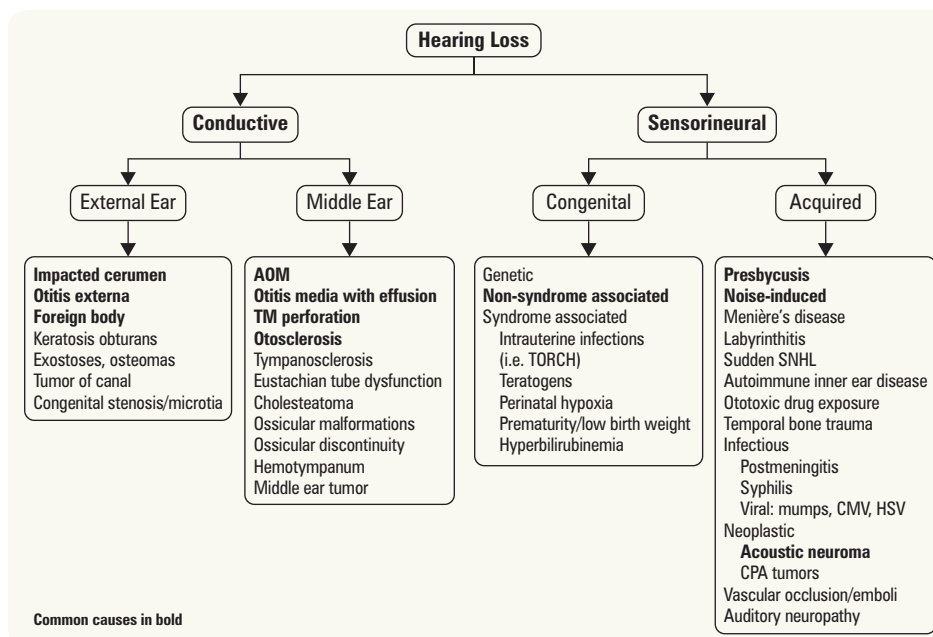

Figure 13. Differential diagnosis of hearing loss

Tinnitus

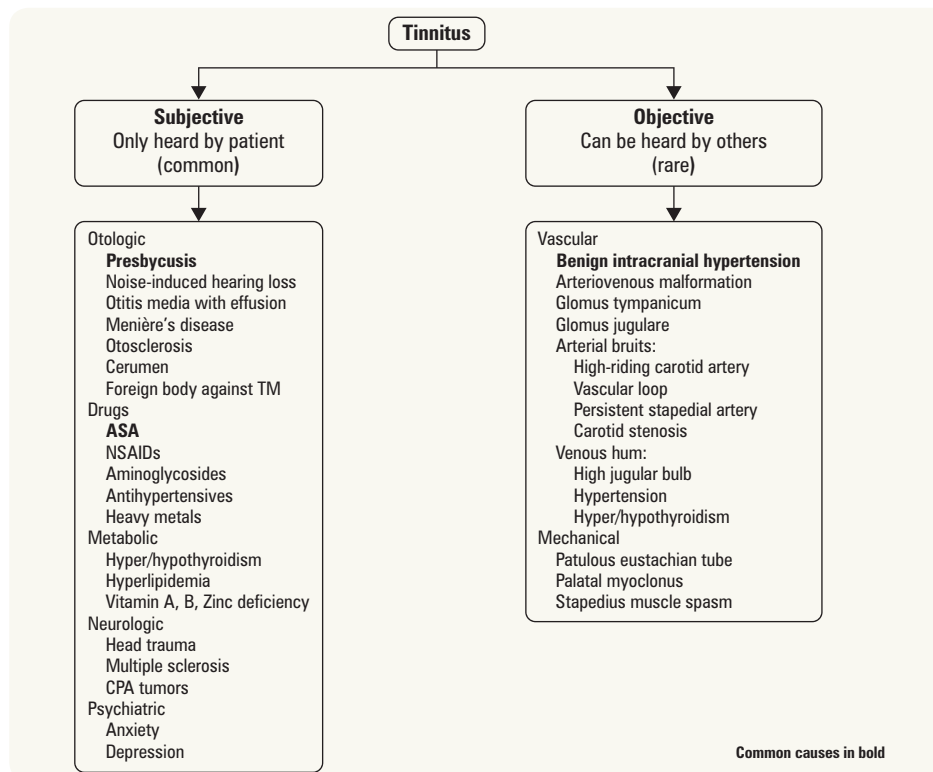

Figure 14. Differential diagnosis of tinnitus

Tinnitus is most commonly associated with SNHL

Glomus Tympanicum/Jugulare Tumor
Signs and Symptoms

- Pulsatile tinnitus
- Hearing loss
- Blue mass behind TM
- Brown's sign (blanching of the TM with pneumatic otoscopy)

Nasal Obstruction

Table 2. Differential Diagnosis of Nasal Obstruction

Acquired	Congenital
Nasal Cavity <ul style="list-style-type: none"> Rhinitis <ul style="list-style-type: none"> Acute/chronic Vasomotor Allergic Rhinosinusitis Foreign bodies Enlarged turbinates Tumor <ul style="list-style-type: none"> Benign: polyps, inverting papilloma Malignant <ul style="list-style-type: none"> SCC Esthesioneuroblastoma (olfactory neuroblastoma) Adenocarcinoma 	Nasal Cavity <ul style="list-style-type: none"> Nasal dermoid cyst Encephalocele Glioma Choanal atresia
Nasal Septum <ul style="list-style-type: none"> Septal deviation Septal hematoma/abscess Dislocated septum 	Nasal Septum <ul style="list-style-type: none"> Septal deviation Septal hematoma/abscess Dislocated septum
Nasopharynx <ul style="list-style-type: none"> Adenoid hypertrophy Tumor <ul style="list-style-type: none"> Benign: juvenile nasopharyngeal angiofibroma (JNA), polyps Malignant: nasopharyngeal carcinoma 	
Systemic <ul style="list-style-type: none"> Granulomatous diseases, diabetes, vasculitis 	

Hoarseness

Table 3. Differential Diagnosis of Hoarseness

Infectious	<ul style="list-style-type: none"> Acute/chronic laryngitis Laryngotracheobronchitis (croup) 	
Inflammatory	<ul style="list-style-type: none"> GERD Vocal cord polyps/nodules Lifestyle: smoking, chronic EtOH use 	
Trauma	<ul style="list-style-type: none"> External laryngeal trauma Endoscopy and endotracheal tube (e.g. intubation granuloma) 	
Neoplasia	<ul style="list-style-type: none"> Benign tumor Papillomas (HPV infection) Minor salivary gland tumors Other 	<ul style="list-style-type: none"> Malignant tumors (e.g. thyroid) SCC Other
Cysts	<ul style="list-style-type: none"> Retention cysts 	
Systemic	<ul style="list-style-type: none"> Endocrine Hypothyroidism Virilization 	<ul style="list-style-type: none"> Connective tissue disease RA SLE
Neurologic (vocal cord paralysis due to superior ± recurrent laryngeal nerve injury)	<ul style="list-style-type: none"> Central lesions <ul style="list-style-type: none"> Cerebrovascular accident (CVA) Head injury Multiple sclerosis (MS) Skull base tumors Arnold-Chiari malformation Peripheral lesions <ul style="list-style-type: none"> Unilateral <ul style="list-style-type: none"> Lung malignancy 	<ul style="list-style-type: none"> Iatrogenic injury: thyroid, parathyroid surgery, carotid endarterectomy, patent ductus arteriosus (PDA) ligation Bilateral <ul style="list-style-type: none"> Iatrogenic injury: bilateral thyroid surgery, forceps delivery Neuromuscular <ul style="list-style-type: none"> Myasthenia gravis
Functional	<ul style="list-style-type: none"> Psychogenic aphonia (hysterical aphonia) 	
Congenital	<ul style="list-style-type: none"> Laryngomalacia Laryngeal web Laryngeal atresia 	

Lung malignancy is the most common cause of extralaryngeal vocal cord paralysis

Neck Mass

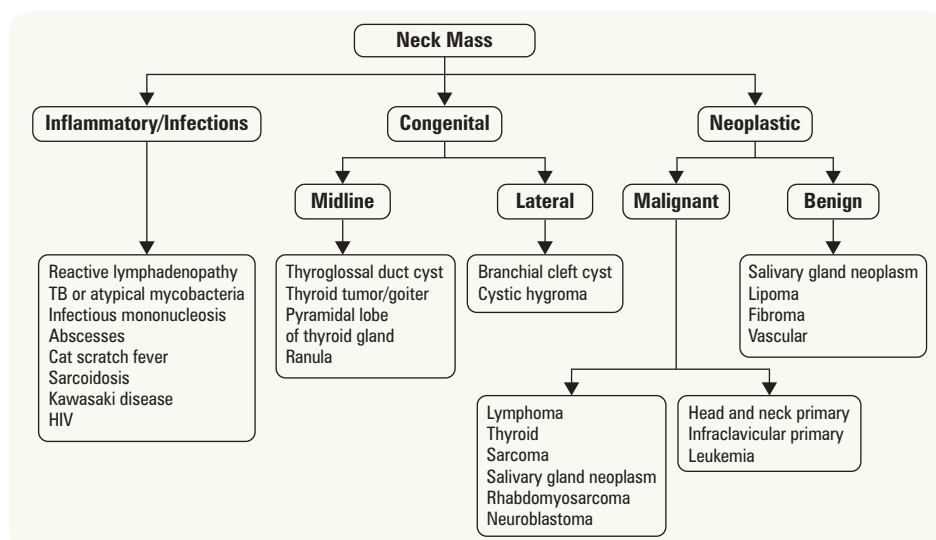

Figure 15. Differential diagnosis of a neck mass

Hearing

Normal Hearing Physiology

- **Conductive pathway (external auditory canal to cochlea):** air conduction of sound energy down the EAC → vibration of the tympanic membrane (area effect) → sequential vibration of the middle ear ossicles: malleus, incus, stapes (lever effect) → transmission of amplified vibrations from the stapes footplate in the middle ear to the oval window of the cochlea in the inner ear → pressure differential on cochlear fluid creates movement along the basilar membrane within the cochlea from base to apex
- **Neural pathway (nerve to brain):** basilar membrane vibration stimulates overlying hair cells in the organ of Corti → stimulation of bipolar neurons in the spiral ganglion of the cochlear division of CN VIII → cochlear nucleus → superior olivary nucleus → lateral lemniscus → inferior colliculus → Sylvian fissure of temporal lobe

Order of the Neural Pathway (with Corresponding Waves on ABR)

E COLI

Eighth cranial nerve (I – II)
Cochlear nucleus (III)
Superior Olivary nucleus
Lateral lemniscus (IV – V)
Inferior colliculus

Types of Hearing Loss

1. Conductive Hearing Loss

- conduction of sound to the cochlea is impaired
- can be caused by external and middle ear disease

2. Sensorineural Hearing Loss

- due to a defect in the conversion of sound into neural signals or in the transmission of those signals to the cortex
- can be caused by disease of the inner ear (cochlea), acoustic nerve (CN VIII), brainstem, or cortex

3. Mixed Hearing Loss

- combination of conductive and sensorineural hearing loss

Auditory Acuity

- whispered-voice test: mask one ear and whisper into the other
- tuning fork tests (see Table 4; audiogram is of greater utility)
- sensitivity depends on which tuning fork used (256 Hz, 512 Hz, 1024 Hz; 512 Hz has greatest sensitivity)
 - Rinne test
 - ♦ 512 Hz tuning fork is struck and held firmly on mastoid process to test BC; the tuning fork is then placed beside the pinna to test AC
 - ♦ If AC > BC → positive Rinne (normal)
 - Weber test
 - ♦ 512 Hz tuning fork is held on vertex of head and patient states whether it is heard centrally (Weber negative) or is lateralized to one side (Weber right, Weber left)
 - ♦ can place vibrating fork on patient's chin while they clench their teeth, or directly on teeth to elicit more reliable response
 - ♦ will only lateralize if difference in hearing loss between ears is >6 dB

Weber Test Lateralization = ipsilateral conductive hearing loss or contralateral sensorineural hearing loss

The Weber test is more sensitive in detecting conductive hearing loss than the Rinne test

HL = Intensity x Duration

Table 4. The Interpretation of Tuning Fork Tests

Examples	Weber	Rinne
Normal or bilateral sensorineural hearing loss	Central	AC > BC (+) bilaterally
Right-sided conductive hearing loss, normal left ear	Lateralizes to right	BC > AC (-) right
Right-sided sensorineural hearing loss, normal left ear	Lateralizes to left	AC > BC (+) bilaterally
Right-sided severe sensorineural hearing loss or dead right ear, normal left ear	Lateralizes to left	BC > AC (-) right*

*A vibrating tuning fork on the mastoid stimulates the cochlea bilaterally, therefore in this case the left cochlea is stimulated by the Rinne test on the right (e.g. a false negative test). These tests are not valid if the ear canals are obstructed with cerumen (e.g. will create conductive loss)

Frequency of Tuning Fork (Hz)	Minimum Hearing Loss for Rinne to Reverse (BC > AC, NEGATIVE Rinne) (dB)
256	15
512	30
1024	45

Range of Frequencies Audible to Human Ear

- 20 to 20000 Hz
- Most sensitive frequencies: 1000 to 4000 Hz
- Range of human speech: 500 to 2000 Hz

Hearing loss most often occurs at higher frequencies. Noise-induced (occupational) HL is seen at 4000 Hz. HL associated with otosclerosis is seen at 2000 Hz (Carhart's notch)

Air conduction thresholds can only be equal to or worse than bone conduction thresholds

Pure Tone Audiometry

- a threshold is the lowest intensity level at which a patient can hear the tone 50% of the time
- thresholds are obtained for each ear at frequencies of 250, 500, 1000, 2000, 4000, and 8000 Hz
- air conduction thresholds are obtained with headphones and measure outer, middle, inner ear, and auditory nerve function
- bone conduction thresholds are obtained with bone conduction oscillators which bypass the outer and middle ear

Degree of Hearing Loss

- determined on basis of the pure tone average (PTA) at 500, 1000, and 2000 Hz

Figure 16. Types of hearing loss and associated audiograms of a left ear

PURE TONE PATTERNS

1. Conductive Hearing Loss (Figure 16B and 16C)

- BC in normal range
- AC outside of normal range
- gap between AC and BC thresholds >10 dB (an air-bone gap)

2. Sensorineural Hearing Loss (Figure 16D and 16E)

- both air and bone conduction thresholds below normal
- gap between AC and BC <10 dB (no air-bone gap)

3. Mixed Hearing Loss

- both air and bone conduction thresholds below normal
- gap between AC and BC thresholds >10 dB (an air-bone gap)

Degree of Hearing Loss

Decibel Loss	Degree of Hearing Loss
0 to 20 dB	Normal
21 to 40 dB	Mild
41 to 55 dB	Moderate
56 to 70 dB	Moderate-Severe
71 to 90 dB	Severe
≥91 dB	Profound

Speech Audiometry

Speech Reception Threshold

- lowest hearing level at which patient is able to repeat 50% of two syllable words which have equal emphasis on each syllable (spondee words)
- SRT and best pure tone threshold in the 500 to 2000 Hz range (frequency range of human speech) usually agree within 5 dB; if not, suspect a retrocochlear lesion or functional hearing loss
- used to assess the reliability of the pure tone audiometry

Speech Discrimination Test

- percentage of words the patient correctly repeats from a list of 50 monosyllabic words
- tested at 40 dB above the patient's SRT, therefore degree of hearing loss is taken into account
- patients with normal hearing or conductive hearing loss score >90%
- score depends on extent of SNHL
- rollover effect: a decrease in discrimination as sound intensity increases; typical of a retrocochlear lesion (e.g. acoustic neuroma)
- investigate further if scores differ more than 20% between ears as asymmetry may indicate a retrocochlear lesion
- used as best predictor of hearing aid response: a poor discrimination score indicates significant neural degeneration and hearing aids may not be the best option for the patient

Impedance Audiometry

Tympanogram

- the Eustachian tube equalizes the pressure between the external and middle ear
- tympanograms graph the compliance of the middle ear system against a pressure gradient ranging from -400 to +200 mmH₂O
- tympanogram peak occurs at the point of maximum compliance: where the pressure in the external canal is equivalent to the pressure in the middle ear
- normal range: -100 to +50 mmH₂O

Figure 17. Tympanograms

Static Compliance

- volume measurement reflecting overall stiffness of the middle ear system
- normal range: 0.3-1.6 cc
- negative middle ear pressure and abnormal compliance indicate middle ear pathology
- in a type B curve, ear canal volumes of >2 cc in children and 2.5 cc in adults indicate TM perforation or presence of a patent ventilation tube

Acoustic Stapedial Reflexes

- stapedius muscle contracts in response to loud sound
- **acoustic reflex threshold** = 70-100 dB greater than hearing threshold; if hearing threshold >85 dB, reflex likely absent
- stimulating either ear causes bilateral and symmetrical reflexes
- for reflex to be present, CN VII must be intact and no conductive hearing loss in monitored ear
- if reflex is absent without conductive or severe sensorineural loss, suspect CN VII lesion
- **acoustic reflex decay test** = ability of stapedius muscle to sustain contraction for 10 s at 10 dB
- normally, little reflex decay occurs at 500 and 1000 Hz
- with cochlear hearing loss, acoustic reflex thresholds are 25-60 dB
- with retrocochlear hearing loss (acoustic neuroma), absent acoustic reflexes or marked reflex decay (>50%) within 5 s

Auditory Brainstem Response

- measures neuroelectric potentials (waves) in response to a stimulus in five different anatomic sites (see *Order of Neural Pathway* sidebar on OT9); this test can be used to determine the site of lesion
- delay in brainstem response suggests cochlear or retrocochlear abnormalities
- does not require volition or co-operation of patient (therefore of value in children and in malingerers)

Otoacoustic Emissions

- objective test of hearing where a series of clicks is presented to the ear and the cochlea generates an echo which can be measured
- often used in newborn screening
- can be used to uncover normal hearing in malingering patients
- absence of emissions can be due to hearing loss or fluid in the middle ear

Aural Rehabilitation

- dependent on degree of hearing loss, communicative requirements, motivation, expectations, and physical and mental abilities
- negative prognostic factors
 - poor speech discrimination
 - narrow dynamic range (recruitment)
 - unrealistic expectations
- types of hearing aids
 - BTE: behind-the-ear (with occlusive mold or open fit which allows natural sound to pass – for milder hearing losses)
 - ITE: in-the-ear, placed in concha
 - ITC: in-the-canal, placed entirely in ear canal
 - CIC: contained-in-canal, placed deeply in ear canal
 - bone conduction – bone-anchored hearing aid (BAHA): attached to the skull
 - contralateral routing of signals (CROS)
- assistive listening devices
 - direct/indirect audio output
 - infrared, FM radio, or induction loop systems
 - telephone, television, or alerting devices
- cochlear implants
 - electrode is inserted into the cochlea to allow direct stimulation of the auditory nerve
 - for profound bilateral sensorineural hearing loss not rehabilitated with conventional hearing aids
 - established indication: post-lingually deafened adults, pre- and post-lingually deaf children

Pre-lingual deafness: deafness occurring before speech and language are acquired

Post-lingual deafness: deafness occurring after speech and language are acquired

Pre-lingually deaf infants are the best candidates for aural rehabilitation because they have maximal benefit from ongoing developmental plasticity

Bone Anchored Hearing Aids (BAHA)
BAHAs function based on bone conduction and are indicated primarily for patients with conductive hearing loss, unilateral hearing loss, and mixed hearing loss who cannot wear conventional hearing aids. BAHAs consist of a titanium implant, an external abutment, and a sound processor. The sound processor transmits vibrations through the external abutment to the titanium implant and then directly to the cochlea

Vertigo

Evaluation of the Dizzy Patient

- vertigo: illusion of rotational, linear, or tilting movement of self or environment
 - vertigo is produced by peripheral (inner ear) or central (brainstem-cerebellum) stimulation
- it is important to distinguish vertigo from other disease entities that may present with similar complaints of “dizziness” (e.g. cardiovascular, psychiatric, neurological, aging)

Table 5. Peripheral vs. Central Vertigo

Symptoms	Peripheral	Central
Imbalance	Moderate-severe	Mild-moderate
Nausea and Vomiting	Severe	Variable
Auditory Symptoms	Common	Rare
Neurologic Symptoms	Rare	Common
Compensation	Rapid	Slow
Nystagmus	Unidirectional Horizontal or rotatory	Bidirectional Horizontal or vertical

Table 6. Differential Diagnosis of Vertigo Based on History

Condition	Duration	Hearing Loss	Tinnitus	Aural Fullness	Other Features
Benign Paroxysmal Positional Vertigo (BPPV)	Seconds	–	–	–	
Menière's Disease	Minutes to hours Precedes attack	Uni/bilateral, fluctuating	+	Pressure/warmth	
Vestibular Neuronitis	Hours to days	–	–	–	
Labyrinthitis	Days	Unilateral	Whistling	–	Recent AOM
Acoustic Neuroma	Chronic	Progressive	+	–	Ataxia CN VII palsy

Table 7. Differential Diagnosis of Vertigo Based on Time Course

Time Course	Condition
Recurrent, lasting	BPPV
Single episode, lasting minutes to hours	Migraine, transient ischemia of the labyrinth or brainstem
Recurrent to hours	Menière's
Prolonged	Vestibular neuritis, MS, Brainstem/cerebellum infarct

BPPV is the most common cause of episodic vertigo; patients often are symptomatic when rolling over in bed or moving their head to a position of extreme posterior extension such as looking up at a tall building or getting their hair washed at the hairdresser

Patients can wear Frenzel's magnifying eyeglasses during the Dix-Hallpike maneuver, which inhibit visual fixation and allow for better visualization of the eyes

Signs of BPPV Seen with Dix-Hallpike Maneuver

- Latency of ~20 s
- Crescendo/decrecendo vertigo lasting 20 s
- Geotropic rotatory nystagmus (nystagmus MUST be present for a positive test)
- Reversal of nystagmus upon sitting up

Benign Paroxysmal Positional Vertigo

Definition

- acute attacks of transient rotatory vertigo lasting **seconds to minutes** initiated by certain head positions, accompanied by torsional (i.e. rotatory) nystagmus (geotropic = fast phase towards the floor)
- most common form of positional vertigo (50% of patients with peripheral vestibular dysfunction)

Etiology

- due to canalithiasis (migration of free floating otoliths within the endolymph of the semicircular canal) or cupulolithiasis (otolith attached to the cupula of the semicircular canal)
 - can affect each of the 3 semicircular canals, posterior canal is affected in >90% of cases
 - causes: head injury, viral infection (URTI), degenerative disease, idiopathic
 - results in slightly different signals being received by the brain from the two balance organs resulting in sensation of movement

Diagnosis

- history (time course, provoking factors, associative symptoms)
- positive Dix-Hallpike maneuver (sensitivity 82%, specificity 71%)

Dix-Hallpike Positional Testing (see website for video and illustrations)

- the patient is rapidly moved from a sitting position to a supine position with the head hanging over the end of the table, turned to one side at 45° and neck extended 20° holding the position for 20 s
- onset of vertigo and rotary nystagmus indicate a positive test for the dependent side
- other diagnostic testing is not indicated in posterior canal BPPV

Treatment

- reassure patient that process resolves spontaneously
- particle repositioning maneuvers
 - Epley maneuver (performed by MD)
 - Brandt-Daroff exercises (performed by patient)
- surgery for refractory cases
- anti-emetics for nausea/vomiting
- drugs to suppress the vestibular system delay eventual recovery and are therefore not used

Menière's Disease (Endolymphatic Hydrops)

Definition

- episodic attacks of tinnitus, hearing loss, aural fullness, and vertigo lasting **minutes to hours**

Proposed Etiology

- inadequate absorption of endolymph leads to endolymphatic hydrops (over accumulation) that distorts the membranous labyrinth

Diagnostic Criteria for Menière's Disease (must have all three)

- Two spontaneous episodes of rotational vertigo ≥20 min
- Audiometric confirmation of SNHL (often low frequency)
- Tinnitus and/or aural fullness

Epidemiology

- peak incidence 40-60 yr
- bilateral in 35% of cases

Clinical Features

- episodic vertigo, fluctuating low frequency SNHL, tinnitus, and aural fullness
- \pm drop attacks (Tumarkin crisis), \pm N/V
- vertigo disappears with time (min to h), but hearing loss remains
- early in the disease: fluctuating SNHL
- later stages: persistent tinnitus and progressive hearing loss
- attacks come in clusters and can be debilitating to the patient
- triggers: high salt intake, caffeine, stress, nicotine, and alcohol

Treatment

- acute management may consist of bed rest, antiemetics, antivertiginous drugs, and low molecular weight dextrans (not commonly used)
- long-term management may include:
 - medical
 - ♦ low salt diet, diuretics (e.g. hydrochlorothiazide, triamterene, amiloride)
 - ♦ antivertiginous drugs prophylactically to decrease intensity of attacks
 - ♦ local application of gentamicin to destroy vestibular end-organ, results in complete SNHL
 - surgical
 - ♦ selective vestibular neurectomy or transtympanic labyrinthectomy
 - ♦ vestibular implants have recently been introduced, experimentally
- must monitor opposite ear as bilaterality occurs in 35% of cases

Drop Attacks (Tumarkin's Otolithic Crisis) are sudden falls occurring without warning and without LOC

Before proceeding with gentamicin treatment, perform a gadolinium enhanced MRI to rule out CPA tumor as the cause of symptoms

Vestibular Neuronitis

Definition

- acute onset of disabling vertigo often accompanied by nausea, vomiting, and imbalance without hearing loss that resolves over **days** leaving a residual imbalance that lasts **days to weeks**

Etiology

- thought to be due to a viral (e.g. measles, mumps, herpes zoster) or post viral inflammatory condition
- ~30% of cases have associated URTI symptoms
- other: microvascular events, diabetes, autoimmune process
- considered to be the vestibular equivalent of Bell's palsy, sudden hearing loss, and acute vocal cord palsy

Clinical Features

- acute phase
 - severe vertigo with nausea, vomiting, and imbalance lasting 1-5 d
 - irritative nystagmus (fast phase towards the offending ear)
 - patient tends to veer towards affected side
- convalescent phase
 - imbalance and motion sickness lasting days to weeks
 - spontaneous nystagmus away from affected side
 - gradual vestibular adaptation requires weeks to months
- incomplete recovery likely with the following risk factors: elderly, visual impairment, poor ambulation
- repeated attacks can occur

Treatment

- acute phase
 - bed rest, vestibular sedatives dimenhydrinate, diazepam
- convalescent phase
 - progressive ambulation especially in the elderly
 - vestibular exercises: involve eye and head movements, sitting, standing, and walking

Labyrinthitis

Definition

- acute infection of the inner ear resulting in vertigo and hearing loss

Etiology

- may be serous (viral) or purulent (bacterial)
- occurs as a complication of acute and chronic otitis media, bacterial meningitis, cholesteatoma, and temporal bone fractures
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*, *P. aeruginosa*, *P. mirabilis*
- viral: rubella, CMV, measles, mumps, varicella zoster

Clinical Features

- sudden onset of vertigo, N/V, tinnitus, and unilateral hearing loss with no associated fever or pain
- meningitis is a serious complication

Investigations

- CT head
- if meningitis is suspected: lumbar puncture, blood cultures

Treatment

- treat with IV antibiotics, drainage of middle ear \pm mastoidectomy

Acoustic Neuroma (Vestibular Schwannoma)

Definition

- schwannoma of the vestibular portion of CN VIII

Pathogenesis

- starts in the internal auditory canal and expands into cerebellopontine angle (CPA), compressing cerebellum and brainstem
- when associated with type 2 neurofibromatosis (NF2): bilateral acoustic neuromas, café-au-lait skin lesions, and multiple intracranial lesions

Clinical Features

- usually presents with unilateral SNHL (chronic) or tinnitus
- dizziness and unsteadiness may be present, but true vertigo is rare as tumor growth occurs slowly and thus compensation occurs
- facial nerve palsy and trigeminal (V1) sensory deficit (corneal reflex) are late complications
- risk factors: exposure to loud noise, childhood exposure to low-dose radiation, history of parathyroid adenoma

Diagnosis

- MRI with gadolinium contrast (gold standard)
- audiogram (to assess SNHL)
- poor speech discrimination relative to the hearing loss
- stapedial reflex absent or significant reflex decay
- ABR: increase in latency of the 5th wave
- vestibular tests: normal or asymmetric caloric weakness (an early sign)

Treatment

- expectant management if tumor is very small, or in elderly
- definitive management is surgical excision
- other options: gamma knife, radiation

Acoustic neuroma is the most common intracranial tumor causing SNHL and the most common cerebellopontine angle tumor

In the elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise

Tinnitus

**Definition**

- an auditory perception in the absence of an acoustic stimuli, likely related to loss of input to neurons in central auditory pathways and resulting in abnormal firing

History

- subjective vs. objective ([Figure 14, OT7](#))
- continuous vs. pulsatile (vascular in origin)
- unilateral vs. bilateral
- associated symptoms: hearing loss, vertigo, aural fullness, otalgia, otorrhea

Investigations

- audiology
- if unilateral
 - ABR, gadolinium enhanced MRI to exclude a retrocochlear lesion
 - CT to diagnose glomus tympanicum (rare)
 - MRI or angiogram to diagnose AVM
- if suspect metabolic abnormality: lipid profile, TSH

Treatment

- if a cause is found, treat the cause (e.g. drainage of middle ear effusion, embolization or excision of AVM)
- with no treatable cause: 50% will improve, 25% worsen, 25% remain the same
- avoid loud noise, ototoxic meds, caffeine, smoking
- tinnitus clinics

- identify situations where tinnitus is most bothersome (e.g. quiet times), mask tinnitus with soft music or "white noise"
- hearing aid if coexistent hearing loss
- tinnitus instrument: combines hearing aid with white noise masker
- trial of tocainamide

Diseases of the External Ear

Cerumen Impaction

Etiology

- ear wax: a mixture of secretions from ceruminous and pilosebaceous glands, squames of epithelium, dust, and debris

Risk Factors

- hairy or narrow ear canals, in-the-ear hearing aids, cotton swab usage, osteomata

Clinical Features

- hearing loss (conductive)
- \pm tinnitus, vertigo, otalgia, aural fullness

Treatment

- ceruminolytic drops (bicarbonate solution, olive oil, glycerine, Cerumenex*)
- syringing
- manual debridement (by MD)

Cerumen impaction is the most common cause of conductive hearing loss for those aged 15-50 yr

Syringing

Indications

- Totally occlusive cerumen with pain, decreased hearing, or tinnitus

Contraindications

- Active infection
- Previous ear surgery
- Only hearing ear
- TM perforation

Complications

- Otitis externa
- TM perforation
- Trauma
- Pain
- Vertigo
- Tinnitus
- Otitis media

Method

- Establish that TM is intact
- Gently pull the pinna superiorly and posteriorly
- Using warm water, aim the syringe nozzle upwards and posteriorly to irrigate the ear canal

Exostoses

Definition

- bony protuberances in the external auditory canal composed of lamellar bone

Etiology

- possible association with swimming in cold water

Clinical Features

- usually an incidental finding
- if large, they can cause cerumen impaction or otitis externa

Treatment

- no treatment required unless symptomatic

Otitis Externa

Etiology

- bacteria (~90% of OE): *Pseudomonas aeruginosa*, *Pseudomonas vulgaris*, *E. coli*, *S. aureus*
- fungus: *Candida albicans*, *Aspergillus niger*

Risk Factors

- associated with swimming ("swimmer's ear")
- mechanical cleaning (Q-tips*), skin dermatitis, aggressive scratching
- devices that occlude the ear canal: hearing aids, headphones, etc.
- allergic contact dermatitis, dermatologic conditions (psoriasis, atopic dermatitis)

Clinical Features

- acute
 - pain aggravated by movement of auricle (traction of pinna or pressure over tragus)
 - otorrhea (sticky yellow purulent discharge)
 - conductive hearing loss \pm aural fullness 2° to obstruction of external canal by swelling and purulent debris
 - posterior auricular lymphadenopathy
 - complicated OE exists if the pinna and/or the periauricular soft tissues are erythematous and swollen
- chronic
 - pruritus of external ear \pm excoriation of ear canal
 - atrophic and scaly epidermal lining, \pm otorrhea, \pm hearing loss
 - wide meatus but no pain with movement of auricle
 - tympanic membrane appears normal

Pulling on the pinna is extremely painful in otitis externa, but is usually well tolerated in otitis media

Treatment

- clean ear under magnification with irrigation, suction, dry swabbing, and C&S
- bacterial etiology
 - antipseudomonal otic drops (e.g. ciprofloxacin) or a combination of antibiotic and steroid (e.g. Cipro HC®)
 - do not use aminoglycoside if the tympanic membrane (TM) is perforated because of the risk of ototoxicity
 - introduction of fine gauze wick (pope wick) if external canal edematous
 - \pm 3% acetic acid solution to acidify ear canal (low pH is bacteriostatic)
 - systemic antibiotics if either cervical lymphadenopathy or cellulitis is present
- fungal etiology
 - repeated debridement and topical antifungals (gentian violet, Mycostatin® powder, boric acid, clioquinol-flumetasone drops)
- \pm analgesics
- chronic otitis externa (pruritus without obvious infection) → corticosteroid alone (e.g. diprosalic acid)

Malignant (Necrotizing) Otitis Externa (Skull Base Osteomyelitis)

Definition

- osteomyelitis of the temporal bone

Epidemiology

- occurs in elderly diabetics and immunocompromised patients

Etiology

- rare complication of otitis externa
- *Pseudomonas* infection in 99% of cases

Clinical Features

- otalgia and purulent otorrhea that is refractory to medical therapy
- granulation tissue on the floor of the auditory canal

Complications

- cranial nerve palsy (most commonly VII>X>XI)
- systemic infection, death

Management

- imaging: high resolution temporal bone CT scan, gadolinium enhanced MRI, technetium scan
- requires hospital admission, debridement, IV antibiotics, hyperbaric O₂
- may require OR for debridement of necrotic tissue/bone

**Gallium and Technetium Scans**

Gallium scans are used to show sites of active infection. Gallium is taken up by PMNs and therefore only lights up when active infection is present. It will not show the extent of osteomyelitis. Technetium scans provide information about osteoblastic activity and as such are used to demonstrate sites of osteomyelitis. Technetium scans help with diagnosis whereas gallium scans are useful in follow-up

Diseases of the Middle Ear

Acute Otitis Media and Otitis Media with Effusion

- see *Pediatric Otolaryngology*, OT39

Chronic Otitis Media

Definition

- an ear with TM perforation in the setting of recurrent or chronic ear infections

Benign

- dry TM perforation without active infection

Chronic Serous Otitis Media

- continuous serous drainage (straw-colored)

Chronic Suppurative Otitis Media

- persistent purulent drainage through a perforated TM

Cholesteatoma

Definition

- a cyst composed of keratinized desquamated epithelial cells occurring in the middle ear, mastoid, and temporal bone
- two types: congenital and acquired

Congenital

- presents as a “small white pearl” behind an intact tympanic membrane (anterior and medial to the malleus) or as a conductive hearing loss
- believed to be due to aberrant migration of external canal ectoderm during development
- not associated with otitis media/Eustachian tube dysfunction

Acquired (more common)

- generally occurs as a consequence of otitis media and chronic Eustachian tube dysfunction
- primary cholesteatoma
 - frequently associated with retraction pockets in the pars flaccida (may lead to attic cholesteatomas which are difficult to visualize)
 - often has crusting or desquamated debris on lateral surface
- secondary cholesteatoma
 - pearly mass evident behind TM, frequently associated with marginal perforation
 - may appear as skin that have replaced the mucosa of the middle ear
- the associated chronic inflammatory process causes progressive destruction of surrounding bony structures

Clinical Features

- history of otitis media (especially if unilateral), ventilation tubes, ear surgery
- symptoms
 - progressive hearing loss (predominantly conductive although may get sensorineural hearing loss in late stage)
 - otalgia, aural fullness, fever
- signs
 - retraction pocket in TM, may contain keratin debris
 - TM perforation
 - granulation tissue, polyp visible on otoscopy
 - malodorous, unilateral otorrhea

Complications

Table 8. Complications of Cholesteatoma

Local	Intracranial
Ossicular erosion: conductive hearing loss	Meningitis
Inner ear erosion: SNHL, dizziness, and/or labyrinthitis	Sigmoid sinus thrombosis
Temporal bone infection: mastoiditis, petrositis	Intracranial abscess (subdural, epidural, cerebellar)
Facial paralysis	

Investigations

- audiogram and CT scan

Treatment

- there is no conservative therapy for cholesteatoma
- surgical: mastoidectomy ± tympanoplasty ± ossicular reconstruction

Mechanisms of Cholesteatoma Formation

- Epithelial migration through TM perforation (2° acquired)
- Invagination of TM (1° acquired)
- Metaplasia of middle ear epithelium or basal cell hyperplasia (congenital)

Complications of AOM are rare due to rapid and effective treatment of AOM with antibiotics

Classic Triad

- Otorrhea
- Tenderness to pressure over the mastoid
- Retroauricular swelling with protruding ear

Mastoiditis

Definition

- infection (usually subperiosteal) of mastoid air cells, most commonly seen approximately two weeks after onset of untreated or inadequately treated acute suppurative otitis media
- more common in children than adults

Etiology

- acute mastoiditis caused by the same organisms as AOM: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*, *S. pyogenes*, *S. aureus*, *P. aeruginosa*

Clinical Features

- otorrhea
- tenderness to pressure over the mastoid
- retroauricular swelling with protruding ear
- fever, hearing loss, ± TM perforation (late)
- CT radiologic findings: opacification of mastoid air cells by fluid and interruption of normal trabeculations of cells (coalescence)

Treatment

- IV antibiotics with myringotomy and ventilation tubes – usually all that is required acutely
- cortical mastoidectomy
 - debridement of infected tissue allowing aeration and drainage
- indications for surgery
 - failure of medical treatment after 48 h
 - symptoms of intracranial complications
 - aural discharge persisting for 4 wk and resistant to antibiotics

Otosclerosis

Definition

- fusion of stapes footplate to oval window so that it cannot vibrate

Etiology

- autosomal dominant, variable penetrance approximately 40%
- F>M, progresses during pregnancy (hormone responsive)

Clinical Features

- progressive conductive hearing loss first noticed in teens and 20s (may progress to sensorineural hearing loss if cochlea involved)
- \pm pulsatile tinnitus
- tympanic membrane normal \pm pink blush (Schwartz's sign) associated with the neovascularization of otosclerotic bone
- characteristic dip at 2000 Hz (Carhart's notch) on audiogram (Figure 16C, OT10)

Otosclerosis is the 2nd most common cause of conductive hearing loss in 15-50 yr old (after cerumen impaction)

Treatment

- monitor with serial audiograms if coping with loss
- hearing aid (air conduction, bone conduction, BAHA)
- stapedectomy or stapedotomy (with laser or drill) with prosthesis is definitive treatment

Diseases of the Inner Ear

Congenital Sensorineural Hearing Loss

Hereditary Defects

- non-syndrome associated (70%)
 - often idiopathic, autosomal recessive
 - connexin 26 (GJB2) most common
- syndrome associated (30%)
 - Waardenburg: white forelock, heterochromia iridis (each eye different color), wide nasal bridge and increased distance between medial canthi
 - Pendred: deafness associated with thyroid gland disorders, SLC26A4 gene, enlarged vestibular aqueducts
 - Treacher-Collins: first and second branchial cleft anomalies
 - Alport: hereditary nephritis

Prenatal TORCH Infections

- toxoplasmosis, others (e.g. HIV, syphilis), rubella, CMV, HSV

Perinatal

- Rh incompatibility
- anoxia
- hyperbilirubinemia
- birth trauma (hemorrhage into inner ear)

Postnatal

- meningitis, mumps, measles

High Risk Factors (for hearing loss in newborns)

- low birth weight/prematurity
- perinatal anoxia (low APGARs)
- kernicterus: bilirubin >25 mg/dL
- craniofacial abnormality
- family history of deafness in childhood
- 1st trimester illness: TORCH infections
- neonatal sepsis
- ototoxic drugs

- perinatal infection, including post-natal meningitis
- consanguinity
- 50-75% of newborns with SNHL have at least one of the above risk factors and 90% of these have spent time in the NICU
- presence of any risk factor: ABR study performed before leaving NICU and at 3 mo adjusted age
- early rehabilitation improves speech and school performance

Presbycusis

Definition

- SNHL associated with aging (starting in 5th and 6th decades)

Etiology

- hair cell degeneration
- age related degeneration of basilar membrane, possibly genetic etiology
- cochlear neuron damage
- ischemia of inner ear

Clinical Features

- progressive, bilateral hearing loss initially at high frequencies, then middle frequencies
- loss of discrimination of speech especially with background noise present – patients describe people as mumbling
- recruitment phenomenon: inability to tolerate loud sounds
- tinnitus

Treatment

- hearing aid if patient has difficulty functioning, hearing loss >30-35 dB, and good speech discrimination
- ± lip reading, auditory training, auditory aids (doorbell and phone lights)

Presbycusis is the most common cause of SNHL

Sudden Sensorineural Hearing Loss

Clinical Features

- presents as a sudden onset of significant SNHL (usually unilateral) ± tinnitus, aural fullness
- usually idiopathic, rule out other causes
 - autoimmune causes (e.g. ESR, rheumatoid factor, ANA)
 - MRI to rule out tumor and/or CT to rule out ischemic/hemorrhagic stroke if associated with any other focal neurological signs (e.g. vertigo, ataxia, abnormality of CN V or VII, weakness)

Treatment

- oral corticosteroids within 3 d of onset: prednisone 1 mg/kg/d for 10-14 d

Prognosis

- depends on degree of hearing loss
- 70% resolve within 10-14 d
- 20% experience partial resolution
- 10% experience permanent hearing loss

Sudden SNHL may easily be confused with ischemic brain events. It is important to keep a high index of suspicion especially with elderly patients presenting with sudden SNHL as well as vertigo

Autoimmune Inner Ear Disease

Etiology

- idiopathic
- may be associated with systemic autoimmune diseases (e.g. rheumatoid arthritis, SLE), vasculitides (e.g. GPA, polyarteritis nodosa), and allergies

Epidemiology

- most common between ages 20-50

Clinical Features

- rapidly progressive or fluctuating bilateral SNHL
- ± tinnitus, aural fullness, vestibular symptoms (i.e. ataxia, disequilibrium, vertigo)

Investigations

- autoimmune workup: CBC, ESR, ANA, rheumatoid factor

Treatment

- high-dose corticosteroids: treat early for at least 30 d
- consider cytotoxic medication for steroid non-responders

Drug Ototoxicity

Aminoglycosides

- streptomycin and gentamicin (vestibulotoxic), kanamycin, and tobramycin (cochleotoxic)
- toxic to hair cells by any route: oral, IV, and topical (if the TM is perforated)
- destroys sensory hair cells: outer first, inner second (therefore otoacoustic emissions are lost first)
- high frequency hearing loss develops earliest
- ototoxicity occurs days to weeks post-treatment
- must monitor with peak and trough levels when prescribed, especially if patient has neutropenia and/or history of ear or renal problems
- q24h dosing recommended (with amount determined by creatinine clearance)
- aminoglycoside toxicity displays saturable kinetics, therefore, once daily dosing presents less risk than divided daily doses
- duration of treatment is the most important predictor of ototoxicity
- treatment: immediately stop aminoglycosides

Salicylates

- hearing loss with tinnitus, reversible if discontinued

Antimalarials (Quinines)

- hearing loss with tinnitus
- reversible if discontinued but can lead to permanent loss

Others

- many antineoplastic agents are ototoxic (weigh risks vs. benefits)
- loop diuretics

Noise-Induced Sensorineural Hearing Loss

Pathogenesis

- 85-90 dB over months or years or single sound impulses >135 dB can cause cochlear damage
- bilateral SNHL initially and most prominently at 4000 Hz (resonant frequency of the temporal bone), known as “boilermaker’s notch” on audiogram, extends to higher and lower frequencies with time (see [Figure 16D, OT10](#))
- speech reception not altered until hearing loss >30 dB at speech frequency, therefore considerable damage may occur before patient complains of hearing loss
- difficulty with speech discrimination, especially in situations with competing noise

Phases of Hearing Loss

- dependent on: intensity of sound and duration of exposure
- temporary threshold shift
 - when exposed to loud sound, decreased sensitivity or increased threshold for sound
 - may have associated aural fullness and tinnitus
 - with removal of noise, hearing returns to normal
- permanent threshold shift
 - hearing does not return to previous state

Treatment

- hearing aid
- prevention
 - ear protectors: muffs, plugs
 - limit exposure to noise with frequent rest periods
 - regular audiologic follow-up

Temporal Bone Fractures

Table 9. Features of Temporal Bone Fractures

	Transverse (1)	Longitudinal (2)
Extension	Into bony labyrinth and internal auditory meatus	Into middle ear
Incidence	10-20%	70-90%
Etiology	Frontal/occipital trauma	Lateral skull trauma
CN Pathology	CN VII palsy (50%)	CN VII palsy (10-20%)
Hearing Loss	SNHL due to direct cochlear injury	CHL secondary to ossicular injury
Vestibular Symptoms	Sudden onset vestibular symptoms due to direct semicircular canal injury (vertigo, spontaneous nystagmus)	Rare
Other Features	Intact external auditory meatus, TM \pm hemotympanum Spontaneous nystagmus CSF leak in Eustachian tube to nasopharynx \pm rhinorrhea (risk of meningitis)	Torn TM or hemotympanum Bleeding from external auditory canal Step formation in external auditory canal CSF otorrhea Battle's sign = mastoid ecchymoses Raccoon eyes = periorbital ecchymoses

- characterized as longitudinal or transverse relative to the long axis of the petrous temporal bone
- temporal bone fractures are rarely purely transverse or longitudinal (often a mixed picture)

Diagnosis

- otoscopy
- do not syringe or manipulate external auditory meatus due to risk of inducing meningitis via TM perforation
- CT head
- audiology, facial nerve tests (for transverse fractures), Schirmer's test (of lacrimation), stapedial reflexes if CN VII palsy
- if suspecting CSF leak: look for halo sign, send fluid for β -2 transferrin

Treatment

- ABCs
- medical: expectant, prevent otogenic meningitis
- surgical: explore temporal bone, indications:
 - CN VII palsy (immediate and complete)
 - gunshot wound
 - depressed fracture of external auditory meatus
 - early meningitis (mastoidectomy)
 - bleeding intracranially from sinus
 - CSF otorrhea (may resolve spontaneously)

Complications

- AOM \pm labyrinthitis \pm mastoiditis
- meningitis/epidural abscess/brain abscess
- post-traumatic cholesteatoma

Figure 18. Types of temporal bone fractures

Signs of Basilar Skull Fracture

Battle's Sign: ecchymosis of the mastoid process of the temporal bone

Raccoon Eyes

CSF Rhinorrhea/Otorrhea

Cranial Nerve Involvement: facial palsy \rightarrow CN VII, nystagmus \rightarrow CN VI, facial numbness \rightarrow CN V

The halo sign: the double ringed appearance of CSF fluid on white filter paper as it separates out from blood

Hemotympanum can be indicative of temporal bone trauma

House-Brackmann Facial Nerve Grading System

Grade I: Normal facial motor function

Grade II: Mild dysfunction

- Slight weakness
- Normal symmetry and tone at rest
- Complete eye closure

Grade III: Moderate dysfunction

- Obvious weakness

Grade IV: Moderately severe dysfunction

- Obvious weakness \pm disfiguring asymmetry
- Incomplete eye closure
- No forehead motion
- Mouth asymmetric motion

Grade V: Severe dysfunction

- Barely perceptible motion of mouth
- Asymmetric at rest

Grade VI: Total paralysis

- No movement

Facial Nerve (CN VII) Paralysis

Etiology

- supranuclear and nuclear (MS, poliomyelitis, cerebral tumors)
- infranuclear

Treatment

- treat according to etiology plus provide corneal protection with artificial tears, nocturnal lid taping, tarsorrhaphy, gold weighting of upper lid
- facial paralysis that does not resolve with time or with medical treatment will often be referred for possible reanimation techniques to restore function
 - common reanimation techniques include
 - ♦ direct facial nerve anastomosis
 - ♦ interpositional grafts
 - ♦ anastomosis to other motor nerves
 - ♦ muscle transpositions

Table 10. Differential Diagnosis of Peripheral Facial Paralysis (PFP)

Etiology	Incidence	Findings	Investigations	Treatment, Follow-up, and Prognosis (Px)
Bell's Palsy Idiopathic, (HSV) infection of the facial nerve Diagnosis of exclusion	80-90% of PFP Risk Factors: DM Pregnancy Viral prodrome (50%)	Hx: Acute onset Numbness of ear Schirmer's test Recurrence (12%) + FHx (14%) Hyperacusis (30%) P/E: Paralysis or paresis of all muscle groups on one side of the face Absence of signs of CNS disease Absence of signs of ear or CPA diseases	Stapedial reflex absent Audiology normal (or baseline) EMG – best measure for prognosis Topognostic testing MRI with gadolinium – enhancement of CN VII and VIII High resolution CT	Rx: Protect the eye to prevent exposure keratitis with patching or tarsorrhaphy Systemic steroids may lessen degeneration and hasten recovery Consider antiviral (acyclovir) F/U: Spontaneous remission should begin within 3 wk of onset Delayed (3-6 mo) recovery portends at least some functional loss Px: 90% recover spontaneously and completely overall; >90% recovery if paralysis was incomplete Poorer if hyperacusis, >60 yr, DM, HTN, severe pain
Ramsay Hunt Syndrome (Herpes Zoster Oticus) Varicella zoster infection of CN VII/VIII	4.5-9% of PFP Risk Factors: >60 yr Impaired immunity Cancer Radiotherapy Chemotherapy	Hx: Hyperacusis SNHL Severe pain of pinna, mouth, or face P/E: Vesicles on pinna, external canal (erupt 3-7 d after onset of pain) Associated herpes zoster ophthalmicus (uveitis, keratoconjunctivitis, optic neuritis, or glaucoma)	Stapedial reflex absent Audiology – SNHL Viral ELISA studies to confirm MRI with gadolinium (86% of facial nerves enhance)	Rx: Avoid touching lesions to prevent spread of infection Systemic steroids can relieve pain, vertigo, avoid postherpetic neuralgia Acyclovir may lessen pain, aid healing of vesicles F/U: 2-4 wk Px: Poorer prognosis than Bell's palsy; 22% recover completely, 66% incomplete paralysis, 10% complete paralysis
TEMPORAL BONE FRACTURE				
Longitudinal (90%)	20% have PFP	Hx: Blow to side of head P/E: Trauma to side of head Neuro findings consistent with epidural/subdural bleed	Skull x-rays CT head	Px: Injury usually due to stretch or impingement; may recover with time
Transverse (10%)	40% have PFP	Hx: Blow to frontal or occipital area P/E: Trauma to front or back of head	Skull x-rays CT head	Px: Nerve transection more likely
Iatrogenic		Variable (depending on level of injury)	Wait for lidocaine to wear off EMG	Rx: Exploration if complete nerve paralysis No exploration if any movement present

Source: Paul Warrick, MD

Rhinitis

Definition

- inflammation of the lining (mucosa) of the nasal cavity

Table 11. Classification of Rhinitis

Inflammatory	Non-Inflammatory
<ul style="list-style-type: none"> Perennial non-allergic <ul style="list-style-type: none"> Asthma, ASA sensitivity Allergic <ul style="list-style-type: none"> Seasonal Perennial Atrophic <ul style="list-style-type: none"> Primary: <i>Klebsiella ozena</i> (especially in elderly) Acquired: post-surgery if too much mucosa or turbinate has been resected Infectious <ul style="list-style-type: none"> Viral: e.g. rhinovirus, influenza, parainfluenza, etc. Bacterial: e.g. <i>S. aureus</i> Fungal Granulomatous: TB, syphilis, leprosy Non-infectious <ul style="list-style-type: none"> Sarcoidosis GPA Irritant <ul style="list-style-type: none"> Dust Chemicals Pollution 	<ul style="list-style-type: none"> Rhinitis medicamentosa <ul style="list-style-type: none"> Topical decongestants Hormonal <ul style="list-style-type: none"> Pregnancy Estrogens Thyroid Idiopathic vasomotor

Rhinitis medicamentosa: rebound congestion due to the overuse of intranasal vasoconstrictors; for prevention, use of these medications for only 5-7 d is recommended

Table 12. Nasal Discharge: Character and Associated Conditions

Character	Associated Conditions
Watery/mucoid	Allergic, viral, vasomotor, CSF leak (halo sign)
Mucopurulent	Bacterial, foreign body
Serosanguinous	Neoplasia
Bloody	Trauma, neoplasia, bleeding disorder, HTN/vascular disease

Allergic Rhinitis (Hay Fever)

Definition

- rhinitis characterized by an IgE-mediated hypersensitivity to foreign allergens
- acute-and-seasonal or chronic-and-perennial
- perennial allergic rhinitis often confused with recurrent colds

Etiology

- when allergens contact the respiratory mucosa, specific IgE antibody is produced in susceptible hosts
- concentration of allergen in the ambient air correlates directly with the rhinitis symptoms

Epidemiology

- age at onset usually <20 yr
- more common in those with a personal or family history of allergies/atopy

Clinical Features

- nasal: obstruction with pruritus, sneezing
- clear rhinorrhea (containing increased eosinophils)
- itching of eyes with tearing
- frontal headache and pressure
- mucosa: swollen, pale, "boggy"
- seasonal (summer, spring, early autumn)
 - pollens from trees
 - lasts several weeks, disappears, and recurs following year at same time
- perennial
 - inhaled: house dust, wool, feathers, foods, tobacco, hair, mold
 - ingested: wheat, eggs, milk, nuts
 - occurs intermittently for years with no pattern or may be constantly present

Complications

- chronic sinusitis/polyps
- serous otitis media

Diagnosis

- history
- direct exam
- allergy testing

Treatment

- education: identification and avoidance of allergen
- nasal irrigation with saline
- antihistamines (e.g. diphenhydramine, fexofenadine)
- oral decongestants (e.g. pseudoephedrine, phenylpropanolamine)
- topical decongestant (may lead to rhinitis medicamentosa)
- other topicals: steroids (fluticasone), disodium cromoglycate, antihistamines, ipratropium bromide
- oral steroids if severe
- desensitization by allergen immunotherapy

Congestion reduces nasal airflow and allows the nose to repair itself (i.e. washes away the irritants)

Treatment should focus on the initial insult rather than target this defense mechanism

Vasomotor Rhinitis

- neurovascular disorder of nasal parasympathetic system (vidian nerve) affecting mucosal blood vessels
- nonspecific reflex hypersensitivity of nasal mucosa
- caused by
 - temperature change
 - alcohol, dust, smoke
 - stress, anxiety, neurosis
 - endocrine: hypothyroidism, pregnancy, menopause
 - parasympathomimetic drugs
 - beware of rhinitis medicamentosa: reactive vasodilation due to prolonged use (>5 d) of nasal drops and sprays

Clinical Features

- chronic intermittent nasal obstruction, varies from side to side
- rhinorrhea: thin, watery
- mucosa and turbinates: swollen
- nasal allergy must be ruled out

Treatment

- elimination of irritant factors
- parasympathetic blocker (Atrovent® nasal spray)
- steroids (e.g. beclomethasone, fluticasone)
- surgery (often of limited lasting benefit): electrocautery, cryosurgery, laser treatment, or removal of inferior or middle turbinates
- vidian neurectomy (rarely done)
- symptomatic relief with exercise (increased sympathetic tone)

Rhinosinusitis

Pathogenesis of Rhinosinusitis

- ostial obstruction or dysfunctional cilia permit stagnant mucous and, consequently, infection
- all sinuses drain to a common prechamber under the middle meatus called the osteomeatal complex

Definition

- inflammation of the mucosal lining of the sinuses and nasal passages

Classification

- acute: <4 wk
- subacute: 4-8 wk
- chronic: >8-12 wk

Table 13. Etiologies of Rhinosinusitis

Ostial Obstruction	Inflammation	<ul style="list-style-type: none"> • URTI • Allergy
	Mechanical	<ul style="list-style-type: none"> • Septal deviation • Turbinate hypertrophy • Polyps • Tumors • Adenoid hypertrophy • Foreign body • Congenital abnormalities (e.g. cleft palate)
	Immune	<ul style="list-style-type: none"> • GPA • Lymphoma, leukemia • Immunosuppressed patients (e.g. neutropenics, diabetics, HIV)
Systemic		<ul style="list-style-type: none"> • Cystic fibrosis • Immotile cilia (e.g. Kartagener's)
Direct Extension	Dental	<ul style="list-style-type: none"> • Infection
	Trauma	<ul style="list-style-type: none"> • Facial fractures

Acute Bacterial Rhinosinusitis

Definition

- bacterial infection of the paranasal sinuses and nasal passages lasting >7 d
- clinical diagnosis requiring ≥ 2 major symptoms, at least one of the symptoms is either nasal obstruction or purulent/discholorated nasal discharge
 - **major symptoms**
 - ♦ facial pain/pressure/fullness
 - ♦ nasal obstruction
 - ♦ purulent/discholorated nasal discharge
 - ♦ hyposmia/anosmia
 - **minor symptoms**
 - ♦ headache
 - ♦ halitosis
 - ♦ fatigue
 - ♦ dental pain
 - ♦ cough
 - ♦ ear pain/fullness

Etiology

- bacteria: *S. pneumoniae* (35%), *H. influenzae* (35%), *M. catarrhalis*, *S. aureus*, anaerobes (dental)
- children are more prone to a bacterial etiology, but viral is still more common
- maxillary sinus most commonly affected
- must rule out fungal causes (mucormycosis) in immunocompromised hosts (especially if painless, black or pale mucosa on examination)

Clinical Features

- sudden onset of
 - nasal blockage/congestion and/or purulent nasal discharge/posterior nasal drip
 - \pm facial pain or pressure, hyposmia, sore throat
- persistent/worsening symptoms >5-7 d or presence of purulence for 3-4 d with high fever
- speculum exam: erythematous mucosa, mucopurulent discharge, pus originating from the middle meatus
- predisposing factors: viral URTI, allergy, dental disease, anatomical defects
- differentiate from acute viral rhinosinusitis (course: <10 d, peaks by 3 d)

Management

- depends on symptom severity (i.e. intensity/duration of symptoms, impact on quality of life)
- mild-moderate: INCS
 - if no response within 72 h, add antibiotics
- severe: INCS + antibiotics
- antibiotics
 - 1st line: amoxicillin x 10 d (TMP-SMX or macrolide if penicillin allergy)
- if no response to 1st line antibiotics within 72 h, switch to 2nd line
 - 2nd line: fluoroquinolones or amoxicillin-clavulanic acid inhibitors
- adjuvant therapy (saline irrigation, analgesics, oral/topical decongestant) may provide symptomatic relief
- CT indicated only if complications are suspected

Acute Rhinosinusitis Complications

Consider hospitalization if any of the following are suspected

- Orbital (Chandler's classification)
 - Periorbital cellulitis
 - Orbital cellulitis
 - Subperiosteal abscess
 - Orbital abscess
 - Cavernous sinus thrombosis
- Intracranial
 - Meningitis
 - Abscess
- Bony
 - Subperiosteal frontal bone abscess ("Pott's Puffy tumor")
 - Osteomyelitis
- Neurologic
 - Superior orbital fissure syndrome (CN III/IV/VI palsy, immobile globe, dilated pupils, ptosis, V1 hypoesthesia)
 - Orbital apex syndrome (as above, plus neuritis, papilledema, decreased visual acuity)

FESS = Functional Endoscopic Sinus Surgery

Opening of the entire osteomeatal complex in order to facilitate drainage while sparing the sinus mucosa

Allergic fungal rhinosinusitis is a chronic sinusitis affecting mostly young, immunocompetent, atopic individuals. Treatment options include FESS \pm intranasal topical steroids, antifungals, and immunotherapy

Chronic Rhinosinusitis

Definition

- inflammation of the mucosa of paranasal sinuses and nasal passages >8-12 wk
- diagnosis requiring ≥ 2 major symptoms for >8-12 wk and ≥ 1 objective finding of inflammation of the paranasal sinuses (CT/endoscopy)

Etiology

- unclear etiology but the following may contribute or predispose:
 - inadequate treatment of acute rhinosinusitis
 - bacterial colonization/biofilms
 - ♦ *S. aureus*, enterobacteriaceae, *Pseudomonas*, *S. pneumoniae*, *H. influenzae*, β -hemolytic streptococci
 - fungal infection (e.g. *Aspergillus*, *Zygomycetes*, *Candida*)
 - anatomic abnormality (e.g. lost ostia patency, deviated septum – predisposing factors)
 - allergy/allergic rhinitis
 - ciliary disorder (e.g. cystic fibrosis, Kartagener syndrome)
 - chronic inflammatory disorder (e.g. GPA)
 - untreated dental disease

Clinical Features (similar to acute, but less severe)

- chronic nasal obstruction
- purulent anterior/posterior nasal discharge
- facial congestion/fullness
- facial pain/pressure
- hyposmia/anosmia
- halitosis
- chronic cough
- maxillary dental pain

Management

- identify and address contributing or predisposing factors
- obtain CT or perform endoscopy
- if polyps present: INCS, oral steroids \pm antibiotics (if signs of infection), refer to otolaryngologist/H&N surgeon
- if polyps absent: INCS, antibiotics, saline irrigation, oral steroids (severe cases)
- antibiotics for 3-6 wk
 - amoxicillin-clavulanic acid inhibitors, fluoroquinolone (moxifloxacin), macrolide (clarithromycin), clindamycin, Flagyl® (metronidazole)
- surgery if medical therapy fails or fungal sinusitis: FESS, balloon sinoplasty

Complications

- same as acute sinusitis, mucocele

Epistaxis

Blood Supply to the Nasal Septum (see Figure 4, OT3)

1. Superior posterior septum
 - internal carotid \rightarrow ophthalmic \rightarrow anterior/posterior ethmoidal
 2. Posterior septum
 - external carotid \rightarrow internal maxillary \rightarrow sphenopalatine artery \rightarrow nasopalatine
 3. Lower anterior septum
 - external carotid \rightarrow facial artery \rightarrow superior labial artery \rightarrow nasal branch
 - external carotid \rightarrow internal maxillary \rightarrow descending palatine \rightarrow greater palatine
- these arteries all anastomose to form Kiesselbach's plexus, located at Little's area (anterior-inferior portion of the cartilaginous septum)
 - bleeding from above middle turbinate is internal carotid, and from below is external carotid

90% of nose bleeds occur in Little's area

Table 14. Etiology of Epistaxis

Type	Causes
Local	Trauma (most common) <ul style="list-style-type: none"> • Fractures: facial, nasal • Self-induced: digital, foreign body
	Tumors <ul style="list-style-type: none"> • Benign: polyps, inverting papilloma, angiofibroma • Malignant: SCC, esthesioneuroblastoma (olfactory neuroblastoma)
	Inflammation <ul style="list-style-type: none"> • Rhinitis: allergic, non-allergic • Infections: bacterial, viral, fungal
	Idiopathic
	Iatrogenic: nasal, sinus, orbit surgery
	Barometric changes
Systemic	Nasal dryness: dry air \pm septal deformities
	Septal perforation
	Chemical: cocaine, nasal sprays, ammonia, etc.
	Coagulopathies <ul style="list-style-type: none"> • Meds: anticoagulants, NSAIDs • Hemophilias, von Willebrand's • Hematological malignancies • Liver failure, uremia
	Vascular: HTN, atherosclerosis, Osler-Weber-Rendu (hereditary hemorrhagic telangiectasia)
	Others: GPA, SLE

**Special Cases**

- Adolescent male with unilateral recurrent epistaxis – consider juvenile nasopharyngeal angiofibroma (JNA); this is the most common benign tumor of the nasopharynx
- Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

Investigations

- CBC, PT/PTT (if indicated)
- x-ray, CT as needed

Treatment

- locate bleeding and achieve hemostasis

1. ABCs

- lean patient forward to minimize swallowing blood and avoid airway obstruction
- apply constant firm pressure for 20 min on cartilaginous part of nose (not bony pyramid)
- if significant bleeding, assess vitals for signs of hemorrhagic shock ± IV NS, cross-match blood

2. Determine Site of Bleeding

- anterior/posterior hemorrhage defined by location in relationship to bony septum
- visualize nasal cavity with speculum
- use cotton pledget with topical lidocaine ± topical decongestant to help identify area of bleeding (often anterior septum)
- if suspicious bleeding disorder, coagulation workup (platelet number and platelet function assay)

3. Control the Bleeding

- first line topical vasoconstrictors
- if first line fails and bleeding adequately visualized, cauterize with silver nitrate
- **do not cauterize both sides of the septum** at one time due to risk of septal perforation from loss of septal blood supply

A. Anterior hemorrhage treatment

- if fail to achieve hemostasis with cauterization:
 - ♦ place anterior pack* with half inch Vaseline®-soaked ribbon gauze strips layered from nasal floor toward nasal roof extending to posterior choanae or lubricated absorbable packing (i.e. Gelfoam wrapped in Surgicel®) for 2-3 d
 - ♦ can also attempt packing with Merocel® or nasal tampons of different shapes
 - ♦ can also apply Floseal® (hemostatic matrix consisting of topical human thrombin and cross-linked gelatin) if other methods fail

B. Posterior hemorrhage treatment

- if unable to visualize bleeding source, then usually posterior source:
 - ♦ place posterior pack* using a Foley catheter, gauze pack, or Epistat® balloon
 - ♦ subsequently, layer anterior packing bilaterally
 - ♦ admit to hospital with packs in for 3-5 d
 - ♦ watch for complications: hypoxemia (nasal-pulmonic reflex), toxic shock syndrome (Rx: remove packs immediately), pharyngeal fibrosis/stenosis, alar/septal necrosis, aspiration

C. If anterior/posterior packs fail to control epistaxis

- ligation or embolization of culprit arterial supply by interventional radiology
- ± septoplasty

* antibiotics for any posterior pack or any pack left for >48 h because of risk of toxic shock syndrome

4. Prevention

- prevent drying of nasal mucosa with humidifiers, saline spray, or topical ointments
- avoidance of irritants
- medical management of HTN and coagulopathies

Hoarseness

Definitions

- hoarseness: change in voice quality, ranging from voice harshness to voice weakness; reflects abnormalities anywhere along the vocal tract from oral cavity to lungs
- dysphonia: a general alteration in voice quality
- aphonia: no sound emanates from vocal folds

If hoarseness present for >2 wk in a smoker, laryngoscopy must be done to rule out malignancy

Acute Laryngitis

Definition

- <2 wk inflammatory changes in laryngeal mucosa

Etiology

- viral: influenza, adenovirus
- bacterial: Group A *Streptococcus*
- mechanical acute voice strain → submucosal hemorrhage → vocal cord edema → hoarseness
- environmental: toxic fume inhalation

Clinical Features

- URTI symptoms, hoarseness, aphonia, cough attacks, ± dyspnea
- true vocal cords erythematous/edematous with vascular injection and normal mobility

Treatment

- usually self-limited, resolves within ~1 wk
- voice rest
- humidification
- hydration

**Vocal Cord Paralysis**

Unilateral: affected cord lies in the paramedian position, inadequate glottic closure during phonation → weak, breathy voice. Usually medializes with time whereby phonation and aspiration improve. Treatment options include voice therapy, injection laryngoplasty (Radiesse), medialization using silastic block

Bilateral: cords rest in midline therefore voice remains good but respiratory function is compromised and may present as stridor. If no respiratory issues, may monitor closely and wait for improvement. If respiratory issues, intubate and will likely require a tracheotomy

- avoid irritants (e.g. smoking)
- treat with antibiotics if there is evidence of coexistent bacterial pharyngitis

Chronic Laryngitis

Definition

- >2 wk inflammatory changes in laryngeal mucosa

Etiology

- repeated attacks of acute laryngitis
- chronic irritants (dust, smoke, chemical fumes)
- chronic voice strain
- chronic rhinosinusitis with postnasal drip
- chronic EtOH use
- esophageal disorders: GERD, Zenker's diverticulum, hiatus hernia
- systemic: allergy, hypothyroidism, Addison's disease

Clinical Features

- chronic dysphonia: rule out malignancy
- cough, globus sensation, frequent throat clearing 2° to GERD
- laryngoscopy: cords erythematous, thickened with ulceration/granuloma formation, and normal mobility

Treatment

- remove offending irritants
- treat related disorders (e.g. antisecretory therapy for GERD)
- speech therapy with voice rest
- ± antibiotics ± steroids to decrease inflammation
- laryngoscopy to rule out malignancy

Vocal Cord Polyps

Definition

- structural manifestation of vocal cord irritation
- acutely, polyp forms 2° to capillary damage in the subepithelial space during extreme voice exertion

Etiology

- most common benign tumor of vocal cords
- voice strain (muscle tension dysphonia)
- laryngeal irritants (GERD, allergies, tobacco)

Epidemiology

- 30-50 yr of age
- M>F

Clinical Features

- hoarseness, aphonia, cough attacks ± dyspnea
- pedicled or sessile polyp on free edge of vocal cord
- typically polyp asymmetrical, soft, and smooth
- more common on the anterior 1/3 of the vocal cord
- intermittent respiratory distress with large polyps

Treatment

- avoid irritants
- endoscopic laryngeal microsurgical removal if persistent or if high risk of malignancy

Vocal Cords: Polyps vs. Nodules

Polyps	Nodule
Unilateral, asymmetric	Bilateral
Acute onset	Gradual onset
May resolve spontaneously	Often follow a chronic course
Subepithelial capillary breakage	Acute: submucosal hemorrhage or edema Chronic: hyalinization within submucosal lesion
Soft, smooth, fusiform, pedunculated mass	Acute: small, discrete nodules Chronic: hard, white, thickened fibrosed nodules
Proton pump inhibitor	Voice rest but no whispering, hydration, speech therapy if refractory to therapy
Surgical excision if persistent or in presence of risk factors for laryngeal cancer	Surgical excision as last resort

Vocal Cord Nodules

Definition

- vocal cord callus
- i.e. "screamer's or singer's nodules"

Etiology

- early nodules occur 2° to submucosal hemorrhage
- mature nodules result from hyalinization which occurs with long-term voice abuse
- chronic voice strain
- frequent URTI, smoke, EtOH

Epidemiology

- frequently in singers, children, bartenders, and school teachers
- F>M

Clinical Features

- hoarseness worst at end of day
- on laryngoscopy
 - often bilateral
 - at the junction of the anterior 1/3 and posterior 2/3 of the vocal cords – point of maximal cord vibration
- chronic nodules may become fibrotic, hard, and white

Treatment

- voice rest
- hydration
- speech therapy
- avoid irritants
- surgery rarely indicated for refractory nodules

Benign Laryngeal Papillomas

Etiology

- HPV types 6, 11
- possible hormonal influence, possibly acquired during delivery

Epidemiology

- biphasic distribution: 1) birth to puberty (most common laryngeal tumor) and 2) adulthood

Clinical Features

- hoarseness and airway obstruction
- can seed into tracheobronchial tree
- highly resistant to complete removal
- some juvenile papillomas resolve spontaneously at puberty
- may undergo malignant transformation
- laryngoscopy shows wart-like lesions in supraglottic larynx and trachea

Treatment

- microdebridement or CO₂ laser
- adjuvants under investigation: interferon, cidofovir, acyclovir
- HPV vaccine may prevent/decrease the incidence but more research is needed

Laryngeal Carcinoma

- see *Neoplasms of the Head and Neck*, OT35

Salivary Glands

Sialadenitis

Definition

- inflammation of salivary glands

Etiology

- viral most common (mumps)
- bacterial causes: *S. aureus*, *S. pneumoniae*, *H. influenzae*
- obstructive vs. non-obstructive
- obstructive infection involves salivary stasis and bacterial retrograde flow

Predisposing Factors

- HIV
- anorexia/bulimia
- Sjögren's syndrome
- Cushing's, hypothyroidism, DM
- hepatic/renal failure
- meds that increase stasis: diuretics, TCAs, β -blockers, anticholinergics, antibiotics
- sialolithiasis (can cause chronic sialadenitis)

Clinical Features

- acute onset of pain and edema of parotid or submandibular gland that may lead to marked swelling
- \pm fever
- \pm leukocytosis
- \pm suppurative drainage from punctum of the gland

Investigations

- U/S imaging to differentiate obstructive vs. non-obstructive sialadenitis

Treatment

- bacterial: treat with cloxacillin \pm abscess drainage, sialogogues
- viral: no treatment

Mumps usually presents with bilateral parotid enlargement \pm SNHL \pm orchitis

Sialolithiasis

Definition

- ductal stone (mainly hydroxyapatite) in adults, sand/sludge in children, leading to chronic sialadenitis
- 80% in submandibular gland, <20% in parotid gland, ~1% in sublingual gland

Risk Factors

- any condition causing duct stenosis or a change in salivary secretions (e.g. dehydration, DM, EtOH, hypercalcemia, psychiatric medication)

Clinical Features

- pain and tenderness over involved gland
- intermittent swelling related to meals
- digital palpation reveals presence of calculus

Investigations

- U/S \pm sialogram

Treatment

- may resolve spontaneously
- encourage salivation to clear calculus
- massage, analgesia, antibiotics, sialogogues (e.g. lemon wedges, sour lemon candies), warm compresses
- remove calculi endoscopically, by dilating duct or orifice, or by excision through floor of the mouth
- if calculus is within the gland parenchyma, the whole gland must be excised

Bilateral enlargement of the parotid glands may be a manifestation of a systemic disease, such as Sjögren's or an eating disorder (i.e. anorexia, bulimia)

Salivary Gland Neoplasms

Etiology

- anatomic distribution
 - parotid gland: 70-85%
 - submandibular gland: 8-15%
 - sublingual gland: 1%
 - minor salivary glands, most concentrated in hard palate: 5-8%
- malignant (see Table 15, OT32 and Table 16, OT36)
- benign
 - benign mixed (pleomorphic adenoma): 80%
 - Warthin's tumor (5-10% bilateral, M>F): 10%
 - cysts, lymph nodes and adenomas: 10%
 - oncocytoma: <1%

Epidemiology

- 3-6% of all head and neck neoplasms in adults
- mean age at presentation: 55-65
- M=F

A mass sitting above an imaginary line drawn between the mastoid process and angle of the mandible is a parotid neoplasm until proven otherwise

Parotid Gland Neoplasms

Clinical Features

- 80% benign (pleomorphic adenoma: most common), 20% malignant (mucoepidermoid: most common)
- if bilateral, suggests benign process (Warthin's tumor, Sjögren's, bulimia, mumps) or possible lymphoma
- facial nerve involvement (i.e. facial paralysis): increases risk of malignancy

Investigations

- FNA biopsy
- CT, U/S, or MRI to determine extent of tumor

Treatment

- treatment of choice is surgery for all salivary gland neoplasms – benign and malignant
- pleomorphic adenomas are excised due to risk of malignant transformation (5% risk over prolonged period of time)
- superficial tumor
 - superficial parotidectomy above plane of CN VII ± radiation
 - incisional biopsy contraindicated
- deep lesion
 - near-total parotidectomy sparing as much of CN VII as possible
 - if CN VII involved then it is removed and cable grafted
- complications of parotid surgery
 - hematoma, infection, salivary fistula, temporary facial paresis, Frey's syndrome (gustatory sweating)

Prognosis

- benign: excellent, <5% of pleomorphic adenomas may recur
- malignant: dependent on stage and type of malignancy (see Table 16, OT36)

DDx Parotid Tumor

Benign

- Pleomorphic adenoma
- Warthin's tumor (more common in men)
- Benign lymphoepithelial cysts (viral etiology e.g. HIV)
- Oncocytoma

Malignant

- Mucoepidermoid carcinoma
- Adenoid cystic carcinoma
- Acinic cell carcinoma

Frey's syndrome is a post-operative complication characterized by gustatory sweating. It is due to aberrant innervation of cutaneous sweat glands by parasympathetic nerve fibers that are divided during surgery

Neck Masses

Approach to a Neck Mass

- ensure that the neck mass is not a normal neck structure (hyoid, transverse process of C1 vertebra, prominent carotid bulb)
- any neck mass persisting for >2 wk should be investigated for possible neoplastic causes

Table 15. Acquired Causes of Neck Lumps According to Age

Age (yr)	Possible Causes of Neck Lump		
<20	1. Congenital	2. Inflammatory/Infectious	3. Neoplastic
20-40	1. Inflammatory	2. Congenital	3. Neoplastic
>40	1. Neoplastic	2. Inflammatory	3. Congenital

Differential Diagnosis

- congenital
 - lateral (branchial cleft cyst, lymphatic/venous/venolymphatic malformation)
 - midline (thyroglossal duct cyst, dermoid cyst, laryngocele)
- infectious/inflammatory
 - reactive lymphadenopathy (2° to tonsillitis, pharyngitis)
 - infectious mononucleosis
 - Kawasaki, Kikuchi, Kimura
 - HIV
 - salivary gland calculi, sialadenitis
 - thyroiditis
- granulomatous disease
 - mycobacterial infections
 - sarcoidosis
- neoplastic
 - lymphoma
 - salivary gland tumors
 - thyroid tumors
 - metastatic malignancy ("unknown primary")

Inflammatory vs. Malignant Neck Masses

	Inflammatory	Neoplastic
History		
Painful	Y	N
H&N infection	Y	N
Fever	Y	N
Weight loss	N	Y
CA risk factors	N	Y
Age	Younger	Older
Physical		
Tender	Y	N
Rubbery	Y	Occ.
Rock hard	N	Y
Mobile	Y	± fixed

Evaluation

Investigations

- history and physical (including nasopharynx and larynx)
- all other investigations and imaging are dependent upon clinical suspicion following history and physical
- laboratory investigations
 - WBC: infection vs. lymphoma
 - Mantoux TB test
 - thyroid function tests and scan
- imaging
 - neck U/S
 - CT scan
 - angiography: vascularity and blood supply to mass
- biopsy: for histologic examination
 - FNA: least invasive
 - needle biopsy
 - open biopsy: for lymphoma
- identification of possible primary tumor (rule out a metastatic lymph node from an “unknown primary”)
 - panendoscopy: nasopharyngoscopy, laryngoscopy, esophagoscopy, bronchoscopy with washings, and biopsy of suspicious lesions
 - biopsy of normal tissue of nasopharynx, tonsils, base of tongue, and hypopharynx
 - primary identified 95% of time → stage and treat
 - primary occult 5% of time: excisional biopsy of node for histologic diagnosis → manage with radiotherapy and/or neck dissection (squamous cell carcinoma)

Congenital Neck Masses

Branchial Cleft Cysts/Fistula

Embryology

- at the 6th wk of development, the 2nd branchial arch grows over the 3rd and 4th arches and fuses with the neighbouring caudal pre-cardial swelling forming the cervical sinus
- 3 types of malformations
 1. branchial fistula: persistent communication between skin and GI tract
 2. branchial sinus: blind-ended tract opening to skin
 3. branchial cyst: persistent cervical sinus with no external opening

Clinical Features

- 2nd branchial cleft malformations most common
 - sinuses and fistulae present in infancy as a small opening anterior to the sternocleidomastoid muscle
 - cysts present as a smooth, painless, slowly enlarging lateral neck mass, often following a URTI
- 1st branchial cleft malformations present as sinus/fistula or cyst in preauricular area or on face over angle of mandible
- 3rd branchial cleft malformations present as recurrent thyroiditis or thyroid abscess and have a tract leading usually to the left pyriform sinus
- there is controversy whether or not 4th branchial cleft anomalies exist, as they may be remnants of the thyrothymic axis

Treatment

- surgical removal of cyst or fistula tract
- if infected: allow infection to settle before removal (antibiotics may be required)

Figure 19. Branchial cleft cysts

Thyroglossal Duct Cysts

Embryology

- thyroid originates as ventral midline diverticulum at base of tongue caudal to junction of 3rd and 4th branchial arches (foramen cecum) and migrates down to inferior aspect of neck
- thyroglossal duct cysts are vestigial remnants of tract

Clinical Features

- usually presents in childhood or during 20-40s as a midline cyst that enlarges with URTI and elevates with swallowing and tongue protrusion

Treatment

- pre-operative antibiotics to reduce inflammation (infection before surgery is a well described cause of recurrence)
- small potential for neoplastic transformation so complete excision of cyst and tissue around tract up to foramen cecum at base of tongue with removal of central portion of hyoid bone (Sistrunk procedure) recommended

Lymphatic Malformation

Definition

- lymphatic malformation arising from vestigial lymph channels of neck

Clinical Features

- usually present by age 2
- can be macrocystic (composed of large thin-walled cysts, usually below level of mylohyoid muscle) or microcystic (composed of minute cysts, usually above level of mylohyoid muscle)
- usually painless, soft, compressible
- infection causes a sudden increase in size

Treatment

- can regress spontaneously after bacterial infection, therefore do not plan surgical intervention until several months after infection
- macrocystic lesions can be treated by sclerotherapy or surgical excision
- microcystic lesions are difficult to treat, but can be debulked

Neoplasms of the Head and Neck

Pre-Malignant Disease

- leukoplakia
 - hyperkeratosis of oral mucosa
 - risk of malignant transformation 5-20%
- erythroplakia
 - red superficial patches adjacent to normal mucosa
 - commonly associated with epithelial dysplasia
 - associated with carcinoma *in situ* or invasive tumor in 40% of cases
- dysplasia
 - histopathologic presence of mitoses and prominent nucleoli
 - involvement of entire mucosal thickness = carcinoma *in situ*
 - associated progression to invasive cancer in 15-30% of cases

Investigations

- initial metastatic screen includes CXR
- scans of liver, brain, and bone only if clinically indicated
- CT scan is superior to MRI for the detection of pathologic nodal disease and bone cortex invasion
- MRI is superior to discriminate tumor from mucus and to detect bone marrow invasion
- ± PET scans

Treatment

- treatment depends on
 - histologic grade of tumor
 - stage
 - physical and psychological health of patient
 - facilities available
 - expertise and experience of the medical and surgical oncology team
- in general
 - 1° surgery for malignant oral cavity tumors with radiotherapy reserved for salvage or poor prognostic indicators
 - 1° radiotherapy for nasopharynx, oropharynx, hypopharynx, larynx malignancies with surgery reserved for salvage
 - palliative chemotherapy for metastatic or incurable disease
 - concomitant chemotherapy increases survival in advanced disease
 - chemotherapy has a role as induction therapy prior to surgery and radiation
 - panendoscopy to detect primary disease when lymph node metastasis is identified
 - anti-EGFR treatment (cetuximab, panitumumab) has a role as concurrent therapy with radiation for SCC of the head and neck (for advanced local and regional disease)

Prognosis

- synchronous tumors occur in 9-15% of patients
- late development of 2nd primary most common cause of post-treatment failure after 36 mo

All patients presenting with a head and neck mass should be asked if they are experiencing the following obstructive, referred, or local symptoms:

- Dyspnea or stridor (positional vs. non-positional)
- Hoarseness or dysphonia
- Otolgia
- Non-healing oral ulcer
- Dysphagia
- Hemoptysis, hematemesis

Detection of cervical lymph nodes on physical exam:

False negative rate: 15-30%
False positive rate: 30-40%

Pathological lymphadenopathy defined radiographically as:

- A jugulodigastric node > 1.5 cm in diameter, or a retropharyngeal node > 1 cm in diameter
- A node of any size which contains central necrosis

Common sites of distant metastases for head and neck neoplasms:
lungs > liver > bones

Table 16. Quick Look-Up Summary of Head and Neck Malignancies – Etiology and Epidemiology

Etiology	Epidemiology	Risk Factors
Oral Cavity		
95% SCC others: sarcoma, melanoma, minor salivary gland tumor	Mean age: 50-60 yr M>F Most common site of H&N cancers 50% on anterior 2/3 of tongue	Smoking/EtOH Poor oral hygiene Leukoplakia, erythroplakia Lichen planus, chronic inflammation Sun exposure – lip HPV infection
Nose and Paranasal Sinus		
75-80% SCC Adenocarcinoma (2nd most common) and mucoepidermoid 99% in maxillary/ethmoid sinus 10% arise from minor salivary glands	Mean age: 50-70 yr Rare tumors ↓ incidence in last 5-10 yr	Wood/shoe/textile industry Hardwood dust (nasal/ethmoid sinus) Nickel, chromium (maxillary sinus) Air pollution Chronic rhinosinusitis
Carcinoma of the Pharynx – Subtypes (Nasopharynx, Oropharynx, Hypopharynx, and Larynx)		
Nasopharynx		
90% SCC ~10% lymphoma	Mean age: 50-59 yr M:F = 2.4:1 Incidence 0.8 per 100,000 100x increased incidence in Southern Chinese	Epstein-Barr virus (EBV) Salted fish Nickel exposure Poor oral hygiene Genetic – Southern Chinese
Oropharynx		
95% SCC – poorly differentiated	Mean age: 50-70 yr M:F = 4:1	Smoking/EtOH HPV infection
Hypopharynx		
95% SCC 3 sites: 1. pyriform sinus (60%) 2. post-cricoid (30%) 3. post pharyngeal wall (10%)	Mean age: 50-70 yr M>F 8-10% of all H&N cancer	Smoking/EtOH
Larynx		
SCC most common 3 sites: 1. supraglottic (30-35%) 2. glottic (60-65%) 3. subglottic (1%)	Mean age: 45-75 yr M:F = 10:1 45% of all H&N cancer	Smoking/EtOH HPV 16 infection strongly associated with the risk of laryngeal squamous cell cancers
Salivary Gland		
40% mucoepidermoid 30% adenoid cystic 5% acinic cell 5% malignant mixed 5% lymphoma	Mean age: 55-65 yr M=F 3-6% of all H&N cancer Rate of malignancy: Parotid 15-25% Submandibular 37-43% Minor salivary >80%	
Thyroid (90% benign – 10% malignant)		
>80% papillary 5-15% follicular 5% medullary <5% anaplastic 1-5% Hurthle cell 1-2% metastatic	Children Adults <30 or >60 yr Nodules more common in females Malignancy more common in males	Radiation exposure Family history – papillary CA or multiple endocrine neoplasia – MEN II Older age Male Papillary – Gardner's, Cowden's, familial adenomatous polyposis (FAP)
Parathyroid		
	Mean age: 44-55 yr Rare tumor	

Risk Factors for Head and Neck Cancer Include:

- Smoking
- EtOH (synergistic with smoking)
- Radiation
- Occupational/environmental exposures
- Oral HPV infection (independent of smoking and EtOH exposure)

The smaller the salivary gland, the greater the likelihood that a mass in the gland is malignant

Table 17. Quick Look-Up Summary of Head and Neck Malignancies – Diagnosis and Treatment

Clinical Features	Investigations	Treatment	Prognosis
Oral Cavity Asymptomatic neck mass (30%) Non-healing ulcer ± bleeding Dysphagia, sialorrhea, dysphonia Oral feter, otalgia, leukoplakia, or erythroplakia (pre-malignant changes or CIS)	Biopsy CT	1 ^o surgery local resection ± neck dissection ± reconstruction 2 ^o radiation	5 yr survival T1/T2: 75% T3/T4: 30-35% Poor prognostic indicators Depth of invasion, close surgical margins location (tongue worse than floor of mouth) Cervical nodes, extra-capsular spread
Nose and Paranasal Sinus Early symptoms: Unilateral nasal obstruction Epistaxis, rhinorrhea Late symptoms: 2 ^o to invasion of nose, orbit, nerves, oral cavity, skin, skull base, cribriform plate	CT/MRI Biopsy	Surgery and radiation Chemoradiotherapy	5 yr survival: 30-60% Poor prognosis 2 ^o to late presentation
Nasopharynx Cervical nodes (60-90%) Nasal obstruction, epistaxis Unilateral otitis media ± hearing loss CN III to VI, IX to XII (25%) Proptosis, voice change, dysphagia	Nasopharyngoscopy Biopsy CT/MRI	1 ^o radiation, chemoradiation Surgery for limited or recurrent disease	5 yr survival T1: 79% T2: 72% T3: 50-60% T4: 36-42%
Oropharynx Odynophagia, otalgia Ulcerated/enlarged tonsil Fixed tongue/trismus/dysarthria Oral feter, bloody sputum Cervical lymphadenopathy (60%) Distant mets: lung/bone/liver (7%)	Biopsy CT	1 ^o radiation 2 ^o surgery local resection ± neck dissection ± reconstruction	Base of tongue – control rates T1: >90%, T4: 13-52% Tonsils – cure rate T1/T2: 90-100%, T4: 15-33% HPV-positive tumors have an approximately 20% improved overall survival rate
Hypopharynx Dysphagia, odynophagia Otagia, hoarseness Cervical lymphadenopathy	Pharyngoscopy Biopsy CT	1 ^o radiation 2 ^o surgery	5 yr survival T1: 53% T2/T3: 36-39% T4: 24%
Larynx Dysphagia, odynophagia, globus Otagia, hoarseness Dyspnea/stridor Cough/hemoptysis Cervical nodes (rare with glottic CA)	Laryngoscopy CT/MRI	1 ^o radiation 2 ^o surgery 1 ^o surgery for bulky T4 disease	5 yr survival T4: >40% (surgery with radiation) Control rate early lesions >90% (radiation) 10 to 12% of small lesions fail radiotherapy
Salivary Gland Painless mass (occ. pain is possible) CN VII palsy Cervical lymphadenopathy Rapid growth Invasion of skin Constitutional signs/symptoms	FNA MRI/CT/U/S	1 ^o surgery ± neck dissection Post-operative radiotherapy Chemotherapy if unresectable	Parotid 10 yr survival: 85, 69, 43, and 14% for stages T1 to T4 Submandibular 2 yr survival: 82%, 5 yr: 69% Minor salivary gland 10 yr survival: 83, 52, 25, 23% for stages T1 to T4
Thyroid Thyroid mass, cervical nodes Vocal cord paralysis Hyper/hypothyroidism Dysphagia	FNA U/S	1 ^o surgery I ¹³¹ for intermediate and high risk well differentiated thyroid cancer	Recurrences occur within 5 yr Need long-term follow-up: clinical exam, thyroglobulin
Parathyroid Increased serum Ca ²⁺ Neck mass Bone disease, renal disease Pancreatitis	Sestamibi	Wide surgical excision Post-operative monitoring of serum Ca ²⁺	Recurrence rates 1 yr: 27% 5 yr: 82% 10 yr: 91% Mean survival: 6-7 yr

Thyroid Carcinoma

Table 18. Bethesda Classification of Thyroid Cytology

Category	Risk of Malignancy
Non-diagnostic or unsatisfactory	Unknown
Benign	0-3%
Follicular lesion of undetermined significance/ Atypia of undetermined significance	5-15%
Follicular/Hurthle cell neoplasms	15-30%
Suspicious for malignancy	60-75%
Malignant	97-99%

Table 19. Thyroid Carcinoma

	Papillary	Follicular	Medullary	Anaplastic	Lymphoma
Incidence (% of all thyroid cancers)	70-75%	10%	3 to 5% (10% familial 90% sporadic)	<5%	<1%
Route of Spread	Lymphatic	Hematogenous	Lymphatic and hematogenous		
Histology	Orphan Annie nuclei Psammoma bodies Papillary architecture	Capsular/vascular invasion Invasion influences prognosis	Amyloid May secrete calcitonin, prostaglandins, ACTH, serotonin, kallikrein, or bradykinin	Giant cells Spindle cells	
Other	Ps – Papillary cancer Popular (most common) Palpable lymph nodes Positive I ¹³¹ uptake Positive prognosis Post-operative I ¹³¹ scan to guide treatments	Fs – Follicular cancer Far away mets Female (3:1) NOT FNA (cannot be diagnosed by FNA) Favorable prognosis	Ms – Medullary cancer Multiple endocrine neoplasia (MEN IIa or IIb) aMyloid Median node dissection	More common in elderly 70% in women 20-30% have Hx of differentiated thyroid Ca (mostly papillary) or nodular goiter mass Rapidly enlarging neck Rule out lymphoma	Usually non-Hodgkin's lymphoma Rapidly enlarging thyroid mass Hx of Hashimoto's thyroiditis increases risk 60x 4:1 female predominance dysphagia, dyspnea, stridor, hoarseness, neck pain, facial edema, accompanied by "B" symptoms*
Prognosis	98% at 10 yr	92% at 10 yr	50% at 10 yr 20% at 10 yr if detected when clinically palpable	20-35% at 1 yr 13% at 10 yr	5 yr survival Stage IE 55%-80% Stage IIE 20%-50% Stage IIE/IV 15%-35%
Treatment	Small tumors: Near total thyroidectomy or lobectomy Diffuse/bilateral: Total thyroidectomy ± post-operative I ¹³¹ treatment	Small tumors: Near total thyroidectomy/lobectomy/isthmectomy Large/diffuse tumors: Total thyroidectomy	Total thyroidectomy Median lymph node dissection if lateral cervical nodes +ve Modified neck dissection Post-operative thyroxine Tracheostomy Screen asymptomatic relatives	Radiation and chemotherapy Small tumors: Total thyroidectomy ± external beam	Non-surgical Combined radiation Chemotherapy (CHOP**)

*B symptoms = fever, night sweats, chills, weight loss >10% in 6 mo

** CHOP = cyclophosphamide, adriamycin, vincristine, prednisone

Approach to Thyroid Nodule

- all patients with thyroid nodules require evaluation of serum TSH and ultrasound
- any nodule >5 mm with suspicious sonographic features (particularly microcalcifications) should undergo FNA
- any nodule >1 cm should undergo FNA
- when performing repeat FNA on initially non-diagnostic nodules, U/S-guided FNA should be employed
- nuclear scanning has minimal value in the investigation of the thyroid nodule

Table 20. Management of the Thyroid Nodule

Treatment	Indications
Radioiodine therapy	For the treatment of hyperthyroidism or as adjuvant treatment after surgery in the treatment of papillary or follicular carcinoma
Chemotherapy and/or radiotherapy	Anaplastic CA or thyroid lymphoma
Surgical excision	Mass that is "suspicious" on FNA Malignancy other than anaplastic CA or thyroid lymphoma Mass that on FNA is benign but increasing in size on serial imaging and/or >3-4 cm in size Hyperthyroidism not amenable to medical therapy

*U/S findings: cystic: risk of malignancy <1%; solid: risk of malignancy ~10%; solid with cystic components: risk of malignancy same as if solid

Indications for Post-Operative Radioactive Iodine Ablation – I¹³¹
Adjuvant therapy: decrease recurrent disease
RAI therapy: treat persistent cancer

Pediatric Otolaryngology

Acute Otitis Media

Definition

- all of: presence of middle ear effusion (MEE); presence of middle ear inflammation (MEI); acute onset of symptoms of MEE and MEI

Epidemiology

- most frequent diagnosis in sick children visiting clinicians' offices and most common reason for antibiotic administration
- peak incidence between 6-15 mo; ~85% of children have >1 episode by 3 yr old
- seasonal variability: peaks in winter

Etiology

- primary defect causing AOM: Eustachian tube dysfunction/obstruction → stasis/colonization by pathogens
- bacterial: *S. pneumoniae*, non-typable *H. influenzae*, *M. catarrhalis*, Group A *Streptococcus*, *S. aureus*
- viral: RSV, influenza, parainfluenza, adenovirus
- commonly due to bacterial/viral co-infection

Predisposing Factors

- Eustachian tube dysfunction/obstruction
 - swelling of tubal mucosa
 - upper respiratory tract infection (URTI)
 - allergic rhinitis
 - chronic rhinosinusitis
 - obstruction/infiltration of Eustachian tube ostium
 - tumor: nasopharyngeal carcinoma (adults)
 - adenoid hypertrophy (not due to obstruction but by maintaining a source of infection)
 - barotrauma (sudden changes in air pressure)
 - inadequate tensor palati function: cleft palate (even after repair)
 - abnormal Eustachian tube
 - Down syndrome (horizontal position of Eustachian tube), Crouzon syndrome, cleft palate, and Apert syndrome
- disruption of action of
 - cilia of Eustachian tube: Kartagener's syndrome
 - mucus secreting cells
 - capillary network that provides humoral factors, PMNs, phagocytic cells
- immunosuppression/deficiency due to chemotherapy, steroids, DM, hypogammaglobulinemia, cystic fibrosis

Risk Factors

- non-modifiable: young age, family history of OM, prematurity, orofacial abnormalities, immunodeficiencies, Down syndrome, race, and ethnicity
- modifiable: lack of breastfeeding, day care attendance, household crowding, exposure to cigarette smoke and air pollution, pacifier use

Pathogenesis

- obstruction of Eustachian tube → air absorbed in middle ear → negative pressure (an irritant to middle ear mucosa) → edema of mucosa with exudate/effusion → infection of exudate from nasopharyngeal secretions

Clinical Features

- triad of otalgia, fever (especially in younger children), and conductive hearing loss
- rarely tinnitus, vertigo, and/or facial nerve paralysis
- otorrhea if tympanic membrane perforated
- infants/toddlers
 - ear-tugging (this alone is not a good indicator of pathology)
 - hearing loss, balance disturbances (rare)
 - irritable, poor sleeping
 - vomiting and diarrhea
 - anorexia
- otoscopy of TM
 - hyperemia
 - bulging, pus may be seen behind TM
 - loss of landmarks: handle and long process of malleus not visible

Antibiotics for Acute Otitis Media in Children

Cochrane DB Syst Rev 2013;1:CD000219
Study: Meta-analysis of Randomized Controlled Trials (RCTs) on children (1-15 mo) with acute otitis media comparing any antibiotic regime to placebo and expectant observation.

Data Sources: Cochrane Central Register of Controlled Trials (2012 issue 10), MEDLINE (1966 to October 2012), OLDMEDLINE (1958 to 1965), EMBASE (January 1990 to November 2012), Current Contents (1966 to November 2012), CINAHL (2008 to November 2012) and LILACS (2008 to November 2012) without language restrictions.

Main Outcomes: 1) Pain at 24 h, 2-3 d, and 4-7 d; 2) Abnormal tympanometry findings; 3) TM perforation; 4) Contralateral otitis; 5) AOM recurrences; 6) Serious complications from AOM; 7) Adverse effects from antibiotics.

Results: Treatment with antibiotics had no significant impact on pain at 24 h. However, pain at 2-3 d and 4-7 d was lower in the antibiotic groups with a NNT of 20. Antibiotics had no significant effect on tympanometry findings, number of AOM recurrences, or severity of complications. Antibiotic treatment led to a significant reduction in TM perforations (NNT 33) and halved contralateral AOM (NNT 11). Adverse events (vomiting, diarrhea, or rash) occurred more often in children taking antibiotics.

Conclusion: The role of antibiotics is largely restricted to pain control at 2-7 d, but most (82%) settle without antibiotics. This can also be achieved by analgesics. However, antibiotic treatment can reduce risk of TM perforation and contralateral AOM episodes. These benefits must be weighed against risks of adverse events from antibiotics.

Clinical Assessment of AOM in Pediatrics

JAMA 2010;304:2161-2169

In assessment of AOM in pediatrics, ear pain is the most useful symptom with a likelihood ratio (LR) between 3.0-7.3. Useful otoscopic signs include erythematous (LR 8.4, 95% CI 7-11), cloudy (LR 34, 95% CI 28-42), bulging (LR 51, 95% CI 36-73), and immobile tympanic membrane (LR 31, 95% CI 26-37) on pneumatic otoscopy.

Indications for Myringotomy and Tympanostomy Tubes in Recurrent AOM (RAOM) and OME

- Chronic bilateral OME and documented hearing difficulties >3 mo
- Unilateral or bilateral OME >3 mo and symptoms likely attributable to OME (e.g. balance problems, poor school performance, ear discomfort, etc)
- At-risk children (permanent hearing loss, speech/language delay, autism-spectrum disorder, syndromes/craniofacial disorders, blindness, cleft palate, developmental delay) with unilateral or bilateral OME with type B tympanogram or persistent effusion > 3 mo
- RAOM (>3 episodes in 6 mo or >4 in 12 mo) with unilateral or bilateral middle ear effusion

Clinical practice guidelines: Tympanostomy tubes in children. *Otolaryng Head Neck* 2013;149:S1-S35

Diagnosis

- history
 - acute onset of otalgia or ear tugging in a preverbal child, otorrhea, decreased hearing
 - unexplained irritability, fever, upper respiratory symptoms, poor sleeping, anorexia, N/V, and diarrhea
- physical
 - febrile
 - MEE on otoscopy: immobile tympanic membrane, acute otorrhea, loss of bony landmarks, opacification of TM, air-fluid level behind TM
 - MEI on otoscopy: bulging TM with marked discoloration (hemorrhagic, red, gray, or yellow)

Management

- observation for 48-72 h without antimicrobials may be appropriate since >80% of AOM in children resolve spontaneously
- criteria for watchful waiting approach
 - child is >6 mo old
 - child does not have immunodeficiency, chronic cardiac or pulmonary disease, anatomical abnormalities of the head or neck, a history of complicated otitis media (suppurative complications of chronic perforation) or Down syndrome
 - the illness is not severe: otalgia appears to be mild and fever is <102.2°F in the absence of antipyretics
 - parents are capable of recognizing signs of worsening illness and can readily access medical care if the child does not improve
- antimicrobials are indicated if child does not meet the criteria for watchful waiting or does not improve/worsens during observation
- maintain hydration
- symptomatic relief: acetaminophen, ibuprofen
- referral to otolaryngology for myringotomy and tympanostomy tubes may be warranted for recurrent infections

Treatment

- **antimicrobial agents for AOM**
 - 1st line treatment (no penicillin allergy)
 - ♦ amoxicillin: 75 mg/kg/d to 90 mg/kg/d divided 3x/d
 - 2nd line treatment
 - ♦ cefprozil: 30 mg/kg/d divided 2x/d
 - ♦ cefuroxime axetil: 30 mg/kg/d divided 2x/d
 - ♦ ceftriaxone: 50 mg/kg intramuscularly (or intravenously) x 1 dose
 - ♦ azithromycin: 10 mg/kg OD x 1 dose, then 5 mg/kg OD x 4 doses
 - ♦ clarithromycin: 15 mg/kg/d divided 2x/d
 - if initial therapy fails (i.e. no symptomatic improvement after 2-3 d)
 - ♦ amoxicillin-clavulanate: 90 mg/kg/d amoxicillin, 6.4 mg/kg/d clavulanate divided 2x/d for 10 d
 - if AOM-related symptoms do not resolve with amoxicillin/clavulanate, a course of ceftriaxone 50 mg/kg/d intramuscularly (or intravenously) 1/d x 3 doses could be considered

Complications

- extracranial
 - hearing loss and speech delay (secondary to persistent MEE), TM perforation, extension of suppurative process to adjacent structures (mastoiditis, petrositis, labyrinthitis), cholesteatoma, facial nerve palsy, middle ear atelectasis, ossicular necrosis, vestibular dysfunction, persistent effusion (often leading to hearing loss)
- intracranial
 - meningitis, epidural and brain abscess, subdural empyema, lateral and cavernous sinus thrombosis, carotid artery thrombosis, facial nerve paralysis
- other
 - mastoiditis, labyrinthitis, sigmoid sinus thrombophlebitis

Otitis Media with Effusion

Definition

- presence of fluid in the middle ear without signs or symptoms of ear infection

Epidemiology

- most common cause of pediatric hearing loss
- not exclusively a pediatric disease
- follows AOM frequently in children
- middle ear effusions have been shown to persist following an episode of AOM for 1 mo in 40% of children, 2 mo in 20%, and >3 mo in 10%

Risk Factors

- same as AOM

Clinical Features

- conductive hearing loss \pm tinnitus
 - confirm with audiogram and tympanogram (flat) (see Figure 16B, OT10 and Figure 17B, OT11)
- fullness – blocked ear
- \pm pain, low grade fever
- otoscopy of tympanic membrane:
 - discoloration – amber or dull gray with “glue” ear
 - meniscus fluid level behind TM
 - air bubbles
 - retraction pockets/TM atelectasis
 - most reliable finding with pneumotoscopy is immobility

Treatment

- expectant: 90% resolve by 3 mo
- document hearing loss with audiogram
- no clinical evidence that antihistamines, decongestants, or antibiotics clear disease faster
- surgery: myringotomy \pm ventilation tubes \pm adenoidectomy (if enlarged or on insertion of second set of tubes after first set falls out)
- ventilation tubes to equalize pressure and drain ear

Complications of Otitis Media with Effusion

- hearing loss, speech delay, learning problems in young children
- chronic mastoiditis
- ossicular erosion
- cholesteatoma especially when retraction pockets involve pars flaccida
- retraction of tympanic membrane, atelectasis, ossicular fixation

Adenoid Hypertrophy

- size peaks at age 5 and resolves by age 12
- increase in size with repeated URTI and allergies

Clinical Features

- nasal obstruction
 - adenoid facies (open mouth, high arched palate, narrow midface, malocclusion)
 - history of hypernasal voice and snoring
 - long-term mouth breather; minimal air escape through nose
- choanal obstruction
 - chronic rhinosinusitis/rhinitis
 - obstructive sleep apnea
- chronic inflammation
 - nasal discharge, post-nasal drip, and cough
 - cervical lymphadenopathy

Diagnosis

- enlarged adenoids on nasopharyngeal exam (usually with flexible nasopharyngoscope)
- enlarged adenoid shadow on lateral soft tissue x-ray

Complications

- Eustachian tube obstruction leading to serous otitis media
- interference with nasal breathing, necessitating mouth-breathing
- malocclusion
- sleep apnea/respiratory disturbance
- orofacial developmental abnormalities

Adenoidectomy

Indications for Adenoidectomy

- chronic upper airway obstruction with sleep disturbance/apnea \pm cor pulmonale
- chronic nasopharyngitis resistant to medical treatment
- chronic serous otitis media and chronic suppurative otitis media (with 2nd set of tubes)
- recurrent acute otitis media resistant to antibiotics
- suspicion of nasopharyngeal malignancy
- persistent rhinorrhea secondary to nasal obstruction

**Figure 20. Waldeyer's ring**

An interrupted circle of protective lymphoid tissue at the upper ends of the respiratory and alimentary tracts

Contraindications

- uncontrollable coagulopathy
- recent pharyngeal infection
- conditions that predispose to velopharyngeal insufficiency (cleft palate, impaired palatal function, or enlarged pharynx)

Complications

- bleeding, infection
- velopharyngeal insufficiency (hypernasal voice or nasal regurgitation)
- scarring of Eustachian tube orifice

Sleep-Disordered Breathing in Children

Definition

- spectrum of sleep-related breathing abnormalities ranging from snoring to OSA

Epidemiology

- peak incidence between 2-8 yr when tonsils and adenoids are the largest relative to the pharyngeal airway

Etiology

- due to a combination of anatomic and neuromuscular factors
 - adenotonsillar hypertrophy
 - craniofacial abnormalities
 - neuromuscular hypotonia (i.e. cerebral palsy, Down syndrome)
 - obesity

Clinical Features

- heavy snoring, mouth breathing, pauses or apnea, enuresis, excessive daytime sleepiness, behavioral/learning problems, diagnosis of ADHD, morning headache, failure to thrive

Investigations

- flexible nasopharyngoscopy for assessment of nasopharynx and adenoids
- polysomnography (apnea-hypopnea index >1/h considered abnormal)

Treatment

- surgical: bilateral tonsillectomy and adenoidectomy
- nonsurgical: CPAP, BiPAP, sleep hygiene

Acute Tonsillitis

- see [Pediatrics](#), P59

Peritonsillar Abscess (Quinsy)

Definition

- cellulitis of space behind tonsillar capsule extending onto soft palate leading to abscess

Etiology

- bacterial: Group A strep (GAS) (50% of cases), *S. pyogenes*, *S. aureus*, *H. influenzae*, and anaerobes

Epidemiology

- can develop from acute tonsillitis with infection spreading into plane of tonsillar bed
- unilateral
- most common in 15-30 yr age group

Clinical Features

- fever and dehydration
- sore throat, dysphagia, and odynophagia
- extensive peritonsillar swelling but tonsil may appear normal
- edema of soft palate
- uvular deviation
- trismus (due to irritation and reflex spasm of the medial pterygoid)
- dysphonia (edema → failure to elevate palate) 2° to CN X involvement
- unilateral referred otalgia
- cervical lymphadenitis

Complications

- aspiration pneumonia 2° to spontaneous rupture of abscess
- airway obstruction
- lateral dissection into parapharyngeal and/or carotid space
- bacteremia
- retropharyngeal abscess

Treatment

- secure airway
- surgical drainage (incision or needle aspiration) with C&S
- warm saline irrigation
- IV penicillin G x 10 d if cultures positive for GAS
- add PO/IV metronidazole or clindamycin x 10 d if culture positive for *Bacteroides*
- consider tonsillectomy after second episode

Other Sources of Parapharyngeal Space Infections

- pharyngitis
- acute suppurative parotitis (see *Salivary Glands*, OT30)
- AOM
- mastoiditis (Bezold's abscess)
- odontogenic infection

**Quinsy Triad**

- Trismus
- Uvular deviation
- Dysphonia ("hot potato voice")

Tonsillectomy

Absolute Indications

- most common indication: sleep-disordered breathing
- 2nd most common indication: recurrent throat infections
- tonsillar hypertrophy causing upper airway obstruction, obstructive sleep apnea, severe dysphagia, or cardiopulmonary complications such as cor pulmonale
- suspicion of malignancy (e.g. lymphoma, squamous cell carcinoma)
- orofacial/dental deformity
- hemorrhagic tonsillitis

Relative Indications (To Reduce Disease Burden)

- recurrent throat infection with a frequency of at least 7 episodes in the past year, at least 5 episodes per year for 2 yr, or at least 3 episodes per year for 3 yr, with documentation in the medical record for each episode of sore throat and 1 or more of the following: temperature $>38.3^{\circ}\text{C}$, cervical adenopathy, tonsillar exudate, or positive test for Group A β -hemolytic *streptococcus* (Paradise Criteria)
- chronic tonsillitis with halitosis (bad breath) or sore throat \pm tonsilloliths (clusters of calcified material that form in the crevices of the tonsils)
- complications of tonsillitis: quinsy/peritonsillar abscess, parapharyngeal abscess, retropharyngeal abscess
- failure to thrive

Relative Contraindications

- velopharyngeal insufficiency: overt or submucous/covert cleft of palate, impaired palatal function due to neurological or neuro-muscular abnormalities
- hematologic: coagulopathy, anemia
- infectious: active local infection without urgent obstructive symptoms

Complications

- hemorrhage: early – within 24 h; delayed – 7-10 d
- odynophagia and/or otalgia; dehydration 2° to odynophagia
- infection
- atlantoaxial subluxation (Grisel's syndrome): rare

Airway Problems in Children

DIFFERENTIAL DIAGNOSIS BY AGE GROUP**Neonates (Obligate Nose Breathers)**

- extralaryngeal
 - choanal atresia (e.g. CHARGE syndrome)
 - nasopharyngeal dermoid, glioma, encephalocele
 - glossoptosis: Pierre-Robin sequence, Down syndrome, lymphatic malformation, hemangioma
- laryngeal
 - laryngomalacia: most common cause of stridor in children
 - laryngocele

- vocal cord palsy (due to trauma or Arnold-Chiari malformation)
- glottic web
- subglottic stenosis
- laryngeal cleft
- tracheal
 - tracheoesophageal fistula
 - tracheomalacia
 - vascular rings

2-3 Months

- congenital
 - laryngomalacia
 - vascular: subglottic hemangioma (more common), innominate artery compression, double aortic arch
 - laryngeal papilloma
- acquired
 - subglottic stenosis: post-intubation
 - tracheal granulation: post-intubation
 - tracheomalacia: post-tracheotomy and TEF repair

Infants – Sudden Onset

- foreign body aspiration
- croup
- bacterial tracheitis
- caustic ingestion
- epiglottitis

Children and Adults

- infection
 - Ludwig's angina
 - peritonsillar/parapharyngeal abscess
 - retropharyngeal abscess
- neoplastic
 - squamous cell carcinoma (SCC) (adults): larynx, hypopharynx
 - retropharyngeal: lymphoma, neuroblastoma
 - nasopharyngeal: carcinoma, rhabdomyosarcoma
- allergic
 - angioneurotic edema
 - polyps (suspect cystic fibrosis in children)
- trauma
 - laryngeal fracture, facial fracture
 - burns and lacerations
 - post-intubation
 - caustic ingestion
- congenital
 - lingual thyroid/tonsil

Signs of Airway Obstruction

Stridor

- note quality, timing (inspiratory or expiratory)
- body position important
 - lying prone: subglottic hemangioma, double aortic arch
 - lying supine: laryngomalacia, glossoptosis
- site of stenosis
 - vocal cords or above: inspiratory stridor
 - subglottis and extrathoracic trachea: biphasic stridor
 - distal tracheobronchial tree: expiratory stridor

Respiratory Distress

- nasal flaring
- supraclavicular and intercostal indrawing
- sternal retractions
- use of accessory muscles of respiration
- tachypnea
- cyanosis
- altered LOC

Feeding Difficulty and Aspiration

- supraglottic lesion
- laryngomalacia
- vocal cord paralysis
- laryngeal cleft → aspiration pneumonia

Acute Laryngotracheobronchitis (Croup)

- inflammation of tissues in subglottic space ± tracheobronchial tree
- swelling of mucosal lining and associated with thick, viscous, mucopurulent exudate which compromises upper airway (subglottic space narrowest portion of upper airway)
- normal function of ciliated mucous membrane impaired

Etiology

- viral: parainfluenzae I (most common), II, III, influenza A and B, RSV

Clinical Features

- age: 4 mo-5 yr
- preceded by URTI symptoms
- generally occurs at night
- biphasic stridor and croupy cough (loud, sea-lion bark)
- appear less toxic than epiglottitis
- supraglottic area normal
- rule out foreign body and subglottic stenosis
- “steeples-sign” on AP x-ray of neck
- if recurrent croup, think subglottic stenosis

Treatment

- racemic epinephrine via MDI q1-2h, prn (only if in respiratory distress)
- systemic corticosteroids (e.g. dexamethasone, prednisone)
- adequate hydration
- close observation for 3-4 h
- intubation if severe
- hospitalize if poor response to steroids after 4 h and persistent stridor at rest
- consider alternate diagnosis if poor response to therapy (e.g. bacterial tracheitis)
- if recurrent episodes of croup-like symptoms, consider bronchoscopy several weeks after acute episode settles to rule out underlying subglottic stenosis

**Signs of Croup****The 3 Ss**

Stridor
Subglottic swelling
Seal bark cough

Acute Epiglottitis

- acute inflammation causing swelling of supraglottic structures of the larynx without involvement of vocal cords

Etiology

- *H. influenzae* type b
- relatively uncommon condition due to Hib vaccine

Clinical Features

- any age, most commonly 1-4 yr
- rapid onset
- toxic-looking, fever, anorexia, restlessness
- cyanotic/pale, inspiratory stridor, slow breathing, lungs clear with decreased air entry
- prefers sitting up (“tripod” posture), open mouth, drooling, tongue protruding, sore throat, dysphagia

Investigations and Management

- investigations and physical exam may lead to complete obstruction, thus preparations for intubation or tracheotomy must be made prior to any manipulation
- stat ENT/anesthesia consult(s)
- WBC (elevated), blood and pharyngeal cultures after intubation
- lateral neck radiograph (only done if patient stable)

Treatment

- secure airway
- IV access with hydration
- antibiotics: IV cefuroxime, cefotaxime, or ceftriaxone
- moist air
- extubate when leak around tube occurs and afebrile
- watch for meningitis

Acute epiglottitis is a medical emergency

When managing epiglottitis, it is important not to agitate the child, as this may precipitate complete obstruction

Thumb sign: cherry-shaped epiglottic swelling seen on lateral neck radiograph

Subglottic Stenosis

Congenital

- diameter of subglottis <4 mm in neonate (due to thickening of soft tissue of subglottic space or maldevelopment of cricoid cartilage)

Acquired

- following prolonged, repeated, or traumatic intubation
 - most commonly due to endotracheal intubation; nasal intubation is less traumatic and preferred in long-term intubation as it puts less pressure on the subglottis (tube sits at different orientation) and there is less movement
 - subglottic stenosis is related to duration of intubation and pressure of the endotracheal tube cuff
- can also be due to foreign body, infection (e.g. TB, diphtheria, syphilis), or chemical irritation

Clinical Features

- biphasic stridor
- respiratory distress
- recurrent/prolonged croup

Diagnosis

- rigid laryngoscopy and bronchoscopy

Treatment

- if soft stenosis: divide tissue with knife or laser, dilate with balloon \pm steroids
- if firm stenosis: laryngotracheoplasty

Laryngomalacia

- short aryepiglottic folds, omega-shaped epiglottis, pendulous mucosa
- caused by indrawing of supraglottis on inspiration leading to laryngopharyngeal reflux of acid

Clinical Features

- high-pitched inspiratory stridor at 1-2 wk
- constant or intermittent and more pronounced supine and following URTI
- usually mild but when severe can be associated with cyanosis or feeding difficulties, leading to failure to thrive

Treatment

- observation is usually sufficient as symptoms spontaneously subside by 12-18 mo in >90% of cases
- if severe, division of the aryepiglottic folds (supraglottoplasty) provides relief

Laryngomalacia is the most common cause of stridor in infants

Foreign Body

Ingested

- usually stuck at cricopharyngeus
- coins, toys, batteries (emergency)
- presents with drooling, dysphagia, stridor if very large

Aspirated

- usually stuck at right mainstem bronchus
- peanuts, carrot, apple core, popcorn, balloons
- presentation
 - stridor if lodged in trachea
 - unilateral "asthma" if bronchial, therefore often misdiagnosed as asthma
 - if totally occludes airway: cough, lobar pneumonia, atelectasis, mediastinal shift, pneumothorax, death

Diagnosis and Treatment

- any patient with suspected foreign body should be kept NPO immediately
- inspiration-expiration chest x-ray (if patient is stable)
- bronchoscopy or esophagoscopy with removal
- rapid onset, not necessarily febrile or elevated WBC

Foreign body inhalation is the most common cause of accidental death in children

Batteries **MUST** be ruled out as a foreign body (vs. coins) as they are lethal and can erode through the esophagus. Batteries have a halo sign around the rim on AP x-ray and a step deformity on lateral x-ray

Deep Neck Space Infection

- most commonly arise from an infection of the mandibular teeth, tonsils, parotid gland, deep cervical lymph nodes, middle ear, or the sinuses
- often a rapid onset and may progress to fatal complications

Etiology

- usually mixed aerobes and anaerobes that represent the flora of the oral cavity, upper respiratory tract, and certain parts of the ears and eyes

Clinical Features

- sore throat or pain and trismus
- dysphagia and odynophagia
- stridor and dyspnea
- late findings may include dysphonia and hoarseness
- swelling of the face and neck, erythema
- asymmetry of the oropharynx with purulent oral discharge
- lymphadenopathy

Diagnosis

- lateral cervical view plain radiograph
- CT
- MRI

Treatment

- secure the airway
- surgical drainage
- maximum doses of IV systemic antimicrobials regimens according to the site of infection

These investigations should be obtained carefully and the surgeon should consider accompanying the patient as the worst place to lose an airway is during imaging

Ludwig's angina is the prototypical infection of the submandibular and sublingual space

Common Medications

Table 21. Antibiotics

Generic Name (Brand Name)	Dose	Indications	Notes
amoxicillin (Amoxil®)	Adult: 500 mg PO tid Children: 75-90 mg/kg/d in 2 divided doses	<i>Streptococcus</i> , <i>Pneumococcus</i> , <i>H. influenzae</i> , <i>Proteus</i> coverage	May cause rash in patients with infectious mononucleosis
piperacillin with tazobactam (Zosyn®)	3 g PO q6h	Gram-positive and negative aerobes and anaerobes plus <i>Pseudomonas</i> coverage	May cause pseudomembranous colitis
ciprofloxacin (Cipro®, Ciloxan®)	500 mg PO bid	<i>Pseudomonas</i> , <i>Streptococci</i> , MRSA, and most Gram-negative; no anaerobic coverage	Do not give systemic quinolones to children
erythromycin (Erythrocin®, EryPed®, Staticin®, T-Stat®)	500 mg PO qid	Alternative to penicillin	Ototoxic

Table 22. Otic Drops

Generic Name (Brand Name)	Dose	Indications	Notes
ciprofloxacin (Ciprodex®)	4 gtt in affected ear bid	For otitis externa and complications of otitis media <i>Pseudomonas</i> , <i>Streptococci</i> , MRSA, and most Gram-negative; no anaerobic coverage	
neomycin, polymyxin B sulfate, and hydrocortisone (Cortisporin®)	5 gtt in affected ear tid	For otitis externa Used for inflammatory conditions which are currently infected or at risk of bacterial infections	May cause hearing loss if placed in inner ear
hydrocortisone and acetic acid (VoSol HC®)	5-10 gtt in affected ear tid	For otitis media	Bactericidal by lowering pH
tobramycin and dexamethasone (TobraDex®)	5-10 gtt in affected ear bid	For chronic suppurative otitis media	Risk of vestibular or cochlear toxicity

Table 23. Nasal Sprays

Generic Name (Brand Name)	Indications	Notes
Steroid		
flunisolide (Nasalide®)	Allergic rhinitis	Requires up to 4 wk of consistent use to have effect
budesonide (Rhinocort®)	Chronic sinusitis	Long-term use
beclomethasone (Beconase®)		Dries nasal mucosa; may cause minor bleeding
mometasone furoate, monohydrate (Nasonex®)		Patient should stop if epistaxis
fluticasone furoate (Veramyst®)		May sting
		Flonase® and Nasonex® not absorbed systemically
Antihistamine		
levocabastine (Livostin®)	Allergic rhinitis	Immediate effect
		If no effect by 3 d then discontinue
		Use during allergy season
Decongestant		
oxymetazoline (Visine L.R.®)	Acute sinusitis	Careful if patient has HTN
phenylephrine	Rhinitis	Short-term use (<5 d)
		If long-term use, can cause decongestant addiction (i.e. rhinitis medicamentosa)
Antibiotic/Decongestant		
gramicidin	Acute sinusitis	
Anticholinergic		
ipratropium bromide (Atrovent®)	Vasomotor rhinitis	Careful not to spray into eyes as can cause burning or precipitation of narrow angle glaucoma
		Increased rate of epistaxis when combined with topical nasal steroids
Lubricants		
saline, Polysporin®, Vaseline®	Dry nasal mucosa	Use prn
		Rhinaris® and Secaris® may cause stinging

Pediatric Quick Reference Values

Table 1. Average Vitals at Various Ages

Age	Pulse (bpm)	Respiratory Rate (br/min)	sBP (mmHg)
Neonate	90-170	40-60	70-90
3-12 mo	80-165	30-55	80-100
1-2 yr	80-125	25-45	90-100
3-11 yr	70-115	18-30	100-110
12-15 yr	60-100	12-18	110-130

Primary Care

Visit Overview

- schedule:
 - newborn (within 1 wk post-discharge), 1, 2, 4, 6, 9, 12, 15, 18, 24 mo
 - annually between age 2 to 6; every other year between age 6 to 11
- content:
 - history and physical exam including growth, development, and nutrition
 - routine immunizations
 - counseling and anticipatory guidance

Routine Immunization

Table 2. U.S. Recommended Immunization Schedule 0-18 Years Old (2014)

Age	DTaP (IM)	Tdap (IM)	IPV (IM)	Hib (IM)	PCV-13 (IM)	Rot-1 (PO)	Men-C-C (IM)	MMR (SC)	Var (SC)	MMRV (SC)	Men-C-ACYW (IM)	HepB (IM)	HPV (IM)	HepA (IM)	Inf (IM)
Birth												✓			
1 mo												✓			
2 mo	✓		✓	✓	✓	✓									
4 mo	✓		✓	✓	✓	✓									
6 mo	✓				✓										
12 mo			✓	✓	✓		✓	✓	✓			✓		✓ ^	
15 mo	✓														
18 mo

11-12 yr		✓									✓		✓		
14-16 yr															
16-18 yr											✓				
Every autumn															✓ *

IM = intramuscular; PO = per oral; SC = subcutaneous, *starting at 6 mo of age, ^ 2 dose series (second dose given 6-18 mo after first)

Acronyms

AAP	American Academy of Pediatrics
ABG	arterial blood gas
ACE	angiotensin converting enzyme
ALL	acute lymphoblastic leukemia
ALPS	autoimmune lymphoproliferative syndrome
ALTE	acute life-threatening event
AML	acute myelogenous leukemia
ANA	antinuclear antibody
AOM	acute otitis media
ARB	angiotensin receptor blocker
ARBD	alcohol-related birth defects
ARND	alcohol-related neurodevelopmental disorder
ASD	atrial septal defect
ASOT	antistreptolysin-o titer
ATN	acute tubular necrosis
AVM	arteriovenous malformation
CAH	congenital adrenal hyperplasia
CF	cystic fibrosis
CHD	congenital heart defect
CML	chronic myelogenous leukemia
CMV	cytomegalovirus
CP	cerebral palsy
CPS	Child Protective Services
DDAVP	1-desamino-8-D-arginine vasopressin
DI	diabetes insipidus
DIC	disseminated intravascular coagulation
DKA	diabetic ketoacidosis
DMARD	disease modifying antirheumatic drug
DS	Down syndrome
DSD	disorder of sexual differentiation
EBV	Epstein-Barr virus
Echo	echocardiogram
EMG	electromyography
FAS	fetal alcohol syndrome
FASD	fetal alcohol spectrum disorder
FISH	fluorescent <i>in situ</i> hybridization
FSH	follicle stimulating hormone
FTT	failure to thrive
G6PD	glucose-6-phosphate dehydrogenase
GA	gestational age
GBM	glomerular basement membrane
GBS	group B <i>Streptococcus</i>
GERD	gastroesophageal reflux disease
GH	growth hormone
GN	glomerulonephritis
GSD	glycogen storage disease
HDNB	hemorrhagic disease of the newborn
Hib	<i>Haemophilus influenzae</i> type b
HIDA	hepatobiliary iminodiacetic acid
HIE	hypoxic ischemic encephalopathy
HPA	human platelet antigen
HRV	human rotavirus
HSP	Henoch-Schönlein purpura
HUS	hemolytic uremic syndrome
IBW	ideal body weight
ICH	intracranial hemorrhage
ITP	immune thrombocytopenic purpura
IUGR	intra-uterine growth restriction
IVH	intraventricular hemorrhage
IVig	intravenous immunoglobulin
JIA	juvenile idiopathic arthritis
LAH	left atrial hypertrophy
LGA	large for gestational age
LH	luteinizing hormone
LLSB	lower left sternal border
LOC	level of consciousness
LP	lumbar puncture
LRTI	lower respiratory tract infection
LVI	left ventricular hypertrophy
MAAS	meconium aspiration syndrome
MCAD	medium-chain acyl-CoA dehydrogenase
MCD	minimal change disease
MDI	metered dose inhaler
MSUD	maple syrup urine disease
NCS	nerve conduction study
NEC	necrotizing enterocolitis
NF	neurofibromatosis
NICU	neonatal intensive care unit
NS	normal saline
OCP	oral contraceptive pill
ORT	oral rehydration therapy
PAC	premature atrial contraction
PDA	patent ductus arteriosus
PKU	phenylketonuria
PPHN	persistent pulmonary hypertension of newborn
PPV	positive pressure ventilation
PVU	psoralen + UVA
RAD	right axis deviation
RAS	renal artery stenosis
RBBB	right bundle branch block
RDS	respiratory distress syndrome
RF	rheumatoid factor
RL	Ringer's lactate
RSV	respiratory syncytial virus
RUSB	right upper sternal border
RVH	right ventricular hypertrophy
RVOTO	right ventricular outflow tract obstruction
SEM	systolic ejection murmur
SGA	small for gestational age
SIADH	syndrome of inappropriate antidiuretic hormone
SVT	supraventricular tachycardia
TEF	tracheo-esophageal fistula
TM	tympenic membrane
TPN	total parenteral nutrition
TTN	transient tachypnea of the newborn
UMN	upper motor neuron
URTI	upper respiratory tract infection
UVA	ultraviolet A
VCUG	voiding cystourethrogram
VSD	ventricular septal defect
VUR	vesicoureteral reflux
WPW	Wolff-Parkinson-White

Table 2. U.S. Recommended Immunization Schedule 0-18 Years Old (2014) (continued)

Vaccine	Adverse Reaction	Contraindication
DTaP-IPV	Prolonged crying Hypotonic unresponsive state (rare) Seizure on day of vaccine (rare)	Evolving unstable neurologic disease Hyporesponsive/hypotonic following previous vaccine Anaphylactic reaction to neomycin or streptomycin
Rot-1	Cough Diarrhea, vomiting	History of intussusception Immunocompromised Abdominal disorder (e.g. Meckel's diverticulum) Received blood products (e.g. immunoglobulin) within 42 d
MMR	Measle-like rash (7-14 d) Lymphadenopathy, arthralgia, arthritis Parotitis (rare) Especially painful injection	Pregnancy Immunocompromised infants (except healthy HIV positive children) Anaphylactic reaction to gelatin
Var	Mild varicella-like papules or vesicles	Pregnant or planning to get pregnant within 3 mo Anaphylactic reaction to gelatin
HepB		Anaphylactic reaction to Baker's yeast
MMRV	Same as MMR and Var vaccines	Same as MMR and Var vaccines
dTAP		1st trimester pregnancy
Inf	Malaise, myalgia Febrile seizure Hypersensitivity reaction	Egg-allergic individuals – unless the risk of the disease outweighs the small risk of a systemic hypersensitivity reaction; referral to an allergy specialist is recommended, as vaccination might be possible after careful evaluation, skin testing, and graded challenge or desensitization
HPV-4	Pruritis	

dTAP = diphtheria, tetanus, acellular pertussis vaccine; DTaP-IPV = diphtheria, tetanus, acellular pertussis, inactivated polio vaccine (i.e. Pentacel®, Pentavax®); HepB = hepatitis B vaccine; Hib = *Haemophilus influenzae* type b conjugate vaccine; HPV-4 = human papillomavirus vaccine; Inf = influenza vaccine; MMR = measles, mumps, rubella vaccine; Men-C-C = meningococcal c conjugate vaccine; MMRV = measles, mumps, rubella, varicella vaccine; Pneu-C-13 = pneumococcal 13-valent conjugate vaccine; Rot-1 = rotavirus oral vaccine; Var = varicella vaccine

**Any Vaccine****Adverse Reactions**

Local: induration, tenderness, redness, swelling

Systemic: fever, rash, irritability

Allergic: urticaria, rhinitis, anaphylaxis

Contraindications

Moderate/severe illness \pm fever

Allergy to vaccine component

No need to delay vaccination for mild URTI

**Vaccination in Cases of Asplenia or Hyposplenia (such as Sickle Cell Disease)**

- Should receive all routine immunizations, including the yearly influenza vaccine
- No vaccines are contraindicated
- Susceptible to infection by encapsulated bacteria (*S. pneumoniae*, *H. influenzae*, *N. meningitidis*)
- For meningococcal, pneumococcal, and *Haemophilus influenzae* b vaccines: regular vaccination in infancy according to recommended immunization schedules PLUS
- Meningococcal vaccination: Meningococcal-C-Conjugate at age ≥ 2 yr + Quadravalent Men-P-ACYW at least 2 wk later
- Booster of Men-P-ACYW q2-5 yr
- Pneumococcal vaccination: Pneumococcal polysaccharide vaccine (Pneu-P-23) at age ≥ 2 yr
- Single booster of Pneu-P-23 at age ≥ 3 yr
- *Haemophilus influenzae* type b vaccination: Consider single booster at age > 5 yr

According to the CDC, the weight of currently available scientific evidence does not support the hypothesis that MMR vaccine causes either autism or IBD. The landmark paper linking autism to the MMR vaccine (*Lancet* 1998;351:637-641) was retracted due to false claims in the article (*Lancet* 2010;375:445)

**Safety and Efficacy of an Attenuated Vaccine Against Severe Rotavirus Gastroenteritis**

NEJM 2006;354:11-22

Study: Randomized, double-blind, phase 3 trial.

Patients: 63,225 healthy infants from Latin America and Finland.

Intervention: Two oral doses of HRV vaccine vs. placebo at 2 and 4 mo of age.

Outcome: Episodes of gastroenteritis and severity.

Results: The vaccine is 85% efficacious against severe rotavirus gastroenteritis and hospitalizations associated with gastroenteritis and 100% efficacious against more severe gastroenteritis.

Vaccine Administration

- injection site
 - infants (<12 mo): anterolateral thigh
 - children: deltoid, subcutaneous tissue of the upper triceps area of the arm (IM injections should be given at 90° angle; SC injections should be given at 45° angle)
- timing of injection
 - varicella and MMR vaccines can be given at either the same visit or separated by > 4 wk (MMRV at 4-6 yr)
 - HPV vaccine given in 3 doses to all adolescents aged 11-12 yr old (HPV-2 or HPV-4 for females; only HPV-4 for males) (0, 2, 6 mo)

Growth and Development

Growth

- growth is not linear
 - most rapid growth during first two years and at puberty
 - tissues grow at different times
 - ♦ first two years = CNS; mid-childhood = lymphoid tissue; puberty = gonads
- measurement of growth
 - premature infants (<37 wk) use corrected GA until age 2 yr
 - body proportion = upper/lower segment ratio (use symphysis pubis as midpoint)
 - ♦ newborn = 1.7, adult male = 0.9, adult female = 1.0

Average Growth Parameters

Table 3. Parameter of Average Growth at Birth

	Normal	Growth	Comments
Birth Weight	3.25 kg (7 lbs)	Gain 20-30 g/d (term neonate) 2 x birth wt by 4-5 mo 3 x birth wt by 1 yr 4 x birth wt by 2 yr	Weight loss (up to 10% of birth weight) in first 7 d of life is normal Neonate should regain birth weight by ~10-14 d of age
Length/Height	50 cm (20 in)	25 cm in 1st yr 12 cm in 2nd yr 8 cm in 3rd yr then 4-7 cm/yr until puberty 1/2 adult height at 2 yr	Measure supine length until 2 yr of age, then measure standing height
Head Circumference	35 cm (14 in)	2 cm/mo for 1st 3 mo 1 cm/mo at 3-6 mo 0.5 cm/mo at 6-12 mo	Measure around occipital, parietal, and frontal prominences to obtain the greatest circumference

Reflexes

Table 4. Reflexes

Reflex	Maneuver to Elicit Reflex	Appropriate Reflex Response
Moro	Infant placed semi-upright, head supported by examiner's hand, sudden withdrawal of supported head with immediate return of support	Abduction and extension of the arms, opening of the hands, followed by flexion and adduction of arms
Galant	Infant held in ventral suspension and one side of back is stroked along paravertebral line	Pelvis will move in the direction of stimulated side
Grasp	Placement of examiner's finger in infant's palm	Flexion of infant's fingers
ATNR	Turn infant's head to one side	"Fencing" posture (extension of ipsilateral leg and arm and flexion of contralateral arm)
Placing	Dorsal surface of infant's foot placed touching edge of table	Flexion followed by extension of ipsilateral limb up onto table (resembles primitive walking)
Rooting	Tactile stimulus near mouth	Infant pursues stimulus with face
Parachute	Tilt infant to side while in sitting position	Ipsilateral arm extension, present by 6-8 mo

ATNR = asymmetric tonic neck reflex

Developmental Milestones

Table 5. Developmental Milestones

Age*	Gross Motor	Fine Motor	Speech and Language	Adaptive and Social Skills
1 mo	Turns head side to side when supine	Hands fisted, thumb in fist	Cries, startles to loud noises	Calms when comforted
2 mo	Briefly raises head when prone, holds head erect when upright	Pulls at clothes	Variety of sounds (e.g. coos, gurgles)	Smiles responsively, recognizes and calms down to familiar voice, follows movement with eyes
4 mo	Lifts head and chest when prone, holds head steady when supported sitting, rolls prone to supine	Briefly holds object when placed in hand, reaches for midline objects	Turns head towards sounds	Laughs responsively, follows moving toy or person with eyes, responds to people with excitement (e.g. leg movement)
6 mo	Tripod sit, pivots in prone position	Ulnar or raking grasp, transfers objects from hand to hand, brings objects to mouth	Babbles	Stranger anxiety, beginning of object permanence
9 mo	Sits well without support, crawls, pulls to stand, stands with support	Early pincer grasp with straight wrist	"Mama, dada" – appropriate, imitates 1 word, responds to "no" regardless of tone	Plays games (e.g. peek-a-boo), reaches to be picked up
12 mo	Gets into sitting position without help, stands without support, walks while holding on	Neat pincer grasp, releases ball with throw	2 words, follows 1-step command, uses facial expression, sounds, actions to make needs known	Responds to own name, separation anxiety begins

*Use corrected GA until 2 yr

Scoliosis Screening

Despite mass school screening implemented in parts of the USA and Canada in the 1970s-90s, the Canadian (1994) and American (2004) Task Forces on Preventive Health Care do NOT currently recommend routine screening using the Forward Bend Test (FBT). Cohort studies indicate that the Forward Bend Test has poor sensitivity for identifying pathological curves. Furthermore, there is no evidence to suggest that screening and increased bracing lead to better outcomes.

Abnormal Reflex Response

- Absence may suggest CNS abnormality
- Persistence after 4-6 mo may indicate abnormality (e.g. cerebral palsy)
- Asymmetry suggests focal motor lesions (e.g. brachial plexus injury)
- Upgoing plantar reflex (Babinski's sign) normal in infants up to age 2 yr

Pediatric Developmental Milestones

- 1 yr: single words
- 2 yr: 2-word sentences; understands 2 step commands
- 3 yr: 3-word combinations; rides tricycle
- 4 yr: counts 4 objects
- See the Nipissing District Developmental Screen for a checklist of important 18 mo milestones: <http://www.ndds.ca>

Table 5. Developmental Milestones (continued)

Age*	Gross Motor	Fine Motor	Speech and Language	Adaptive and Social Skills
15 mo	Walks without support, crawls up stairs/steps	Picks up and eats finger foods, scribbles, stacks 2 blocks	Says 4-5 words, points to needs/wants	Looks to see how others react (e.g. after falling)
18 mo	Runs, walks forward pulling toys or carrying objects	Tower of 3 cubes, scribbling, eats with spoon	10 words, follows simple commands	Shows affection towards others, points to show interest in something
24 mo	Climbs up 2 feet per step, runs, kicks ball, walks up and down steps	Tower of 6 cubes, undresses	2-3 word phrases, uses "I, me, you", 50% intelligible, understands 2-step commands	Parallel play, helps to dress
3 yr	Tricycle, climbs up 1 foot per step, down 2 feet per step, stands on one foot briefly	Copies a circle, turns pages one at a time, puts on shoes, dress/undress fully except buttons	Combines 3 or more words into sentence, recognizes colors, prepositions, plurals, counts to 10, 75% intelligible	Knows sex and age, shares some of the time, plays make-believe games
4 yr	Hops on 1 foot, down 1 foot per step	Copies a cross, uses scissors, buttons clothes	Speech 100% intelligible, uses past tense, understands 3-part directions	Cooperative play, fully toilet-trained by day, tries to comfort someone who is upset
5 yr	Skips, rides bicycle	Copies a triangle and square, prints name, ties shoelaces	Fluent speech, future tense, alphabet, retells sequence of a story	Cooperates with adult requests most of the time, separates easily from caregiver

*Use corrected GA until 2 yr

**Developmental Red Flags**

- Gross motor: not walking at 18 mo
- Fine motor: handedness at <10 mo
- Speech: <3 words at 18 mo
- Social: not smiling at 3 mo; not pointing at 15-18 mo

Nutrition

Dietary Requirements

Weight	<10 kg	10-20 kg	>20 kg
Needs	100 kcal/kg/d	1,000 cal + 50 kcal/kg/d for each kg >10	1,500 cal + 20 kcal/kg/d for each kg >20

Dietary Recommendations

- 0-6 mo: breast milk or formula
 - exclusive breast milk during first 6 mo recommended over formula unless contraindicated
 - breastfed infants require supplements: vitamin K (all babies get at birth, breastfed or not), vitamin D (400-800 IU/d), fluoride (after 6 mo if not sufficient in water), iron (6-12 mo, only if not receiving fortified cereals/meat/meat alternatives)
- >6 mo: solid food introduction – do not delay beyond 9 mo
 - 2-3 new foods per week with a few days in between each food to allow time for adverse reaction identification
 - suggested order of introduction
 - ♦ meat, meat alternatives, and iron-enriched cereal (rice cereal is least allergenic)
 - ♦ pureed vegetables
 - ♦ fruit
- 9-12 mo: finger foods and switch to homogenized (3%) milk
 - foods to avoid
 - ♦ honey until past 12 mo (risk of botulism)
 - ♦ added sugar, salt
 - ♦ excessive milk (i.e. no more than 16 oz/d after 1 yr)
 - ♦ juice (not nutritious, too much sugar)
 - ♦ anything that is a choking hazard (chunks, round foods like grapes)

Breastfeeding

- content of breast milk
 - colostrum (first few days): clear, rich in nutrients (i.e. high protein, low fat), immunoglobulin
 - mature milk: 70:30 whey:casein ratio, fat from dietary butterfat, carbohydrate from lactose
- advantages
 - easily digested, low renal solute load
 - immunologic
 - ♦ contains IgA, macrophages, active lymphocytes, lysozymes, lactoferrin (which inhibits *E. coli* growth in intestine)
 - ♦ lower pH promotes growth of lactobacillus in GI tract
 - parent-child bonding
 - economical, convenient

- contraindicated if mother
 - is receiving chemotherapy or radioactive compounds
 - has HIV/AIDS, active untreated TB, herpes in breast region
 - is using >0.5 g/kg/d of alcohol or illicit drugs
 - is taking medications known to cross to breast milk
 - OCPs are *not* a contraindication to breastfeeding (estrogen may decrease lactation, but is not dangerous to infant)
 - MotherRisk – valuable research and counseling on reproductive risk or safety of drugs and chemicals
- complications in infant
 - breastfeeding jaundice (first 1-2 wk): due to lack of maternal milk production and subsequent infant dehydration (see *Jaundice*, P72), likely a mechanical problem
 - breast milk jaundice (0.5% of newborns, persists up to 4-6 mo): rare, not fully understood, thought to be due to substances in breast milk that inhibit conjugation of bilirubin or increase enterohepatic circulation of bilirubin, likely a biochemical problem; check bilirubin to rule out conjugated hyperbilirubinemia
 - ♦ baby presents healthy and thriving, and jaundice resolves
 - poor weight gain: consider dehydration or FTT
 - oral candidiasis (thrush): check baby's mouth for white cheesy material that does not scrape off; treat baby with antifungal such as nystatin (Mycostatin®); can occur in breast or bottle-fed infants

Table 6. Common Formulas Compared to Breast Milk

Type of Nutrition	Indications	Content (as compared to breast milk)
Cow's Milk Based (Enfamil®, Similac®)	Prematurity Transition into breastfeeding Contraindication to breastfeeding	Lower whey:casein ratio Plant fats instead of dietary butterfat
Fortified Formula	Low birth weight Prematurity	Higher calories and vitamins A, C, D, K May only be used in hospital due to risk of fat-soluble vitamin toxicity
Soy Protein (Isomil®, Prosobee®)	Galactosemia Cow milk protein Intolerance/allergy Desire for vegetarian/vegan diet	Corn syrup solids or sucrose in place of lactose
Partially Hydrolyzed Proteins (Good Start®)	Delayed gastric emptying Risk of cow milk protein allergy	Protein is 100% whey with no casein
Protein Hydrolysate (Nutramigen®, Alimentum®, Pregestimil®, Portagen®)	Malabsorption Food allergy	Protein is 100% casein with no whey Corn syrup solids, sucrose, or tapioca starch instead of lactose Expensive
Amino Acid (Neocate®, PurAmino™)	Food allergy Short gut	Free amino acids (no protein) Corn syrup solids instead of lactose Very expensive
Metabolic	Inborn errors of metabolism	Various different compositions for children with galactosemia, propionic acidemia, etc.

Medications that Cross into Breast Milk

- Antimetabolites
- Bromocriptine
- Chloramphenicol
- High dose diazepam
- Ergots
- Gold
- Metronidazole
- Tetracycline
- Lithium
- Cyclophosphamide

Signs of Inadequate Intake

- <6 wet diapers/d after first wk
- <7 feeds/d
- Rule of thumb: ~1 stool/d of age for first wk
- Sleepy or lethargic, sleeping throughout the night <6 wk
- Weight loss >10% of birth weight
- Jaundice

Breastfeeding and the Use of Human Milk

Pediatrics 2012;129:e827

Study: Guidelines by the American Academy of Pediatrics (AAP).

Patients: Healthy term infants.

Recommendations: The AAP recommends exclusive breastfeeding for about 6 mo to continue for at least the first year and beyond for as long as mutually desired by mother and child. At about 6 mo, complementary foods rich in iron and other micronutrients should be introduced. AAP recommends 8-12 feedings per 24 h with 400 IU of vitamin D drops daily with no other supplements (such as water or formula).

Dietary Exposures and Allergy Prevention in High-Risk Infants

Paediatr Child Health 2013;18(10):545-549

There is no evidence that restriction of highly allergenic foods is beneficial in the first year of life. Later introduction of peanut, fish, or egg does not prevent, and may increase the risk of developing food allergy. There is also no evidence that dietary restrictions during pregnancy or breastfeeding are protective to the child.

Injury Prevention Counseling

- injuries are the leading cause of death in children >1 yr of age
- main causes: motor vehicle accidents, burns, drowning, falls, choking, infanticide

Table 7. Injury Prevention Counseling

0-6 mo	6-12 mo	1-2 yr	2-5 yr
Do not leave alone on bed, on changing table, or in tub	Install stair barriers	Never leave unattended	Bicycle helmet
Keep crib rails up	Discourage use of walkers	Keep pot handles turned to back of stove	Never leave unsupervised at home, driveway, or pool
Check water temperature before bathing	Avoid play areas with sharp-edged tables and corners	Caution with whole grapes, nuts, raw carrots, hotdogs, etc. due to choking hazard	Teach bike safety, stranger safety, and street safety
Do not hold hot liquid and infant at the same time	Cover electrical outlets	No running while eating	Swimming lessons (>4 yr), sunscreen (from 6 mo), fences around pools
Check milk temperature before feeding	Unplug appliances when not in use	Appropriate car seats	Appropriate car seats (toddler seat)
Appropriate car seats are required before leaving hospital	Keep small objects, plastic bags, cleaning products, and medications out of reach		
	Supervise during feeding		
	Appropriate car seats		

Note: This list is not exhaustive. For more details, see Rourke Baby Record (http://www.rourkebabyrecord.ca/pdf/RBR20110nt_Eng.pdf)

Common Complaints

Breath Holding Spells

- epidemiology: 0.1-5% of healthy children 6 mo-4 yr of age, usually start during first year of life
- etiology: child is provoked (usually by anger, injury, or fear) → holds breath and becomes silent → spontaneously resolves or loses consciousness
- types
 - cyanotic (more common), usually associated with anger/frustration
 - pallid, usually associated with pain/surprise
- management
 - usually resolves spontaneously and rarely progresses to seizure
 - help child control response to frustration and avoid drawing attention to spell

Circumcision

- elective procedure
 - recent evidence shows health benefits outweigh risks and justify access to procedure
 - often for religious or culture reasons
- benefits: prevention of phimosis and slightly reduced incidence of UTI, STD, balanitis, cancer of the penis
- complications (<1%): local infection, bleeding, urethral injury
- contraindications: presence of genital abnormalities (e.g. hypospadias) or known bleeding disorder

Circumcision

Pediatrics 2012;130:e756-e785

Study: Guidelines by the AAP.

Recommendations: The AAP radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of UTIs, penile cancer, and transmission of some STDs, including HIV. There is believed to be no effect on penile sexual function, sensitivity, or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

Crying/Fussing Child

- history
 - description of baseline feeding, sleeping, crying patterns
 - infectious symptoms: fever, tachypnea, rhinorrhea, ill contacts
 - feeding intolerance: gastroesophageal reflux with esophagitis, N/V, diarrhea, constipation
 - trauma
 - recent immunizations (vaccine reaction) or medications (drug reactions), including maternal drugs taken during pregnancy (neonatal withdrawal syndrome) and drugs that may be transferred via breast milk
 - inconsistent history, pattern of numerous emergency department visits, high-risk social situations all raise concern of maltreatment

Table 8. Physical Exam and Differential Diagnosis

Organ System	Possible Examination Findings	Possible Diagnosis
HEENT	Bulging fontanelle Blepharospasm, tearing Retinal hemorrhage Oropharyngeal infections	Meningitis, shaken baby syndrome, hydrocephalus Corneal abrasion, glaucoma Shaken baby syndrome Thrush, gingivostomatitis, herpangina, otitis media
Neurological	Irritability or lethargy	Meningitis, shaken baby syndrome
Cardiovascular	Poor perfusion Tachycardia	Sepsis, anomalous coronary artery, meningitis, myocarditis, CHF
Respiratory	Tachypnea Grunting	Pneumonia, CHF Respiratory disease, response to pain
Abdominal	Mass, empty RLQ	Intussusception
Genitourinary	Scrotal swelling Penile/clitoral swelling	Incarcerated hernia, testicular torsion Hair tourniquet
Rectal	Anal fissure Hemoccult positive stool	Constipation or diarrhea Intussusception, NEC, volvulus
Musculoskeletal	Point tenderness or decreased movement	Fracture, syphilis, osteomyelitis, toe/finger hair tourniquet

Infantile Colic

- definition: unexplained paroxysms of irritability and crying for >3 h/d, >3 d/wk for >3 wk in an otherwise healthy, well-fed baby (rule of 3s)
- epidemiology: 10% of infants; usual onset 10 d to 3 mo of age with peak at 6-8 wk
- etiology: lag in development of normal peristaltic movement in gastrointestinal tract; other theories suggest a lack of self-soothing mechanisms or extreme of normal
- management
 - parental relief, rest, and reassurance
 - hold baby, pacifier, car ride, music, vacuum, check diaper
 - medications (Ovol® drops, gripe water) have no proven benefit, some evidence for probiotics
 - if breastfeeding, elimination of cow's milk protein from mother's diet (effective in very small percentage of cases)
 - try casein hydrolysate formula (Nutramigen®)
 - time – all resolve, most in the first 2-3 mo of life

Dentition and Caries

Dentition

- primary dentition (20 teeth)
 - first tooth at 5-9 mo (lower incisor), then 1/mo
 - 6-8 central teeth by 1 yr
 - assessment by dentist 6 mo after eruption of first tooth and certainly by 1 yr of age (Grade B recommendation)
- secondary dentition (32 teeth)
 - first adult tooth is 1st molar at 6 yr, then lower incisors

Caries

- milk caries: decay of superior front teeth and back molars in first 4 yr of life
- cause: often due to prolonged feeding (e.g. put to bed with bottle, prolonged breastfeeding)
- prevention
 - no bottle at bedtime, clean teeth after last feed
 - minimize juice and sweetened pacifier
 - clean teeth with soft damp cloth or toothbrush and water
 - water fluoridation

Enuresis

Definition

- involuntary urinary incontinence by day and/or night in child >5 yr

General Approach

- should be evaluated if dysuria, change in color, odor, stream, secondary or diurnal, change in gait, stool incontinence

Primary Nocturnal Enuresis

- definition: involuntary loss of urine at night, bladder control has never been attained
- epidemiology: M>F; 10% of 6 yr olds, 3% of 12 yr olds, 1% of 18 yr olds
- etiology: developmental disorder or maturational lag in bladder control while asleep
- management
 - time and reassurance (~20% resolve spontaneously each yr)
 - behavior modification (limiting fluids, voiding prior to sleep), bladder retention exercises, scheduled toileting overnight has limited effectiveness
 - conditioning: "wet" alarm wakes child upon voiding (70% success rate)
 - medications (considered second line therapy, may be used for sleepovers/camp): DDAVP oral tablets (high relapse rate, costly), imipramine (Tofranil®) (rarely used, lethal if overdose, cholinergic side effects)

Secondary Enuresis

- definition: involuntary loss of urine at night, develops after child has sustained period of bladder control (>6 mo)
- etiology: inorganic regression due to stress or anxiety (e.g. birth of sibling, significant loss, family discord), focused on other activities, secondary to organic disease (UTI, DM, DI, neurogenic bladder, CP, seizures, pinworms)
- management: treat underlying cause

Treatment for primary nocturnal enuresis should not be considered until 7 yr of age due to high rate of spontaneous cure

Antidiuretic Hormone Regulation in Primary Nocturnal Enuresis

Arch Dis Child 1995;73(6):508-11

Treatment of primary nocturnal enuresis using DDAVP is based upon the hypothesis that ADH secretion is insufficient at night. The known efficacy of the treatment on the one hand, and persisting doubts about its theoretical basis on the other, formed the background of the present study. Ten children (mean age 10.5 yr) with primary nocturnal enuresis were compared with a corresponding control group of eight patients. Diurnal and nocturnal urine production, ADH secretion, and plasma osmolality were determined. No differences between the two groups were found for urine production, ADH levels during day and night, or plasma osmolality. However, in order to regulate plasma osmolality the enuretic children required a markedly greater output of ADH: 2.87 pg/ml/mmol/kg compared with 0.56 in the controls ($p < 0.01$). The results are consistent with the established fact that ADH secretion is a function of plasma osmolality, and they contradict the hypothesis that urine production is increased at night in enuretics because of lower ADH secretion.

Diurnal Enuresis

- definition: daytime wetting (60-80% also wet at night)
- etiology: micturition deferral (holding urine until last minute) due to psychosocial stressor (e.g. shy), structural anomalies (e.g. ectopic ureteral site, neurogenic bladder), UTI, constipation, CNS disorders, DM
- management: treat underlying cause, behavioral (scheduled toileting, double voiding, good bowel program), pharmacotherapy

Encopresis

- definition: fecal incontinence in a child >4 yr old, at least once per mo for 3 mo
- prevalence: 1-1.5% of school-aged children (rare in adolescence); M:F = 6:1 in school-aged children
- causes: chronic constipation (retentive encopresis), Hirschsprung disease, hypothyroidism, hypercalcemia, spinal cord lesions, anorectal malformations, bowel obstruction

Retentive Encopresis

- definition: child holds bowel movement, develops constipation, leading to fecal impaction and seepage of soft or liquid stool (overflow incontinence)
- etiology
 - physical: painful stooling often secondary to constipation
 - emotional: disturbed parent-child relationship, coercive toilet training, social stressors
- clinical presentation
 - history
 - ♦ crosses legs or stands on toes to resist urge to defecate
 - ♦ distressed by symptoms, soiling of clothes
 - ♦ toilet training coercive or lacking in motivation
 - ♦ may show oppositional behavior
 - ♦ abdominal pain
 - physical exam
 - ♦ digital rectal exam: large fecal mass in rectal vault
 - ♦ anal fissures (result from passage of hard stools)
 - ♦ palpable stool in LLQ
- management
 - complete clean-out of bowel: PEG 3350 given orally is most effective, enemas and suppositories may be second line therapies, but these are invasive and often less effective
 - maintenance of regular bowel movements (see *Pediatric Gastroenterology, Constipation Treatment, P38*)
 - assessment and guidance regarding psychosocial stressors
 - behavioral modification
- complications: recurrence, toxic megacolon (requires >3-12 mo to treat), bowel perforation

Toilet Training

- 90% of children attain bladder control before bowel control
- generally, females train earlier than males
- 25% by 2 yr (in North America), 98% by 3 yr have daytime bladder control
- signs of toilet readiness
 - ambulating independently, stable on potty, desire to be independent or to please caregivers (i.e. motivation), sufficient expressive and receptive language skills (2-step command level), can stay dry for several hours (large enough bladder), can recognize need to go, able to remove clothing

Failure to Thrive

- definition
 - weight <3rd percentile, falls across two major percentile curves, or <80% of expected weight for height and age
 - inadequate caloric intake most common factor in poor weight gain
 - may have other nutritional deficiencies (e.g. protein, iron, vitamin D)
 - factors affecting physical growth: genetics, intrauterine factors, internal time clock, nutrition, endocrine hormones, chronic infections/diseases, psychosocial factors
- clinical presentation
 - history
 - ♦ nutritional intake
 - ♦ current symptoms
 - ♦ past illnesses

**Energy Requirements**

- 0-10 kg: 100 kcal/kg/d
- 10-20 kg: 1,000 kcal + 50 kcal/kg/d for each kg >10
- >20 kg: 1,500 kcal + 20 kcal/kg/d for each kg >20

- ♦ family history: growth, puberty, parental height and weight including mid-parental height
- ♦ psychosocial history
- physical exam
 - ♦ growth parameters, plotted: height, weight, head circumference, arm span
 - ♦ vital signs
 - ♦ complete head to toe exam
 - ♦ dysmorphic features or evidence of chronic disease
 - ♦ upper to lower segment ratio
 - ♦ sexual maturity staging
 - ♦ signs of maltreatment or neglect
- investigations (as indicated by clinical presentation)
 - CBC, blood smear, electrolytes, T4, TSH
 - bone age x-ray
 - chromosomes/karyotype
 - chronic illness: chest (CXR, sweat Cl⁻), cardiac (CXR, ECG, Echo), GI (celiac screen, inflammatory markers, malabsorption), renal (urinalysis), liver (enzymes, albumin)

Table 9. Failure to Thrive Patterns

Growth Parameters			Suggestive Abnormality	
Decreased Wt	Normal Ht	Normal HC	Caloric insufficiency Decreased intake	Hypermetabolic state Increased losses
Decreased Wt	Decreased Ht	Normal HC	Structural dystrophies Endocrine disorder	Constitutional growth delay (BA < CA) Familial short stature (BA = CA)
Decreased Wt	Decreased Ht	Decreased HC	Intrauterine insult	Genetic abnormality

BA = bone age; CA = chronological age; HC = head circumference; Ht = height; Wt = weight

Non-Organic FTT (90%)

- most common cause of FTT
- results from complex factors in parent-child relationship
 - dietary intake, knowledge about feeding, improper mixing of formula, economic factors
 - feeding environment
 - parent-child interaction, attachment
 - child behaviors, hunger/satiety cues
 - social factors: stress, poverty
- management
 - most as outpatient using multidisciplinary approach: primary care physician, dietitian, psychologist, social work, Child Protection Services
 - medical: oromotor problems, iron-deficiency anemia, gastroesophageal reflux
 - nutritional: educate about age-appropriate foods, calorie boosting, mealtime schedules and environment to reach goal of 90-110% IBW, correct nutritional deficiencies, and promote catch-up growth/development
 - behavioral: positive reinforcement, mealtime environment

Organic FTT (10%)

- inadequate intake: vomiting, oromotor dysfunction, anorexia
- excessive consumption: CHD, CF, hyperthyroidism
- abnormal utilization: inborn errors of metabolism
- excessive output: IBD, celiac, malabsorption
- management: treat specific cause

Energy Requirements

- see *Nutrition, P6*

Obesity

- definition: BMI >95th percentile for age and height
- risk factors: genetic predisposition (e.g. both parents obese – 80% chance of obese child)
- etiology: organic causes are rare (<5%), but may include Prader-Willi, Carpenter, Turner, Cushing syndromes, hypothyroidism
- complications: association with HTN, dyslipidemia, slipped capital femoral epiphysis, type 2 DM, asthma, obstructive sleep apnea, gynecomastia, polycystic ovarian disease, early menarche, irregular menses, psychological trauma (e.g. bullying, decreased self-esteem, unhealthy coping mechanisms, depression)
- childhood obesity is not reliable predictor of adult obesity unless >180% of IBW; adolescent obesity good predictor of adult obesity
- management
 - encouragement and reassurance; engagement of entire family

Upper to Lower Segment Ratio

- **Increased** in achondroplasia, short limb syndromes, hypothyroid, storage diseases
- **Decreased** in Marfan's, Klinefelter's, Kallman's syndromes, and testosterone deficiency
- **Calculation:** upper segment/lower segment
 - Upper segment: top of head to pubic symphysis
 - Lower segment: pubic symphysis to floor

Mid-Parental Height

- Boys target height = (father ht + mother ht + 13) / 2
- Girls target height = (father ht + mother ht – 13) / 2
- Note:** height should be taken in cm

Clinical Signs of FTT

SMALL KID
 Subcutaneous fat loss
 Muscle atrophy
 Alopecia
 Lethargy
 Lagging behind normal
 Kwashiorkor
 Infection (recurrent)
 Dermatitis

Prevalence and Trends in Obesity and Severe Obesity Among Children in the United States, 1999-2012.

JAMA Pediatr 2014;168(6):561-566

Objective: To examine the prevalence of obesity and severe obesity over time for 14 yr of the continuous National Health and Nutrition Examination Survey, 1999-2012, and to examine differences in the trends by age, race/ethnicity, and sex.

Participants: Representative sample (N = 26,690) of children in the United States, ages 2-19 yr, in repeated cross-sections of the National Health and Nutrition Examination Survey, 1999-2012.

Main Outcomes: Prevalence of overweight (body mass index [BMI] ≥ 85th percentile), obesity (BMI ≥ 95th percentile for age and sex), class 2 obesity (BMI ≥ 120% of the 95th percentile or BMI ≥ 35), and class 3 obesity (BMI ≥ 140% of the 95th percentile or BMI ≥ 40).

Results: From 2011-2012, 17.3% of children in the United States aged 2-19 yr were obese. Additionally, 5.9% of children met criteria for class 2 obesity and 2.1% met criteria for class 3 obesity. Although these rates were not significantly different from 2009-2010, all classes of obesity have increased over the last 14 yr.

Conclusions: Nationally representative data do not show any significant changes in obesity prevalence in the most recently available years, although the prevalence of obesity may be stabilizing.

- diet: qualitative changes (do not encourage weight loss, but allow for linear growth to catch up with weight), special diets used by adults and very low calorie diets are not encouraged
- behavior modification: increase activity, change eating habits/meal patterns
- education: multidisciplinary approach, dietitian, counseling
- surgery and pharmacotherapy are not frequently used in children
- increase activity, reduce screen time

Poison Prevention

- keep all types of medicines, vitamins, and chemicals locked up in a secure container
- potentially dangerous: medications, illicit drugs, drain cleaners, furniture polish, insecticides, cosmetics, nail polish remover, automotive products
- do not store any chemicals in juice, soft drink, or water bottles
- keep alcoholic beverages out of reach: 3 oz hard liquor can kill a 2 yr old
- always read labels before administering medicine to ensure correct medication drug and dose and/or speak with a pharmacist or healthcare provider

Rashes

Table 10. Common Pediatric Rashes

Type of Rash	Differential	Appearance	Management
Diaper Dermatitis			
	Irritant contact dermatitis	Shiny, red macules/patches, no skin fold involvement	Eliminate direct skin contact with urine and feces, allow periods of rest without a diaper, frequent diaper changes, topical barriers (petrolatum, zinc oxide or paste), short-term low-potency topical corticosteroids (severe cases)
	Seborrheic dermatitis	Yellow, greasy macules/plaques on erythema, scales	Short-term, low-potency topical corticosteroids
	Candidal dermatitis	Erythematous macerated papules/plaques, satellite lesions, involvement of skin folds	Antifungal agents
Other Dermatitis			
	Atopic dermatitis	Erythematous, papules/plaques, oozing, excoriation, lichenification, classic areas of involvement	Eliminate exacerbating factors, maintain skin hydration, corticosteroids, topical calcineurin inhibitor, daily baths
	Nummular dermatitis	Annular erythematous plaques, oozing, crusting	Avoid irritant if identified, potent topical steroid in emollient base, short-term systemic steroids ± antibiotics (severe)
	Allergic contact dermatitis	Red papules/plaques/vesicles/bullae, only in area of allergen	Mild: soothing lotion (e.g. calamine lotion) Moderate: low-to-intermediate potency topical corticosteroids Severe: systemic corticosteroids and antihistamine
	Irritant contact dermatitis	Morphology depends on irritant	Avoid skin contact
	Dyshidrotic dermatitis	Papulovesicular, cracking/fissuring, hands and feet ("tapioca pudding")	Mild/moderate: medium/potent topical corticosteroids Severe: systemic corticosteroids, local PUVA or UVA treatments
Infectious			
	Scabies	Polymorphic (red excoriated papules/nodules, burrows), in web spaces/folds, very pruritic	Permethrin (Nix) 5% cream for patient and family (2 applications, 1 wk apart)
	Impetigo	Honey-colored crusts or superficial bullae	Oral antibiotics (e.g. cephalixin/erythromycin) Topical if mild: fucidic acid or mupirocin cream
	Tinea corporis	Round erythematous plaques, central clearing and scaly border	Topical anti-fungal for skin, systemic anti-fungals for nails/head

Pediatric Exanthems (see *Infectious Pediatric Exanthems*, P57)

Drug Reactions (see *Dermatology*, D21)

Acne (see *Dermatology*, D11)

Sleep Disturbances

Types of Sleep Disturbances

- insufficient sleep quantity
 - difficulty falling asleep (e.g. limit setting sleep disorder)
 - ♦ preschool and older children
 - ♦ bedtime resistance
 - ♦ due to caregiver's inability to set consistent bedtime rules and routines
 - ♦ often exacerbated by child's oppositional behaviors
- poor sleep quality
 - frequent arousals (e.g. sleep-onset association disorder)
 - ♦ infants and toddlers
 - ♦ child learns to fall asleep only under certain conditions or associations (e.g. with parent, held, rocked or fed, with light on, in front of television), and loses ability to self-soothe
 - ♦ during the normal brief arousal periods of sleep (q90-120 min), child cannot fall back asleep because same conditions are not present
 - obstructive sleep apnea
 - ♦ epidemiology: 1-5% of preschool aged children, more common in African American children
 - ♦ definition: partial or intermittent complete airway obstruction during sleep causing disrupted ventilation and sleep pattern
 - ♦ features: snoring/gasping/noisy breathing during sleep and irritable/tired/hyperactive during the day
 - ♦ sequelae: cardiovascular (HTN/LV remodeling due to sympathetic activation), growth, cognitive, and behavioral deficits
 - ♦ risk factors: adenotonsillar hypertrophy, obesity
 - ♦ management: watchful waiting, weight reduction, airway pressure devices, or surgery depending on the cause
 - ♦ adenotonsillectomy does not improve executive function or attention but reduces symptoms and improves behavior, quality of life, and polysomnographic findings
- parasomnias
 - episodic nocturnal behaviors (e.g. sleepwalking, sleep terrors, nightmares)
 - often involves cognitive disorientation and autonomic/skeletal muscle disturbance

Management of Sleep Disturbances

- set strict bedtimes and "wind-down" routines
- do not send child to bed hungry
- positive reinforcement for: limit setting sleep disorder
- always sleep in own bed, in a dark, quiet, and comfortable room
- do not use bedroom for timeouts
- systematic ignoring and gradual extinction for: sleep-onset association disorder

Nightmares

- epidemiology: common in boys, 4-7 yr
- associated with REM sleep (anytime during night)
- features: upon awakening, child is alert and clearly recalls frightening dream ± associated with daytime stress/anxiety
- management: reassurance

Night Terrors

- epidemiology: 15% of children have occasional episodes
- abrupt sitting up, eyes open, screaming
- clinical features: occurs in early hours of sleep, stage 4 of sleep; signs of panic and autonomic arousal, no memory of event, inconsolable, stress/anxiety can aggravate them
- course: remits spontaneously at puberty
- management: reassurance for parents, ensure child is safe (e.g. if sleepwalks)

Daily Sleep Requirement

- <6 mo 16 h
- 6 mo 14.5 h
- 12 mo 13.5 h
- 2 yr 13 h
- 4 yr 11.5 h
- 6 yr 9.5 h
- 12 yr 8.5 h
- 18 yr 8 h

Nap Patterns

- 2/d at 1 yr
- 1/d at 2 yr: 2-3 h
- 0.5/d at 5 yr: 1.7 h

Sudden Infant Death Syndrome

Definition

- sudden and unexpected death of an infant <12 mo of age in which the cause of death cannot be found by history, examination, or a thorough postmortem and death scene investigation

Epidemiology

- 0.5/1,000 (leading cause of death between 1-12 mo of age); M:F = 3:2
- more common in children placed in prone position
- in full term infants, peak incidence is 2-4 mo, 95% of cases occur by 6 mo
- increase in deaths during peak RSV season
- most deaths occur between midnight and 8 AM

Risk Factors

- prematurity, smoking in household, socially disadvantaged, higher incidence in Aboriginals and African Americans
- risk of SIDS is increased 3-5x in siblings of infants who have died of SIDS
- bedsharing: sleeping on a sofa, sleeping with an infant after consumption of alcohol/street drugs or extreme fatigue, infant sleeping with someone other than primary caregiver

Prevention

- “Back to Sleep, Front to Play” (place infant on back when sleeping)
- allow supervised play time daily in prone position (“tummy time”)
- alarms, monitors not recommended – increase anxiety, do not prevent life-threatening events
- avoid overheating and overdressing
- appropriate infant bedding (e.g. firm mattress; avoid loose bedding, pillows, stuffed animals, and crib bumper pads)
- no smoking
- pacifiers appear to have a protective effect; do not reinsert if it falls out during sleep

**Apparent Life-Threatening Events**

A group of conditions often marked by an episode of apnea, cyanosis, change in tone, or change in mental status occurring in a child, where an observer fears the child may be dying. There is no clear connection between most ALTEs and SIDS. Evaluating for a cause of the ALTE (e.g. infection, cardiac, neurologic) is guided by history, physical exam, and period of observation

Child Abuse and Neglect

**Definition**

- an act of commission (physical, sexual, or psychological abuse) or omission (neglect) by a caregiver that harms a child

Legal Duty to Report

- upon reasonable grounds to suspect abuse and/or neglect, physicians are required by legislation to contact the Child Protective Services (CPS) to personally disclose all information relevant to the child safety concern
- duty to report overrides patient confidentiality; physician is protected against liability

Ongoing Duty to Report

- if there are additional reasonable grounds to suspect abuse and/or neglect, a further report to the CPS must be made

Risk Factors

- environmental factors: social isolation, poverty, domestic violence
- caregiver factors: personal history of abuse, psychiatric illness, substance abuse, single parent family, poor social and vocational skills, below average intelligence
- child factors: difficult temperament, disability, special needs (e.g. developmental delay), premature

Physical Abuse

History

- history that is not compatible with physical findings, or history not reproducible
- delay in seeking medical attention that is unexplained by other factors

Physical Exam

- physical findings not explained by underlying medical condition
- growth parameters (weight, height, head circumference)
- recurrent or multiple injuries not explained by accidental injury or child's development level
- patterned skin injuries: belt buckle, hand prints, burns that do not match provided history
- injury location: bruises on areas with abundant soft-tissue cushioning, such as abdomen, buttocks, genitalia, fleshy part of cheek; bruises on ears; posterior rib/metaphyseal/scapular/vertebral/sternal fractures (more suspicious for non-accidental injuries); immersion burns (e.g. hot water)
- altered mental status: head injury, poisoning
- head trauma is the leading cause of death in child maltreatment (e.g. acceleration-deceleration forces [shaking], direct force application [blow or impact])

Investigations

- document all injuries on a body diagram: type, location, size, shape, color, pattern
 - photography of skin injuries is ideal (police or hospital photography preferred; do not use physician's personal camera)
- blood tests to rule out medical causes (e.g. thrombocytopenia or coagulopathy)
- screen for abdominal trauma (transaminases and amylase): if increased, abdo CT recommended
- skeletal survey in children <2 yr
 - bone scan can be beneficial for assessing rib fractures (not helpful for skull or metaphyseal region due to active bone growth) – consider bone scan if equivocal findings on initial skeletal survey
 - dilated eye examination by pediatric ophthalmologist to rule out retinal hemorrhage
 - be aware of “red herrings” (e.g. Mongolian blue spots vs. bruises)
 - neuroimaging: CT and/or MRI

“If no bruising, no bruising”

**Presentation of Neglect**

- FTT, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents, no stranger anxiety

Sexual Abuse

Epidemiology

- peak ages at 2-6 yr and 12-16 yr
- most perpetrators are male and known to child
 - in decreasing order: family member, non-relative known to victim, stranger

History

- diagnosis usually depends on child disclosing to someone or forensic interview done by a trained individual
- psychosocial: specific or generalized fears, depression, nightmares, social withdrawal, lack of trust, low self-esteem, school failure, sexually aggressive behavior, advanced sexual knowledge, sexual preoccupation or play

Physical Exam

- recurrent UTIs, pregnancy, STDs, vaginitis, vaginal bleeding, pain, genital injury, enuresis

Investigations

- depend on presentation, age, sex, and pubertal development of child
 - sexual assault examination kit within 24 h if prepubertal, within 72 h if pubertal
 - rule out STD, UTI, pregnancy (consider STD prophylaxis or emergency contraception)
 - rule out other injuries (vaginal/anal/oral penetration, fractures, head trauma)

Neglect

History

- from child and each caregiver separately (if possible)

Physical Exam

- head to toe (do not force), growth parameters, nutrition status
- dental care
- emotional state

Investigations

- blood tests to rule out medical conditions (e.g. thrombocytopenia or coagulopathy)

Management of Physical Abuse, Child Abuse, and Neglect

- report all suspicions to CPS; request emergency visit if imminent risk to child or any siblings in the home
- acute medical care: hospitalize for medical evaluation or treatment of injuries if indicated
- arrange consultation to social work and appropriate follow-up
- may need to discharge child directly to CPS or to responsible guardian under CPS supervision

Adolescent Medicine

Adolescent History (HEEADSSS)

- tailor your history according to the clinical context

Home: Who do you live with? What kind of place do you live in?

Education/Employment: What grade are you in? What are your favorite subjects? What was your average on your last report card?

Eating: Tell me about your meals/snacks in a typical day. Have you ever gone on a diet? (for *Eating Disorders* – see [Psychiatry, PS26](#))

Activities: What do you do after school? On the weekends? How much time do you spend on the computer/watching TV every day? Do you use social media (i.e. Facebook, Twitter, Instagram, etc.)?

Drugs: Which seems to be more popular at your school, alcohol or drugs? How often do you drink/smoke marijuana/take other drugs? Do you smoke cigarettes? When you drink, do you usually get drunk? Have you ever passed out or not been able to remember what happened while you were drinking? Has anything bad ever happened to you while you were drunk or stoned? (for *Substance Abuse* – see [Psychiatry, PS18](#))

Sexuality: Are you romantically interested in anyone? When you think about having sex with someone, do you think about girls, boys, or both? Have you ever had sex with anyone? Whether the answer is yes or no, the next question is: What activities would you include in the term 'having sex'? What do you do to prevent getting a STD/getting pregnant/getting someone pregnant? Has anyone ever given you money, drugs, or other stuff in exchange for sex? (for *Sexually Transmitted Diseases* – see [Gynecology, GY25](#))

Adolescent Psychosocial Assessment

HEEADSSS

Home
Education/Employment
Eating
Activities
Drugs
Sexuality
Suicide and depression
Safety/Violence

Rates of drug use in high school students who have used in the past year: alcohol (58.2%), cannabis (25.6%), tobacco (11.7%)

Suicidality/Depression: On a scale of 1 to 10, where 1 is so sad that you might kill yourself and 10 is the happiest you could be, where are you most days? Is there a difference between school days and the weekend? Have you ever thought seriously about suicide? Did you make a plan? (for *Depression/Suicide* – see [Psychiatry](#), PS7, PS2)

Safety/Violence: Do you ever get into a car with a driver who has been drinking? Do you always wear a seatbelt/bicycle helmet? Are you being bullied at school? Has anyone ever touched you in an unwanted way?

For *Normal and Abnormal Pubertal Development*, P31

Prevalence of depression: 1-2% in pre-pubertal children and 6-8% in adolescents

Date rape comprises 80% of sexual assault in teenagers

Cardiology

Congenital Heart Disease

PRENATAL CIRCULATION

Figure 1. Prenatal circulation

Embryologic Development

- most critical period of fetal heart development is between 3-8 wk gestation
- single heart tube grows rapidly, forcing it to bend back upon itself and assume the shape of a four chambered heart; insults at this time are most likely to lead to CHD

Before Birth

- fetal lungs are bypassed by flow through fetal shunts
 - shunting deoxygenated blood
 - ♦ ductus arteriosus: connection between pulmonary artery and aorta
 - shunting oxygenated blood
 - ♦ foramen ovale: connection between right and left atria
 - ♦ ductus venosus: connection between umbilical vein and inferior vena cava

At Birth

- with first breath, lungs open up → pulmonary resistance decreases → pulmonary blood flow increases
- separation of low resistance placenta → systemic circulation becomes a high resistance system → ductus venosus closure
- increased pulmonary flow → increased left atrial pressures → foramen ovale closure
- increased oxygen concentration in blood after first breath → decreased prostaglandins → ductus arteriosus closure
- closure of fetal shunts and changes in vascular resistance → infant circulation assumes normal adult flow

Fetal circulation is designed so that oxygenated blood is preferentially delivered to the brain and myocardium

Epidemiology

- 8/1,000 live births have CHD, which may present as a heart murmur, heart failure, or cyanosis; VSD is the most common lesion

Investigations

- Echo, ECG, CXR
- pre and postductal oxygen saturations, 4 limb BPs, hyperoxia test

CYANOTIC VS. ACYANOTIC CONGENITAL HEART DISEASE

- cyanosis: blue mucous membranes, nail beds, and skin secondary to an absolute concentration of deoxygenated hemoglobin of at least 30 g/dL
- acyanotic heart disease (i.e. L to R shunt, obstruction occurring beyond lungs): blood passes through pulmonary circulation → oxygenation takes place → low levels of deoxygenated blood in systemic circulation → no cyanosis
- cyanotic heart disease (i.e. R to L shunt): blood bypasses the lungs → no oxygenation occurs → high levels of deoxygenated hemoglobin enters the systemic circulation → cyanosis

Characteristic CXR Findings in CHD

- Boot-shaped heart: tetralogy of Fallot, tricuspid atresia
- Egg-shaped heart: transposition of great arteries
- "Snowman" heart: total anomalous pulmonary venous return

Figure 2. Common congenital heart diseases

Acyanotic Congenital Heart Disease

1. LEFT-TO-RIGHT SHUNT LESIONS

- extra blood is displaced through a communication from the left to the right side of the heart → increased pulmonary blood flow → increased pulmonary pressures
- shunt volume is dependent upon three factors: (1) size of defect, (2) pressure gradient between chambers or vessels, and (3) peripheral outflow resistance
- untreated shunts can result in pulmonary vascular disease, left ventricular dilatation and dysfunction, right ventricular HTN and RVH, and ultimately R to L shunts

Atrial Septal Defect

- 3 types: *ostium primum* (common in DS), *ostium secundum* (most common type, 50-70%), *sinus venosus* (defect located at entry of superior vena cava into right atrium)
- epidemiology: 6-8% of congenital heart lesions
- natural history
 - 80-100% spontaneous closure rate if ASD diameter <8 mm
 - if remains patent, CHF and pulmonary HTN can develop in adult life
- clinical presentation
 - history: often asymptomatic in childhood
 - physical exam: grade 2-3/6 pulmonic outflow murmur, widely split and fixed S2
 - children with large ASDs may have signs of heart failure (tachypnea, FTT, hepatomegaly, pulmonary rales/retractions)
- investigations
 - ECG: RAD, mild RVH, RBBB
 - CXR: increased pulmonary vasculature, cardiac enlargement
 - Echo: test of choice
- management: elective surgical or catheter closure between 2-5 yr of age

Ventricular Septal Defect

- most common congenital heart defect (30-50%)
- small VSD (majority)
 - clinical presentation
 - history: asymptomatic, normal growth and development
 - physical exam: early systolic to holosystolic murmur, best heard at LLSB, thrill

- investigations: ECG and CXR are normal; Echo to confirm diagnosis
- management: most close spontaneously
- moderate-to-large VSD
 - epidemiology: CHF by 2 mo; late secondary pulmonary HTN if left untreated
 - clinical presentation
 - ♦ history: delayed growth, decreased exercise tolerance, recurrent URIs or “asthma” episodes
 - ♦ physical exam: holosystolic murmur at LLSB, mid-diastolic rumble at apex, size of VSD is inversely related to intensity of murmur
 - investigations
 - ♦ ECG: LVH, LAH, RVH
 - ♦ CXR: increased pulmonary vasculature, cardiomegaly, CHF
 - ♦ Echo: diagnostic
 - management: treatment of CHF and surgical closure by 1 yr old

**Moderate-to-Large VSD**

Size of VSD is inversely related to intensity of murmur

**Figure 3. Patent ductus arteriosus****Patent Ductus Arteriosus**

- patent vessel between descending aorta and left pulmonary artery (normally, functional closure within first 15 h of life, anatomical closure within first days of life)
- epidemiology
 - 5-10% of all congenital heart defects
 - delayed closure of ductus is common in premature infants (1/3 of infants <1,750 g); this is different from PDA in term infants
- natural history: spontaneous closure common in premature infants, less common in term infants
- clinical presentation
 - history: asymptomatic, or have apneic or bradycardic spells, poor feeding, accessory muscle use, CHF
 - physical exam: tachycardia, bounding pulses, hyperactive precordium, wide pulse pressure, continuous “machinery” murmur best heard at left infraclavicular area
- investigations
 - ECG: may show left atrial enlargement, LVH, RVH
 - CXR: normal to mildly enlarged heart, increased pulmonary vasculature, prominent pulmonary artery
 - Echo: diagnostic
- management
 - indomethacin (Indocid®): antagonizes prostaglandin E₂, which maintains ductus arteriosus patency; only effective in premature infants
 - catheter or surgical closure if PDA causes respiratory compromise, FTT, or persists beyond 3rd mo of life

**Physical Exam for PDA (in term infant)**

- Heavy “machinery” murmur
- High pulse rate
- Wide pulse pressure
- Hyperactive precordium
- Big bounding pulse

2. OBSTRUCTIVE LESIONS

- present with decreased urine output, pallor, cool extremities and poor pulses, shock or sudden collapse

Coarctation of the Aorta

- definition: narrowing of aorta (almost always at the level of the ductus arteriosus)
- epidemiology: commonly associated with bicuspid aortic valve (50%); Turner syndrome (35%)
- clinical presentation
 - history: often asymptomatic
 - physical exam
 - ♦ blood pressure discrepancy between upper and lower extremities (increased suspicion/severity if >20 mmHg difference)
 - ♦ diminished or delayed femoral pulses relative to brachial (i.e. brachial-femoral delay)
 - ♦ possible systolic murmur with late peak at apex, left axilla, and left back
 - ♦ if severe, presents with shock in the neonatal period when the ductus arteriosus closes
- investigations: ECG shows RVH early in infancy, LVH later in childhood; Echo or MRI for diagnosis
- prognosis: can be complicated by HTN; if associated with other lesions (e.g. PDA, VSD) can lead to CHF
- management: give prostaglandins to keep ductus arteriosus patent for stabilization and perform surgical correction in neonates; for older infants and children balloon arterioplasty may be an alternative to surgical correction. The American Heart Association and the American College of Cardiology recommend that correction of coarctation should be done as early as possible to reduce long-term morbidity and increase survival

**Figure 4. Coarctation of the aorta****Aortic Stenosis**

- 4 types: valvular (75%), subvalvular (20%), supra-valvular, and idiopathic hypertrophic subaortic stenosis (5%)
- clinical presentation
 - history: often asymptomatic, but may be associated with CHF, exertional chest pain, syncope, or sudden death
 - physical exam: SEM at RUSB with aortic ejection click at the apex (only for valvular stenosis)
- diagnosis: Echo
- management: valvular stenosis is usually treated with balloon valvuloplasty, patients with subvalvular or supra-valvular stenosis require surgical repair, exercise restriction required

Pulmonary Stenosis

- 3 types: valvular (90%), subvalvular, or supravulvar
- definition of critical pulmonary stenosis: inadequate pulmonary blood flow, dependent on ductus for oxygenation, progressive hypoxia and cyanosis
- natural history: may be part of other congenital heart lesions (e.g. Tetralogy of Fallot) or in association with syndromes (e.g. congenital rubella, Noonan syndrome)
- clinical presentation
 - history: spectrum from asymptomatic to CHF
 - physical exam: wide split S2 on expiration, SEM at LUSB, pulmonary ejection click (for valvular lesions)
- investigations
 - ECG: RVH
 - CXR: post-stenotic dilation of the main pulmonary artery
 - Echo: diagnostic
- management: surgical repair if critically ill or if symptomatic in older infants/children

Causes of Cyanotic Heart Disease – 5T's

Truncus arteriosus
Transposition of the great vessels
Tricuspid atresia
Tetralogy of Fallot
Total anomalous pulmonary venous return

Figure 5. Tetralogy of Fallot

Tetralogy of Fallot

1. VSD
2. RVOTO
3. Aortic root "overriding" VSD
4. RVH

Ebstein's Anomaly

- Septal and posterior leaflets of tricuspid valve are malformed and displaced into the RV
- Potential for RV dysfunction, tricuspid stenosis, tricuspid regurgitation, or functional pulmonary atresia if RV unable to open pulmonic valves
- Accessory conduction pathways (e.g. WPW) are often present

Etiology

- Unknown, associated with maternal lithium and benzodiazepine use in 1st trimester

Treatment

- Newborns: consider closure of tricuspid valve + aortopulmonary shunt, or transplantation
- Older children: tricuspid valve repair or valve replacement + ASD closure

Figure 6. Transposition of the great arteries

Cyanotic Congenital Heart Disease

- systemic venous return re-enters systemic circulation directly
- most prominent feature is cyanosis (O_2 sat <75%)
- hyperoxic test differentiates between cardiac and other causes of cyanosis
 - obtain preductal, right radial ABG in room air, then repeat after the child inspires 100% O_2
 - if PaO_2 improves to greater than 150 mmHg, cyanosis less likely cardiac in origin
- pre-ductal and post-ductal pulse oximetry
 - >5% difference suggests R to L shunt

1. RIGHT-TO-LEFT SHUNT LESIONS

Tetralogy of Fallot

- epidemiology: 10% of all CHD, most common cyanotic heart defect diagnosed beyond infancy with peak incidence at 2-4 mo of age
- pathophysiology
 - embryological defect due to anterior and superior deviation of the outlet septum leading to: VSD, RVOTO (i.e. pulmonary stenosis), over-riding aorta, and RVH
 - ♦ infants may initially have a L → R shunt (therefore no cyanosis); however, RVOTO is progressive, leading to increasing R → L shunting with hypoxemia and cyanosis
 - ♦ degree of RVOTO determines the direction and degree of shunt and, therefore, the extent of clinical cyanosis and degree of RVH
- clinical presentation
 - history: hypoxic "tet" spells
 - ♦ during exertional states (crying, exercise) the increasing pulmonary vascular resistance and decrease in systemic resistance causes an increase in right-to-left shunting
 - ♦ clinical features include paroxysms of rapid and deep breathing, irritability and crying, increasing cyanosis, decreased intensity of murmur (decreased flow across RVOTO)
 - ♦ if severe, can lead to decreased level of consciousness, seizures, death
 - physical exam
 - ♦ single loud S2 due to severe pulmonary stenosis (i.e. RVOTO), SEM at LSB
- investigations
 - ECG: RAD, RVH
 - CXR: boot-shaped heart, decreased pulmonary vasculature, right aortic arch (in 20%)
 - Echo: diagnostic
- management of spells: O_2 , knee-chest position, fluid bolus, morphine sulfate, propranolol
- treatment: surgical repair at 4-6 mo of age; earlier if marked cyanosis or "tet" spells

2. OTHER CYANOTIC CONGENITAL HEART DISEASES

Transposition of the Great Arteries (TGA)

- epidemiology: 3-5% of all congenital cardiac lesions, most common cyanotic CHD in neonates
- pathophysiology: parallel pulmonary and systemic circulations
 - systemic: body → RA → RV → aorta → body
 - pulmonary: lungs → LA → LV → pulmonary artery → lungs
 - survival is dependent on mixing through PDA, ASD, or VSD
- physical exam
 - neonates: ductus arteriosus closure causes rapidly progressive severe hypoxemia unresponsive to oxygen therapy, acidosis, and death
 - VSD present: cyanosis is not prominent; CHF within first weeks of life
 - VSD absent: no murmur

- investigations
 - ECG: RAD, RVH, or may be normal
 - CXR: egg-shaped heart with narrow mediastinum (“egg on a string”)
 - Echo: diagnostic
- management
 - symptomatic neonates: prostaglandin E1 infusion to keep ductus open until balloon atrial septostomy
 - surgical repair: arterial switch performed in the first two weeks in those without a VSD while LV muscle is still strong

Total Anomalous Pulmonary Venous Return

- epidemiology: 1-2% of CHD
- pathophysiology
 - all pulmonary veins drain into right-sided circulation (systemic veins, RA)
 - no direct oxygenated pulmonary venous return to left atrium
 - often associated with obstruction at connection sites
 - ASD must be present for oxygenated blood to shunt into the LA and systemic circulation
- management: surgical repair in all cases and required urgently for severe cyanosis

Truncus Arteriosus

- pathophysiology
 - single great vessel gives rise to the aorta, pulmonary, and coronary arteries
 - truncal valve overlies a large VSD
 - potential for coronary ischemia with fall in pulmonary vascular resistance
- management: surgical repair within first 6 wk of life

Hypoplastic Left Heart Syndrome

- epidemiology: 1-3% of CHD; most common cause of death from CHD in first month of life
- pathophysiology: LV hypoplasia may include atretic or stenotic mitral and/or aortic valve, small ascending aorta, and coarctation of the aorta with resultant systemic hypoperfusion
- systemic circulation is dependent on ductus patency; upon closure of the ductus, infant presents with circulatory shock and metabolic acidosis
- management
 - intubate and correct metabolic acidosis
 - IV infusion of prostaglandin E1 to keep ductus open
 - surgical palliation (overall survival 50% to late childhood) or heart transplant

4 Features of Hypoplastic Left Heart Syndrome

- Hypoplastic LV
- Narrow mitral/aortic valves
- Small ascending aorta
- Coarctation of the aorta

Congestive Heart Failure

- see [Cardiology and Cardiac Surgery, C33](#)

Etiology

- CHD
- cardiomyopathy (primary or secondary)
- high output circulatory states (e.g. anemia, AVMs, cor pulmonale, hyperthyroidism)
- non-cardiac (e.g. sepsis, renal failure)
- pressure overload (e.g. aortic stenosis/coarctation, pulmonary stenosis, HTN)
- volume overload (e.g. L to R shunt, valve insufficiency)

History

- infant: feeding difficulties, early fatigability, diaphoresis while sleeping or eating, respiratory distress, lethargy, FTT
- child: decreased exercise tolerance, fatigue, decreased appetite, respiratory distress, frequent URTIs or “asthma” episodes
- orthopnea, paroxysmal nocturnal dyspnea, pedal/dependent edema are all uncommon in children

Physical Findings

- 4 key features: tachycardia, tachypnea, cardiomegaly, hepatomegaly
- FTT
- alterations in peripheral pulses, four limb blood pressures (in some CHDs)
- dysmorphic features associated with congenital syndromes

Investigations

- CXR: cardiomegaly, pulmonary venous congestion
- ECG: sinus tachycardia, signs of underlying cause (heart block, atrial enlargement, hypertrophy, ischemia/infarct)
- Echo: structural and functional assessment
- blood work: CBC, electrolytes, BUN, Cr, LFTs

4 Key Features of CHF

2 Tachy's and 2 Megaly's

- Tachycardia
- Tachypnea
- Cardiomegaly
- Hepatomegaly

Management

- general: sitting up, O₂, sodium and water restriction, increased caloric intake
- pharmacologic: diuretics, afterload reduction (e.g. ACE inhibitor), β -blockers; digoxin rarely used
- curative: correction of underlying cause

Dysrhythmias

- see [Cardiology and Cardiac Surgery, C15](#)
- can be transient or permanent, congenital (structurally normal or abnormal) or acquired (toxin, infection, infarction)

Sinus Arrhythmia

- phasic variations with respiration (present in almost all normal children)

Sinus Tachycardia

- rate of impulses arising from sinus node is elevated (>150 bpm in infants, >100 bpm in older children)
- characterized by: beat-to-beat heart rate variability with changes in activity, P waves present/normal, PR constant, QRS narrow
- etiology: HTN, fever, anxiety, sepsis, anemia/hypoxia, PE, drugs, etc.
- differentiate from SVT (see below) by slowing the sinus rate (vagal massage, β -blockers) to identify sinus P waves

Premature Atrial Contractions

- may be normal variant or can be caused by electrolyte disturbances, hyperthyroidism, cardiac surgery, digitalis toxicity

Premature Ventricular Contractions

- common in adolescents
- benign if single, uniform, disappear with exercise, and no associated structural lesions
- if not benign, may degenerate into more severe dysrhythmias

Supraventricular Tachycardia

- abnormally rapid heart rhythm originating above the ventricles – most frequent sustained dysrhythmia in children
- no beat-to-beat HR variability, >220 bpm (infants) or >180 bpm (children), P waves absent/abnormal, PR indeterminable, QRS usually narrow
- pre-excitation syndromes (subset of SVT): WPW syndrome, congenital defect (see [Cardiology and Cardiac Surgery C21](#))

Complete Heart Block

- congenital heart block can be caused by maternal anti-Ro or anti-La (e.g. mother with SLE)
- often diagnosed *in utero* (may lead to development of fetal hydrops)
- clinical symptoms related to level of block (the lower the block, the slower the heart rate and greater the symptoms of inadequate cardiac output)
- symptomatic patients need a pacemaker

Pediatric vs. Adult ECG

Pediatric ECG findings that may be normal:

- HR > 100 bpm
- Shorter PR and QT intervals and QRS duration
- Inferior and lateral small Q waves
- RV larger than LV in neonates, so normal to have:
 - RAD
 - Large precordial R waves
 - Upright T waves
 - Inverted T waves in the anterior precordial leads from early infancy to teen years

Heart Murmurs

- 50-80% of children have audible heart murmurs at some point in their childhood
- most childhood murmurs are functional (e.g. “innocent”) without associated structural abnormalities and have normal ECG and radiologic findings
- in general, murmurs can become audible or accentuated in high output states (e.g. fever, anemia)

Table 11. Differentiating Heart Murmurs

	Innocent	Pathological
History and Physical	Asymptomatic	Symptoms and signs of cardiac disease (FTT, exercise intolerance)
Timing	SEM	All diastolic, pansystolic, or continuous (except venous hum)
Grade	<3/6; soft/blowing/vibratory	$\geq 3/6$ (palpable thrill); harsh
Splitting	Physiologic S2	May have fixed split or single S2
Extra Sounds/Clicks	None	May be present
Change of Position	Murmur varies	Unchanged

Table 12. Five Innocent Heart Murmurs

Type	Description	Age	Differential Diagnosis
Peripheral Pulmonic Stenosis	Neonates, low-pitched, radiates to axilla and back	Neonates, usually disappears by 3-6 mo	PDA Pulmonary stenosis
Still's Murmur	Vibratory, LLSB or apex, SEM	3-6 yr	Subaortic stenosis Small VSD
Venous Hum	Infraclavicular hum, continuous, R>L	3-6 yr	PDA
Pulmonary Ejection	Soft, blowing, LUSB, SEM	8-14 yr	ASD Pulmonary stenosis
Supraclavicular Arterial Bruit	Low intensity, above clavicles	Any age	Aortic stenosis Bicuspid aortic valve

Infective Endocarditis

- see [Infectious Diseases](#), ID17

Development

Approach to Global Developmental Delay

- also known as Early Developmental Impairment

Definition

- performance significantly below average in two or more domains of development
- when persistent, these become developmental disabilities, which are lifelong impairments

Epidemiology

- 5-10% of children have neurodevelopmental delay
- careful evaluation can reveal a cause in 50-70% of cases

Etiology

- CNS abnormalities (meningitis/encephalitis, brain malformation, trauma, etc.)
- sensory deficits (hearing, vision)
- environmental (psychosocial neglect, lead exposure, antenatal drug or alcohol exposure, etc.)
- genetic/chromosomal disorders (DS, Fragile X, etc.)
- metabolic disorders (inborn errors of metabolism, hypothyroidism, etc.)
- obstetrical (prematurity, HIE, TORCH infections, etc.)

Clinical Presentation

- history
 - intrauterine exposures, perinatal events
 - detailed developmental milestones: rate of acquisition, regression of skills
 - associated problems: feeding, seizures, behavior, sleep
 - family history, consanguinity
 - social history
- physical exam
 - dysmorphic features, hepatosplenomegaly, neurocutaneous markers, growth parameters, detailed neurological examination
- investigations
 - neurodevelopmental assessment, vision and hearing test, psychosocial evaluation, OT, PT and/or SLP assessments, genetics consultation
 - laboratory testing and imaging (guided by history and physical exam)
 - ♦ microarray, chromosomes, FISH, Fragile X testing, neuroimaging, metabolic workup, neuroelectrophysiologic testing

Management

- dependent on specific area of delay
- therapy services (e.g. speech and language therapy for language delay, OT and/or PT for motor delay), early intervention services (e.g. infant development services)

Intellectual Disability

Definition

- state of functioning that begins in childhood and is characterized by limitations in both intelligence and adaptive skills
- historically defined as an IQ <70

Epidemiology

- 1% of general population; M:F = 1.5:1

Etiology

- any disorder that interferes with brain development and functioning
- prenatal (majority): TORCH infections, FASD
- genetic/metabolic: DS, Fragile X, PKU, untreated or delayed diagnosis of congenital hypothyroidism, CNS abnormalities, other chromosomal/metabolic disorders

Risk Factors

- male, consanguineous parents, family history, older maternal age, decreasing maternal education, certain ethnicities
- prenatal: pre-eclampsia, maternal malnutrition or DM
- perinatal: prematurity, low birth weight, birth trauma/hypoxia
- postnatal: ICH, CNS or other serious infection, hypoxia, environmental toxins, psychosocial deprivation, malnutrition

Clinical Presentation

- history
 - well below average general intellectual functioning
 - significant deficits in adaptive functioning in at least two of: communication, self-care, home-living, social skills, self-direction, academic skills, work, leisure, health, safety
- physical exam
 - check growth, dysmorphic features, complete physical exam
- investigations
 - standardized psychology assessment (includes IQ test and measure of adaptive functioning)
 - vision, hearing, and neurologic assessment
 - genetic and metabolic testing as indicated

Management

- main objective: enhance adaptive functioning level
- requires an interprofessional team with strong case co-ordination
- emphasize community-based treatment and early intervention
- individual/family therapy, behavior management services, therapy services (e.g. OT, SLP), medications for associated conditions
- education: life skills, vocational training, communication skills, family education
- psychosocial support for individual and family; respite care

Prognosis

- higher rates of sensory deficits, motor impairment, behavioral/emotional disorders, seizures, psychiatric illness

DSM-5 Criteria for Intellectual Disability

- Deficits in intellectual functioning
- Deficits or impairments in adaptive functioning
- These limitations are evident during childhood or adolescence

Classification of Intellectual Disability

Severity	% Cases	IQ
Mild	85	50-70
Moderate	10	35-49
Severe	3-4	20-34
Profound	1-2	<20

Language Delay

Definition

- no universally accepted definition, but often identified around 18 mo of age with enhanced well baby visit
- if formally tested, performance on a standardized assessment of language is at least one standard deviation below mean of age
- can be expressive (ability to produce or use language), receptive (ability to understand language), or both

Epidemiology

- ~10-15% of 2 yr children have a language delay, but only 4-5% remain delayed after 3 yr
- ~6-8% of school-aged children have specific language impairment (many of whom were not identified before school entry)

Etiology

- cognitive disability
- constitutional language delay
- genetic/metabolic: DS, Fragile X syndrome, Williams syndrome, hypothyroidism, PKU, etc.
- hearing impairment
- mechanical problems: cleft palate, cranial nerve palsy
- medical condition: seizure disorder (includes acquired epileptic aphasia), CP, TORCH infection, iron deficiency, lead poisoning, etc.
- autism spectrum disorder
- psychosocial: neglect or abuse
- selective mutism

Risk Factors

- male, positive family history, prematurity, psychosocial (poverty, low parental education, maternal depression)

Clinical Presentation

- history
 - concerns about hearing, delay in language development or regression in previously normal language development
 - delayed language milestones on well-child check up; presence of red flags
 - must determine if language delay is expressive, receptive, or mixed
 - children with expressive language delays may have concurrent behavior problems or drooling (because of abnormal oral musculature)
 - risk factors for hearing loss (hereditary, recurrent AOM) and language delay
- physical exam
 - guided by history: look for abnormal growth, dysmorphisms, unusual social interactions (lack of eye contact, not pointing)
 - include full exam of the external/internal ear (e.g. TM scarring), oral pharynx (e.g. cleft palate), and neurologic system (including tone)
- investigations
 - use of language specific screens in primary care setting: The Early Language Milestone, CAT/CLAMS, MCHAT, etc.
 - all children with suspected language delay MUST be referred to an audiologist for a hearing assessment
 - CBC (to rule out anemia), venous blood lead levels, genetic/metabolic workup as indicated

Management

- specific to etiology
- often multidisciplinary and requires appropriate referrals: early intervention services, special education services, SLP, OHNS and dental professionals, general support services
- primary care provider can help reinforce family's understanding of delay and provide follow-up and care coordination
- prevention: parents can read aloud to their child, engage in dialogic reading, avoid baby talk, narrate daily activities, etc.

Prognosis

- depends on etiology
- if language delay persists beyond 5 yr old, more likely to have difficulties in adulthood
- persistent language delay is associated with poor academic performance, behavioral problems, social isolation

**Risk Factors for Sensorineural Hearing Loss**

- Genetic syndromes/family history
- Congenital (TORCH) infections
- Craniofacial abnormalities
- < 1,500 g birthweight
- Hyperbilirubinemia/kernicterus
- Asphyxia/low APGAR scores
- Bacterial meningitis, viral encephalitis

Bilingual exposure generally does NOT explain a frank delay in language development

Primary care physicians should suspect a receptive language delay in any young child with an expressive language delay

Fetal Alcohol Spectrum Disorder

**Definition**

- term describing the range of effects of prenatal exposure to alcohol, including physical, mental, behavioral, and learning disabilities
- no "safe" level of alcohol consumption during pregnancy has been established
- spectrum includes: FAS, partial FAS, ARBD, and ARND

Epidemiology

- prevalence of FAS and FASD is 0.1% and 1.0%, respectively
- most common preventable cause of intellectual disability

Pathogenesis

- specific mechanism of FASD is unknown, but hypotheses include nutritional deficits, toxic effects of acetaldehyde, alteration of placental transport, abnormal protein synthesis, and altered cerebral neurotransmission

Diagnosis

- often misdiagnosed or missed entirely
- diagnosis of FAS, ARBD, and ARND all require evidence of maternal drinking during pregnancy
- criteria for diagnosis of FAS
 - agrowth deficiency: low birth weight and/or decelerating weight over time not due to nutrition
 - characteristic pattern of facial anomalies: short palpebral fissures, flattened philtrum, thin upper lip, flat midface
 - CNS dysfunction: microcephaly and/or neurobehavioral dysfunction (hyperactivity, fine motor problems, attention deficits, learning disabilities, cognitive disabilities, difficulties in adaptive functioning, etc.)
- criteria for diagnosis of ARBD
 - congenital anomalies, including malformations and dysplasias of the cardiac, skeletal, renal, ocular, and auditory systems
- criteria for diagnosis of ARND
 - CNS dysfunction (similar to FAS)
 - complex pattern of behavioral or cognitive abnormalities inconsistent with developmental level that cannot be explained by familial background or environment alone

Management

- early diagnosis is essential to prevent secondary disabilities
- no cure, but individuals with FASD and their families should be linked to community resources and services to improve outcome

Prognosis

- secondary disabilities include unemployment, mental health problems, difficulties with the law, inappropriate sexual behavior, disrupted school experience, peer problems

Learning Disabilities

Definition

- specific and persistent failure to acquire academic skills despite conventional instruction, adequate intelligence, and sociocultural opportunity
- a significant discrepancy between a child's intellectual ability and their academic performance
- several types: learning disabilities in reading, writing, mathematics

Epidemiology

- prevalence: 2-10%
- high incidence of psychiatric comorbidity: anxiety, dysthymia, conduct disorder, major depressive disorder, oppositional defiant disorder, ADHD

Etiology

- pathogenesis is unknown, likely genetic factors involved
- learning disabilities may be associated with a number of conditions:
 - genetic/metabolic: Turner syndrome, Klinefelter syndrome
 - perinatal: prematurity, low birth weight, birth trauma/hypoxia
 - postnatal: CNS damage, hypoxia, environmental toxins, FAS, psychosocial deprivation (understimulation), malnutrition
- poor visual acuity is NOT a cause

Risk Factors

- positive family history, prematurity, other developmental and mental health conditions, neurologic disorders (e.g. seizure disorders, neurofibromatosis), history of CNS infection/irradiation/traumatic injury

Clinical Presentation

- history and physical exam
 - school difficulties (academic achievement, behavior, attention, social interaction)
 - development of negative self-concept → reluctance to participate even in areas of strength
 - social issues: overt hostility towards parents/teachers; difficulties making friends for several reasons (problems remembering names, difficulties with language to engage in conversations, inability to understand games and complex rules, etc.), bullying, and anxiety
 - look for dysmorphisms, complete physical exam
- investigations
 - standardized tests for IQ
 - individual scores on achievement tests in reading, mathematics, or written expression (WISC III, WRAT) >2 SD below that expected for age, education, and IQ

Management

- provide quality instruction for specific learning disability
- support student by modifying the curriculum and/or providing accommodations (e.g. scribe for writing, extra time for tests, photocopied notes, etc.)
- consider grade retention in certain students
- specialized education placements that can provide educational remediation

Prognosis

- limited information available about persistence of learning disabilities over time
- low self-esteem, poor social skills, 40% school drop-out rate

Motor Delay

- see *Cerebral Palsy*, P87 and *Muscular Dystrophy*, P45

Endocrinology**Antidiuretic Hormone****Diabetes Insipidus**

- see *Endocrinology*, E19 and *Nephrology*, NP11

Syndrome of Inappropriate Antidiuretic Hormone

- see *Endocrinology*, E19 and *Nephrology*, NP9

**Diabetes Mellitus****DIABETES MELLITUS TYPE 1**

- insulin deficiency following destruction of the pancreatic β cells

Epidemiology

- most common form of DM in children, M=F
- variable prevalence internationally, affects ~1.7:1,000 children and adolescents in the US
- can present at any age, but bimodal peaks at 5-7 yr old and at puberty

Etiology

- type 1A: cell-mediated autoimmune destruction of β -cells of the pancreas
- type 1B: rare, non-immune variation; unknown cause
- disease results from some level of genetic predisposition and an environmental trigger
 - human leukocyte antigen locus confers ~50% of genetic susceptibility
 - trigger likely infectious and/or hormonal (as suggested by bimodal peaks in age of onset)

Risk Factors

- positive family history of type 1 DM, personal or family history of other autoimmune diseases

Clinical Presentation

- history
 - initially presents as polyuria, often manifested as nocturia or secondary enuresis
 - polydipsia, weight loss (lack of insulin leading to a catabolic state), and polyphagia
 - DKA on initial presentation (~20%): vomiting, abdominal pain, confusion/lethargy
- physical exam
 - tachypnea, signs of dehydration, \downarrow LOC, Kussmaul's respiration, ketone breath
- investigations
 - initial tests: urine dipstick (glucose, ketones), random blood glucose (200 mg/dL)
 - DKA blood work: venous/arterial blood gas, osmolality, plasma glucose, bicarbonate, HbA1c, serum ketones, BUN, Cr, electrolytes, CBC
 - if etiology is unclear, consider ordering autoimmune antibodies (anti-Gad, anti-islet)

Management

- disclose diagnosis and prompt patient education around survival skills, meal plans, and insulin injections
- refer patient to diabetes team with pediatric expertise for education, ongoing care, and psychosocial support
- management is multidisciplinary and family-centered
- conventional insulin regimen
 - 2/3 of total daily insulin dose in AM (1/3 rapid acting + 2/3 intermediate-acting)
 - 1/3 of total daily insulin dose in PM (1/3 rapid acting + 2/3 intermediate-acting)

**Diagnostic Criteria for DM (Types 1 and 2)**

One of:

- HbA1c $> 6.5\%$ (not validated in children)
- Fasting glucose ≥ 126 mg/dL
- 2 h plasma glucose during OGTT ≥ 200 mg/dL
- Random glucose ≥ 200 mg/dL with classic symptoms of hyperglycemia (polyuria, polydipsia, weight loss)

**Blood Glucose Targets by Age**

Age Range	Pre-Meal Blood Glucose Target	HbA1c Target
<6	100-180 mg/dL	<8.5%
6-12	90-180 mg/dL	<8%
13-19	90-150 mg/dL	<7.5%
>19	As adult	<7%

- intensive insulin regimen (multiple daily injections)
 - studies show increased glycemic control with intensive vs. conventional dosing
 - 1/2 of total daily insulin dose as long-acting insulin (either morning or bedtime)
 - remainder of total daily insulin dose given as short or rapid-acting insulin divided before meals (dosage varies between meals depending on glucose content of meal and exercise/activity pattern)
 - can also use insulin infusion pump
- blood glucose monitoring
 - tight glycemic control decreases rate of long-term complications
 - glycemic targets: age <6 fasting blood glucose (BG) 100-180 mg/dL, HbA1c <8.5%; age 6-12 fasting BG 90-180 mg/dL, HbA1c ≤ 8%; age 13-19 fasting BG 90-150 mg/dL, HbA1c ≤ 7.5%
 - for tighter control, may consider continuous subcutaneous insulin infusion (CSII) pump or MDI (multiple daily injections regimen: basal insulin plus analog for meals)
 - young children are more susceptible to hypoglycemia
- if DKA present: ABCs, admit, monitors, correct fluid losses, administer insulin and restore glucose gradually, correct electrolyte disturbances, identify/treat precipitating event, avoid complications (i.e. cerebral edema)
 - low threshold to investigate (CT/MRI) and treat DKA, as cerebral edema is a major concern
 - see [Endocrinology, E11](#)
- screen for micro- and macrovascular complications (regular ophthalmology assessments, blood pressure, microalbuminuria), concurrent autoimmune diseases (thyroiditis, celiac disease, etc.), and mental health issues (depression, eating disorders)

Prognosis

- no cure currently
- short-term complications
 - hypoglycemia
 - ♦ due to missed/delayed meals, excess insulin or exercise, illness
 - ♦ can lead to seizures and/or coma
 - ♦ reversed with PO/IV glucose or IM glucagon
 - hyperglycemia
 - ♦ due to intercurrent illness, diet-to-insulin mismatch
 - ♦ ↑ risk of end-organ damage
 - DKA: due to missed insulin doses, infection; most common cause of death
- long-term complications
 - microvascular: retinopathy, nephropathy, neuropathy
 - macrovascular: metabolic syndrome, CVD, CAD, PVD
 - increased risk of other autoimmune diseases

DIABETES MELLITUS TYPE 2

- see [Family Medicine, FM22](#), [Endocrinology, E6](#)
- impaired glucose metabolism due to increased peripheral insulin resistance
- rare before 10 yr of age, but more common in older children/adolescents
- prevalence is rising mainly due to the increased incidence of childhood obesity
- risk factors: obesity, positive family history, female gender, certain ethnic groups
- clinical presentation may be similar to that of type 1 DM, though most children are asymptomatic
- may present in DKA or hyperglycemic hyperosmotic nonketotic state
- management
 - criteria to start insulin: distinction between type 1 and type 2 DM unclear, child is ketotic or in ketoacidosis, random blood glucose ≥ 250 mg/dL, or HbA1c > 9%
 - initiate lifestyle modification program, including diet, weight loss, physical activity (moderate-to-vigorous activity for at least 60 min/d; screen time less than 2 h/d)
 - start metformin as 1st line therapy at time of diagnosis
 - glycemic target: HbA1c ≤ 7%
 - if glycemic targets not achieved within 3-6 mo from diagnosis with lifestyle intervention alone, either metformin, glimepiride, or insulin should be initiated
 - monitor HbA1c every 3 mo
 - advise patient to monitor finger-stick blood glucose levels if on medication with risk of hypoglycemia, are changing medication regimen, have not met treatment goals, or have intercurrent illness
- prognosis: includes microvascular and macrovascular complications similar to type 1 DM

Management of Newly Diagnosed Type 2 DM in Children and Adolescents

Pediatrics 2013;131(2):364-382

Key Action Statements:

1. Clinicians should ensure that insulin therapy is initiated for children and adolescents with type 2 DM who are ketotic or in DKA and in whom the distinction between types 1 and 2 DM is unclear and, in usual cases, should initiate insulin therapy for patients.
 - a. who have random venous or plasma BG concentrations ≥ 250 mg/dL; or
 - b. whose HbA1c is > 9%.
2. Clinicians should initiate a lifestyle modification program, including nutrition and physical activity, and start metformin as first-line therapy for children and adolescents at the time of diagnosis of type 2 DM.
3. The committee suggests that clinicians monitor HbA1c concentrations every 3 mo and intensify treatment if treatment goals for finger-stick BG and HbA1c concentrations are not being met.
4. Clinicians should advise patients to monitor finger-stick BG concentrations in patients who
 - a. are taking insulin or other medications with a risk of hypoglycemia; or
 - b. are initiating or changing their diabetes treatment regimen; or
 - c. have not met treatment goals; or
 - d. have intercurrent illnesses.
5. Clinicians should incorporate the Academy of Nutrition and Dietetics' Pediatric Weight Management Evidence-Based Nutrition Practice Guidelines in their dietary or nutrition counseling of patients with type 2 DM at the time of diagnosis and as part of ongoing management.
6. Clinicians should encourage children and adolescents with type 2 DM to engage in moderate-to-vigorous exercise for at least 60 min daily and to limit nonacademic "screen time" to less than 2 h/d.

Short Stature DDx

ABCDEFGF

Alone (neglected infant)
 Bone dysplasias (rickets, scoliosis, mucopolysaccharidoses)
 Chromosomal (Turner, Down)
 Delayed growth (constitutional)
 Endocrine (low GH, Cushing, hypothyroid)
 Familial
 GI malabsorption (celiac, Crohn's)

4 Questions to Ask when Evaluating

Short Stature

- Was there IUGR?
- Is the growth proportionate?
- Is the growth velocity normal?
- Is bone age delayed?

Growth

APPROACH TO SHORT STATURE

Definition

- short stature: height < 3rd percentile
- poor growth evidenced by growth deceleration (height crosses major percentile lines, growth velocity < 25th percentile)

Epidemiology

- ~2.5% of the population by definition

Etiology

- see sidebar

Clinical Presentation

- history and physical exam
 - plot on growth curve (special growth charts available for Turner syndrome, achondroplasia, DS)
 - assess for dysmorphic features, disproportionate short stature
 - risk factors for GH deficiency: previous head trauma, history of intracranial bleed or infection, head surgery or irradiation, positive family history, breech delivery
 - decreased growth velocity may be more worrisome than actual height
- investigations
 - calculate mid-parental height: children are usually in a percentile between their parents' height
 - AP x-ray of left hand and wrist for bone age
 - remaining investigations guided by history and physical (e.g. TSH, sweat chloride, etc.)

Management

- depends on severity of problem as perceived by parents/child
- no treatment for non-pathological short stature, except for idiopathic short stature
- GH therapy: if administered at an early age, can help patients achieve adult height
- requirements
 - GH shown to be deficient by 2 different stimulation tests
 - growth velocity <3rd percentile or height <<3rd percentile
 - bone age x-rays show unfused epiphyses/delayed bone age
- support and management of resultant self-image issues, social anxiety, etc.

To check for proportionality, measure upper to lower segment ratio (U/L) using the pubic symphysis as your landmark. Normals are 1.7 for newborn, 1.4 for young child, 0.9 for adult male, 1.0 for adult female

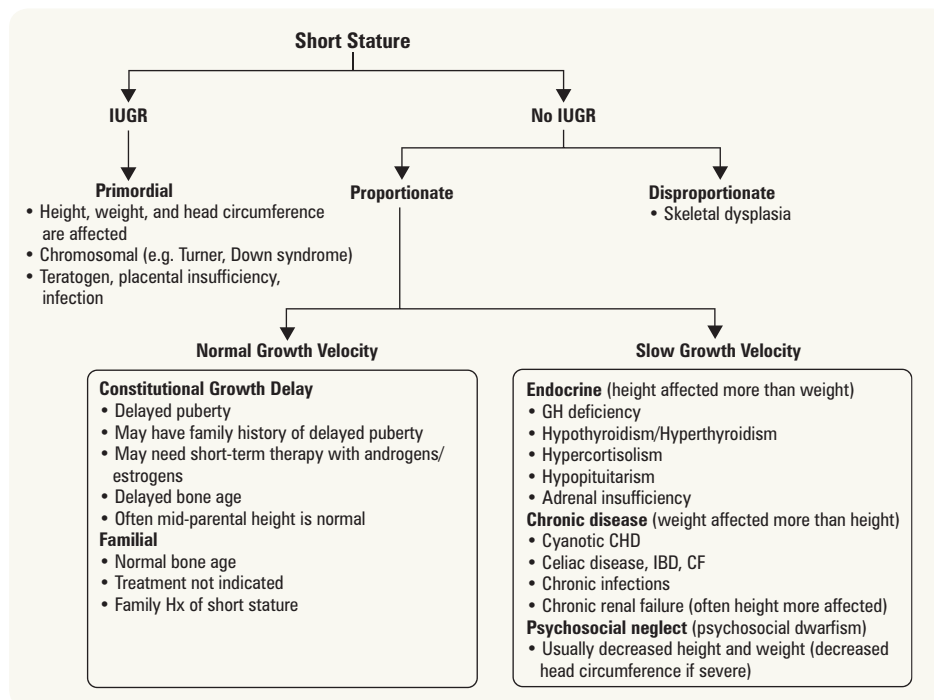

Figure 7. Approach to the child with short stature

TALL STATURE

- height greater than two SD above the mean for a given age, sex, and race

Etiology

- constitutional/familial
- endocrine: Beckwith-Wiedemann syndrome, hyperthyroidism, hypophyseal gigantism, precocious puberty
- genetic: homocystinuria, Klinefelter syndrome, Marfan syndrome, Sotos syndrome

Hypercalcemia/Hypocalcemia/Rickets

- see [Endocrinology](#), E39, E40, E45

Hyperthyroidism and Hypothyroidism

- may be congenital or acquired (for acquired causes, see [Endocrinology](#), E20 and E26)

CONGENITAL HYPERTHYROIDISM

- also known as neonatal Graves' disease

Epidemiology

- ~1:25,000 neonates, M=F

Etiology

- results from transplacental passage of maternal thyroid stimulating antibodies from mother with a history of Graves' disease

Clinical Presentation

- history and physical exam
 - clinical manifestations may be masked if mother on antithyroid treatment
 - may present with tachycardia with CHF, heart murmur, goiter, craniosynostosis, irritability, poor feeding, FTT
- investigations
 - serum levels of TSH and free T4 in all infants with suspected congenital hyperthyroidism, or infants born to mothers with Graves' disease

Management

- methimazole until antibodies cleared
- symptomatic treatment as needed (e.g. β -blockers to control tachycardia)

Prognosis

- if prompt and adequate treatment given, most neonates improve rapidly
- antibodies usually spontaneously cleared by 2-3 mo of life
- fetal or neonatal hyperthyroidism may have adverse effects on CNS development, leading to developmental and behavior problems

CONGENITAL HYPOTHYROIDISM

Epidemiology

- incidence: 1:4,000-1:20,000 newborns births; F:M = 2:1
- one of the most common preventable causes of intellectual disability

Etiology

- may be classified as permanent primary, central, or transient hypothyroidism
- ~85% of primary cases are sporadic (mostly thyroid dysgenesis), remaining 15% are hereditary (mostly inborn errors of thyroid synthesis)
- causes of transient hypothyroidism: maternal antibody-mediated, iodine deficiency (rare in developed countries), prenatal exposure to antithyroid medications

Clinical Presentation

- history and physical exam
 - usually asymptomatic in neonatal period because maternal T4 crosses the placenta
 - prolonged jaundice, constipation, sluggish, hoarse cry, lethargy, poor feeding, macroglossia, coarse facial features, large fontanelles, umbilical hernia
- investigations
 - diagnosis through newborn screening of TSH or free T4; abnormal results should be confirmed with serum levels from venipuncture

Management

- thyroxine replacement

Prognosis

- excellent outcome if treatment started within 1-2 mo of birth
- if treatment started after 3-6 mo of age, may result in permanent developmental delay and/or disability (mild to profound)

Sexual Development

AMBIGUOUS GENITALIA**Definition**

- newborn or child whose gender is difficult to assign based on the appearance of genitalia
- subtype of DSD: a condition in which development of chromosomal, gonadal, or anatomic sex is atypical
- subtypes: 46,XX DSD, 46,XY DSD, ovotesticular DSD (true hermaphrodite)

Epidemiology

- incidence of genital abnormalities at birth is as high as 1:300
- prevalence of complex anomalies with true sexual ambiguity much lower at ~1:5,000

Etiology

- 46,XY DSD
 - inborn error of testosterone biosynthesis or Leydig cell hypoplasia
 - 5- α -reductase deficiency, androgen receptor deficiency, or insensitivity
 - LH/hCG unresponsiveness
- 46,XX DSD
 - virilizing CAH (most common)
 - maternal source: virilizing ovarian or adrenal tumors, untreated maternal CAH, placental aromatase deficiency
- ovotesticular DSD
 - both ovarian follicles and seminiferous tubules in the same patient with a 46,XX karyotype
 - mixed gonadal dysgenesis

Risk Factors

- parental consanguinity, positive family history of ambiguous genitalia, early childhood illness/death, or primary amenorrhea, maternal medications during pregnancy (e.g. androgens, progesterones, danazol, phenytoin, aminoglutethimide, endocrine disruptors)

Clinical Presentation

- history
 - thorough obstetrical history, including prenatal screens and maternal medications
 - family history: autosomal recessive pattern may suggest CAH, X-linked recessive pattern may suggest androgen insensitivity syndrome
- physical exam
 - male pseudohermaphrodite (XY): small phallus, hypospadias, undescended testicles
 - female pseudohermaphrodite (XX): clitoral hypertrophy, labioscrotal fusion
 - look for concurrent midline defects, dysmorphic features, and congenital abnormalities
- investigations
 - karyotype and genetic workup as indicated
 - blood work: electrolytes and renin (evidence of salt-wasting in CAH); 17-OH-progesterone, androgens, FSH, and LH
 - imaging: abdominal U/S to look for uterus, testicles, ovaries

Management

- depends on underlying etiology
- avoid announcement of probable sex or use of personal pronouns until all tests are complete
- continuous psychosocial support for parents and child during development
- elective surgical reconstruction of genitalia is sometimes possible

CONGENITAL ADRENAL HYPERPLASIA**Definition**

- autosomal recessive disorder characterized by the partial or total defect of various synthetic enzymes of the adrenal cortex required for cortisol and aldosterone production

Epidemiology

- occurs in ~1:15,000 live births
- most common cause of ambiguous genitalia

Etiology

- for biosynthetic pathways of adrenal cortex, see [Endocrinology, E29](#)
- 21-OH responsible for ~95% of CAH cases
- results in ↓ cortisol and aldosterone production with shunting toward ↑↑ androgens
- cortisol deficiency leads to elevated ACTH, which causes adrenal hyperplasia
- rarer causes include deficiencies in 11-OH, cholesterol desmolase, 17-OH, and 3-HSD

**Clinical Presentation**

- depends on which enzyme in cortisol synthesis pathway is defective
- presentation of 21-OH deficiency can be divided into
 - classic deficiency with salt wasting: inadequate aldosterone resulting in FTT, hyperkalemia, hyponatremia, hypoglycemia, acidosis
 - classic deficiency without salt wasting: simple virilizing type
 - non-classic: signs/symptoms of androgen excess (e.g. amenorrhea, precocious puberty, etc.)
- 21-OH deficiency screening is part of many newborn screening programs across North America
- high serum levels of 17-OH progesterone in random blood sample diagnostic for 21-OH deficiency

Management

- correct any abnormalities in fluids, electrolytes, or serum glucose
- provide glucocorticoids/mineralocorticoids as necessary, extra glucocorticoids in times of stress
- psychosocial support

Prognosis

- complications if untreated include virilization, acne, salt wasting, hypotension

NORMAL PUBERTAL DEVELOPMENT**Physiology**

- puberty occurs with the maturation of the HPG axis
- ↑ pulsatile release of GnRH → ↑ release of LH and FSH → maturation of gonads, release of sex steroids → secondary sexual characteristics
- adrenal production of androgens also required

Females

- onset: age 8-13 yr old (may start as early as 7 yr in girls of African descent)
- usual sequence
 1. thelarche: breast budding
 2. pubarche: axillary hair, body odor, mild acne
 3. growth spurt
 4. menarche: mean age 12.5 yr; indicates that growth spurt is almost complete; menses may be irregular in duration and length of cycle
- early puberty is common and often constitutional, late puberty is rare (rule out organic causes)

Males

- onset: age 9-14 yr old
- usual sequence
 1. testicular enlargement
 2. penile enlargement
 3. pubarche: axillary and facial hair, body odor, mild acne
 4. growth spurt: occurs later in boys
- early puberty is uncommon (rule out organic causes), late puberty is common and often constitutional
- gynecomastia (transient development of breast tissue) is a common self-limited condition seen in 50% of males during puberty (but any discharge from nipple or fixed mass should be investigated)

Tanner Staging

- scale used in pediatrics that defines physical measurements of development based on external primary and secondary sex characteristics

Figure 8. Tanner staging

PRECOCIOUS PUBERTY

Definition

- development of secondary sexual characteristics 2-2.5 SD before population mean
- <8 yr old for females, <9 yr old for males

Epidemiology

- F:M = 1/10,000

Etiology

- usually idiopathic in females (90%), more suggestive of pathology in males (50%)
- central (GnRH dependent)
 - hypergonadotropic hypergonadism; hormone levels as in normal puberty
 - premature activation of the HPG axis
 - differential diagnosis: idiopathic or constitutional (most common in females), CNS disturbances (tumors, hamartomas, post-meningitis, increased ICP, radiotherapy), NF, primary severe hypothyroidism
- peripheral (GnRH independent)
 - hypogonadotropic hypergonadism
 - differential diagnosis: adrenal disorders (CAH, adrenal neoplasm), testicular/ovarian tumor, gonadotropin/hCG secreting tumor (hepatoblastoma, intracranial teratoma, germinoma), exogenous steroid administration, McCune-Albright syndrome, aromatase excess syndrome, rarely hypothyroidism (Van Wyk-Grumbach syndrome)

Clinical Presentation

- history
 - symptoms of puberty, family history of precocious puberty, medical illness
- physical exam
 - growth velocity
 - ♦ prepubertal: 4-6 cm/yr
 - ♦ growth spurt: boys 8-10 cm/yr, girls 6-8 cm/yr
 - complete physical exam, including Tanner staging and neurological assessment
- investigations
 - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, DHEA-S, 17-OH-progesterone)
 - secondary tests: MRI head, pelvic U/S, β -hCG, GnRH, and/or ACTH stimulation test

A child with proven central precocious puberty should receive an MRI of the brain

Management

- indications for medical intervention to delay progression of puberty: rapid advancement of puberty, early age, risk of compromise of final adult height, psychological
- central causes: goals are to preserve height and alleviate psychosocial stress; GnRH agonists (e.g. leuprolide) most effective
- peripheral causes: goal is to limit effects of elevated sex steroids; treat underlying cause; medications that decrease the production of a specific sex steroid or block its effects (e.g. ketoconazole, spironolactone, tamoxifen, anastrozole), surgical intervention

DELAYED PUBERTY**Definition**

- failure to develop secondary sex characteristics by 2-2.5 SD beyond the population mean
 - for males: lack of testicular enlargement by 14 yr old
 - for females: lack of breast development by 13 yr old OR absence of menarche by 16 yr old or within 5 yr of pubertal onset

Epidemiology

- M>F

Etiology

- usually constitutional delay in males, more suggestive of pathology in females
- central causes
 - constitutional delay in activation of HPG axis (most common)
 - hypogonadotropic hypogonadism
- peripheral causes
 - hypergonadotropic hypogonadism (e.g. primary gonadal failure, gonadal damage, Turner syndrome, hormone deficiency, androgen insensitivity syndrome, etc.)

Clinical Presentation

- history: weight loss, short stature, family history of puberty onset, medical illness, high performance athletes (females)
- physical exam: growth velocity (minimum 4 cm/yr), Tanner staging, neurological exam, complete physical exam
- investigations
 - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, IGF-1), CBC, electrolytes, BUN, Cr, LFTs, liver enzymes, ESR, CRP, urinalysis
 - secondary tests: MRI head, pelvic U/S, karyotype, IBD panel, celiac disease panel, LH levels following GnRH agonist

Management

- identify and treat underlying cause
- hormonal replacement: cyclic estradiol and progesterone for females, testosterone for males

Gastroenterology

Vomiting

History

- characteristic of emesis (e.g. projectile, bilious, bloody)
- pattern of emesis (e.g. association with feeds, cyclic, morning)
- associated symptoms (e.g. anorexia, diarrhea, etc.)
- red flags: bilious or bloody emesis, projectile vomit, abdominal distension and tenderness, high fever, signs of dehydration
- note that vomiting without diarrhea is most likely not gastroenteritis

Physical Findings

- vital signs to determine clinical status and hydration state

Investigations

- CBC, electrolytes, BUN, Cr, amylase, lipase, glucose done routinely
- in sick child, add: ESR, venous blood gases, C&S (blood, stool), imaging

Vomiting: forceful expulsion of stomach contents through the mouth

Regurgitation: the return of partially digested food from the stomach to the mouth

Table 13. Common Differential Diagnosis, Associated Findings, and Diagnostic Approach Based on Age

Cause	Suggestive Findings	Diagnostic Approach
NEONATES – NON-BILIOUS		
TEF	Vomiting, excessive secretions soon after birth (e.g. drooling, choking, respiratory distress), inability to feed, inability to advance NG tube	Inability to advance NG tube, CXR, upper GI series with water-soluble contrast
Pyloric stenosis	Projectile vomiting immediately after feeding, dehydrated, palpable “olive” in RUQ, decreased stools, hunger	U/S of pylorus, upper GI study (if U/S not diagnostic) Electrolytes, ABG (hypokalemic, hypochloremic metabolic alkalosis)
GERD	Fussiness after feeds, spit ups, arching of back, poor weight gain	Empiric trial of acid suppression, pH monitoring study, upper GI study, endoscopy
Sepsis	Fever, lethargy, tachycardia, tachypnea, widening pulse pressure	CBC, cultures (blood, urine, CSF), CXR
Inborn error of metabolism	Poor feeding, FTT, jaundice, hepatosplenomegaly, cardiomyopathy, dysmorphism, developmental delay	Electrolytes, ABG (hyponatremic, hyperkalemic metabolic acidosis), lactate, ammonia, LFTs, BUN, Cr, serum glucose, bilirubin, PT/PTT, CBC
NEONATES – BILIOUS		
Malrotation with volvulus	Bilious emesis, abdominal distension, pain, bloody stool, shock	AXR, upper GI series, contrast enema
Duodenal atresia	Bilious emesis, abdominal distension, often seen in DS, jaundice, polyhydramnios during pregnancy	AXR, upper GI series (‘double bubble’ sign)
Hirschsprung’s disease	Bilious emesis, abdominal distension, pain, failure to pass stool	AXR, upper GI series, contrast enema, rectal biopsy
CHILDREN AND ADOLESCENTS		
Gastroenteritis	Diarrhea, fever, sick contact, recent travel	CBC, stool culture
Appendicitis	Periumbilical discomfort that later localizes to RLQ, fever, anorexia	Abdominal U/S
Intussusception	Colicky progressive abdominal pain, drawing of leg up to chest, lethargy, bloody stool	Abdominal U/S
Non-GI infection (e.g. meningitis)	Fever, localized findings depending on cause	Cultures (CSF, blood, urine), brain imaging, CXR
Increased ICP	Nocturnal waking, progressive recurrent headache worse with Valsalva, nuchal rigidity	Brain CT without contrast Therapeutic LP in idiopathic intracranial HTN
Toxic ingestion	Finding possibly varying by substance-toxidrome, often a history of ingestion	Qualitative and sometimes quantitative levels (urine β -hCG, blood)
Pregnancy	Amenorrhea, morning sickness, bloating, breast tenderness	Urine β -hCG
Cyclic vomiting	At least 3 self-limited episodes of vomiting lasting 12 h, 7 d between episodes, no organic cause of vomiting	Diagnosis of exclusion

**Pyloric Stenosis 3 Ps**

- Palpable mass
- Peristalsis visible
- Projectile vomiting (2-4 wk after birth)

Management

- rehydration (see *Fluids and Electrolytes*, P78)
- treat underlying cause

Gastroesophageal Reflux

Epidemiology

- extremely common in infancy (up to 50%)

Clinical Presentation

- vomiting typically soon after feeding, non-bilious, rarely contains blood, small volume (<30 mL)

Investigations

- thriving baby requires no investigation
- investigations required if concomitant FTT, feeding aversion, recurrent cough, pneumonia or bronchospasm, GI blood loss or symptoms persist after 18 mo

Management

- conservative: thickened feeds, frequent and smaller feeds
- medical
 - short-term parenteral feeding to enhance weight gain
 - ranitidine, PPI: decreases gastric acidity, decreases esophageal irritation
 - domperidone, metoclopramide: improves gastric emptying and GI motility; safety concerns and limited efficacy, should be reserved for children with gastroparesis contributing to GERD
- surgical: indicated for failure of medical therapy (Nissen fundoplication)

Complications

- esophagitis, strictures, Barrett's esophagus, FTT, aspiration, oral feeding aversion

Tracheoesophageal Fistula

- see [General Surgery](#), GS64

**Pyloric Stenosis**

- see [General Surgery](#), GS61

**Duodenal Atresia**

- see [General Surgery](#), GS63

**Malrotation of the Intestine**

- see [General Surgery](#), GS62

**Diarrhea**

- definition of diarrhea varies with diet and age (stool normalcy difficult to define in children)
- infants → increase in stool frequency to twice as often per day; older children → 3+ loose or watery stools/d
- duration: acute: <2 wk; chronic: >2 wk

Pathophysiology

- osmotic: due to non-absorbable solutes in GI tract (e.g. lactose intolerance)
- secretory: increased secretion of Cl⁻ ions and water in intestinal lumen (e.g. bacterial toxin)
- malabsorption: decreased GI surface area (e.g. short bowel syndrome)

History

- frequency, duration, quality of diarrhea
- associated symptoms (e.g. fever, abdominal pain, hematochezia, etc.)
- recent antibiotic use or recent travel
- elements of diet

Physical Findings

- vital signs to determine clinical status and hydration state

Investigations

- acute diarrhea
 - stool for C&S, O&P, electron microscopy for viruses, *C. difficile* toxin, microscopy (leukocytes suggestive of invading pathogen), blood and urine cultures, blood work
- chronic diarrhea
 - serial heights, weights, growth percentiles
 - if child growing well and thriving, workup is limited (stool cultures as above, stool reducing substances)
 - red flags: poor growth, chronic rash, other serious infections, hospitalizations for dehydration
 - ♦ require full workup (as per below)
 - stool: consistency, pH, reducing substances, microscopy, occult blood, O&P, C&S, *C. difficile* toxin, 3 d fecal fat, α -1-antitrypsin clearance, fecal elastase
 - urinalysis, urine culture
 - CBC, differential, ESR/CRP, smear, electrolytes, total protein, albumin, carotene, Ca²⁺, PO₄³⁻, Mg²⁺, Fe, ferritin, folate, fat-soluble vitamins, PTT, INR

Diarrhea is defined as an increase in frequency and/or decreased consistency of stools compared to normal

Normal stool volume:
Infants: 5-10 g/kg/d
Children: 200 g/d

**Diarrhea Red Flags**

Bloody stool, fever, petechiae or purpura, signs of severe dehydration, weight loss/FTT

**Indications for Medical Evaluation of Acute Diarrhea**

- Age <6 mo
- Fever
- Visible blood in stool
- Frequent, substantial volume of diarrhea
- Signs of dehydration
- Change in mental status

MMWR Recomm Rep 2003;52(RR-16):1-16

- sweat chloride, celiac screen, thyroid function tests, urine VMA and HVA, HIV test, lead levels
- CXR, upper GI series and follow-through
- specialized tests: endoscopy, small bowel biopsy

Differential Diagnosis

Table 14. Differential Diagnosis of Diarrhea

Infectious				Non-infectious
Acute	Viral Rotavirus Norwalk Enteric adenovirus	Bacterial <i>Salmonella</i> <i>Campylobacter</i> <i>Shigella</i> Pathogenic <i>E. coli</i> <i>Yersinia</i> <i>C. difficile</i>	Parasitic <i>Giardia lamblia</i> <i>Entamoeba histolytica</i>	Antibiotic-induced Non-specific: associated with systemic infection Hirschsprung's disease Toxin ingestion Primary disaccharidase deficiency
Chronic	0 – 3 mo	3 mo – 3 yr	3 – 18 yr	Uncommon
No FTT	GI infection	GI infection Toddler's diarrhea	GI infection Lactase deficiency Irritable bowel syndrome	Drug-induced Chronic constipation UTI
FTT	Disaccharidase deficiency Cow's milk protein intolerance CF	Celiac disease	IBD Endocrine (thyrotoxicosis, Addison's) Neoplastic (pheochromocytoma, lymphoma)	Short bowel syndrome Schwachman-Diamond syndrome

Gastroenteritis

History

- non-specific: diarrhea, vomiting, fever, anorexia, headache, myalgias, abdominal cramps
- bacterial and parasitic agents more common in older children (2-4 yr)
- recent infectious contacts: symptoms usually begin 24-48 h after exposure

Physical Exam

- febrile
- dehydrated: must assess extent (see [Dehydration, P78](#))

Investigations

- not usually necessary in young children
- stool analysis: leukocytes/erythrocytes suggests bacterial or parasitic etiology; pH <6 and presence of reducing substances suggests viral etiology

Complications

- viral gastroenteritis usually self-limiting (lasts 3-7 d in most cases)
- adverse effects related to hypovolemia, shock, tissue acidosis, and rapid onset and over-correction of electrolyte imbalances
- death in severe dehydration (rare in developed countries)

Table 15. Gastroenteritis

	Viral Infection	Bacterial Infection
Etiology	Most common cause of gastroenteritis Commonly: rotaviruses (most common), enteric adenovirus, norovirus (typically older children)	<i>Salmonella</i> , <i>Campylobacter</i> , <i>Shigella</i> , pathogenic <i>E. coli</i> , <i>Yersinia</i> , <i>C. difficile</i>
Clinical Presentation	Associated with URTIs Resolves in 3-7 d Slight fever, malaise, vomiting, vague abdominal pain	Severe abdominal pain High fever Bloody diarrhea
Risk Factors	Day care, young age, sick contacts, immunocompromised Bacterial infection: travel, poorly cooked meat, poorly refrigerated foods, antibiotics	
Management	Prevention and treatment of dehydration most important (see Dehydration, P78) Early refeeding advisable, start with small amounts of easily digested carbohydrates, postpone dairy and fibrous vegetables May return to age-appropriate diet once rehydrated and vomiting stops Anti-emetics improve vomiting, but worsen diarrhea Antibiotic or antiparasitic therapy when indicated, antidiarrheal medications not indicated Notify Public Health authorities if appropriate Promote regular hand-washing and return to school 24 h after last diarrheal episode to prevent transmission Rotavirus vaccine	

Toddler's Diarrhea

Epidemiology

- most common cause of chronic diarrhea during infancy
- onset between 6-36 mo of age, ceases spontaneously between 2-4 yr

Clinical Presentation

- diagnosis of exclusion in thriving child
- 4-6 bowel movements per day
- diet history (e.g. excess juice intake overwhelms small bowel resulting in disaccharide malabsorption)
- stool may contain undigested food particles
- excoriated diaper rash

Management

- reassurance that it is self-limiting
- 4Fs (adequate Fiber, normal Fluid intake, 35-40% Fat, discourage excess Fruit juice)

Lactase Deficiency (Lactose Intolerance)

Clinical Presentation

- chronic, watery diarrhea and abdominal pain, bloating associated with dairy intake
- primary lactose intolerance: crampy abdominal pain with loose stool (older children, usually of East Asian and African descent)
- secondary lactose intolerance: older infant, persistent diarrhea (post viral/bacterial infection, celiac disease, or IBD)

Diagnosis

- trial of lactose-free diet
- watery stool, acid pH, positive reducing sugars
- positive breath hydrogen test if >6 yr

Management

- lactose-free diet, soy formula
- lactase-containing tablets/capsules/drops (e.g. Lacteeze®, Lactaid®)

Irritable Bowel Syndrome

- see [Gastroenterology](#), G23

Celiac Disease

- see [Gastroenterology](#), G18
- in children: presents at any age, usually 6-24 mo with the introduction of gluten in the diet
- FTT with poor appetite, irritability, apathy, rickets, wasted muscles, flat buttocks, rarely distended abdomen
- GI symptoms: anorexia, N/V, edema, anemia, abdominal pain
- non-GI manifestations: iron-deficiency anemia, dermatitis herpetiformis, dental enamel hypoplasia, osteopenia/osteoporosis, short stature, delayed puberty, behavioral changes
- associated with other autoimmune disorders

Celiac disease is associated with an increased prevalence of IgA deficiency. Since tTG is an IgA-detecting test, you must order an accompanying IgA level

Milk Protein Allergy

Pathophysiology

- immune-mediated mucosal injury (IgE- and non-IgE-mediated)

Clinical Presentation

- up to 50% of children intolerant to cow's milk may be intolerant to soy protein as well
- often history of atopy
- can present as
 - proctocolitis: mild diarrhea, small amounts of bloody stools (common presentation in young infant)
 - enterocolitis: vomiting, diarrhea, anemia, hematochezia
 - enteropathy: chronic diarrhea, hypoalbuminemia

A Celiac disease diet must avoid gluten present in "**BROW**" foods

Barley
Rye
Oats (controversial)
Wheat

Management

- casein hydrolysate formula (dairy-free e.g. Nutramigen®, Pregestimil®) or mother may remove all milk protein from diet and continue breastfeeding (with adequate calcium and vit D intake)
- often outgrow by 1 yr of age

Inflammatory Bowel Disease

- see [Gastroenterology, G19](#)

**Cystic Fibrosis**

- see [Respirology, P92](#)

Constipation

- decreased stool frequency (<3 stools/wk) and/or stool fluidity (hard, pellet-like)

FUNCTIONAL CONSTIPATION

- 99% of cases of constipation
- Rome III criteria; ≥ 2 of the following
 - ≤ 2 defecations in the toilet/wk
 - ≥ 1 episode of fecal incontinence/wk
 - history of retentive posturing or excessive volitional stool retention
 - history of painful or hard bowel movements
 - large fecal mass in rectum
 - history of large diameter stools that may obstruct toilet

Pathophysiology

- lack of fiber in diet or change in diet, poor fluid intake, behavioral
 - infants: often occurs when introducing cow's milk after breast milk due to high fat and solute content, lower water content
 - toddlers/older children: can occur during toilet training, or due to pain on defecation, leading to withholding of stool
 - two crucial time periods: toilet training and starting school

Management

- education: explanation of mechanism of functional constipation for parents/older children
- clean out: oral (PEG, mineral oil, or other oral laxatives) or rectal (phosphate soda, saline, or mineral oil enemas), or combination
- maintenance: adequate fluid intake (if <6 mo, 150 mL/kg/d), adequate dietary fiber (fruit, vegetables, whole grains), stool softening (PEG 3350, mineral oil), appropriate toilet training technique (dedicated time for defecation: 3-10 min, 1-2 x/d)
- children should be treated for at least 6 mo, and should not be weaned from maintenance therapy until they are having regular bowel movements without difficulty
- regular follow-up with ongoing support and encouragement is essential

Complications

- pain retention cycle: anal fissures + pain \rightarrow withhold passing stool \rightarrow chronic dilatation \pm overflow incontinence

HIRSCHSPRUNG'S DISEASE (Congenital Aganglionic Megacolon)

- see [General Surgery, GS63](#)

**OTHER ORGANIC DISORDERS CAUSING CONSTIPATION**

- endocrine: hypothyroidism, DM, hypercalcemia
- neurologic: spinal cord abnormalities/trauma, NF
- anatomic: bowel obstruction, anus (imperforate, atresia, stenosis, anteriorly displaced)
- drugs: lead, chemotherapy, opioids
- others

Abdominal Pain

ACUTE ABDOMINAL PAIN

History

- description of pain (location, radiation, duration, constant vs. colicky, relation to meals)
- associated symptoms: N/V, diarrhea, fever

Physical Exam

- abdominal exam, peritoneal signs, bowel sounds, rectal exam, rash

Investigations

- CBC, differential, urinalysis to rule out UTI

Table 16. Differential Diagnosis of Acute Abdominal Pain

Gastrointestinal	Hepatobiliary Tract	Genitourinary	Hematologic	Miscellaneous
Gastroenteritis	Cholecystitis	UTI	Henoch-Schönlein purpura	DKA
Appendicitis	Pancreatitis	Nephrolithiasis	Sickle cell crisis	Pneumonia
Meckel's diverticulum		Testicular torsion		Somatization
Mesenteric adenitis		Ovarian torsion		
Ileus		Ectopic pregnancy		
Intestinal obstruction		PID		
(incarcerated hernia, intussusception, volvulus)		Endometriosis		
Malabsorption		Menstruation		
IBS				
Constipation				

APPENDICITIS

- see [General Surgery](#), GS28
- most common cause of acute abdomen after 5 yr of age
- clinical features: low grade fever, abdominal pain, anorexia, N/V (after onset of pain), peritoneal signs (generalized peritonitis is a common presentation in infants/young children)
- treatment: surgical
- complications: perforation (common in young children), abscess

INTUSSUSCEPTION

- telescoping of segment of bowel into distal segment causing ischemia and necrosis

Epidemiology

- 90% idiopathic, children with CF or GJ tube at significantly increased risk; M:F = 3:1
- 50% between 3-12 mo, 75% before 2 yr of age

Pathophysiology

- usual site: ileocecal junction; jejunum in children with GJ tubes
- lead point of telescoping segment may be swollen Peyer's patches, Meckel's diverticulum, polyp, malignancy, HSP, structural abnormalities

Clinical Presentation

- "classic triad" (<25%) patients – abdominal pain, palpable mass, red currant jelly stools
- often preceded by URTI
- sudden onset of recurrent, paroxysmal, severe periumbilical pain with pain-free intervals
- later vomiting (may be bilious) and rectal bleeding (late finding)
- shock and dehydration; lethargy may be only presenting symptom

Intussusception – Classic Triad

- Abdominal pain
- Palpable mass
- Red currant jelly stools

Diagnosis

- U/S, air enema

Management

- air enema can be therapeutic (reduces intussusception in 75% of cases), reduction under hydrostatic pressure, surgery rarely needed
- recurrence rate 10-15%, need to consider pathologic lead point

Chronic Abdominal Pain

Epidemiology

- prevalence: 10% of school children (peak at 8-10 yr), F>M

Etiology

- organic (<10%)
 - gastrointestinal
 - constipation (cause vs. effect), infectious
 - IBD, esophagitis, peptic ulcer disease, lactose intolerance
 - anatomic anomalies, masses
 - pancreatic, hepatobiliary
 - genitourinary causes: recurrent UTI, nephrolithiasis, chronic PID, Mittelschmerz
 - neoplastic
- functional abdominal pain (90%): can be diagnosed when there are no alarm symptoms or signs, physical exam is normal, and stool sample tests are negative for occult blood; no further testing is required, unless high suspicion for organic cause

Clinical Presentation

- clustering episodes of vague, crampy periumbilical/epigastric pain, vivid pain description
- seldom awakens child from sleep, less common on weekends
- aggravated by exercise, alleviated by rest
- psychological factors related to onset and/or maintenance of pain, school avoidance
- psychiatric comorbidity: anxiety, somatoform, mood, learning disorders, sexual abuse, eating disorders, elimination disorders
- diagnosis of exclusion

Investigations

- fecal occult blood and others based on clinical suspicion (CBC, ESR, urinalysis, etc.)

Management

- continue to attend school
- manage any emotional or family problems, counseling, CBT
- trial of high fiber diet, trial of lactose-free diet
- possible role for amitriptyline
- reassurance

Prognosis

- pain resolves in 30-50% of children within 2-6 wk of diagnosis
- 30-50% of children with functional abdominal pain have functional pain as adults (e.g. IBS)

Chronic Abdominal Pain

Rule of 3s

3 episodes of severe pain
Child >3 yr old
Over 3 mo period

Red Flags for Organic Etiology of Chronic Abdominal Pain

- Age <5 yr old
- Fever
- Localizes pain away from midline
- Anemia
- Evidence of GI blood loss
- Rash
- Pain awakens child at night
- Travel history
- Prominent vomiting, diarrhea
- Weight loss or failure to gain weight
- Deceleration in linear growth
- Joint pain
- Family history of IBD
- Abnormal or unexplained physical exam findings

Abdominal Mass

Table 17. Differential Diagnosis for Abdominal Mass

	Benign	Malignant
Renal (note: 50% of abdominal masses in newborn are renal in origin)	Hydronephrosis Polycystic kidney disease Hamartoma	Nephroblastoma (Wilms' tumor) Renal cell carcinoma
Adrenal		Neuroblastoma
Ovarian	Ovarian cysts	Ovarian tumors
Other	Hepatomegaly/splenomegaly Pyloric stenosis Abdominal hernia Teratoma Fecal impaction	Lymphoma Rhabdomyosarcoma Retroperitoneal sarcoma

Upper Gastrointestinal Bleeding

- see [Gastroenterology](#), G25

Lower Gastrointestinal Bleeding

- see [Gastroenterology, G27](#)

Etiology

- acute
 - infectious (bacterial, parasitic)
 - antibiotic-induced (*C. difficile*)
 - NEC in preterm infants
 - anatomic
 - malrotation/volvulus, intussusception
 - Meckel's diverticulitis
 - anal fissures, hemorrhoids
 - vascular/hematologic
 - HSP
 - HUS
 - coagulopathy
- chronic
 - anal fissures (most common)
 - colitis
 - IBD
 - allergic (milk protein)
 - structural
 - polyps (most are hamartomas)
 - neoplasms (rare)
 - coagulopathy

Physical Exam

- hemodynamic status, evidence of FTT, fever
- anal and rectal exam: tags, fissures, anal fistulas, polyps, foreign body, blood per rectum
- stool appearance
- NG aspirate
- lower GI bleed may present as melena (if it involves the small bowel) or hematochezia

Investigations

- stool cultures (C&S, *C. difficile* toxin)
- urinalysis and microscopy
- CBC, smear, differential, ESR, CRP, electrolytes, urea, Cr, INR, PTT, albumin, iron studies, amoeba titers
- radiologic investigations (including abdominal x-ray to rule out obstruction)
- Meckel's radionuclide scan

Management

- acute stabilization: ABCs, volume and blood replacement, bowel rest (NPO, NG tube)
- once stable, endoscopy and/or surgery as indicated

Genetics, Dysmorphisms, and Metabolism

Genetics

MECHANISMS OF INHERITANCE

Mendelian Inheritance

- disorders caused by mutation of one or both copies of a gene, inherited in one of two patterns:
 - autosomal: encoded by genes on one of 22 pairs of autosomes (chromosomes 1-22)
 - X-linked: encoded by a gene on the X chromosome

Triplet Repeat Expansions

- disorder in which trinucleotide repeats in certain genes exceed the normal number and result in altered expression of the gene or production of an abnormal protein (e.g. Fragile X syndrome, spinocerebellar ataxias, myotonic dystrophy, Huntington disease)

Imprinting Disorders

- imprinting: epigenetic process that involves methylation or acetylation of DNA, affecting gene expression
- imprinted genes are expressed differently depending on whether they are inherited from the mother or the father (parent-of-origin gene expression)
- occur when imprinted alleles are silenced (e.g. Prader-Willi syndrome, Angelman syndrome, Beckwith-Wiedemann syndrome)

Mitochondrial Inheritance

- disorders caused by mutations of the DNA present in mitochondria
- inheritance pattern: mother passes on the defect to all her children; father does not pass on the defect since embryo only receives mitochondria from the mother (in the egg)

Autosomal Dominant

Disorder is expressed in a heterozygote (inheritance is 'vertical', both males and females are affected and can transmit the trait) e.g. NF-1

Autosomal Recessive

Disorder is manifested if both copies of the gene have mutations (inheritance is 'horizontal', disease not found in multiple generations, parents of an affected child are usually normal) e.g. CF

X-linked

Males have a single X chromosome and are affected by recessive and dominant X-linked disorders, while **females** have two X chromosomes and recessive X-linked disorders are rarely expressed in females e.g. Duchenne Muscular Dystrophy

METHODS OF GENETIC TESTING

- microarray analysis
 - a microarray is a collection of DNA probes attached to a solid surface
 - microarray analysis can identify small deletions or duplications of genetic material anywhere in the genome
 - indicated when there is developmental delay + one or more major malformations
- FISH: usually to identify a gain or loss of chromosomal material
- karyotype: microscopic analysis of all 46 chromosomes with a special stain that shows large changes in the number or structure of chromosomes

Genetic Anomalies

Minor and Major Anomalies

- minor anomaly: an unusual anatomic feature that is of no serious medical or cosmetic consequence to the patient
- major anomaly: anomaly that creates significant medical, surgical, or cosmetic problems for the patient

Mechanism for Anomalies

- malformation: results from an intrinsically abnormal developmental process (e.g. polydactyly)
- disruption: results from the extrinsic breakdown of, or interference with, an originally normal developmental process (e.g. amniotic band disruption sequence)
- deformation: alteration of the final form of a structure by mechanical forces (e.g. Potter deformation sequence)
- dysplasia: abnormal development that results in abnormal organization of cells into tissues (e.g. bone dysplasia)

Multiple Anomalies

- association: non-random occurrence of multiple independent anomalies that appear together more than would be predicted by chance but are not believed to have a single etiology (e.g. VACTERL)
- sequence: related anomalies that come from a single initial major anomaly or precipitating factor that changes the development of other surrounding or related tissues or structures (e.g. Potter sequence)
- syndrome: a pattern of anomalies that occur together and are caused by a single known or unknown cause (e.g. Down syndrome)

VACTERL Association

- V** Vertebral dysgenesis
- A** Anal atresia (imperforate anus)
± fistula
- C** Cardiac anomalies
- T-E** TracheoEsophageal fistula
± esophageal atresia
- R** Renal anomalies
- L** Limb anomalies

Approach to the Dysmorphic Child

- genetic disorders are the most common cause of infant death in developed countries

General Approach to the Dysmorphic Child

- Are the anomalies major or minor?
- What is the mechanism underlying the anomaly?
- Do the anomalies fit as part of an association, sequence, or syndrome?

History

- prenatal/obstetrical history (see [Obstetrics, OB2](#)) with particular attention to potential teratogenic exposures
- complete 3 generation family pedigree: consanguinity, stillbirths, neonatal deaths, specific illnesses, intellectual disability, multiple miscarriages, ethnicity

Physical Exam

Check the umbilical cord for 2 arteries and 1 vein. The presence of a single umbilical artery may be associated with other congenital anomalies

Figure 9. Physical exam of the dysmorphic child

Investigations

- screening for TORCH infections
- serial photographs if child is older
- x-rays for bony abnormalities
- cytogenetic studies
 - karyotype if recognized syndrome
 - chromosome microarray analysis (array comparative genomic hybridization) if developmental delay with one or more congenital anomalies
 - FISH if microdeletion syndrome or trisomy suspected
- biochemistry: specific enzyme assays
- single gene testing

Management

- prenatal counseling and assessing risk of recurrence
- referral for specialized pediatric or genetic care

Genetic Syndromes

Table 18. Common Genetic Syndromes

	Trisomy 21	Trisomy 18	Trisomy 13
Disease	DS	Edwards' syndrome	Patau syndrome
Incidence	1:600-800 births Most common abnormality of autosomal chromosomes Rises with advanced maternal age from 1:1,500 at age 20 to 1:20 by age 45	1:6,000 live births F:M = 3:1	1:10,000 live births
Cranium/Brain	Mild microcephaly, flat occiput, 3rd fontanelle, brachycephaly	Microcephaly, prominent occiput	Microcephaly, sloping forehead, occipital scalp defect, holoprosencephaly
Eyes	Upslanting palpebral fissures, inner epicanthal folds, speckled iris (Brushfield spots), refractive errors (myopia), acquired cataracts, nystagmus, strabismus	Microphthalmia, hypotelorism, iris coloboma, retinal anomalies	Microphthalmia, corneal abnormalities
Ears	Low-set, small, overfolded upper helix, frequent AOM, hearing loss	Low-set, malformed	Low-set, malformed
Facial Features	Protruding tongue, large cheeks, low flat nasal bridge, small nose	Cleft lip/palate Small mouth, micrognathia	60-80% cleft lip and palate
Skeletal/MSK	Short stature Excess nuchal skin Joint hyperflexibility (80%) including dysplastic hips, vertebral anomalies, atlantoaxial instability	Short stature Clenched fist with overlapping digits, hypoplastic nails, clinodactyly, polydactyly	Severe growth retardation Polydactyly, clenched hand
Cardiac Defect	50%, particularly atrioventricular septal defect	60% (VSD, PDA, ASD)	80% (VSD, PDA, ASD)
GI	Duodenal/esophageal/anal atresia, TEF, Hirschsprung's disease, chronic constipation	Hernia, TEF	
GU	Cryptorchidism, rarely fertile	Polycystic kidneys, cryptorchidism	Polycystic kidneys

Table 18. Common Genetic Syndromes (continued)

	Trisomy 21	Trisomy 18	Trisomy 13
CNS	Hypotonia at birth Low IQ, developmental delay, hearing problems Onset of Alzheimer's disease in 40s	Hypertonia	Hypo- or hypertonia Seizures, deafness Severe developmental delay
Other Features	Transverse palmar crease, clinodactyly, and absent middle phalanx of the 5th finger 1% lifetime risk of leukemia Polycythemia Hypothyroidism	SGA Rocker-bottom feet	Single umbilical artery Midline anomalies: scalp, pituitary, palate, heart, umbilicus, anus Rocker-bottom feet
Prognosis/Management	Prognosis: long-term management per AAP Guidelines (Health Supervision of Children with Down syndrome), recommend chromosomal analysis, CBC, Echo, yearly thyroid test, atlanto-occipital x-ray at 2 yr, sleep study, hearing test, and ophthalmology assessment	44% die in 1st month 10% survive past 1 yr Profound intellectual disability in survivors	33% die in 1st month, 50% by 2nd month, 90% by 1 yr from FTT Profound intellectual disability in survivors

Table 19. Most Common Sex Chromosome Disorders

	Fragile X Syndrome	Klinefelter Syndrome	Turner Syndrome	Noonan Syndrome
Genotype	X-linked Genetic anticipation CGG trinucleotide repeat on X chromosome measurable by molecular analysis	47,XXY (most common) 48,XXXY, 49,XXXXY	45,X (most common)	46,XX or 46,XY Autosomal dominant (not a sex chromosome disorder) with variable expression <i>PTPN11</i> mutation most common cause Higher transmission of affected maternal gene
Incidence	1:3,600 males, 1:6,000 females Most common heritable cause of intellectual disability in boys	1:1,000 live male births Increased risk with advanced maternal age	1:4,000 live female births Risk not increased with advanced maternal age	1:2,000 male and female live births
Phenotype	Overgrowth: prominent jaw, forehead, and nasal bridge with long and thin face, large protuberant ears, macroorchidism, hyperextensibility, and high arched palate Complications: seizures, scoliosis, mitral valve prolapse	Tall, slim, underweight No features prepuberty Postpuberty: male may suffer from developmental delay, long limbs, gynecomastia, lack of facial hair	Short stature, short webbed neck, low posterior hair line, wide carrying angle Broad chest, widely spaced nipples Lymphedema of hands and/or feet, cystic hygroma in newborn with polyhydramnios, lung hypoplasia Coarctation of aorta, bicuspid aortic valve Renal and cardiovascular abnormalities, increased risk of HTN Less severe spectrum with mosaic	Certain phenotypic features similar to females with Turner syndrome; therefore, sometimes called the "male Turner syndrome", although it affects both males and females Short stature, webbed neck, triangular facies, hypertelorism, low set ears, epicanthal folds, ptosis Pectus excavatum Right-sided CHD, pulmonary stenosis Increased risk of hematological cancers
IQ and Behavior	Mild to moderate intellectual disability, 20% of affected males have normal IQ ADHD and/or autism Female carriers may show intellectual impairment Male carriers may demonstrate tremor/ataxia syndrome in later life	Mild intellectual disability Behavioral or psychiatric disorders – anxiety, shyness, aggressive behavior, antisocial acts	Mildly deficient to normal intelligence	Moderate intellectual disability in 25% of patients
Gonad and Reproductive Function	Prepubertal carrier females at risk of developing premature ovarian failure	Infertility due to hypogonadism/hypospermia	Streak ovaries with deficient follicles, infertility, primary amenorrhea, impaired development of secondary sexual characteristics	Delayed puberty
Diagnosis/Prognosis/Management	Molecular testing of <i>FMR1</i> gene: overamplification of the trinucleotide repeat, length of segment is proportional to severity of clinical phenotype (genetic anticipation)	Increased risk of germ cell tumors and breast cancer Management: testosterone in adolescence	Normal life expectancy if no complications Increased risk of X-linked diseases Management: Echo, ECG to screen for cardiac malformation GH therapy for short stature Estrogen replacement at time of puberty for development of secondary sexual characteristics	Molecular testing of <i>PTPN11</i> gene Management: affected males may require testosterone replacement therapy at puberty Echo, ECG

Table 20. Other Genetic Syndromes

	DiGeorge Syndrome	Prader-Willi Syndrome	Angelman Syndrome	CHARGE Syndrome
Genotype	Microdeletions of chromosome region 22q11	Lack of expression of genes on paternal chromosome 15q11-13 due to deletion, maternal uniparental disomy of chromosome 15, or imprinting defect	Lack of expression of genes on maternal chromosome 15q11-13 due to deletion or inactivation or paternal uniparental disomy	2/3 of children with CHARGE have been found to have a <i>CHD7</i> mutation on chromosome 8
Incidence	Second most common genetic diagnosis (next to DS)	1:15,000		1:10,000
Clinical Features	"CATCH 22" Cyanotic CHD Anomalies: craniofacial anomalies typically micrognathia and low set ears Thymic hypoplasia: "immunodeficiency" recurrent infections Cognitive impairment Hypoparathyroidism, hypocalcemia 22q11 microdeletions High risk for psychiatric disorders	"H₃O": Hypotonia and weakness, Hypogonadism, Obsessive Hyperphagia, Obesity Short stature, almond-shaped eyes, small hands and feet with tapering of fingers Developmental delay (variable) Hypopigmentation, type 2 DM	Ataxia with severe intellectual disability, seizures, tremulousness, hypotonia Midface hypoplasia, fair hair, uncontrollable laughter	"CHARGE" C Coloboma H congenital Heart disease A choanal Atresia R mental Retardation G GU anomalies E Ear anomalies

DUCHENNE MUSCULAR DYSTROPHY

Epidemiology

- 1:4,000 males

Etiology

- one type of muscular dystrophy characterized by progressive skeletal and cardiac muscle degeneration
- X-linked recessive: 1/3 spontaneous mutations, 2/3 inherited mutations
- missing structural protein (dystrophin) → muscle fiber fragility → fiber breakdown → necrosis and regeneration

Clinical Presentation

- proximal muscle weakness by age 3, positive Gower's sign, waddling gait, toe walking
- pseudohypertrophy of calf muscles (muscle replaced by fat) and wasting of thigh muscles
- decreased reflexes
- non-progressive delayed motor and cognitive development (dysfunctional dystrophin in brain)
- cardiomyopathy

Diagnosis

- molecular genetic studies of dystrophin gene (DMD) (first line)
- family history (pedigree analysis)
- increased CK (50-100x normal) and lactate dehydrogenase
- elevated transaminases
- muscle biopsy, EMG

Management

- supportive (e.g. physiotherapy, wheelchairs, braces), prevent obesity
- cardiac health monitoring and early intervention
- bone health monitoring and intervention (vitamin D, bisphosphonates)
- steroids (e.g. prednisone or deflazacort)
- surgical (for scoliosis)
- gene therapy trials underway

Complications

- patient usually wheelchair-bound by 12 yr of age
- early flexion contractures, scoliosis, osteopenia of immobility, increased risk of fracture
- death due to pneumonia/respiratory failure or CHF in 2nd-3rd decade

Gower's Sign

Child uses hands to "climb up" the legs to move from a sitting to a standing position

Metabolic disease must be ruled out in any newborn who becomes acutely ill after a period of normal behavior and development or with a family history of early infant death even if the newborn screen is negative

Metabolic Diseases

- inherited disorders of metabolism; often autosomal recessive
- infants and older children may present with FTT or developmental delay
- newborn screening includes metabolic disorders

Table 21. Metabolic Disorders

	Organic and Amino Acid Disorders	Carbohydrate Disorders	Fatty Acid Disorders	Organelle Disorders
Examples of Conditions	PKU Tyrosinemia Homocystinuria MSUD Alkaptonuria Urea cycle defects	Galactosemia GSDs: von Gierke's, Pompe's, Cori's, Andersen, McArdle	MCAD deficiency Carnitine deficiency	Mucopolysaccharidosis Congenital disorders of glycosylation Lysosomal storage diseases: Hurler's, Niemann-Pick, Tay-Sachs, Gaucher, Fabry, Krabbe
Clinical Manifestations	Irritability, lethargy, poor feeding Seizures Intellectual disability Vomiting and acidosis after feeding initiation Sweet-smelling urine (MSUD)	Vomiting and acidosis after feeding initiation Growth retardation, FTT	Lethargy, poor feeding Seizures, coma Symptoms triggered by fasting Liver dysfunction Sudden infant death	Seizures/early-onset severe epilepsy Acute and chronic encephalopathy Developmental delay Bone crises (Gaucher) Deafness, blindness
Laboratory Findings	Hypoglycemic hyperammonemia, high anion gap (organic acidemia) Normoglycemic hyperammonemia, normal anion gap (urea cycle defects)	Hypoglycemia, hyperlipidemia (GSD)	Hypoketotic hypoglycemia Elevated free fatty acids	Elevated urine oligosaccharides (oligosaccharidoses) and glycosaminoglycans (mucopolysaccharidoses)
Physical Exam	Hypotonia/hypertonia Microcephaly, musty odor, eczema, hypopigmentation (PKU) Dark urine, pigmented sclerae, arthralgias (alkaptonuria) Lens subluxation, marfanoid appearance (homocystinuria)	Infantile cataracts (galactosemia) Hepatomegaly Muscle weakness/cramping	Hepatomegaly Hypotonia	Dysmorphic facial features Macrocephaly (Tay-Sachs, Hurler's) Hepatosplenomegaly (not Tay-Sachs) Cherry-red spot on macula (Niemann-Pick, Tay-Sachs, Gaucher's) Corneal clouding (Hurler's) Infantile cataract (Fabry) Peripheral neuropathy (Fabry, Krabbe) Spasticity

Initial Investigations

- important to send lab studies at initial presentation in order to facilitate immediate diagnosis and treatment
- check newborn screening results
- electrolytes, ABGs (calculate anion gap, rule out acidosis)
- CBC with differential and smear
- blood glucose (hypoglycemia seen with organic acidemia, fatty acid oxidation defects, and GSDs)
- lactate, ammonium (hyperammonemia with urea cycle defects), plasma Ca^{2+} and Mg^{2+}
- routine urinalysis: ketonuria must be investigated
- carnitine levels with acylcarnitine profile
- others: urate, urine nitroprusside, plasma amino acid screen, urine organic acids, CSF glycine, free fatty acids (3- β -hydroxybutyrate ratio >4 in fatty acid oxidation defect)
- storage diseases: urine mucopolysaccharide and oligosaccharide screen

Treatment

- varies according to inborn error of metabolism
- dietary restrictions, supplementation, enzyme replacement therapy, gene therapy, liver transplant, stem cell transplant

PHENYLKETONURIA

Epidemiology

- 1:10,000; autosomal recessive disease

Etiology

- deficiency of phenylalanine hydroxylase prevents conversion of phenylalanine to tyrosine leading to build up of toxic metabolites
- mothers who have PKU may have infants with congenital abnormalities

Clinical Presentation

- baby is normal at birth, then develops a musty odor, eczema, hypertonia, tremors, and mental retardation
- hypopigmentation due to low tyrosine (fair hair, blue eyes)

Management

- PKU screening at birth
- dietary restriction of phenylalanine starting within the first 10 d of life
- duration of dietary restriction controversial – lifelong or until end of puberty; should be resumed during pregnancy to maintain normal phenylalanine levels

GALACTOSEMIA

Epidemiology

- 1:60,000; autosomal recessive disease

Etiology

- most commonly due to deficiency of galactose-1-phosphate uridylyltransferase leading to an inability to process lactose/galactose

Clinical Presentation

- signs of liver and renal failure, jaundice, FTT, and cataracts with ingestion of lactose/galactose

Management

- elimination of galactose from the diet (e.g. dairy, breast milk)
- most infants are fed a soy-based diet

Complications

- increased risk of sepsis, especially *E. coli*
- if the diagnosis is not made at birth, liver and brain damage may become irreversible

Hematology

Approach to Anemia

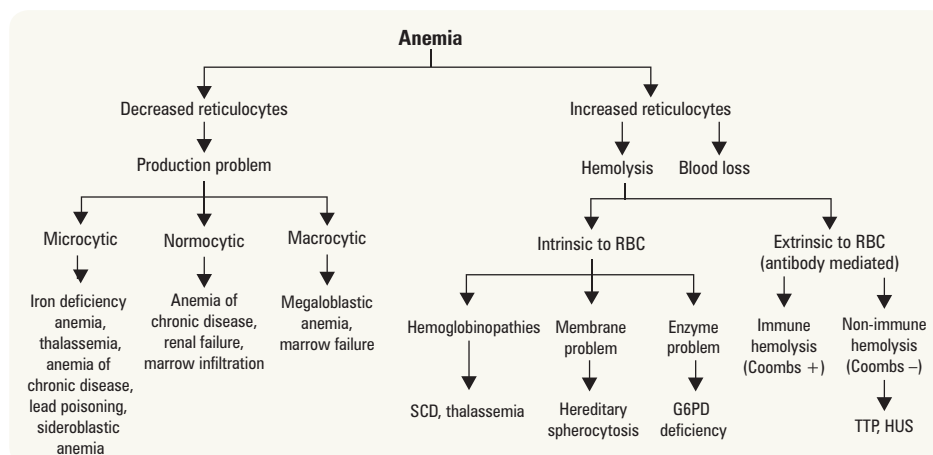

Figure 10. Approach to anemia

Physiologic Anemia

- high Hb (>170 g/L) and reticulocyte count at birth is caused by a hypoxic environment *in utero*
- after birth, levels start to fall due to shorter fetal RBC lifespan, decreased RBC production (during first 6-8 wk of life, there is virtually no erythropoiesis due to new O₂ rich environment), and increasing blood volume secondary to growth
- lowest levels about 100 g/L at 8-12 wk age (earlier and more exaggerated in premature infants); levels rise spontaneously with activation of erythropoiesis
- no treatment usually required

Iron Deficiency Anemia

- most common cause of childhood anemia
- full term infants exhaust iron reserves by 6 mo of age
- premature infants have lower reserves, therefore exhausted by 2-3 mo of age
- common diagnosis between 6 mo-3 yr and 11-17 yr due to periods of rapid growth and increased iron requirements; adolescents also have poor diet and menstrual losses

Etiology

- children at risk (premature, LBW, low SES, First Nations, etc.)
- dietary risk factors: whole cow milk in first year of life

Normal Hb Values by Age

Age	Hb Range (g/L)
Newborn	13.7-20.1
2 wk	13.0-20.0
3 mo	9.5-14.5
6 mo-6 yr	10.5-14.0
7-12 yr	11.0-16.0
Adult female	12.0-16.0
Adult male	14.0-18.0

MCV in childhood varies with age
Rule of thumb: lower normal limit of MCV = 70 + age (yr) until 80 fL (adult standard)

- age >6 mo: <2 servings/d of iron-fortified cereal, red meat, or legumes
- age <12 mo: use of low-iron formula (<10 mg/L), primary diet of cow, goat, or soy milk
- age 1-5 yr: >16-20 oz/d of non-fortified milk
- blood loss
 - iatrogenic: repeated blood sampling (especially in hospitalized neonates)
 - allergic: cow milk protein-induced colitis

Iron deficiency is rare in children <6 mo in the absence of blood loss or prematurity

Clinical Manifestation

- usually asymptomatic until marked anemia, pallor, fatigue, pica (eating non-food materials), tachycardia, systolic murmur, angular cheilitis, koilonychia

Investigations

- CBC: low Hb, MCV, and MCH, reticulocyte count normal or high (absolute number low)
- Mentzer index (MCV/RBC) can help distinguish iron deficiency anemia from thalassemia
 - ratio <13 suggests thalassemia; ratio >13 suggests iron deficiency
- blood smear: hypochromic, microcytic RBCs, pencil shaped cells, poikilocytosis
- iron studies: low ferritin, other (low iron, high total iron binding capacity, high transferrin, low transferrin saturation)
- initial therapy: trial of iron

Prevention

- breastfed term infants: begin iron supplementation (1 mg/kg/d) at 4-6 mo, continuing until able to eat ≥2 feeds/d of iron-rich foods
- non-breastfed (<50% of diet) term infants: give iron-fortified formula from birth
- premature infants: give iron supplements from 1 mo through to 1 yr of age
- no cow's milk until 9-12 mo, early introduction of red meat and iron-rich vegetables: total daily iron should be 11 mg (age 6-12 mo), 7 mg (age 1-3 yr)
- universal screening of Hb levels recommended at 9 mo

Management

- encourage diverse, balanced diet, limit homogenized milk to 16-20 oz/d
- oral iron therapy: 6 mg/kg/d elemental iron, divided bid to tid, for 3 mo
 - increased reticulocyte count in 2-3 d (peaks day 5-7)
 - increased hemoglobin in 4-30 d
 - repletion of iron stores in 1-3 mo
 - repeat hemoglobin levels after 1 mo of treatment
- poor response to oral iron therapy: non-compliance, medication intolerance, ongoing blood loss, IBD, celiac disease, incorrect diagnosis

Ferritin is an acute phase reactant, therefore, normal or high ferritin does not exclude iron deficiency anemia during an infection

Complications

- can cause irreversible effects on development if untreated (behavioral and intellectual deficiencies)
- angular cheilitis, glossitis, koilonychia (spoon nails)

Vitamin K Deficiency

- HDNB due to relative deficiencies of vitamin K-dependent coagulation factors
 - generalized bleeding; GI/intracranial hemorrhage
- IM injection at birth, can also be given orally (3 doses: at birth, 2-4 wk, 6-8 wk) but infants at higher risk of HDNB
- reason for administration at birth
 - human milk contains small amounts of vitamin K, and infants require ingestion of large volumes of human milk to promote GI bacterial colonization
 - until few days after birth, susceptible to vitamin K deficiency

Anemia of Chronic Disease

- see [Hematology](#), H16

Sickle Cell Disease

- see [Hematology](#), H21

Presentation

- newborn screen
- clinical disease presents at 5-6 mo of age after fall in fetal Hb

8% of African Americans carry the HbS trait, 0.2% have the disease

Heterozygotes (trait) are relatively malaria-resistant

- anemia, fever (medical emergency – infection is leading cause of death in SCD), jaundice, splenomegaly, crisis (dactylitis is often the first presentation)
- sickle cell trait: asymptomatic (may have microscopic hematuria and later isothermia)
- vaso-occlusive crisis
 - due to obstruction of blood vessels by rigid, sickled cells → tissue hypoxia → cell death; presents as fever and pain in any organ; most commonly in long bones of arms and legs, chest, abdomen, CNS (stroke), dactylitis (in young children), priapism
 - acute chest crisis: fever, chest pain, progressive respiratory distress, increased WBC count, pulmonary infiltrates
 - aplastic crisis: depression of erythropoiesis (decreased reticulocyte count to <1%, decreased Hb), generally associated with infection (especially parvovirus B19)
- acute splenic sequestration: sudden, massive pooling of red cells in spleen, splenomegaly, tender spleen, acute fall in hemoglobin, shock, increased reticulocyte count; splenic dysfunction (functional asplenia) by 5 yr of age secondary to auto-infarction; risk for sepsis from encapsulated organisms
- risk of osteomyelitis with *Salmonella*

Other Manifestations

- long-term complications: growth delay, bony abnormalities (e.g. avascular necrosis of femoral head), gallstones, retinopathy, restrictive lung disease (screen with PFTs), cardiomyopathy (screen with Echo), and pulmonary HTN

Management

- acute crises
 - admit for supportive and symptomatic treatment
 - fluids (1.5x maintenance; 1x maintenance only if in chest crisis), analgesia (opioid, multi-modal), antibiotics (e.g. 3rd generation cephalosporins), incentive spirometry and ambulation to decrease risk of chest crisis
 - straight transfusions for symptomatic/significant anemia, evolving chest crisis
 - RBC exchange transfusion for impending stroke, severe chest crisis, persistent priapism
 - O₂ if respiratory distress or chest crisis (with incentive spirometry)
 - CBC, reticulocyte counts, cultures if febrile, CXR, or LP if indicated
- chronic
 - early aggressive treatment of infections, prophylactic antibiotics (daily oral penicillin)
 - pneumococcal, meningococcal, hepatitis B, Hib, and influenza vaccines
 - folate supplementation
 - hydroxyurea if frequent crises, history of acute chest syndrome (raises HbF level)
 - transcranial Doppler to assess risk of stroke
 - chronic transfusion program if history of stroke or abnormal transcranial Doppler
 - genetic counseling and education
 - annual fundoscopic exam (after 10 yr old)
 - bi-annual screening for pulmonary HTN (after 12 yr old)
 - bi-annual chemistry and urinalysis to monitor organ dysfunction

Thalassemia

- see [Hematology](#), H19

Hereditary Spherocytosis

- see [Hematology](#), H23

Glucose-6-Phosphate Dehydrogenase Deficiency

- see [Hematology](#), H23

G6PD deficiency protects against parasitism of RBCs (i.e. malaria)

Bleeding Disorders

- see [Hematology](#), H27

Table 22. Evaluation of Abnormal Bruising/Bleeding

	PFA	PT	PTT	VIII:C	vWF	Platelets	Fibrinogen
Hemophilia A	N	N	↑	↓	N	N	N
Hemophilia B	N	N	↑	N	N	N	N
von Willebrand Disease	↑	N	N or ↑	↓	↓	N	N
DIC	N or ↑	↑	↑	↓	N	↓	↓
Vitamin K Deficiency	N	↑	↑	N	N	N	N
Thrombocytopenia	↑	N	N	N	N	↓	N

DIC = disseminated intravascular coagulation; PFA = platelet function assay; VIII:C = Factor VIII coagulant activity; vWF = von Willebrand's factor;

Extensive bruising in the absence of lab abnormalities: consider child maltreatment

The American Society of Hematology 2011 Evidence-Based Practice Guideline for Immune Thrombocytopenia

Blood 2011;117(16):4190-207

Recommendations

- Bone marrow examination is unnecessary in children and adolescents with the typical features of ITP.
- Bone marrow examination is not necessary in children who fail IVIg therapy (grade 1B).
- Children with no bleeding or mild bleeding (defined as skin manifestations only, such as bruising and petechiae) may be managed with observation alone regardless of platelet count.
- For pediatric patients requiring treatment, a single dose of IVIg (0.8-1 g/kg) or a short course of corticosteroids may be used as first-line treatment.
- IVIg can be used if a more rapid increase in the platelet count is desired.
- Anti-D therapy is not advised in children with a hemoglobin concentration that is decreased due to bleeding, or with evidence of autoimmune hemolysis.

Suggestions

- Bone marrow examination is also not necessary in similar patients prior to initiation of treatment with corticosteroids or before splenectomy.
- Testing for antinuclear antibodies is not necessary in the evaluation of children and adolescents with suspected ITP.
- A single dose of anti-D can be used as first-line treatment in Rh-positive, nonsplenectomized children requiring treatment.

Immune Thrombocytopenic Purpura

Epidemiology

- most common cause of thrombocytopenia in childhood
- peak age: 2-6 yr, M=F
- incidence 5:100,000 children per yr

Etiology

- caused by autoantibodies that bind to platelet membranes → Fc-receptor mediated splenic uptake → destruction of platelets

Clinical Presentation

- 50% present 1-3 wk after viral illness (URTI, chicken pox)
- sudden onset of petechiae, purpura, epistaxis in an otherwise well child
- clinically significant bleed in only 3% (severe bleed more likely with platelet count <10) with <0.5% risk of intracranial bleed
- no lymphadenopathy, no hepatosplenomegaly
- labs: thrombocytopenia with normal RBC, WBC
- bone marrow aspirate only if atypical presentation (≥ 1 cell line abnormal, hepatosplenomegaly)
- differential diagnosis: leukemia, drug-induced thrombocytopenia, HIV, infection (viral), autoimmune (SLE, ALPS)

Management

- observation vs. pharmacologic intervention highly debated; spontaneous recovery in >70% of cases within 3 mo
- treatment with IVIg or prednisone if mucosal or internal bleeding, platelets <10, or at risk of significant bleeding (surgery, dental procedure, concomitant vasculitis or coagulopathy)
- life-threatening bleed: additional platelet transfusion ± emergency splenectomy
- persistent (>3-12 mo) or chronic (>12 mo): re-evaluate; treat if symptoms persist
- supportive: avoid contact sports and ASA/NSAIDs

Hemophilia

- see [Hematology](#), H31

von Willebrand's Disease

- see [Hematology](#), H30

Oncology

- cancer is the second most common cause of death after injuries in children after 1 yr of age
- cause is rarely known, but increased risk for children with: chromosomal syndromes (e.g. Trisomy 21), prior malignancy, neurocutaneous syndromes, immunodeficiency syndromes, family history, exposure to radiation, chemicals, biologic agents
- leukemias are the most common type of pediatric malignancy (40%), followed by brain tumors (20%), and lymphomas (15%)
- some malignancies are more prevalent in certain age groups:
 - newborns: neuroblastoma, Wilms' tumor, retinoblastoma
 - infancy and childhood: leukemia, neuroblastoma, Wilms' tumor, retinoblastoma
 - adolescence: lymphoma, gonadal tumors, bone tumors
- unique treatment considerations in pediatrics because radiation, chemotherapy, and surgery can impact growth and development, endocrine function, and fertility
- good prognosis: treatments have led to remarkable improvements in overall survival and cure rates for many pediatric cancers (>80%)

Lymphadenopathy

Clinical Presentations

- features of malignant lymphadenopathy: firm, discrete, non-tender, enlarging, immobile ± suspicious mass/imaging findings ± constitutional symptoms
- fluctuance, warmth, or tenderness are more suggestive of benign nodes (infection)

Differential Diagnosis

- infection
 - viral: URTI, EBV, CMV, adenovirus, HIV
 - bacterial: *S. aureus*, GAS, anaerobes, *Mycobacterium* (e.g. TB), cat scratch disease (*Bartonella*)
 - other: fungal, protozoan, *Rickettsia*
- autoimmune: rheumatoid arthritis, SLE, serum sickness
- malignancy: lymphoma, leukemia, metastatic solid tumors
- storage diseases: Niemann-Pick, Gaucher's
- other: sarcoidosis, Kawasaki disease, histiocytoses

Most common cause of acute bilateral cervical LAD is viral illness

Investigations

- generalized lymphadenopathy
 - CBC and differential, blood culture
 - uric acid, LDH
 - ANA, RF, ESR
 - EBV/CMV/HIV serology
 - toxoplasma titer
 - fungal serology
 - CXR
 - TB tests
 - biopsy
- regional lymphadenopathy
 - period of observation if asymptomatic
 - trial of oral antibiotics
 - ultrasound
 - biopsy (especially if persistent >6 wk and/or constitutional symptoms)

Leukemia

- see [Hematology](#), H37, H40, H43, H48

Epidemiology

- mean age of diagnosis 2-5 yr but can occur at any age
- heterogeneous group of diseases
 - ALL (80%)
 - AML (15%)
 - CML (<5%)
- children with DS are 15x more likely to develop leukemia

Clinical Presentation

- infiltration of leukemic cells into bone marrow results in bone pain and bone marrow failure (anemia, neutropenia, thrombocytopenia)
- infiltration into tissues results in lymphadenopathy, hepatosplenomegaly, CNS manifestations, testicular disease
- fever, fatigue, weight loss, bruising, and easy bleeding

- hyperleukocytosis (total WBC $>10.0 \times 10^9/\text{dL}$) is a medical emergency
 - presents clinically with respiratory or neurological distress caused by hyperviscosity of blood and leukostasis
 - risk of ICH, pulmonary leukostasis syndrome, tumor lysis syndrome
 - management: fluids, allopurinol/rasburicase, fresh frozen plasma/platelets to correct thrombocytopenia, induction chemotherapy, avoid transfusing RBCs unless symptomatic (and then use very small volumes)

Management

- combination chemotherapy using non-cross resistant chemotherapy agents, allogeneic stem cell transplantation for high-grade or recurrent disease
- supportive care and management of treatment complications
 - febrile neutropenia: see [Infectious Diseases, ID46](#)
 - tumor lysis syndrome: see [Hematology, H52](#)

Prognosis

- 80-90% 5 yr event-free survival for ALL, 50-60% 5 yr survival for AML
- patients are stratified into standard risk and high risk based on WBC and age; other prognostic factors include presence of CNS/testicular disease, immunophenotype, cytogenetics, and initial response to therapy (most important prognostic variable)

Lymphoma

- see [Hematology, H44](#)

Epidemiology

- Hodgkin lymphoma: incidence is bimodal, peaks at ages 15-34 and >50 yr old
- non-Hodgkin lymphoma: incidence peaks at 7-11 yr

Clinical Presentation

- Hodgkin lymphoma
 - most common presentation is persistent, painless, firm, cervical, or supraclavicular lymphadenopathy
 - can present as persistent cough or dyspnea (secondary to mediastinal mass) or less commonly as splenomegaly, axillary, or inguinal lymphadenopathy
 - constitutional symptoms in 30% of children
- non-Hodgkin lymphoma
 - generally categorized into lymphoblastic, large cell, and Burkitt's/Burkitt's-like lymphoma
 - rapidly growing tumor with distant metastases (unlike adult non-Hodgkin lymphoma)
 - signs and symptoms related to disease site: most commonly abdomen, chest (mediastinal mass), head and neck region

Constitutional symptoms = fever, chills, night sweats, unexplained weight loss

Management

- Hodgkin lymphoma
 - combination chemotherapy and radiation
 - aimed at limiting cumulative doses of anthracyclines (toxic to heart) and alkylators (risk of second malignancy, infertility) and limiting dose and field of radiation
 - increasing role for use of PET scanning to assess early disease response and plan therapy
- non-Hodgkin lymphoma
 - combination chemotherapy
 - no added benefit of radiation in pediatric protocols

Prognosis

- Hodgkin lymphoma: $>90\%$ 5 yr survival
- non-Hodgkin lymphoma: 75-90% 5 yr survival

Brain Tumors

- see [Neurosurgery, NS10, NS38](#)

Wilms' Tumor (Nephroblastoma)

Epidemiology

- usually diagnosed between 2-5 yr M=F
 - most common primary renal neoplasm of childhood
 - 5-10% of cases both kidneys are affected (simultaneously or in sequence)

Differential Diagnosis

- hydronephrosis, polycystic kidney disease, renal cell carcinoma, neuroblastoma

Clinical Presentation

- 80% present with asymptomatic, unilateral abdominal mass
- may also present with HTN, gross hematuria, abdominal pain, vomiting
- may have pulmonary metastases at time of diagnosis (respiratory symptoms)

Associated Congenital Abnormalities

- WAGR syndrome (**W**ilms' tumor, **A**niridia, **G**enital anomalies, mental **R**etardation) with 11p13 deletion
- Beckwith-Wiedemann syndrome
 - characterized by enlargement of body organs (especially tongue), hemihypertrophy, renal medullary cysts, and adrenal cytomegaly
 - also at increased risk for developing hepatoblastoma, and less commonly adrenocortical tumors, neuroblastomas, and rhabdomyosarcomas
- Denys-Drash syndrome: characterized by gonadal dysgenesis and nephropathy leading to renal failure

Management

- staging ± nephrectomy
- chemotherapy, radiation for higher stages

Prognosis

- 90% long-term survival

Neuroblastoma

Epidemiology

- most common cancer occurring in first year of life
- neural crest cell tumor arising from sympathetic tissues (neuroblasts)

Clinical Presentation

- can originate from any site in sympathetic nervous system, presenting as mass in neck, chest, or abdomen (most common site is adrenal gland)
- signs and symptoms of disease vary with location of tumor
 - thoracic: dyspnea, Horner's syndrome
 - abdomen: palpable mass
 - spinal cord compression
- metastases are common at presentation (>50% present with advanced stage disease):
 - usually to bone or bone marrow (presents as bone pain, limp)
 - can also present with periorbital ecchymoses, abdominal pain, emesis, fever, weight loss, anorexia, hepatomegaly, "blueberry muffin" skin nodules
- paraneoplastic: HTN, palpitations, sweating (from excessive catecholamines), diarrhea, FTT (from vasoactive intestinal peptide secretion), opsomyoclonus
- diagnostic criteria (either of the following)
 - unequivocal histologic diagnosis from tumor tissue biopsy
 - evidence of metastasis to bone marrow ("rosettes") on aspirate analysis, with concomitant elevation of urine or serum catecholamine metabolite (VMA, HVA) levels

Management

- depends on prognostic factors and may include combination of: surgery, radiation, chemotherapy, autologous stem cell transplantation, immunotherapy

Prognosis

- prognosis is often poor due to late detection
- good prognostic factors
 - "age and stage" are important determinants of better outcome: 12-18 mo, stage I, II, IV-S disease ("S" designates a "Special" classification only pertaining to infants)
 - primary site: posterior mediastinum and neck
 - low serum ferritin
 - specific histology
 - tumor cell markers: aneuploidy, absent *MYCN* oncogene amplification

Bone Tumors

- see [Orthopedics](#), OR43

Infectious Diseases

Fever

Definition

- fever: no generally accepted definition, a practical definition is $>100.4^{\circ}\text{F}/38^{\circ}\text{C}$ oral or rectal
- fever without a source/focus: acute febrile illness (typically <10 d duration) with no cause of fever even after careful history and physical
- fever of unknown origin: daily or intermittent fevers for at least 2 consecutive weeks of uncertain cause after careful history and physical, and initial laboratory assessment

Etiology

- infectious: anatomic approach (CNS, ears, upper and lower respiratory tract, GI, GU, skin, soft tissue, bones and joints, etc.)
- inflammatory: mainly autoimmune (Kawasaki disease, JIA, IBD, SLE, etc.)
- malignancy: childhood cancers (leukemia, lymphoma, neuroblastoma, etc.)
- miscellaneous: dehydration, drugs and toxins, post-immunization, familial dysautonomia, factitious disorder, etc.

Diagnosis

- history: duration, height and pattern of fever, associated symptoms, exposures, constitutional symptoms, recent antipyretic use, ethnic or genetic background, day care, sick contacts, travel, tick bites
- physical exam: toxic vs. non-toxic, vitals, growth, complete exam of the skin, HEENT, chest, abdomen, lymph nodes, genitalia
- investigations: guided by history, physical exam, and clinical suspicion

Evaluation of Neonates and Infants with Fever

- several protocols exist that attempt to identify neonates and young infants at low risk of serious bacterial infection (e.g. Rochester criteria)
 - such protocols are not as sensitive in the 1-28 d age group; therefore, febrile neonates should be considered high risk regardless of clinical presentation and laboratory findings

Management

- admit to hospital if appropriate
- treat the source if known
- replace fluid losses (e.g. from vomiting, diarrhea, etc.); maintenance fluid needs are higher in febrile child
- reassure parents that most fevers are benign and self-limited
- antipyretics (acetaminophen and/or ibuprofen) are not necessary in most cases, but can be given if child is uncomfortable

Rochester Criteria – Developed to Identify Infants ≤ 60 d of Age with Fever at Low Risk of Serious Bacterial Infection

Clinically	Well
WBC Count	$5-15 \times 10^9/\text{L}$
Bands	$<1.5 \times 10^9/\text{L}$
Urinalysis	<10 WBC/HPF
Stool (if diarrhea)	5 WBC/HPF
Past Health	Born >37 wk Home with/before mom No hospitalizations No prior antibiotic use No prior treatment for unexplained hyperbilirubinemia No chronic disease

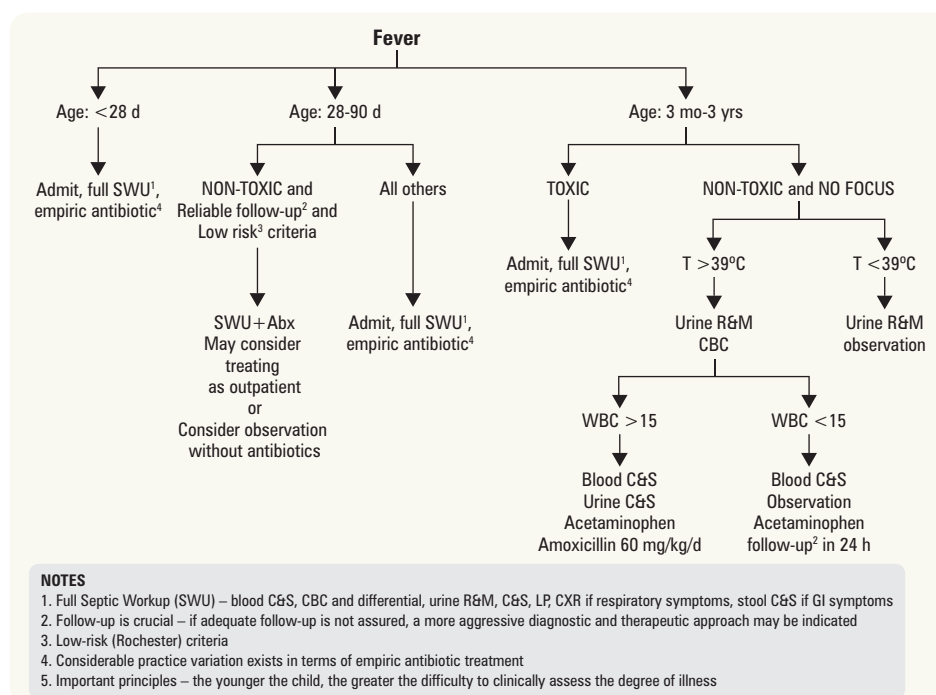

Figure 11. Approach to the febrile child

Acute Otitis Media

Definition

All of

1. presence of middle ear effusion
2. presence of middle ear inflammation
3. acute onset of symptoms of middle ear effusion and inflammation

Epidemiology

- 60-70% of children have at least 1 episode of AOM before 3 yr of age
- 18 mo-6 yr most common age group
- peak incidence January to April
- one third of children have had ≥ 3 episodes by age 3

Etiology

- *S. pneumoniae*: 32% of cases (incidence decreasing due to pneumococcus vaccine)
- *H. influenzae* (non-typeable): 28% of cases
- *M. catarrhalis*: 14% of cases
- *S. aureus* and *S. pyogenes* (all β -lactamase producing)
- anaerobes (newborns)
- Gram-negative enterics (infants)
- viral

Predisposing Factors

- Eustachian tube dysfunction/obstruction
 - swelling of tubal mucosa: URTI, allergic rhinitis, chronic rhinosinusitis
 - obstruction/infiltration of Eustachian tube ostium: adenoid hypertrophy (not due to obstruction but by maintaining a source of infection), barotrauma (sudden changes in air pressure)
 - inadequate tensor palati function: cleft palate (even after repair)
 - abnormal Eustachian tube: DS (horizontal position of Eustachian tube), Crouzon syndrome, cleft palate, and Apert syndrome
- disruption of action of
 - cilia of Eustachian tube: Kartagener's syndrome
 - mucus secreting cells
 - capillary network that provides humoral factors, neutrophils, phagocytic cells
- immunosuppression/deficiency due to chemotherapy, steroids, DM, hypogammaglobulinemia, CF

Risk Factors

- bottle feeding, pacifier use
- second-hand smoke
- crowded living conditions (day care/group child care facilities) or sick contacts
- male
- family history

Pathogenesis

- obstruction of Eustachian tube \rightarrow air absorbed in middle ear \rightarrow negative pressure (an irritant to middle ear mucosa) \rightarrow edema of mucosa with exudate/effusion \rightarrow infection of exudate from nasopharyngeal secretions

Clinical Features

- triad of otalgia, fever (especially in younger children), and conductive hearing loss
- rarely tinnitus, vertigo, and/or facial nerve paralysis
- otorrhea if tympanic membrane perforated
- infants/toddlers: ear-tugging (this alone is not a good indicator of pathology), hearing loss, balance disturbances (rare), irritable, poor sleeping, vomiting and diarrhea, anorexia
- otoscopy of TM: hyperemia, bulging, pus may be seen behind TM, loss of landmarks (e.g. handle and long process of malleus not visible)

Diagnosis and Management

- Diagnose AOM if
 - moderate to severe bulging of TM or new onset of otorrhea not due to otitis externa
 - mild bulging of tympanic membrane and recent (< 48 h) ear pain or intense erythema of TM
 - do not diagnose AOM if no middle ear effusion (based on pneumatic otoscopy or tympanometry)
- antibiotic treatment hastens resolution: 10 d course
 - 1st line
 - ♦ amoxicillin 75-90 mg/kg/d divided into two doses: safe, effective, and inexpensive
 - ♦ if penicillin allergic: macrolide (clarithromycin, azithromycin – high resistance), trimethoprim-sulphamethoxazole (Bactrim®)

Clinical Assessment of AOM in Pediatrics

JAMA 2010;304:2161-2169

In assessment of AOM in pediatrics, ear pain is the most useful symptom with a LR between 3.0-7.3. Useful otoscopic signs include erythematous (LR 8.4, 95% CI 7-11), cloudy (LR 34, 95% CI 28-42), bulging (LR 51, 95% CI 36-73), and immobile tympanic membrane on pneumatic otoscopy (LR 31, 95% CI 26-37).

The Diagnosis and Management of Acute Otitis Media

Pediatrics 2013;131:e964-e999

Strong Recommendations

- Management of AOM should include an assessment of pain; if pain is present, the clinician should recommend treatment to reduce pain.
- Severe AOM in young children:
 - Prescribe antibiotic therapy for AOM (bilateral or unilateral) in children 6 mo and older with severe signs or symptoms (i.e. moderate or severe otalgia or otalgia for at least 48 h or temperature 102.2°F [39°C] or higher).
- Recommend pneumococcal conjugate vaccine to all children according to vaccination schedule.

Recommendations

- Diagnose AOM in children who present with moderate to severe bulging of the TM or new onset of otorrhea not due to acute otitis externa.
- Diagnose AOM in children who present with mild bulging of the TM and recent (< 48 h) onset of ear pain (holding, tugging, rubbing of the ear in a nonverbal child) or intense erythema of the TM.
- Non-severe AOM in young children:
 - Prescribe antibiotic therapy for bilateral AOM in children 6 mo through 23 mo of age without severe signs or symptoms (i.e. mild otalgia for less than 48 h and temperature less than 102.2°F [39°C]).
 - Either prescribe antibiotic therapy or offer observation with close follow-up based on joint decision-making with the parent(s)/caregiver(s) for unilateral AOM in children 6-23 mo of age OR bilateral or unilateral AOM in children ≥ 24 mo without severe signs or symptoms; when observation is used, a mechanism must be in place to ensure follow-up and begin antibiotic therapy if the child worsens or fails to improve within 48-72 h of onset of symptoms.
- Prescribe amoxicillin for AOM when a decision to treat with antibiotics has been made and the child has not received amoxicillin in the past 30 d or the child does not have concurrent purulent conjunctivitis or the child is not allergic to penicillin.
- Prescribe an antibiotic with additional β -lactamase coverage for AOM when a decision to treat with antibiotics has been made, and the child has received amoxicillin in the last 30 d or has concurrent purulent conjunctivitis, or has a history of recurrent AOM unresponsive to amoxicillin.
- Reassess the patient if the caregiver reports that the child's symptoms have worsened or failed to respond to the initial antibiotic treatment within 48-72 h and determine whether a change in therapy is needed.
- Do NOT prescribe prophylactic antibiotics to reduce the frequency of episodes of AOM in children with recurrent AOM.
- Recommend annual influenza vaccine to all children according to vaccination schedule.
- Encourage exclusive breastfeeding for at least 6 mo.
- Encourage avoidance of tobacco smoke exposure.

Option

- Offer tympanostomy tubes for recurrent AOM (3 episodes in 6 mo or 4 episodes in 1 yr with 1 episode in the preceding 6 mo).

- 2nd line
 - ♦ amoxicillin-clavulanic acid (Augmentin®)
 - ♦ cephalosporins: cefuroxime axetil (Zinacef®), ceftriaxone (Rocephin®), cefaclor (Ceclor®), cefixime (Suprax®)
 - ♦ AOM deemed unresponsive if clinical signs/symptoms and otoscopic findings persist beyond 48 h of antibiotic treatment
- symptomatic therapy
 - antipyretics/analgesics (e.g. acetaminophen)
 - decongestants: may relieve nasal congestion but does not treat AOM
- prevention
 - parent education about risk factors
 - antibiotic prophylaxis: amoxicillin or macrolide shown effective at half therapeutic dose
 - pneumococcal and influenza vaccine
 - surgery
 - ♦ choice of surgical therapy for recurrent AOM depends on whether local factors (Eustachian tube dysfunction) are responsible (use ventilation tubes), or regional disease factors (tonsillitis, adenoid hypertrophy, sinusitis) are responsible

Complications

- extracranial: hearing loss and speech delay (secondary to persistent middle ear effusion), TM perforation, extension of suppurative process to adjacent structures (mastoiditis, petrositis, labyrinthitis), cholesteatoma, facial nerve palsy, middle ear atelectasis, ossicular necrosis, vestibular dysfunction
- intracranial: meningitis, epidural and brain abscess, subdural empyema, lateral and cavernous sinus thrombosis, carotid artery thrombosis

Otitis Media with Effusion

Definition

- presence of fluid in the middle ear without signs or symptoms of ear infection

Epidemiology

- most common cause of pediatric hearing loss
- not exclusively a pediatric disease
- follows AOM frequently in children
- middle ear effusions have been shown to persist following an episode of AOM for 1 mo in 40% of children, 2 mo in 20%, and >3 mo in 10%

Risk Factors

- same as AOM

Clinical Features

- conductive hearing loss ± tinnitus
- fullness – blocked ear
- ± pain, low grade fever
- otoscopy of TM
 - discoloration – amber or dull gray with “glue” ear
 - meniscus fluid level behind TM
 - air bubbles
 - retraction pockets/TM atelectasis
 - most reliable finding with pneumatic otoscopy is immobility

Treatment

- expectant: 90% resolve by 3 mo
- document hearing loss with audiogram (see [Otolaryngology](#) Figure 16B and Figure 17B, OT10)
- no statistical proof that antihistamines, decongestants, antibiotics clear disease faster
- surgery: myringotomy ± ventilation tubes ± adenoidectomy (if enlarged or on insertion of second set of tubes after first set falls out)
- ventilation tubes to equalize pressure and drain ear

Complications of OME

- hearing loss, speech delay, learning problems in young children
- chronic mastoiditis
- ossicular erosion
- cholesteatoma especially when retraction pockets involve pars flaccida
- retraction of tympanic membrane, atelectasis, ossicular fixation

Gastroenteritis

- see [Gastroenterology](#), P36

HIV Infection

- see [Infectious Diseases](#), ID29

Infectious Pediatric Exanthems

Table 23. Common Infectious Pediatric Exanthems

Disease	Pathogen(s)	Incubation Period	Communicability	Mode of Transmission	Rash	Associated Features	Management	Outcomes and Complications
Erythema Infectiosum (i.e. Fifth Disease)	Parvovirus B19	4-14 d	Low risk of transmission once symptomatic	Respiratory secretions or infected blood	Appearance: uniform, erythematous maculopapular 'lacy' rash Timing: 10-17 d after symptoms (immune response) Distribution: bilateral cheeks ('slapped cheeks') with circumoral sparing; may affect trunk and extremities	Initial 7-10 d of flu-like illness and fever Rash may be warm, non-tender, and pruritic Less common presentations include 'gloves and socks syndrome' or STAR complex (sore throat, arthritis, rash)	Supportive	Rash fades over days to week, but may reappear months later with sunlight, exercise Aplastic crisis
Gianotti-Crosti Syndrome (i.e. Papular Acrodermatitis)	EBV and Hep B (majority)	Variable	None	—	Appearance: asymptomatic symmetric papules Distribution: face, cheeks, extensor surfaces of the extremities, spares trunk	Viral prodrome May have lymphadenopathy and/or hepatosplenomegaly	Supportive Pain control	Resolves in 3-12 wk
Hand, Foot, and Mouth Disease	Coxsackie group A	3-5 d	Likely 1-7 d after symptoms but may be up to months	Direct and indirect contact with infected bodily fluids, fecal-oral	Appearance: vesicles and pustules on an erythematous base Distribution: acral	Enanthem: vesicles in the POSTERIOR oral cavity (pharynx, tongue)	Supportive	Mainly dehydration
Herpes Simplex	HSV 1,2	1-26 d		Direct contact, often through saliva for HSV-1 and sexual contact for HSV-2	Grouped vesicles on an erythematous base	Enanthem: vesicles/erosions in the ANTERIOR oral cavity (buccal mucosa, tongue) May present with herpetic whitlow (autoinoculation)	Mainly supportive Consider oral or topical antivirals	Local: secondary skin infections, keratitis, gingivostomatitis CNS: encephalitis Disseminated hepatitis, DIC Eczema herpeticum
Kawasaki Disease	See P96							
Measles	Morbillivirus	8-13 d	4 d before and after rash	Airborne	Appearance: erythematous maculopapular Timing: 3 d after start of symptoms Distribution: starts at hairline and spreads downwards with sparing of palms and soles	Prodrome of cough, coryza, conjunctivitis (3 Cs) Enanthem: Koplik's spots 1-2 d before rash Desquamation Positive serology for measles IgM	Infected: supportive Unimmunized contacts: measles vaccine within 72 h of exposure or IgG within 6 d of exposure Respiratory isolation, report to Public Health Prevention: MMR vaccine	Secondary bacterial infections: AOM, sinusitis, pneumonia Encephalitis Rare: myocarditis, pericarditis, thrombocytopenia, Stevens-Johnson syndrome, GN, subacute sclerosing panencephalitis

Table 23. Common Infectious Pediatric Exanthems (continued)

Disease	Pathogen(s)	Incubation Period	Communicability	Mode of Transmission	Rash	Associated Features	Management	Outcomes and Complications
Non-Specific Enteroviral Exanthems	Enteroviruses	Variable	Variable	Direct and indirect contact with infected bodily fluids	Polymorphous rash (macules, papules, vesicles, petechiae, urticaria)	Systemic involvement is rare, but possible	Supportive Diagnosis confirmed using viral cultures (NP and rectal swabs)	Self-limiting
Roseola	HHV 6	5-15 d	Unknown	—	Appearance: blanching, pink, maculopapular Timing: appears once fever subsides Distribution: starts at the neck and trunk and spreads to the face and extremities	High grade fever Common: irritability, anorexia, lymphadenopathy, erythematous TM and pharynx, Nagayama spots (erythematous papules on soft palate and uvula) Less common: cough, coryza, bulging fontanelles	Supportive	CNS: febrile seizures (10-25%), aseptic meningitis Thrombocytopenia
Rubella	Rubivirus	14-21 d	7 d before and after eruptions	Droplet	Appearance: pink, maculopapular Timing: 1-5 d after start of symptoms Distribution: starts on face and spreads to neck and trunk	Prodrome of low grade fever and occipital/retroauricular nodes STAR complex (sore throat, arthritis, rash) Positive serology for rubella IgM	Infected: supportive Prevention: MMR vaccine Report to Public Health	Excellent prognosis with acquired disease Arthritis may last days to weeks Encephalitis Irreversible defects in congenitally infected patients (i.e. congenital rubella syndrome)
Scarlet Fever	See P60							
Varicella	Varicella zoster virus	0-21 d	1-2 d pre-eruptions and 5 d post-eruption	Mainly airborne, but also through direct contact with vesicle fluid	Appearance: groups of skin lesions, polymorphic, from macules to papules to vesicles to crusts Timing: 1-3 d after start of symptoms Distribution: generalized	Significant pruritis Enanthem: vesicular lesions which may become pustular or ulcerate	Supportive Avoid salicylates (due to risk of Reye syndrome) Consider antivirals Respiratory and contact isolation, report to Public Health Prevention: varicella vaccine	Skin: bacterial suprainfection, necrotizing fasciitis CNS: acute encephalitis and cerebellar ataxia Systemic: hepatitis, DIC Congenital varicella syndrome if intrapartum infection

Infectious Mononucleosis

Definition

- systemic viral infection caused by EBV with multivisceral involvement; often called “the great imitator”

Epidemiology

- peak incidence between 15-19 yr old
- ~50% of children in developed countries have a primary EBV infection by 5 yr old, but <10% of children develop clinical infection

Etiology

- EBV: a member of herpesviridae
- transmission is mainly through infected saliva (“kissing disease”) and sexual activity (less commonly); incubation period of 1-2 mo

Risk Factors

- infectious contacts, sexually active, multiple sexual partners in the past

History

- prodrome: 2-3 d of malaise, anorexia
- infants and young children: often asymptomatic or mild disease
- older children and adolescents: malaise, fatigue, fever, sore throat, abdominal pain (often LUQ), headache, myalgia

Physical Exam

- classic triad: febrile, generalized non-tender lymphadenopathy, pharyngitis/tonsillitis (exudative)
- ± hepatosplenomegaly
- ± periorbital edema, ± rash (urticarial, maculopapular, or petechial) – more common after inappropriate treatment with β -lactam antibiotics
- any “-itis” (including arthritis, hepatitis, nephritis, myocarditis, meningitis, encephalitis, etc.)

Investigations

- heterophil antibody test (Monospot® test)
 - 85% sensitive in adults and older children, but only 50% sensitive if <4 yr of age
 - false positive results with HIV, SLE, lymphoma, rubella, parvovirus
- EBV titers
- CBC and differential, blood smear: atypical lymphocytes, lymphocytosis, Downey cells ± anemia ± thrombocytopenia
- throat culture to rule out streptococcal pharyngitis

Management

- supportive: adequate rest, hydration, saline gargles, and analgesics for sore throat
- splenic enlargement is often not clinically apparent so all patients should avoid contact sports for 6-8 wk
- if airway obstruction secondary to nodal and/or tonsillar enlargement is present (especially younger children), admit for steroid therapy
- acyclovir does NOT reduce duration of symptoms or result in earlier return to school/work

Prognosis

- most acute symptoms resolve in 1-2 wk, though fatigue may last for months
- short-term complications: splenic rupture, Guillain-Barré syndrome

Infectious Pharyngitis/Tonsillitis

Definition

- inflammation of the pharynx, especially the tonsils if present, causing a sore throat

Etiology

- viral (~80%): adenoviruses, enteroviruses, coxsackie, upper respiratory tract viruses, EBV, CMV
- bacterial (~20%): mainly GAS, *M. pneumoniae* (older children), *N. gonorrhoeae* (sexually active), *C. diphtheriae* (unvaccinated)
- fungal: *Candida*

Epidemiology

- season: GAS pharyngitis more common in late winter or early spring; viral all year long
- age: GAS pharyngitis peak incidence at 5-12 yr of age and uncommon <3 yr; viral pharyngitis affects all ages

History

- GAS: sore throat (may be severe), fever, malaise, headache, abdominal pain, N/V, absence of other URTI symptoms
- viral: sore throat (often mild), conjunctivitis, cough, rhinorrhea, hoarseness, diarrhea, flu-like symptoms (fever, malaise, myalgias)

Physical Exam

- GAS: febrile, pharyngeal/tonsillar erythema and exudates, enlarged (>1 cm) and tender anterior cervical lymph nodes, palatal petechiae, strawberry tongue, scarlatiniform rash
- viral: afebrile, absent/mild tonsillar exudates, minor and non-tender adenopathy, viral exanthems

Investigations

- no single sign or symptom reliably identifies GAS as the causative organism in children with sore throat
- scores are used to predict if throat culture will be positive (e.g. McIsaac Criteria)
 - these score systems have not been found to be sensitive or specific enough to diagnose GAS in children and adolescents with sore throat
- suspected diagnosis of GAS pharyngitis should be confirmed with a rapid streptococcal antigen test and a follow-up throat culture if the rapid test is negative

Management

- antibiotics (for GAS/*S. pyogenes*)
 - penicillin V or amoxicillin or erythromycin (if penicillin allergy) x 10 d
 - can prevent rheumatic fever if given within 9 d of symptoms; does NOT alter risk of post-streptococcal GN
- supportive: hydration and acetaminophen for discomfort due to pain and/or fever
- follow-up: if uncomplicated course, no follow-up or post-antibiotic throat cultures needed
- prophylaxis: consider tonsillectomy for proven, recurrent streptococcal tonsillitis

Complications

- preventable with antibiotics: AOM, sinusitis, cervical adenitis, mastoiditis, retropharyngeal/peritonsillar abscess, sepsis
- immune-mediated complications: scarlet fever, acute rheumatic fever, post-streptococcal GN, reactive arthritis, pediatric autoimmune neuropsychiatric disorder associated with group A *Streptococci* (i.e. PANDAS)

SCARLET FEVER

- diffuse erythematous eruption
- delayed-type hypersensitivity reaction to pyrogenic exotoxin produced by GAS
- acute onset of fever, sore throat, strawberry tongue
- 24-48 h after pharyngitis, rash begins in the groin, axillae, neck, antecubital fossa; Pastia's lines may be accentuated in flexural areas
- within 24 h, sandpaper rash becomes generalized with perioral sparing, non-pruritic, non-painful, blanchable
- rash fades after 3-4 d, may be followed by desquamation
- treatment is penicillin, amoxicillin, or erythromycin x 10 d

RHEUMATIC FEVER

- inflammatory disease due to antibody cross-reactivity following GAS infection
- affects ~1:10,000 children in developed world; much more prevalent in developing nations; peak incidence at 5-15 yr of age
- mainly a clinical diagnosis based on Jones Criteria (revised):
 - requires 2 major OR 1 major and 2 minor PLUS evidence of preceding strep infection (history of scarlet fever, GAS pharyngitis culture, positive rapid Ag detection test, ASOTs)
- treatment: penicillin or erythromycin for acute course x 10 d, prednisone if severe carditis
- secondary prophylaxis with daily penicillin or erythromycin
- complications
 - acute: myocarditis, conduction system aberrations (sinus tachycardia, atrial fibrillation), valvulitis (acute MR), pericarditis
 - chronic: valvular heart disease (mitral and/or aortic insufficiency/stenosis), infectious endocarditis ± thromboembolic phenomenon
 - onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever

McIsaac Criteria (if > 3 yr old)

HOT LACE

Hot (fever > 100.4°F)

Lymphadenopathy (anterior cervical, tender)

Age 3-14 yr

No Cough

Erythematous, exudative tonsils

CMAJ 1998;158(1):75-83

Scarlet Fever

4 Ss and 4 Ps

Sore throat

Swollen tonsils

Strawberry tongue

Sandpaper rash

Perioral sparing

Non-**P**ruritic

Non-**P**ainful

Peeling

Jones Criteria

Major: STREP

Sydenhams chorea

Transient migratory arthritis

Rheumatic subcutaneous nodules

Erythema marginatum

Pancarditis (endocarditis, myocarditis, pericarditis)

Minor: PEACE

PR interval prolonged

ESR elevated

Arthralgias

CRP elevated

Elevated temperature (fever)

POST-STREPTOCOCCAL GLOMERULONEPHRITIS

- most common in children aged 4-8 yr old; M>F
- antigen-antibody mediated complement activation with diffuse, proliferative GN
- occurs 1-3 wk following initial GAS infection (skin or throat)
- clinical presentation varies from asymptomatic, microscopic and macroscopic hematuria (cola-colored urine) to all features of nephritic syndrome (see P81)
- diagnosis is confirmed with elevated serum antibody titers against streptococcal antigens (ASOT, anti-DNAse B), low serum complement (C3)
- management
 - symptomatic: fluid and sodium restrictions; loop diuretics for HTN and edema
 - in severe cases, may require dialysis if renal function significantly impaired
 - treat with penicillin or erythromycin if evidence of persistent GAS infection
- 95% of children recover completely within 1-2 wk; 5-10% have persistent hematuria

Meningitis

Definition

- inflammation of the meninges surrounding the brain and spinal cord

Epidemiology

- peak age: 6-12 mo; 90% of cases occur in children <5 yr old

Etiology

- viral: enteroviruses, HSV
- bacterial: age-related variation in specific pathogens
- fungal and parasitic meningitis also possible
- most often due to hematogenous spread or direct extension from a contiguous site

Risk Factors

- unvaccinated
- immunocompromised: asplenia, DM, HIV, prematurity
- recent or current infections: AOM, sinusitis, orbital cellulitis
- neuroanatomical: congenital defects, dermal sinus, neurosurgery, cochlear implants, recent head trauma
- exposures: day care centers, household contact, recent travel

History

- signs and symptoms variable and dependent on age, duration of illness, and host response to infection
- infants: fever, lethargy, irritability, poor feeding, N/V, diarrhea, respiratory distress, seizures
- children: fever, headache, photophobia, N/V, confusion, back/neck pain/stiffness, lethargy, irritability

Physical Exam

- infants: toxic, hypothermia, bulging anterior fontanelle, respiratory distress, apnea, petechial/purpuric rash, jaundice
- children: toxic, ↓ LOC, nuchal rigidity, Kernig's and Brudzinski's signs, focal neurologic findings, petechial/purpuric rash

Investigations

- blood work: CBC, electrolytes, Cr, BUN, glucose, C&S
- LP required for definitive diagnosis
 - Gram stain, bacterial C&S, WBC count and differential, RBC count, glucose, protein concentration
 - acid-fast stain if suspect TB
 - PCR for specific bacteria if available (helpful if already treated with antibiotics)
 - urinalysis and urine C&S in infants, Gram stain and culture of petechial/purpuric lesions
 - HSV and enterovirus PCR if suspected

**Signs of Meningismus****BONK on the head**

Brudzinski's sign

Opisthotonos*

Nuchal rigidity

Kernig's sign

*Opisthotonos: rigid spasm of the body, with the back fully arched and the heels and head bent back

Table 24. CSF Findings of Meningitis

Component	Normal Child	Normal Newborn	Bacterial Meningitis	Viral Meningitis	Herpes Meningitis
WBC (/μL)	0-6	0-30	>1,000 (cloudy, xanthochromic)	100-500*	10-1,000
Neutrophils (%)	0	2-3	>50	<40	<50
Glucose (mmol/L)	2.2-4.4	1.8-6.7	<1.66	>1.66	>1.66
Protein (mg/dL)	0.2-0.3	0.19-1.49	>1.0	0.50-1.0	>0.75
RBC (/μL)	0-2	0-2	0-10	0-2	10-50

*Lymphocytes predominate Modified from: *Peds in Review* 1993;14:11-18 and *Ped Inf Dis J* 1996;15:298-303

Management

- supportive care
 - preservation of adequate cerebral perfusion by maintaining normal BP and managing ↑ ICP
 - close monitoring of fluids, electrolytes, glucose, acid-base disturbances, coagulopathies
- bacterial meningitis
 - if suspected or cannot be excluded, commence empiric antibiotic therapy while awaiting cultures or if LP contraindicated or delayed
 - adjuvant dexamethasone BEFORE antibiotic for Hib meningitis; consider for those >6 wk with pneumococcal meningitis
 - isolation with appropriate infection control procedures until 24 h after culture-sensitive antibiotic therapy
 - fluid restrict if any concern for SIADH
 - hearing test
 - report to Public Health; prophylactic antibiotics for close contacts of Hib and *N. meningitidis* meningitis

Table 25. Antibiotic Management of Bacterial Meningitis

Age	Main Pathogens	Antibiotics
0-28 d	GBS, <i>E. coli</i> , <i>Listeria</i> Other: Gram-negative bacilli	Ampicillin + cefotaxime
28-90 d	Overlap of neonatal pathogens and those seen in older children	Ampicillin + cefotaxime ± vancomycin
>90 d	<i>S. pneumoniae</i> , <i>N. meningitidis</i>	Ceftriaxone ± vancomycin

- viral meningitis
 - mainly supportive (except for HSV)
 - acyclovir for HSV meningitis
 - report to Public Health
- prophylaxis: appropriate vaccinations significantly decrease incidence of bacterial meningitis (see [Routine Immunization, P3](#))

Complications

- mortality: neonate 15-20%, children 4-8%; pneumococcus > meningococcus > Hib
- acute: SIADH, subdural effusion/empyema, brain abscess, disseminated infection (osteomyelitis, septic arthritis, abscess), shock/DIC
- chronic: hearing loss, neuromotor/cognitive delay, learning disabilities, neurological deficit, seizure disorder, hydrocephalus

Mumps

Definition

- acute, self-limited viral infection that is most commonly characterized by adenitis and swelling of the parotid glands

Epidemiology

- incidence has declined since introduction of two-dose MMR vaccination schedule
- average of 25 reported cases per yr
- majority of reported cases in children between 5-10 yr of age

Etiology

- mumps virus (RNA virus of the genus *Rubulavirus* in the *Paramyxoviridae* family)
- transmission via respiratory droplets, direct contact, fomites
- incubation period: 14-25 d

- infectivity period: 7 d pre-parotitis to 5 d post-parotitis
- upper respiratory tract → lymph nodes → salivary glands, gonads, pancreas, meninges, kidney, heart, thyroid

History

- non-specific prodrome of fever, headache, malaise, myalgias (especially neck pain)
- usually followed within 48 h by parotid swelling secondary to parotitis (bilateral, preauricular, ear pushed up and out)
- parotid gland is tender and pain worsened with spicy or sour foods
- one third of infections do not cause clinically apparent salivary gland swelling and may simply present as an URTI

Investigations

- clinical diagnosis, but may be confirmed with IgM positive serology within 4 wk of acute infection
 - may also use PCR or viral cultures from oral secretions, urine, blood, and CSF
 - blood work: CBC (leukopenia with relative lymphocytosis), serum amylase (elevated)

Management

- mainly supportive: analgesics, antipyretics, warm or cold packs to parotid may be soothing
- admit to hospital if serious complications (meningitis, pancreatitis)
- droplet precautions recommended until 5 d after onset of parotid swelling
- prophylaxis: routine vaccination (see *Routine Immunization*, P3)

Complications

- common: aseptic meningitis, orchitis/oophoritis
- less common: encephalitis, pancreatitis, thyroiditis, myocarditis, arthritis, GN, ocular complications, hearing impairment

Pertussis

Definition

- prolonged respiratory illness characterized by paroxysmal coughing and inspiratory “whoop”

Epidemiology

- ~10 million children <1 yr old affected worldwide, causes up to 400,000 deaths per yr
- greatest incidence among children <1 yr (not fully immunized) and adolescents (waning immunity)

Etiology

- *Bordetella pertussis*: Gram negative pleomorphic rod
- highly contagious; transmitted via respiratory droplets released during intense coughing
- incubation period: 6-20 d; most contagious during catarrhal phase but may remain contagious for weeks after

History

- prodromal catarrhal stage
 - lasts 1-7 d; URTI symptoms (coryza, mild cough, sneezing) with NO or LOW-GRADE fever
- paroxysmal stage
 - lasts 4-6 wk; characterized by paroxysms of cough (“100 day cough”), sometimes followed by inspiratory whoop (“whooping cough”)
 - infants <6 mo may present with post-tussive apnea, whoop is often absent
 - onset of attacks precipitated by yawning, sneezing, eating, physical exertion
 - ± post-tussive emesis, may become cyanotic before whoop
- convalescent stage
 - lasts 1-2 wk; characterized by occasional paroxysms of cough, but decreased frequency and severity
 - non-infectious but cough may last up to 6 mo

Investigations

- NP specimen using aspirate or NP swab
 - gold standard: culture using special media (Regan-Lowe agar)
 - PCR to detect pertussis antigens
- blood work: CBC (lymphocytosis) and serology (antibodies against *B. pertussis*)

Management

- admit if paroxysms of cough are associated with cyanosis and/or apnea and give O₂
- supportive care

- antimicrobial therapy indicated if *B. pertussis* isolated, or symptoms present for <21 d
 - use macrolide antibiotics (azithromycin, erythromycin, or clarithromycin)
- droplet isolation until 5 d of treatment and report to Public Health
- prophylaxis
 - macrolide antibiotics for all household contacts
 - prevention with vaccination in infants and children (Pentacel®), and booster in adolescents (Adacel®) (see [Routine Immunization, P3](#))

Complications

- pressure-related from paroxysms: subconjunctival hemorrhage, rectal prolapse, hernias, epistaxis
- respiratory: sinusitis, pneumonia, aspiration, atelectasis, pneumomediastinum, pneumothorax, alveolar rupture
- neurological: seizures (~3%), encephalopathy, ICH
- mortality: ~0.3%; highest risk in infants <6 mo old

Pneumonia

- see [Pediatric Respiriology, P90](#)

Periorbital (Preseptal) and Orbital Cellulitis

- see [Ophthalmology, OP10](#)

Sexually Transmitted Disease

- see [Family Medicine, FM45](#) and [Gynecology, GY25](#)

Sinusitis

- see [Family Medicine, FM46](#)
- complication of ≤10% of URTIs in children
- clinical diagnosis
- diagnostic imaging is NOT required to confirm diagnosis in children
 - routine CT not recommended, but consider if suspect complications of sinusitis, persistent/recurrent disease, need for surgery
- antibiotic therapy for all children (although nearly half resolve spontaneously within 4 wk)
- complications: preseptal/orbital (preseptal/orbital cellulitis, orbital abscess, osteomyelitis, etc.), intracranial (meningitis, abscess, etc.), Pott's Puffy tumor

Urinary Tract Infection

Definition

- infection of the urinary bladder (cystitis) and/or kidneys (pyelonephritis)

Epidemiology

- overall prevalence in infants and young children presenting with fever is 7%
- <4-6 wk old: more common in boys
- >1 yr old: females have two- to four-fold higher prevalence

Etiology

- majority (>95%) have a monomicrobial cause (~70% *E. coli*)
- Gram-negative bacilli: *E. coli*, *Klebsiella*, *Proteus*, *Enterobacter*, *Pseudomonas*
- Gram-positive cocci: *S. saprophyticus*, *Enterococcus*

Risk Factors

- non-modifiable: female gender, Caucasian, previous UTIs, family history
- modifiable: urinary tract abnormalities (VUR, neurogenic bladder, obstructive uropathy, posterior urethral valve), dysfunctional voiding, repeated bladder catheterization, uncircumcised males, labial adhesions, sexually active, constipation, toilet training

Cardinal Signs of Orbital Cellulitis

- Ophthalmoplegia/diplopia
- Decreased visual acuity
- Pain with extraocular eye movement

Bagged urine specimen not useful for ruling in UTI (high false positive rate >85%), but useful for ruling out UTI (high sensitivity)

Features Suggestive of Pyelonephritis

- High-grade fever
- Flank or high abdominal pain
- CVA tenderness on palpation

History

- infants and young child: often just fever or non-specific symptoms (poor feeding, irritability, FTT, jaundice if <28 d old, vomiting)
- older child: fever, urinary symptoms (dysuria, urgency, frequency, incontinence, hematuria), abdominal and/or flank pain

Physical Exam

- infants and young child: toxic vs. non-toxic, febrile, FTT, jaundice; look for external genitalia abnormalities (phimosis, labial adhesions) and lower back signs of occult myelodysplasia (e.g. hair tufts), which may be associated with neurogenic bladder
- older child: febrile, suprapubic and/or CVA tenderness, abdominal mass (enlarged bladder or kidney); may present with short stature, FTT or HTN secondary to renal scarring from previously unrecognized or recurrent UTIs

Investigations

- sterile urine specimen
 - clean catch, catheterization, or suprapubic aspiration
 - urinalysis (leukocyte esterase, nitrites, erythrocytes, hemoglobin), microscopy (bacteria and leukocytes, erythrocytes), C&S
- diagnosis established if urinalysis suggests infection AND if $\geq 50,000$ colony-forming units per mL of a uropathogen cultured

Management

- admit if: <2 mo old, urosepsis, persistent vomiting, inability to tolerate oral medication, moderate-severe dehydration, immunocompromised, complex urologic pathology, inadequate follow-up, failure to respond to outpatient therapy
- supportive care: maintenance of hydration and adequate pain control
- antibiotics
 - base on local antimicrobial susceptibility patterns
 - commence broad empiric therapy until results of urine C&S known, and then tailor as appropriate
 - neonates: IV ampicillin and gentamicin
 - infants and older children: oral cephalexin if outpatient; IV ampicillin and gentamicin if inpatient
 - duration 7-14 d
- imaging
 - renal and bladder U/S for all febrile infants with UTIs looking for anatomical abnormalities, hydronephrosis, abscess
 - VCUG not recommended after 1st febrile UTI unless U/S reveals hydronephrosis, obstructive uropathies or other signs suggestive of high-grade VUR
- follow-up: outpatients to return in 24-48 h if no clinical response and seek prompt medical evaluation for future febrile illnesses
- prophylaxis: generally not recommended unless higher grades of VUR

Complications

- long-term morbidity: focal renal scarring develops in 8% of patients; long-term significance unknown

Sensitivity and Specificity of Urine Dip in Children

	Sensitivity	Specificity
Microscopy leukocytes	73%	81%
Nitrites	53%	98%
Leukocyte esterase	83%	78%
Microscopy bacteriuria	81%	83%
Leukocyte esterase or nitrites, or microscopy positive	99.8%	70%

Pediatrics 2011;128:595-610

Prophylaxis After First Febrile Urinary Tract Infection in Children? A Multicenter, Randomized Controlled, Noninferiority Trial

Pediatrics 2008;122:1064-1071

Study: Randomized, controlled, open-label, 2 armed, noninferiority trial.

Patients: 338 patients aged 2 mo-<7 yr who had a first episode of febrile UTI.

Intervention: No prophylaxis vs. prophylaxis.

Outcome: Recurrence rate of febrile UTI and rate of renal scarring.

Results: No significant difference in recurrence rate or in the rate of renal scarring between the prophylaxis and no prophylaxis group.

Neonatology

Gestational Age and Size

Definitions

- classification by GA
 - preterm: <37 wk
 - near-term: 35-37 wk
 - term: 37-42 wk
 - post-term: >42 wk
- classification by birth weight
 - SGA: 2 SD < mean weight for GA or <10th percentile
 - AGA: within 2 SD of mean weight for GA
 - LGA: 2 SD > mean weight for GA or >90th percentile

Dubowitz/Ballard Scores

GA can be determined after birth using Dubowitz/Ballard scores:

- Assessment at delivery of physical maturity (e.g. plantar creases, lanugo, ear maturation) and neuromuscular maturity (e.g. posture, arm recoil) translates into a score from -10 to +50
- Higher score means greater maturity (increased GA)
- -10 = 20 wk; +50 = 44 wk
- Ideal = 35-40, which corresponds to GA 38-40 wk
- Only accurate ± 2 wk

Table 26. Abnormalities of Gestational Age and Size

Features	Causes	Problems
Pre-Term Infants <37 wk	Spontaneous: cause unknown Maternal disease: HTN, DM, cardiac and renal disorders Fetal conditions: multiple pregnancy, congenital abnormalities Pregnancy issues: placental insufficiency, placenta previa, uterine malformations, previous preterm birth, infection Behavioral and psychological contributors: smoking, EtOH, drug use, psychosocial stressors Sociodemographic factors: age, socioeconomic conditions	RDS, apnea of prematurity, chronic lung disease, bronchopulmonary dysplasia Feeding difficulties, NEC Hypocalcemia, hypoglycemia, hypothermia Anemia, jaundice Retinopathy of prematurity ICH/IVH PDA
Post-Term Infants >42 wk Leathery skin Meconium staining	Most cases unknown Increased in first pregnancies Previous post-term birth Genetic factors	Increased risk of stillbirth or neonatal death Increased birthweight Fetal "postmaturity syndrome": impaired growth due to placental dysfunction Meconium aspiration
SGA Infants <10 th percentile Asymmetric (head-sparing): late onset, growth arrest	Extrinsic causes: placental insufficiency, poor nutrition, HTN, multiple pregnancies, drugs, EtOH, smoking	Perinatal hypoxia Hypoglycemia, hypocalcemia, hypothermia, hyperviscosity (polycythemia), jaundice, hypomotility
Symmetric: early onset, lower growth	Intrinsic causes: maternal infections (TORCH), congenital abnormalities, syndromal, idiopathic	PDA
LGA Infants >90 th percentile	Maternal DM Racial or familial factors Increasing parity Previous LGA infant, high BMI, large pregnancy weight gain Certain syndromes	Birth trauma, perinatal depression (meconium aspiration) RDS, TTN Jaundice, polycythemia Hypoglycemia, hypocalcemia

Routine Neonatal Care

- erythromycin ointment: applied to both eyes for prophylaxis of ophthalmia neonatorum
- vitamin K IM: prophylaxis against HDNB
- newborn screening tests
 - metabolic disorders (amino acid disorders, organic acid disorders, fatty acid oxidation defects, biotinidase deficiency, galactosemia)
 - blood disorders (SCD, other hemoglobinopathies)
 - endocrine disorders (CAH, congenital hypothyroidism)
 - others (CF, SCID)
 - congenital hearing loss
- if mother Rh negative: send cord blood for blood group and direct antiglobulin test
- if mother hepatitis B surface antigen positive: HBIG and start hepatitis B vaccine series

Neonatal Resuscitation

- assess Apgar score at 1 and 5 min
- if <7 at 5 min then reassess q5min, until >7
- do not wait to assign Apgar score before initiating resuscitation

Table 27. Apgar Score

Sign	0	1	2
Heart Rate	Absent	<100/min	>100/min
Respiratory Effort	Absent	Slow, irregular	Good, crying
Irritability	No response	Grimace	Cough/cry
Tone	Limp	Some flexion of extremities	Active motion
Color	Blue, pale	Body pink, extremities blue (acrocyanosis)	Completely pink

Apgar Score

Appearance (color)
Pulse (heart rate)
Grimace (irritability)
Activity (tone)
Respiration (respiratory effort)
Or: "How Ready Is This Child?"

Initial Resuscitation

- anticipation: know maternal history, history of pregnancy, labor, and delivery
- steps to take for all infants (before ABCs)
 - warm (radiant heater, warm towels) and dry the newborn (remove wet towels)
 - position and clear airway ("sniffing" position)
 - stimulate infant: rub lower back gently or flick soles of feet EXCEPT if meconium present (in which case tracheal suction first)
 - assess breathing and heart rate
- Airway
 - if meconium is present and
 - ♦ baby is vigorous (strong respiratory effort, good muscle tone, HR >100): no further resuscitative interventions required
 - ♦ baby is not vigorous: intubate and suction trachea while monitoring vital signs; if prolonged or unsuccessful intubation, attempt bag mask ventilation
 - if no meconium and suction required, suction mouth first and then nose
- Breathing
 - if HR <100 or apneic, apply PPV
 - PPV at rate of 40-60/min with enough pressure to see visible chest expansion and note increase in HR
 - monitor preductal SpO₂
 - if PPV not effective (no increase in HR, no chest rise, low SpO₂), incorporate corrective actions
- Circulation
 - if HR <60 after 30 s of effective ventilation, start chest compressions ("60 or less, compress")
 - should provide 100% oxygen as soon as chest compressions are required
 - chest compressions at lower 1/3 of the sternum and 1/3 of the AP depth at a rate of 120 events per min (3 compressions:1 ventilation = 120 compressions/min:40 breaths/min)

Targeted Preductal SpO₂ After Birth

1 min	60-65%
2 min	65-70%
3 min	70-75%
4 min	75-80%
5 min	80-85%
10 min	85-95%

Corrective Actions for PPV in Neonatal Resuscitation

MR SOPA

Mask readjustment
 Reposition airway
 Suction mouth and nose
 Open mouth
 Pressure increase
 Alternative airway

Table 28. Interventions Used in Neonatal Resuscitation

Intervention	Schedule	Indications	Comments
Epinephrine (adrenaline)	0.1-0.3 mL/kg/dose of 1:10,000 (0.01-0.03 mg/kg) IV 0.5-1 mL/kg/dose of 1:10,000 (0.05-0.1 mg/kg) endotracheally can be considered while awaiting IV access (IV preferred) Can be repeated q3-5 min prn	HR <60 and not rising	Side effects: tachycardia, HTN, cardiac arrhythmias
Naloxone (Narcan®)	0.1 mg/kg IV/IM	Not recommended as part of initial resuscitation HR and oxygenation should be restored by supporting ventilation	Do not use for chronic opiate exposure – may cause withdrawal symptoms including HTN, irritability, seizures Action of opioid outlasts action of naloxone therefore close monitoring required after administration
Fluid Bolus (NS, whole blood, Ringer's lactate)	10 mL/kg May need to be repeated Avoid giving too rapidly as large volume rapid infusions can be associated with IVH	Evidence of hypovolemia	

Approach to the Depressed Newborn

- a depressed newborn lacks one or more of the following characteristics of a normal newborn
 - pulse >100 bpm
 - cries when stimulated
 - actively moves all extremities
 - has a good strong cry
- approximately 10% of newborn babies require assistance with breathing after delivery

Table 29. Etiology of Respiratory Depression in the Newborn

Etiology	Examples
Respiratory Problems	RDS/hyaline membrane disease Pulmonary hypoplasia CNS depression MAS Pneumonia Pneumothorax Pleural effusions Congenital malformations
Anemia (severe)	Erythroblastosis fetalis Secondary hydrops fetalis
Maternal Causes	Drugs/anesthesia (opiates, magnesium sulphate) DM Maternal myasthenia gravis
Congenital Malformations/Birth Injury	Nuchal cord, perinatal depression Bilateral phrenic nerve injury Potter's sequence
Shock	Antepartum hemorrhage
CHD	Transposition of the great arteries with intact ventricular septum
Other	Hypothermia Hypoglycemia Infection

Diagnosis

- vital signs
- detailed maternal history: include prenatal care, illnesses, use of drugs, labor, previous high risk pregnancies, infections during pregnancy, current infections, duration of ruptured membranes, blood type and Rh status, amniotic fluid status, GA, meconium, Apgar scores
- clinical findings (observe for signs of respiratory distress such as cyanosis, tachypnea, retractions, grunting, temperature instability)
- laboratory results (CBC, ABG, blood type, glucose)
- transillumination of chest to evaluate for pneumothorax
- CXR

Management

- ABCs
- intubation and suction if meconium present
- apply tactile stimulation if no meconium
- provide PPV if apneic or HR <100 bpm
- monitor SpO₂ and HR (if <60 bpm, start chest compressions)
- provide ventilatory support and treat the underlying cause

Common Conditions of Neonates

Apnea

Definition

- “periodic breathing”: normal respiratory pattern seen in newborns in which periods of rapid respiration are alternated with pauses lasting 5-10 s
- “apnea”: absence of respiratory gas flow for >20 s (or less if associated with bradycardia or desaturation) – 3 types
 - central: no chest wall movement, no signs of obstruction
 - obstructive: chest wall movement continues against obstructed upper airway, no airflow
 - mixed: combination of central and obstructive apnea

Differential Diagnosis

- in term infants, apnea requires full workup as it can be associated with sepsis
- other causes
 - CNS
 - ♦ apnea of prematurity (<34 wk): combination of CNS immaturity and obstructive apnea; resolves by 36 wk GA; diagnosis of exclusion
 - ♦ seizures
 - ♦ ICH
 - ♦ hypoxic injury

- infectious: sepsis, meningitis, NEC
- GI: GERD, aspiration with feeding
- metabolic: hypoglycemia, hyponatremia, hypocalcemia, inborn error of metabolism
- cardiovascular: anemia, hypovolemia, PDA, heart failure
- medications: morphine

Management

- O₂, ventilatory support, maintain normal blood gases
- tactile stimulation
- correct underlying cause
- medications: methylxanthines (caffeine) stimulate the CNS and diaphragm and are used for apnea of prematurity (not in term infants)

Bleeding Disorders in Neonates

Clinical Presentation

- oozing from the umbilical stump, excessive bleeding from peripheral venipuncture/heel stick sites/IV sites, large caput succedaneum, cephalohematomas (in absence of significant birth trauma), subgaleal hemorrhage and prolonged bleeding following circumcision

Etiology

- 4 major categories
 - increased platelet destruction: maternal ITP or SLE, infection/sepsis, DIC, neonatal alloimmune thrombocytopenia, autoimmune thrombocytopenia
 - decreased platelet production/function: pancytopenia, bone marrow replacement, Fanconi anemia, Trisomy 13 and 18
 - metabolic: congenital thyrotoxicosis, inborn error of metabolism
 - coagulation factor deficiencies (see [Hematology, H29](#)): hemophilia A/B, HDNB

NEONATAL ALLOIMMUNE THROMBOCYTOPENIA

Epidemiology

- 1 per 4,000-5,000 live births

Pathophysiology

- platelet equivalent of Rh disease of the newborn
- occurs when mother is negative for HPA and fetus is positive
- development of maternal IgG antibodies against HPA antigens on fetal platelets

Clinical Presentation

- petechiae, purpura, thrombocytopenia in otherwise healthy neonate
- severe disease can lead to intracranial bleeding

Diagnosis

- maternal and paternal platelet typing and identification of platelet alloantibodies

Treatment

- IVIg to mother prenatally starts in second trimester ± steroids ± fetal platelet transfusions
- treat neonate with IVIg
- if transfusion required should be with washed maternal platelets or donor HPA negative platelets

AUTOIMMUNE THROMBOCYTOPENIA

Pathophysiology

- caused by antiplatelet antibodies from maternal ITP or SLE
- passive transfer of antibodies across placenta

Clinical Presentation

- similar presentation to neonatal alloimmune thrombocytopenia, but thrombocytopenia usually less severe

Treatment

- steroids to mother for 10-14 d prior to delivery or IVIg to mother before delivery
- treat neonate with IVIg (usually if platelets <60,000)
- transfusion of infant with maternal/donor platelets only in severe cases, as antibodies will destroy transfused platelets

HEMORRHAGIC DISEASE OF THE NEWBORN

Pathophysiology

- caused by vitamin K deficiency
- factors II, VII, IX, X are vitamin K-dependent, therefore both PT and PTT are abnormal

Etiology and Clinical Presentation

- neonates at risk of vitamin K deficiency if: vitamin K poorly transferred across the placenta; maternal use of antiepileptics; insufficient bacterial colonization of colon at birth to synthesize vitamin K; breastfed (vitamin K intake inadequate in breastfed infants)
- neonate may present with hematomas, ICH (causing apnea or seizures), internal bleeding, hematuria, bruising, prolonged bleeding (often from mucous membranes, umbilicus, circumcision, and venipunctures)

Prevention

- vitamin K IM administration at birth to all newborns

Bronchopulmonary Dysplasia

Definition

- also known as chronic lung disease
- clinically defined as O₂ requirement for >28 d plus persistent need for oxygen and/or ventilatory support at 36 wk corrected GA
- damage to developing lungs with prolonged intubation/ventilation

Investigations

- CXR findings may demonstrate decreased lung volumes, areas of atelectasis, and hyperinflation

Treatment

- no good treatments
- gradual wean from ventilator, optimize nutrition
- dexamethasone may help decrease inflammation and encourage weaning, but use of dexamethasone is associated with increased risk of adverse neurodevelopmental outcomes

Prognosis

- chronic respiratory failure may lead to pulmonary HTN, poor growth, and right-sided heart failure
- patients with bronchopulmonary dysplasia may continue to have significant impairment and deterioration in lung function late into adolescence
- some lung abnormalities may persist into adulthood including airway obstruction, airway hyper-reactivity, and emphysema
- associated with increased risk of adverse neurodevelopmental outcomes

Cyanosis

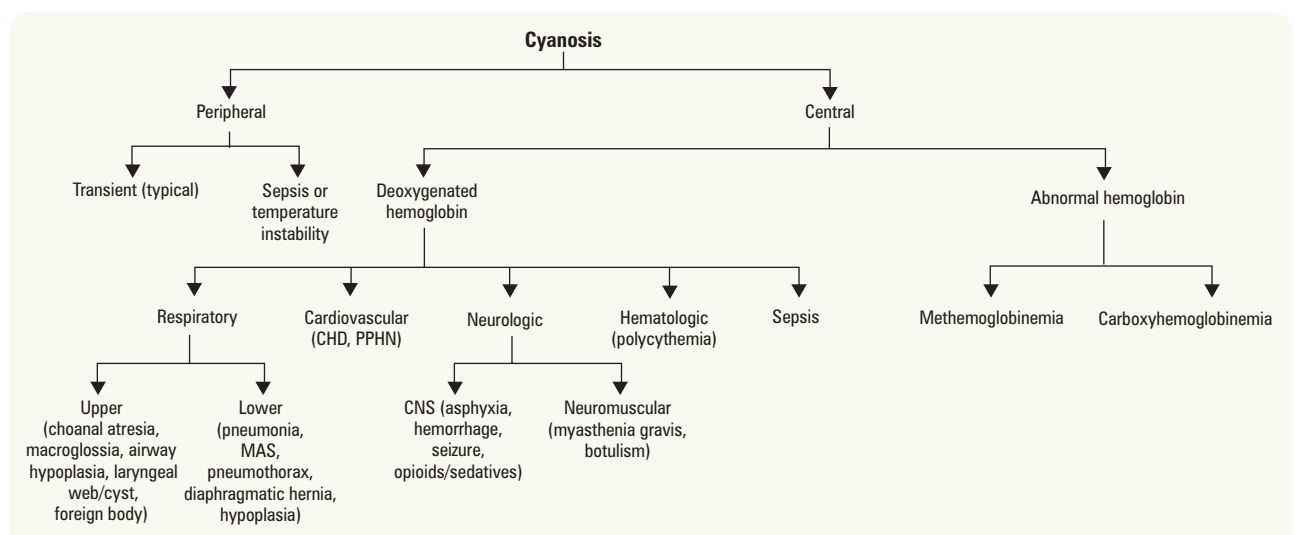

Figure 12. Approach to neonatal cyanosis

Management

- ABGs
 - elevated CO₂ suggests respiratory cause
 - hyperoxia test (to distinguish between cardiac and respiratory causes of cyanosis): get baseline PaO₂ in room air, then PaO₂ on 100% O₂ for 10-15 min
 - ♦ PaO₂ <150 mmHg: suggests cyanotic CHD or possible PPHN (see *Pediatric Cardiology*, P16)
 - ♦ PaO₂ >150 mmHg: suggests cyanosis likely due to respiratory or non-cardiac cause
- CXR: look for respiratory abnormalities (respiratory tract malformations, evidence of shunting, pulmonary infiltrates) and cardiac abnormalities (cardiomegaly, abnormalities of the great vessels)

Carboxyhemoglobinemia (secondary to carbon monoxide poisoning) results in impaired binding of oxygen to hemoglobin but does not discolor the blood. Therefore it may not register on pulse oximetry and cyanosis may not be evident clinically

Methemoglobinemia typically reads higher on pulse oximetry than the true level of oxyhemoglobin. Methemoglobinemia alters the absorption of red light at the two wavelengths that pulse oximetry uses to predict oxygen saturation

Diaphragmatic Hernia

- see [General Surgery](#), GS12

Definition

- developmental defect of the diaphragm with herniation of abdominal organs into thorax
- associated with pulmonary hypoplasia and PPHN

Clinical Presentation

- respiratory distress, cyanosis
- scaphoid abdomen and barrel-shaped chest
- affected side dull to percussion and breath sounds absent, may hear bowel sounds instead
- heart sounds shifted to contralateral side
- asymmetric chest movements, trachea deviated away from affected side
- may present outside of neonatal period
- often associated with other anomalies (cardiovascular, CNS, chromosomal abnormalities)
- CXR: bowel loops in thorax (usually left side), displaced mediastinum

Treatment

- immediate intubation required at birth: DO NOT bag mask ventilate because air will enter stomach and further compress lungs
- place large bore orogastric tube to decompress bowel
- initial stabilization and management of pulmonary hypoplasia and PPHN, hemodynamic support and surgery when stable

Hypoglycemia

Definition

- glucose <40 mg/dL

Etiology

- decreased carbohydrate stores: premature, SGA, RDS, maternal HTN
- endocrine: hormonal deficiencies (GH, cortisol, epinephrine), insulin excess (infant of diabetic mother, Beckwith-Wiedemann syndrome/islet cell hyperplasia), HPA axis suppression (panhypopituitarism)
- inborn errors of metabolism: fatty acid oxidation defects, galactosemia
- miscellaneous: sepsis, hypothermia, polycythemia

Clinical Findings

- signs often non-specific and subtle: lethargy, poor feeding, irritability, tremors, apnea, cyanosis, seizures

Management

- identify and monitor infants at risk (pre-feed blood glucose checks)
- begin oral feeds as soon as possible after birth and ensure regular feeds
- if significant and/or symptomatic hypoglycemia, provide glucose IV and titrate according to blood sugar levels
- if persistent hypoglycemia or no predisposing cause, send “critical blood work” during an episode of hypoglycemia: ABG, ammonia, β-hydroxybutyrate, cortisol, free fatty acids, GH, insulin, lactate, urine dipstick for ketones

Intraventricular Hemorrhage

Definition

- hemorrhage originating in the periventricular subependymal germinal matrix

Epidemiology

- incidence and severity inversely proportional to GA
- 50% of IVH occurs within 8 h of birth; 90% occurs by day 3

Risk Factors

- prematurity (<32 wk), BW <1,500 g, need for vigorous resuscitation at birth, pneumothorax, ventilated preterm infants, hemodynamic instability, RDS, coagulopathy

Clinical Presentation

- many infants with IVH are asymptomatic
- subtle signs: apnea, bradycardia, changes in tone or activity, altered LOC
- catastrophic presentation: bulging fontanelle, sudden drop in hematocrit, acidosis, seizures, hypotension

Classification

- Papile classification
- parenchymal hemorrhage may also occur in the absence of IVH
- routine head U/S screening of all preterm infants <32 wk or <1,500 g gestation throughout NICU stay
- consider MRI at term for extremely LBW infants

Management of Acute Hemorrhage

- supportive care to maintain blood volume and acid-base status
- avoid fluctuations in blood pressure and cerebral blood flow
- follow-up with serial imaging

Prognosis

- outcome depends on grade of IVH
- short-term sequelae for severe IVH: mortality, extension of bleed, posthemorrhagic hydrocephalus, posthemorrhagic infarction, cyst formation
- possible long-term major neurological sequelae: CP, cognitive deficits, motor deficits, visual and hearing impairment
- Grades I and II hemorrhages have a relatively favorable prognosis
- greatest morbidity and mortality is seen with Grade IV hemorrhage and posthemorrhagic hydrocephalus requiring ventriculoperitoneal shunt placement

Papile Classification

Grade I: germinal matrix hemorrhage
Grade II: IVH without ventricular dilatation
Grade III: IVH with ventricular dilatation
Grade IV: IVH with parenchymal extension

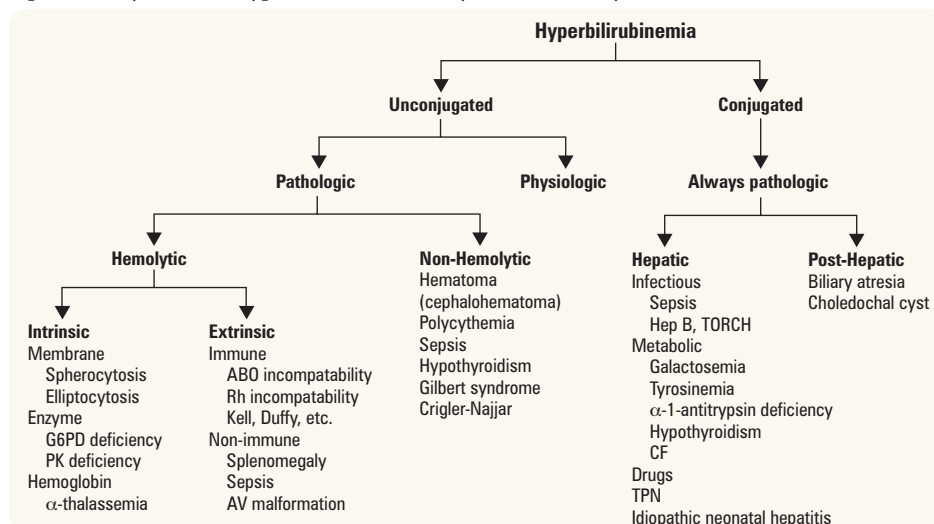

Jaundice

Clinical Presentation

- jaundice is visible at serum bilirubin levels of 5 mg/dL; visual assessment is often misleading
- look at sclera, tip of nose in natural light
- jaundice more severe/prolonged (due to increased retention of bilirubin in the circulation) with: prematurity, acidosis, hypoalbuminemia, dehydration, hemolysis

Jaundice is very common – 60% of term newborns develop visible jaundice

Jaundice in the first 24 h of life and conjugated hyperbilirubinemia are always pathological

Figure 13. Approach to neonatal hyperbilirubinemia

PHYSIOLOGIC JAUNDICE

Epidemiology

- term infants: onset 3-4 d of life, resolution by 10 d of life
- premature infants: higher peak and longer duration

Pathophysiology

- increased hematocrit and decreased RBC lifespan
- immature glucuronyl transferase enzyme system (slow conjugation of bilirubin)
- increased enterohepatic circulation

Breastfeeding Jaundice

- common; due to a lack of milk production → dehydration → exaggerated physiologic jaundice

Breast Milk Jaundice

- 1 per 200 breastfed infants
- glucuronyl transferase inhibitor found in breast milk
- onset 7 d of life, peak at 2-3 wk of life, usually resolved by 6 wk

Table 30. Risk Factors for Jaundice

Maternal Factors	Perinatal Factors	Neonatal Factors
Ethnic group (e.g. Asian, native American) Complications during pregnancy (infant of diabetic mother, Rh or ABO incompatibility) Breastfeeding	Birth trauma (cephalohematoma, ecchymoses) Prematurity	Difficulty establishing breastfeeding Infection (sepsis, hepatitis) Genetic factors Polycythemia Drugs TPN

Table 31. Causes of Neonatal Jaundice by Age

<24 h	24-72 h	72-96 h	Prolonged (>1 wk)
ALWAYS PATHOLOGIC Hemolytic Rh or ABO incompatibility Sepsis Congenital infection (TORCH) Severe bruising/hemorrhage	Physiologic, polycythemia Dehydration (breastfeeding jaundice) Hemolysis G6PD deficiency Pyruvate kinase deficiency Spherocytosis Bruising, hemorrhage, hematoma Sepsis/congenital infection	Physiologic ± breastfeeding Sepsis	Breast milk jaundice Prolonged physiologic jaundice in preterm Hypothyroidism Neonatal hepatitis Conjugation dysfunction e.g. Gilbert syndrome, Crigler-Najjar syndrome Inborn errors of metabolism e.g. galactosemia Biliary tract obstruction e.g. biliary atresia

PATHOLOGIC JAUNDICE

- all cases of conjugated hyperbilirubinemia; some cases of unconjugated hyperbilirubinemia are pathologic

Investigations

- unconjugated hyperbilirubinemia
 - hemolytic workup: CBC, reticulocyte count, blood group (mother and infant), peripheral blood smear, Coombs test
 - if baby is unwell or has fever: septic workup (CBC and differential, blood and urine cultures ± LP, CXR)
 - other: G6PD screen (especially in males), TSH
- conjugated hyperbilirubinemia must be investigated without delay
 - consider liver enzymes (AST, ALT), coagulation studies (PT, PTT), serum albumin, ammonia, TSH, TORCH screen, septic workup, galactosemia screen (erythrocyte galactose-1-phosphate uridylyltransferase levels), metabolic screen, abdominal U/S, HIDA scan, sweat chloride

Jaundice must be investigated if:

- It occurs within 24 h of age
- Conjugated hyperbilirubinemia is present
- Unconjugated bilirubin rises rapidly or is excessive for patient's age and weight
- Persistent jaundice lasts beyond 1-2 wk of age

TREATMENT OF UNCONJUGATED HYPERBILIRUBINEMIA

- to prevent kernicterus
- breastfeeding does not usually need to be discontinued, ensure adequate feeds and hydration
- lactation consultant support, mother to pump after feeds
- treat underlying causes (e.g. sepsis)
- phototherapy (blue-green wavelength, not UV light)
 - insoluble unconjugated bilirubin is converted to excretable form via photoisomerization
 - serum bilirubin should be monitored during and immediately after therapy (risk of rebound because photoisomerization reversible when phototherapy discontinued)

- contraindicated in conjugated hyperbilirubinemia: results in “bronzed” baby
- side effects: skin rash, diarrhea, eye damage (eye shield used routinely for prevention), dehydration
- use published guidelines and nomogram for initiation of phototherapy
- exchange transfusion
 - indications: high bilirubin levels as per published graphs based on age, weeks gestation
 - most commonly performed for hemolytic disease and G6PD deficiency
 - use of IVIg in case of severe hyperbilirubinemia (DAT+) becoming evidence-based practice

**“Bronzed” Baby in Infants with Conjugated Hyperbilirubinemia**

Phototherapy results in the production and accumulation of a toxic metabolite which also imparts a bronze hue on the baby's skin

KERNICTERUS**Etiology**

- unconjugated bilirubin concentrations exceed albumin binding capacity and bilirubin is deposited in the brain resulting in permanent damage (typically basal ganglia or brainstem)
- incidence increases as serum bilirubin levels increase above 19.8 mg/dL
- can occur at lower levels in presence of sepsis, meningitis, hemolysis, hypoxia, acidosis, hypothermia, hypoglycemia, and prematurity

Clinical Presentation

- up to 15% of infants have no obvious neurologic symptoms
- early stage: lethargy, hypotonia, poor feeding, emesis (bilirubin encephalopathy)
- mid stage: hypertonia, high pitched cry, opisthotonic posturing (back arching), bulging fontanelle, seizures, pulmonary hemorrhage
- late stage (first year and beyond)
 - hypotonia, delayed motor skills, extrapyramidal abnormalities (choreoathetoid CP), gaze palsy, mitral regurgitation, sensorineural hearing loss

Prevention

- exchange transfusion, IVIg if indicated

BILIARY ATRESIA

- see [General Surgery](#), GS63

**Definition**

- atresia of the extrahepatic bile ducts which leads to cholestasis and increased conjugated bilirubin after the first week of life
- progressive obliterative cholangiopathy

Epidemiology

- incidence: 1:10,000-15,000 live births
- associated anomalies in 10-35% of cases: situs inversus, congenital heart defects, polysplenia

Clinical Presentation

- dark urine, pale stool, jaundice (persisting for >2 wk), abdominal distension, hepatomegaly

Diagnosis

- conjugated hyperbilirubinemia, abdominal U/S
- HIDA scan (may be bypassed in favor of biopsy if timing of diagnosis is critical)
- liver biopsy

Treatment

- surgical drainage procedure
- hepatoportoenterostomy (Kasai procedure; most successful if <8 wk of age)
- two-thirds will eventually require liver transplantation
- vitamins A, D, E, and K; diet should be enriched with medium-chain triglycerides to ensure adequate fat ingestion

Necrotizing Enterocolitis**Definition**

- intestinal inflammation associated with focal or diffuse ulceration and necrosis
- primarily affecting terminal ileum and colon

Epidemiology

- affects 1-5% of preterm newborns admitted to NICU

Pathophysiology

- postulated mechanism of bowel ischemia: mucosal damage and enteral feeding → bacterial growth → bowel necrosis/gangrene/perforation

Risk Factors

- prematurity (immature defenses)
- asphyxia, shock (poor bowel perfusion)
- hyperosmolar feeds
- enteral feeding with formula (breast milk can be protective)
- sepsis

Clinical Presentation

- usually presents at 2-3 wk of age
- distended abdomen
- increased amount of gastric aspirate/vomit with bile staining
- frank or occult blood in stool
- feeding intolerance
- diminished bowel sounds
- signs of bowel perforation (sepsis, shock, peritonitis, DIC)

Investigations

- AXR: pneumatosis intestinalis (intramural air is a hallmark of NEC), free air, fixed loops, ileus, thickened bowel wall, portal venous gas
- CBC, ABG, lactate, blood culture, electrolytes
- high or low WBC, low platelets, hyponatremia, acidosis, hypoxia, hypercapnea

Treatment

- NPO (7-10 d), vigorous IV fluid resuscitation, decompression with NG tube, supportive therapy
- TPN
- antibiotics (usually ampicillin, gentamicin ± metronidazole if risk of perforation x 7-10 d)
- serial AXRs detect early perforation (40% mortality in perforated NEC)
- peritoneal drain/surgery if perforation
- surgical resection of necrotic bowel and surgery for complications (e.g. perforation, strictures)

Role of Human Milk in Extremely Low Birth Weight Infants' Risk of Necrotizing Enterocolitis or Death

J Perinatol 2009;29:57-62

Purpose: To determine if human milk intake is related to decreased risk of NEC or death.

Study: An association between proportion of human milk to total intake (enteral and parenteral), enteral intake alone, and total volume during the first 14 d after birth to NEC and death was evaluated.

Patients: 1,272 infants with a birth weight between 401 to 1,000 g.

Main Outcome: NEC or death occurring between 14 d after birth to 120 d or hospital discharge.

Results: For each 10% increase in the proportion of human milk to total intake, there was a decrease in likelihood of NEC or death (HR 0.83, 95% CI 0.72-0.96). Infants who developed NEC or died were more likely to receive parenteral nutrition only compared to infants who did not develop NEC or die (19 vs. 7.8%).

Summary: A reduction in the risk of NEC or death among extremely low birth weight infants was associated with human milk feeding. A possible dose-dependent beneficial effect of human milk is suggested in extremely low birth weight infants.

Persistent Pulmonary Hypertension of the Newborn

Epidemiology

- incidence 1.9 per 1,000 live births

Clinical Presentation

- usually presents within 12 h of birth with severe hypoxemia/cyanosis; may have only mild respiratory distress

Pathophysiology

- persistence of fetal circulation as a result of persistent elevation of pulmonary vascular resistance
- R → L shunt through PDA, foramen ovale → decreased pulmonary blood flow and hypoxemia → further pulmonary vasoconstriction

Risk Factors

- secondary PPHN: asphyxia, MAS, RDS, sepsis, pneumonia, structural abnormalities (e.g. diaphragmatic hernia, pulmonary hypoplasia)
- primary PPHN occurs in absence of risk factors
- more common in term or post-term infants

Investigations

- measure pre- and post-ductal oxygen levels
- hyperoxia test to exclude CHD
- ECG (RV strain)
- Echo reveals increased pulmonary arterial pressure and a R → L shunt across PDA and patent foramen ovale; also used to rule out other cardiac defects

Treatment

- maintain good oxygenation (SaO₂ >95%) in at-risk infants
- O₂ given early and tapered slowly, minimize stress and metabolic demands, maintain normal blood gases, circulatory support
- mechanical ventilation, high frequency oscillation in a sedated muscle-relaxed infant
- nitric oxide, surfactant
- extracorporeal membrane oxygenation used in some centers when other therapy fails

Respiratory Distress in the Newborn

Clinical Presentation

- tachypnea: RR >60/min; tachycardia: HR >160/min
- grunting, subcostal/intercostal indrawing, nasal flaring
- duskiness, central cyanosis
- decreased air entry, crackles on auscultation

Differential Diagnosis of Respiratory Distress

- pulmonary: RDS, TTN, MAS, pleural effusion, pneumothorax, congenital lung malformations
- infectious: sepsis, pneumonia
- cardiac: CHD (cyanotic, acyanotic), PPHN
- hematologic: blood loss, polycythemia
- anatomic: TEF, congenital diaphragmatic hernia, mucous or meconium plug, upper airway obstruction (see [Otolaryngology, OT44](#))
- metabolic: hypoglycemia, inborn errors of metabolism
- neurologic: CNS damage (trauma, hemorrhage), drug withdrawal syndromes

Investigations

- CXR, ABG (or venous blood gas from umbilical venous line)
- CBC, blood cultures, blood glucose
- Echo, ECG if indicated

Table 32. Distinguishing Features of RDS, TTN, MAS

	Respiratory Distress Syndrome (RDS)	Transient Tachypnea of the Newborn (TTN)	Meconium Aspiration Syndrome (MAS)
Etiology	Surfactant deficiency → poor lung compliance due to high alveolar surface tension → atelectasis → ↓ surface area for gas exchange → hypoxia + acidosis → respiratory distress “Hyaline membrane disease”	Delayed resorption of fetal lung fluid → accumulation of fluid in peribronchial lymphatics and vascular spaces → tachypnea “Wet lung syndrome”	Meconium is sterile but causes airway obstruction, chemical inflammation, and surfactant inactivation leading to chemical pneumonitis
Gestational Age	Preterm	Usually term and late preterm	Term and post-term
Risk Factors	Maternal DM Preterm delivery Male sex LBW Acidosis, sepsis Hypothermia Second born twin	Maternal DM Maternal asthma Male sex Macrosomia (>4,500 g) Elective Cesarean section or short labor Late preterm delivery	Meconium-stained amniotic fluid Post-term delivery
Clinical Presentation	Respiratory distress within first few hours of life, worsens over next 24-72 h Hypoxia Cyanosis	Tachypnea within the first few hours of life ± retractions, grunting, nasal flaring Often NO hypoxia or cyanosis	Respiratory distress within hours of birth Small airway obstruction, chemical pneumonitis → tachypnea, barrel chest with audible crackles Hypoxia
CXR Findings	Homogenous infiltrates Air bronchograms Decreased lung volumes May resemble pneumonia (GBS) If severe, “white-out” with no differentiation of cardiac border	Perihilar infiltrates “Wet silhouette”; fluid in fissures	Hyperinflation Patchy atelectasis Patchy and coarse infiltrates 10-20% have pneumothorax
Prevention	Prenatal corticosteroids (e.g. Celestone® 12 mg q24h x 2 doses) if risk of preterm delivery <34 wk Monitor lecithin:sphingomyelin (L/S) ratio with amniocentesis, L/S >2:1 indicates lung maturity	Where possible, avoidance of elective Cesarean delivery, particularly before 38 wk GA	If infant is depressed at birth, intubate and suction below vocal cords Avoidance of factors associated with <i>in utero</i> passage of meconium (e.g. post term delivery)
Treatment	Resuscitation Oxygen Ventilation Surfactant (decreases alveolar surface tension, improves lung compliance, and maintains functional residual capacity)	Supportive Oxygen if hypoxic Ventilator support (e.g. CPAP) IV fluids and NG tube feeds if too tachypneic to feed orally	Resuscitation Oxygen Ventilatory support Surfactant Inhaled nitric oxide Extracorporeal membrane oxygenation for PPHN

Table 32. Distinguishing Features of RDS, TTN, MAS (continued)

	RDS	TTN	MAS
Complications	In severe prematurity and/or prolonged ventilation, increased risk of bronchopulmonary dysplasia	Hypoxemia Hypercapnea Acidosis PPHN	Hypoxemia Hypercapnea Acidosis PPHN Pneumothorax Pneumomediastinum Chemical pneumonitis Secondary surfactant inhibition Respiratory failure
Prognosis	Dependent on GA at birth and severity of underlying lung disease; long-term risks of chronic lung disease	Recovery usually expected in 24-72 h	Dependent on severity, mortality up to 20%

PNEUMONIA

- see *Pediatric Respiriology*, P90
- consider in infants with prolonged or premature rupture of membranes, maternal fever, or if mother is GBS positive
- suspect if infant exhibits respiratory distress, temperature instability, or WBC is low, elevated, or left-shifted
- symptoms may be non-specific
- CXR: hazy lung and/or distinct infiltrates (may be difficult to differentiate from RDS)

Retinopathy of Prematurity

- see *Ophthalmology*, OP41

**Sepsis in the Neonate****Table 33. Sepsis Considerations in the Neonate**

Early Onset (<72 h)	Late Onset (72 h – 28 d)
Vertical transmission, 95% present within 24 h after birth Risk factors: Maternal infection: UTI, GBS positive, previous child with GBS sepsis or meningitis Maternal fever/leukocytosis/chorioamnionitis Prolonged rupture of membranes (>18 h) Preterm labor Pathogens: GBS, <i>E. coli</i> , <i>Listeria</i> most common Pneumonia more common with early onset sepsis	Acquired after birth Most common in preterm infants in NICU (most commonly due to coagulase negative <i>Staphylococcus</i>) Other pathogens implicated include GBS, anaerobes, <i>E. coli</i> , <i>Klebsiella</i>

Signs of Sepsis

- no reliable absolute indicator of occult bacteremia in infants <3 mo, most specific result has been WBC <5
- temperature instability (hypo/hyperthermia)
- respiratory distress, cyanosis, apnea
- tachycardia/bradycardia
- lethargy, irritability
- poor feeding, vomiting, abdominal distension, diarrhea
- hypotonia, seizures, lethargy
- jaundice, hepatomegaly, petechiae, purpura

**Chronic Perinatal Infections****CHEAP TORCHES**

Chicken pox/shingles
Hepatitis B
Epstein-Barr virus
AIDS (HIV)
Parvovirus B19 (erythema infectiosum)
Toxoplasmosis
Other
Rubella virus
Cytomegalovirus/Coxsackievirus
HSV
Every STD
Syphilis

See *Obstetrics*, OB20

Skin Conditions of the Neonate

Table 34. Common Neonatal Skin Conditions

Neonatal Skin Condition	Description
Vasomotor Response (Cutis Marmorata, Acrocyanosis)	Transient mottling when exposed to cold; usually normal, particularly if premature
Vernix Caseosa	Soft, creamy, white layer covering baby at birth
Congenital Dermal Melanocytosis ('Mongolian Spots')	Slate gray macules over lower back and buttocks (may look like bruises); common in dark skinned infants
Capillary Hemangioma	Raised red lesion, which increases in size after birth and involutes; 50% resolved by 5 yr, 90% by 9 yr
Erythema Toxicum	Yellow-white papules surrounded by erythema, eosinophils within the lesions; common rash, resolves by 2 wk
Milia	Lesions 1-2 mm firm white pearly papules on nasal bridge, cheeks, and palate; self-resolving
Pustular Melanosis	Brown macular base with pustules, seen more commonly in African American infants; may be present at birth
Nevus Simplex (Salmon Patch)	Transient macular vascular malformation of the eyelids and/or neck ("Angel Kiss" or "Stork Bite"); most lesions disappear by 1 yr of life
Neonatal Acne	Inflammatory papules and pustules mainly on face; self-resolving

Fluids and Electrolytes

Approach to Infant/Child with Dehydration

Etiology

- decreased intake: poor oral intake during acute illness, breastfeeding difficulties, eating disorders
- increased losses: common sites include GI tract (diarrhea, vomiting, bleeding), skin/mucous membranes (fever, burns, hemorrhage, stomatitis), urine (osmotic diuresis [e.g. hyperglycemia, DKA], diuretic therapy, DI, post-obstructive/post ATN recovery diuresis), and respiratory tract (tachypnea, bronchiolitis, pneumonia)

Management

- if suspect dehydration based on history (acute illness, decreased number of wet diapers, lethargy, changes in mental status, increased thirst, etc.), you must:

1) Determine degree of extracellular volume contraction

Table 35. Assessment of Degree of Extracellular Volume Contraction Based on Physical Exam

	Mild	Moderate	Severe
<2 yr	5%*	10%*	15%*
>2 yr	3%*	6%*	9%*
Pulse	Normal, full	Rapid	Rapid, weak
Blood Pressure	Normal	Low to normal	Decreased in shock (very late finding in pediatrics and very dangerous)
Urine Output	Decreased	Markedly decreased	Anuria
Oral Mucosa	Slightly dry	Dry	Parched
Anterior Fontanelle	Normal	Sunken	Markedly sunken
Eyes	Normal	Sunken	Markedly sunken
Skin Turgor	Normal	Decreased	Tenting
Capillary Refill	Normal (<3 s)	Normal to increased	Increased (>3 s)

* Note that percentages refer to percent loss of pre-illness body weight

2) Determine the likely electrolyte disturbance

- dependent on etiology of dehydration and type of fluid loss (isotonic vs. hypertonic vs. hypotonic)

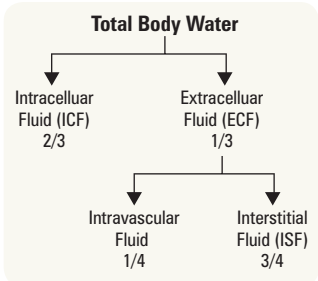

Figure 14. Body fluid compartments

	Electrolyte Concentrations of Na ⁺ and K ⁺ (in mEq/L)		
		ICF	ECF
	Sodium	10	140
	Potassium	150	4

Assessment of Severity of Dehydration

C BASE H₂O

Capillary refill

BP

Anterior fontanelle

Skin turgor

Eyes sunken

HR

Oral mucosa

Output of urine

Table 36. Electrolyte Content of Various Bodily Fluids

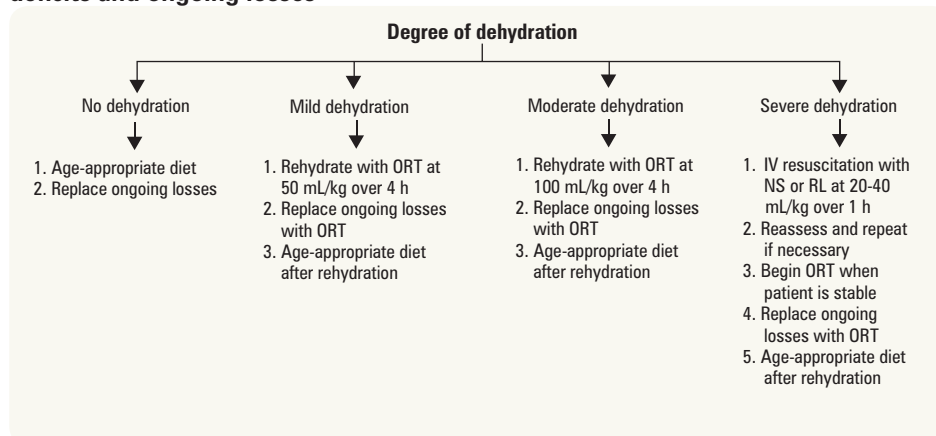

Bodily Fluid	Na ⁺ (mmol/L)	K ⁺ (mmol/L)	Cl ⁻ (mmol/L)	HCO ₃ ⁻ (mmol/L)
Saliva	30-80	20	70	30
Gastric Juice	60-80	15	100	0
Pancreatic Juice	140	5-10	60-90	40-100
Bile	140	5-10	100	40
Small Bowel	140	20	100	25-50
Large Bowel	75	30	30	0
Sweat	20-70	5-10	40-60	0

- for moderate and severe dehydration, initial investigations should include urinalysis and blood work examining electrolyte (Na⁺, K⁺, Cl⁻), glucose, and acid-base (blood pH, pCO₂, HCO₃⁻ disturbances), and impaired renal function (creatinine, BUN)

3) Determine if the child requires PO or IV rehydration

- dehydrated child must receive adequate fluid management, including replacement of ongoing losses and maintenance fluids
- initial management using ORT advantages: ↓ cost, no IV needed, incidence of iatrogenic hyper/hyponatremia, parental involvement in therapy
- indications for IV rehydration therapy: severe dehydration requiring close monitoring and frequent assessment of electrolytes, inability to tolerate ORT (e.g. vomiting, alteration in mental status, ileus, monosaccharide malabsorption, etc.), inability to provide ORT, failure of ORT in providing adequate rehydration (e.g. persistent diarrhea or vomiting)

4) Return the child to a normal volume and electrolyte status by replacing current deficits and ongoing losses

**Figure 15. Algorithm for deficit replacement and replacement of ongoing losses in the dehydrated child**

5) Provide the appropriate fluid and electrolyte maintenance daily requirements

Table 37. Maintenance Fluid Requirements

Body Weight	100:50:20 Rule (24 h maintenance fluids)	4:2:1 Rule (hourly rate of maintenance fluids)
1-10 kg	100 cc/kg/d	4 cc/kg/h
11-20 kg	50 cc/kg/d	2 cc/kg/h
>20 kg	20 cc/kg/d	1 cc/kg/h

- types of fluids used: NS, RL, half NS (0.45% NaCl), 0.2% NS (for neonates only), D5W, and D10W (for neonates only); add potassium chloride if hypokalemic
- in children, all maintenance fluids should have a dextrose component due to their higher risk of hypoglycemia, especially if they are NPO
- common IV fluid combinations used in pediatrics
 - first month of life: D5W/0.2 NS + KCl 20 mEq/L (only add KCl if voiding well)
 - children: D5W/NS + KCl 20 mEq/L or D5W/0.45 NS + KCl 20 mEq/L
 - NS: as bolus to restore circulation in dehydrated children (remains almost entirely distributed in intravascular space)

Special Consideration – SIADH

Clinical Signs: hyponatremia and excretion of concentrated urine

Renal Failure: certain medications (e.g. morphine), post-operative, pain, N/V, pulmonary disease (e.g. pneumonia), CNS disease (e.g. meningitis)

Caution: acute hyponatremia is associated with rapid administration of hypotonic IV, this can lead to cerebral edema and herniation

- most important thing to remember when correcting Na aberrations due to fluid deficits
 - risk of cerebral edema with rapid rehydration with hypotonic or isotonic solutions (i.e. NS), therefore replace fluid slowly with close monitoring; aim to adjust (increase or decrease) plasma [Na⁺] by no more than 12 mmol/L/d
 - management depends on etiology, severity of symptoms, and timing (acute vs. chronic)

6) Continue to monitor fluid and electrolyte status

- accurate monitoring of daily fluid intake (PO and IV) and ongoing losses (urine output, diarrhea, emesis, drains)
- if child receiving >50% of maintenance fluids through IV, serum electrolyte values should be monitored daily and therapy adjusted accordingly
- avoid iatrogenic hyper/hyponatremia, keep the possibility of SIADH in mind

Nephrology

Common Pediatric Renal Diseases

Table 38. Common Manifestations of Renal Disease

Neonate	Common Causes
Flank Mass	Hydronephrosis, polycystic disease (autosomal dominant or recessive subtypes), tumor
Hematuria	Renal vein thrombosis, asphyxia, malformation, trauma
Anuria/Oliguria	Bilateral renal agenesis, obstruction, asphyxia
Child and Adolescent	
Cola/Red-Colored Urine	Acute GN (post-streptococcal, HSP, IgA nephropathy, etc.), hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis)
Gross Hematuria	Urologic disease (nephrolithiasis, trauma, etc.), UTI, acute GN
Edema	Nephrotic syndrome, nephritis, acute/chronic renal failure, consider cardiac or liver disease
HTN	GN, renal failure, dysplasia (consider coarctation, drugs, endocrine causes)
Polyuria	DM, central and nephrogenic DI, renal Fanconi's syndrome (genetic/metabolic/acquired causes), hypercalcemia, polyuric renal failure (renal dysplasia)
Proteinuria	Orthostatic, nephrotic syndrome (MCD, etc.), GN
Oliguria	Dehydration, ATN, interstitial nephritis, acute or chronic kidney disease (i.e. renal failure)
Urgency	UTI, vulvovaginitis

Hemolytic Uremic Syndrome

Definition

- simultaneous occurrence of the triad of 1) non-immune microangiopathic hemolytic anemia, 2) thrombocytopenia, and 3) acute renal injury

Epidemiology

- annual incidence of 1-2 per 100,000 in Canada
- most common cause of acute renal failure in children

Etiology

- diarrhea positive HUS: 90% of pediatric HUS from *E. coli* O157:H7, shiga toxin, or verotoxin
- diarrhea negative HUS: other bacteria, viruses, familial, drugs, familial/genetic

Pathophysiology

- toxin binds, invades, and destroys colonic epithelial cells, causing bloody diarrhea
- toxin enters the systemic circulation, attaches, and injures endothelial cells (especially in kidney), causing a release of endothelial products (e.g. von Willebrand factor, platelet aggregating factor)
- platelet/fibrin thrombi form in multiple organ systems (e.g. kidney, pancreas, brain, etc.) resulting in thrombocytopenia
- RBCs are forced through occluded vessels, resulting in fragmented RBCs (schistocytes) that are removed by the reticuloendothelial system (hemolytic anemia)

History and Physical Exam

- history: initial presentation of abdominal pain and diarrhea, followed by bloody diarrhea; within 5-7 d begins to show signs of anemia, thrombocytopenia, and renal insufficiency
- physical exam: pallor, jaundice (hemolysis), edema, petechiae, HTN

Investigations

- CBC (anemia, thrombocytopenia), blood smear (schistocytes), electrolytes, renal function, urinalysis (microscopic hematuria), stool cultures, and verotoxin/shigella toxin assay

Management

- mainly supportive: nutrition, hydration, ventilation (if necessary), blood transfusion for symptomatic anemia
- monitor electrolytes and renal function: dialysis if electrolyte abnormality (hyperkalemia) cannot be corrected, fluid overload, or uremia
- steroids are not helpful
- antibiotics are contraindicated because death of bacteria leads to increased toxin release and worse clinical course

Prognosis

- 5-10% mortality, 10-30% long-term renal damage (HTN, proteinuria, decreased renal function)

Nephritic Syndrome

Definition

- acute or chronic syndrome affecting the kidney, characterized by glomerular injury and inflammation, and defined by hematuria (>5 RBCs per high-powered microscope field) and the presence of dysmorphic RBCs and RBC casts on urinalysis
- often accompanied by at least one of proteinuria (<50 mg/kg/d), edema, HTN, azotemia, and oliguria

Epidemiology

- highest incidence in children aged 5-15 yr old

Etiology

- humoral immune response to a variety of etiologic agents → immunoglobulin deposition → complement activation, leukocyte recruitment, release of growth factors/cytokines → glomerular inflammation and injury → porous podocytes → hematuria + RBC casts ± proteinuria
- HTN secondary to fluid retention and increased renin secretion by ischemic kidneys

Nephritic Syndrome

PHAROH

Proteinuria (<50 mg/kg/d)
Hematuria
Azotemia
RBC casts
Oliguria
HTN

Table 39. Major Causes of Nephritic Syndrome

	Decreased C3	Normal C3
Primary (idiopathic)	Post-infectious GN (most common cause of acute GN in pediatrics) Membranoproliferative <ul style="list-style-type: none"> • Type I (50-80%) • Type II (>80%) 	IgA nephropathy Idiopathic rapidly progressive GN Anti-GBM disease
Secondary (systemic disease)	SLE Bacterial endocarditis Abscess or shunt nephritis Cryoglobulinemia	HSP (very common) Polyarteritis nodosa Granulomatosis with polyangiitis Goodpasture's syndrome

Risk Factors

- see *Major Causes of Nephritic Syndrome*, above

History and Physical Exam

- often asymptomatic; some overlap in clinical findings for nephritic and nephrotic syndrome
- gross hematuria, mild-moderate edema, oliguria, HTN
- signs and symptoms suggestive of underlying systemic causes (e.g. fever, arthralgias, rash, dyspnea, pulmonary hemorrhage)

Investigations

- urine
 - dipstick (hematuria, 0 to 2+ proteinuria) and microscopy (>5 RBCs per high-powered microscope field, acanthocytes, RBC casts)
 - first morning urine protein/creatinine ratio (<200 mg/mmol)

- blood work
 - impaired renal function (\uparrow Cr and BUN) resulting in \downarrow pH and electrolyte abnormalities (hyperkalemia, hyperphosphatemia, hypocalcemia)
 - mild anemia on CBC (secondary to hematuria)
 - hypoalbuminemia (secondary to proteinuria)
 - appropriate investigations to determine etiology: C3/C4 levels, serologic testing for recent streptococcal infection (ASOT, anti-hyaluronidase, anti-streptokinase, anti-NAD, anti-DNAse B), ANA, anti-DNA antibodies, ANCA, serum IgA levels, anti-GBM antibodies
- renal biopsy should be considered only in the presence of acute renal failure, no evidence of streptococcal infection, normal and C3/C4

Management

- treat underlying cause
- symptomatic
 - renal insufficiency: supportive (dialysis if necessary), proper hydration
 - HTN: salt and fluid restriction (but not at expense of renal function), ACE inhibitors or ARBs for chronic persistent HTN (not acute cases because ACE inhibitors or ARBs may decrease GFR further)
 - edema: salt and fluid restriction, possibly diuretics (avoid if significant intravascular depletion)
- corticosteroids if indicated: IgA nephropathy, lupus nephritis, etc.

Prognosis

- dependent on underlying etiology
- complications include HTN, heart failure, pulmonary edema, chronic kidney injury (requiring renal transplant)

Nephrotic Syndrome

Definition

- clinical syndrome affecting the kidney, characterized by significant proteinuria, peripheral edema, hypoalbuminemia, and hyperlipidemia

Epidemiology

- highest incidence in children 2-6 yr old, M>F

Etiology

- primary (idiopathic): nephrotic syndrome in the absence of systemic disease (most common cause in pediatrics)
 - glomerular inflammation ABSENT on renal biopsy: MCD (85%), focal segmental glomerular sclerosis
 - glomerular inflammation PRESENT on renal biopsy: membranoproliferative GN, IgA nephropathy
- secondary: nephrotic syndrome associated with systemic disease or due to another process causing glomerular injury (<10% in pediatrics)
 - autoimmune: SLE, DM, rheumatoid arthritis
 - genetic: sickle cell disease, Alport syndrome
 - infections: hepatitis B/C, post-streptococcal, infective endocarditis, HUS, HIV
 - malignancies: leukemia, lymphoma
 - medications: captopril, penicillamine, NSAIDs, antiepileptics
 - vasculitides: HSP, granulomatosis with polyangiitis
- congenital: congenital nephropathy of the Finnish type, Denys-Drash syndrome, etc.

Risk Factors

- family history, certain systemic illnesses and medications (as per *Etiology*)

History and Physical Exam

- non-specific (e.g. irritability, malaise, fatigue, anorexia, diarrhea)
- edema
 - often first sign; detectable when fluid retention exceeds 3-5% of body weight
 - starts periorbital and often pretibial \rightarrow edematous areas are white, soft, and pitting
 - gravity dependent: periorbital edema \downarrow and pretibial edema \uparrow over the day
 - anasarca may develop (i.e. marked periorbital and peripheral edema, ascites, pleural effusions, scrotal/labial edema)
- decrease in effective circulating volume (e.g. tachycardia, HTN, oliguria, etc.)
- foamy urine is a possible sign of proteinuria

PALE

Proteinuria (>50 mg/kg/d)
HypoAlbuminemia (<20 g/L)
HyperLipidemia
Edema

Daily protein excretion can be estimated from a random urine protein/creatinine ratio

Investigations

- urine
 - urine dipstick (3 to 4+ proteinuria, microscopic hematuria) and microscopy (oval fat bodies, hyaline casts)
 - first morning urine protein/creatinine ratio (>200 mg/mmol)
- blood work
 - diagnostic: hypoalbuminemia (<25 g/L), hyperlipidemia/hypercholesterolemia (total cholesterol >5 mmol/L)
 - secondary: electrolytes (hypocalcemia, hyperkalemia, hyponatremia), renal function (↑ BUN and Cr), coagulation profile (↓ PTT)
 - appropriate investigations to rule out secondary causes: CBC, blood smear, C3/C4, ANA, hepatitis B/C titers, ASOT, HIV serology, etc.
- consider renal biopsy if: HTN, gross hematuria, ↓ renal function, low serum C3/C4, no response to steroids after 4 wk of therapy, frequent relapses (>2 in 6 mo), presentation before first year of life (high likelihood of congenital nephrotic syndrome), presentation ≥12 yr (rule out more serious renal pathology than MCD)

Management

- MCD: oral prednisone 2 mg/kg/d (or equivalent) for up to 12 wk → varicella status should be known before starting
- consider cytotoxic agents, immunomodulators, or high-dose pulse corticosteroid if steroid resistant
- symptomatic
 - edema: salt and fluid restriction, possibly diuretic (avoid if significant intravascular depletion); furosemide + albumin for anasarca
 - hyperlipidemia: generally resolves with remission; limit dietary fat intake; consider statin therapy if persistently nephrotic
 - hypoalbuminemia: IV albumin and furosemide not routinely given; consider if refractory edema
 - abnormal BP: control BP; fluid resuscitation if severe intravascular depletion; ACEI or ARBs for persistent HTN
- diet: no added salt; monitor caloric intake and supplement with Ca²⁺ and Vit D if on corticosteroids
- daily weights and BP to assess therapeutic progress
- secondary infections: treat with appropriate antimicrobials; antibiotic prophylaxis not recommended; pneumococcal vaccine at diagnosis and varicella vaccine after remission; varicella Ig + acyclovir if exposed while on corticosteroids
- secondary hypercoagulability: mobilize, avoid hemoconcentration due to hypovolemia, prompt sepsis treatment; heparin if thrombi occur

Long-Term Steroid Use Associations:

- Increased appetite
- Impaired growth
- Behavioral changes
- Risk of infection
- Salt and water retention
- HTN
- Bone demineralization

Prognosis

- generally good: 80% of children responsive to corticosteroids
- up to 2/3 experience relapse, often multiple times; sustained remission with normal kidney function usually by adolescence
- complications: ↑ risk of infections (spontaneous peritonitis, cellulitis, sepsis); hypercoagulability due to decreased intravascular volume and antithrombin III depletion (PE, renal vein thrombosis); intravascular volume depletion, leading to hypotension, shock, renal failure; side effects of drugs

Hypertension in Childhood

Definition

- HTN: sBP and/or dBP ≥95th percentile for sex, age, and height on ≥3 occasions
- pre-HTN: sBP and/or dBP ≥90th percentile but <95th percentile OR BP ≥120/80 irrespective of age, gender, and height

Table 40. 95th Percentile Blood Pressures (mmHg)

Age (Yr)	Female		Male	
	50th Percentile for Height	75th Percentile for Height	50th Percentile for Height	75th Percentile for Height
1	104/58	105/59	102/57	104/58
6	111/73	112/73	114/74	115/75
12	123/80	124/81	123/81	125/82
17	129/84	130/85	136/87	138/88

Adapted from: Update on the 1987 Task Force Report on High Blood Pressure in Children and Adolescents Working Group Report from the National High Blood Pressure Education Program

Epidemiology

- increasing prevalence of both HTN and pre-HTN over the last 25+ yr
- prevalence: 3-5% for HTN, 7-10% for pre-HTN; M>F

Etiology

- primary HTN
 - diagnosis of exclusion
 - most common in older children (≥ 10 yr), especially if positive family history, overweight, and only mild HTN
 - responsible for ~90% of cases of HTN in adolescents, rarely in young children
- secondary HTN
 - identifiable cause of HTN (most likely etiology depends on age)
 - responsible for majority of childhood HTN
- always consider white coat HTN for all ages

Table 41. Etiology of Secondary HTN by Age Group

System	Neonates	1 mo-6 yr	7-12 yr	>13 yr
Endocrine/Metabolic	CAH	Wilms' tumor (\uparrow renin) Neuroblastoma (\uparrow catecholamines)	Endocrinopathies*	Endocrinopathies*
Renal	Congenital renal disease	Renal parenchymal disease	Renal parenchymal disease	Renal parenchymal disease
Vascular	Coarctation of the aorta Renal artery thrombosis	Coarctation of the aorta RAS	Renovascular abnormalities	
Drugs		Corticosteroids Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus	Corticosteroids OCP Cyclosporine and tacrolimus Recreational drugs (amphetamines, cocaine, etc.)

*Note: may include hyperthyroidism, hyperparathyroidism, Cushing's syndrome, primary hyperaldosteronism/Conn's syndrome, pheochromocytoma

Risk Factors

- primary HTN: male gender, positive family history, metabolic syndrome, obstructive sleep apnea, African American, prematurity/LBW
- secondary HTN: history of renal disease, abdominal trauma, family history of autoimmune diseases, umbilical artery catheterization

History

- often asymptomatic, but can include FTT, fatigue, epistaxis
- symptoms of hypertensive emergency
 - neurologic: headache, seizures, focal complaints, change in mental status, visual disturbances
 - cardiovascular: symptoms of MI or heart failure (chest pain, palpitations, cough, SOB)
- symptoms of secondary HTN: guided by etiology; ask about medications and recreational drugs (current and past)

Physical Exam

- BP measurement (make sure correct cuff size is used), plot on growth chart, BMI
- look for signs of hypertensive emergency (e.g. full neurologic exam, ophthalmoscopy, precordial exam, peripheral pulses, perfusion status)
- look for signs of secondary HTN

Investigations

- laboratory
 - urine dipstick for hematuria and/or proteinuria (renal disease), urine catecholamines (pheochromocytoma, neuroblastoma)
 - blood work: renal function tests (electrolytes, Cr, BUN), consider renin and aldosterone levels (RAS, Conn's syndrome, Wilms' tumor)
 - other specific hormones if indicated on history and physical
- imaging: Echo (coarctation, heart function), abdominal U/S (RAS, abdominal mass), renal radionuclide imaging (renal scarring)
- other: ocular exam

Management

- treat underlying cause
- non-pharmacologic: modify concurrent cardiovascular risk factors (weight reduction, exercise, salt restriction, smoking cessation)
- pharmacologic: gradual lowering of BP using thiazide diuretics; no antihypertensives have been formally studied in children; if hypertensive emergencies use hydralazine, labetalol, sodium nitroprusside

Signs of Secondary HTN

- Edema (renal parenchymal disease)
- Abdominal or renal bruit (RAS)
- Differential 4 limb BP/diminished femoral pulses (coarctation)
- Abdominal mass (Wilms', neuroblastoma)
- Goiter/skin changes (hyperthyroidism)
- Ambiguous genitalia (CAH)

Pediatric BP Calculation

$$\text{sBP} = \text{age} \times 2 + 90$$

$$\text{dBP} = 2/3 \times \text{sBP}$$

- management of end-organ damage (e.g. retinopathy, LVH)
- consider referral to specialist

Prognosis

- end-organ damage (similar to adults) including LVH, CHF, cerebrovascular insults, renal disease, retinopathy

Neurology

Seizure Disorders

- see [Neurology](#), N16

Differential Diagnosis of Seizures in Children

- benign febrile seizure
- CNS: infection, tumor, HIE, trauma, hemorrhage
- metabolic: hypoglycemia, hypocalcemia, hyponatremia
- idiopathic epilepsy and epileptic syndromes
- others: neurocutaneous syndromes, AVM, drug ingestions/withdrawal
- seizure mimics

Investigations

- lab tests: CBC, electrolytes, calcium, magnesium, glucose
- toxicology screen if indicated
- EEG
- CT/MRI, if indicated (focal neurological deficit or has not returned to baseline several hours after seizure)
- consider LP if first-time non-febrile seizure (not indicated for determining recurrence risk of benign febrile seizures or to determine seizure type or epileptic syndrome)

CHILDHOOD EPILEPTIC SYNDROMES

Infantile Spasms

- brief, repeated symmetric contractions of neck, trunk, extremities (flexion and extension) lasting 10-30 s
- occur in clusters; often associated with developmental delay; onset 4-8 mo
- 20% unknown etiology (usually good response to treatment); 80% due to metabolic or developmental abnormalities, encephalopathies, or are associated with neurocutaneous syndromes (usually poor response to treatment)
- can develop into West syndrome (infantile spasms, psychomotor developmental arrest, and hyperarrhythmia) or Lennox-Gastaut (see below)
- typical EEG: hyperarrhythmia (high voltage slow waves, spikes and polyspikes, background disorganization)
- management: ACTH, vigabatrin, benzodiazepines

Lennox-Gastaut

- characterized by triad of 1) multiple seizure types, 2) diffuse cognitive dysfunction, and 3) slow generalized spike and slow wave EEG
- onset commonly 3-5 yr of age
- seen with underlying encephalopathy and brain malformations
- management: valproic acid, benzodiazepines, and ketogenic diet; however, response often poor

Juvenile Myoclonic Epilepsy (Janz Syndrome)

- myoclonus particularly in morning; frequently presents as generalized tonic-clonic seizures
- adolescent onset (12-16 yr of age); autosomal dominant with variable penetrance
- typical EEG: 3.5-6 Hz irregular spike and wave, increased with photic stimulation
- management: lifelong treatment (valproic acid); excellent prognosis

Childhood Absence Epilepsy

- multiple daily absence seizures lasting <30 s without post-ictal state that may resolve spontaneously or become generalized in adolescence
- peak age of onset 6-7 yr, F>M, strong genetic predisposition
- typical EEG: 3 Hz spike and wave
- management: valproic acid or ethosuximide

Heart problems, such as long QT syndrome and hypertrophic cardiomyopathy, are often misdiagnosed as epilepsy. Include cardiac causes of syncope in your differential diagnosis, particularly when the episodes occur during physical activity.

Seizure Mimics

- Benign paroxysmal vertigo
- Breath holding
- Hypoglycemia
- Narcolepsy
- Night terror
- Pseudoseizure
- Syncope
- TIA
- Tic

Ketogenic Diet and Other Dietary Treatments for Epilepsy

Cochrane DB Syst Rev 2012;3:CD001903

Study: Systematic review of all studies of ketogenic and related diets. Included the review of 4 RCTs, 6 prospective studies, and 5 retrospective studies.

Population: Adults and children with diagnosed epilepsy of any type.

Intervention: Ketogenic diet, control (placebo diet, any treatment with known antiepileptic properties).

Main Outcome Measure: Seizure control at 3, 6, 12 mo.

Results: Studies showed a response rate of at least 38-50% seizure reduction at 3 mo. This response was maintained for up to a year. A range of side effects were reported. The most frequent were gastrointestinal effects (30%).

Conclusion: The ketogenic diet is a valid option for people with medically-intractable epilepsy.

Benign Focal Epilepsy of Childhood with Rolandic/Centrotemporal Spikes

- focal motor seizures involving tongue, mouth, face, upper extremity usually occurring in sleep-wake transition states; remains conscious, but aphasic post-ictally
- onset peaks at 5-10 yr of age; 16% of all non-febrile seizures; remits spontaneously in adolescence without sequelae
- typical EEG: repetitive spikes in centrotemporal area with normal background
- management: frequent seizures controlled by carbamazepine, no medication if infrequent seizures

General Approach to Treatment

- education for patient and parents including education and precautions in daily life (e.g. buddy system, showers instead of baths)
- medication
 - initiate: treatment with drug appropriate to seizure type; often if >2 unprovoked afebrile seizures within 6-12 mo
 - optimize: start with one drug and increase dosage until seizures controlled
 - if no effect, switch over to another before adding a second antiepileptic drug
 - continue antiepileptic drug therapy until patient free of seizures for >2 yr, then wean over 4-6 mo
- ketogenic diet (high fat diet): used in patients who do not respond to polytherapy or who do not wish to take medication (valproic acid contraindicated in conjunction with ketogenic diet because may increase hepatotoxicity)
- legal obligation to report to Ministry of Transportation if patient wishes to drive

Generalized and Partial Seizures

- see [Neurology, N16](#)

Febrile Seizures

Epidemiology

- most common cause of seizure in children (3-5% of children)
- M>F; age 6 mo-6 yr

Clinical Presentation

- often with associated illness or fever and family history
- no evidence of CNS infection/inflammation before or after seizure; no history of non-febrile seizures

Table 42. Comparison of Typical and Atypical Febrile Seizures

Simple/Typical (70-80%)	Complex/Atypical (20-30%)
All of the following: <ul style="list-style-type: none"> • Duration <15 min (95% <5 min) • Generalized tonic-clonic • No recurrence in 24 h period • No neurological impairment or developmental delay before or after seizure 	At least one of the following: <ul style="list-style-type: none"> • Duration >15 min • Focal onset or focal features during seizure • Recurrent seizures (>1 in 24 h period) • Previous neurological impairment or neurological deficit after seizure

Workup

- history: determine focus of fever, description of seizure, medications, trauma history, development, family history
- physical exam: LOC, signs of meningitis, neurological exam, head circumference, focus of infection
- septic workup including LP if suspecting meningitis (strongly consider if child <12 mo; consider if child is 12-18 mo; only if meningeal sign present if child >18 mo)
- if typical febrile seizure, investigations only for determining focus of fever
- EEG/CT/MRI brain not warranted unless atypical febrile seizure or abnormal neurologic findings

Management

- counsel and reassure patient and parents
 - febrile seizures do not cause brain damage
 - very small risk of developing epilepsy: 9% in child with multiple risk factors; 2% in child with typical febrile seizures compared to 1% in general population
 - 33% chance of recurrence (mostly within 1 yr of first seizure and in children <1 yr old)
- antipyretics and fluids for comfort (though neither prevent seizure)

- prophylaxis with antiepileptic drugs not recommended
- if high risk for recurrent or prolonged seizures, have rectal or sublingual lorazepam at home
- treat underlying cause of fever

Recurrent Headache

- see [Neurology, N43](#)

Differential Diagnosis

- primary headache: tension, migraine, cluster
- secondary headache: see [Neurology, N43](#)

General Assessment

- if unremarkable history and neurological and general physical exam is negative, most likely diagnosis is migraine or tension headache
- CT or MRI if history or physical reveals red flags
- inquire about level of disability, academic performance, after-school activities

Headache – Red Flags

- New headache
- Worst headache of their life
- Acute onset
- Focal neurological deficits
- Constitutional symptoms
- Worse in morning
- Worse with bending over, coughing, straining
- Change in LOC
- Sudden mood changes
- Disturbed sleep
- Fatigue
- Withdrawal from social activities

Hypotonia

- decreased resistance to passive movements – “floppy baby”

Differential Diagnosis

- central: chromosomal (DS, Prader-Willi, Fragile X syndrome), metabolic (hypoglycemia, kernicterus), perinatal problems (asphyxia, ICH), endocrine (hypothyroidism, hypopituitarism), systemic illness (TORCH infection, sepsis, dehydration), CNS malformations, dysmorphic syndromes
- peripheral: motor neuron (spinal muscular atrophy, polio), peripheral nerve (Charcot-Marie-Tooth syndrome) neuromuscular junction (myasthenia gravis), muscle fiber (mitochondrial myopathy, muscular dystrophy, myotonic dystrophy)

History and Physical Exam

- proper assessment of tone requires accurate determination of GA
- differentiate between UMN and LMN lesion: spontaneous posture (spontaneous movement, movement against gravity, frog-leg position); muscle weakness; joint mobility (hyperextensibility); muscle bulk; presence of fasciculations
- postural maneuvers
 - traction response: pull to sit, look for flexion of arms to counteract traction and head lag
 - axillary suspension: suspend infant by holding at axilla and lifting; hypotonic babies will slip through grasp because of low shoulder girdle tone
 - ventral suspension: infant is prone and supported under the abdomen by one hand; infant should be able to hold up extremities; inverted “U” posturing demonstrates hypotonia
- dysmorphic features, cognitive ability, reflexes, strength

Causes of hypotonia that respond to rapid treatment: hypokalemia, hypermagnesemia, acidemia, toxins, drugs, hypoglycemia, seizure, infection, intracranial bleeding, hydrocephalus

Investigations

- rule out systemic disorders (e.g. electrolytes, ABG, blood glucose, CK, and serum/urine investigations for multiple etiologies including mitochondrial causes)
- neuroimaging: MRI/MRA when indicated
- EMG, muscle biopsy/NCS
- chromosome analysis, genetic testing, metabolic testing, neuromuscular testing

Treatment

- depends on etiology: some treatments available for specific diagnosis
- counsel parents on prognosis and genetic implications
- refer patients for specialized care, refer for rehabilitation, OT, PT, assess feeding ability

Cerebral Palsy

Definition

- a symptom complex, not a disease
- non-progressive central motor impairment syndrome due to insult to or anomaly of the immature CNS
- incidence: 1.5-2.5/1,000 live births (industrialized nations)
- life expectancy is dependent on the degree of mobility and intellectual impairment, not on severity of CNS lesion

Etiology

- often obscure, no definite etiology identified in 1/3 of cases
- 10% related to intrapartum asphyxia; 10% due to postnatal insult (infections, asphyxia, prematurity with IVH and trauma)
- association with LBW babies

Clinical Presentation

- general signs: delay in motor milestones, developmental delay, learning disabilities, visual/hearing impairment, seizures, microcephaly, uncoordinated swallow (aspiration)

Table 43. Types of Cerebral Palsy

Type	% of Total	Characteristics	Area of Brain Involved
Spastic	70-80%	Truncal hypotonia in first yr Increased tone, increased reflexes, clonus Can affect one limb (monoplegia), one side of body (hemiplegia), both legs (diplegia), or both arms and legs (quadriplegia)	UMN of pyramidal tract Diplegia associated with periventricular leukomalacia in premature babies Quadriplegia associated with HIE (asphyxia), higher incidence of intellectual disability
Athetoid/Dyskinetic	10-15%	Athetosis (involuntary writhing movements) ± chorea (involuntary jerky movements) Can involve face, tongue (results in dysarthria)	Basal ganglia (may be associated with kernicterus)
Ataxic	<5%	Poor coordination, poor balance (wide based gait) Can have intention tremor	Cerebellum
Mixed	10-15%	More than one of the above motor patterns	

Investigations

- may include metabolic screen, chromosome studies, serology, neuroimaging, EMG, EEG (if seizures), ophthalmology assessment, audiology assessment

Treatment

- maximize potential through multidisciplinary services such as primary care physician, OT, PT, SLP, school supports, etc.
- orthopedic management (e.g. dislocations, contractures, rhizotomy)
- management of symptoms: spasticity (baclofen, Botox®), constipation (stool softeners)

Neurocutaneous Syndromes

- characterized by tendency to form tumors of the CNS, PNS, viscera, and skin

NEUROFIBROMATOSIS TYPE I

- autosomal dominant but 50% are the result of new mutations
- also known as von Recklinghausen disease
- incidence 1:3,000, mutation in *NF1* gene on 17q11.2 (codes for neurofibromin protein)
- learning disorders, abnormal speech development, and seizures are common
- diagnosis of NF-1 requires 2 or more of
 - ≥6 café-au-lait spots (>5 mm if prepubertal, >1.5 cm if postpubertal)
 - ≥2 neurofibromas of any type or one plexiform neurofibroma
 - ≥2 Lisch nodules (hamartomas of the iris)
 - optic glioma
 - freckling in the axillary or inguinal region
 - a distinctive bony lesion (e.g. sphenoid dysplasia, cortical thinning of long bones)
 - a first degree relative with confirmed NF-1

NEUROFIBROMATOSIS TYPE II

- autosomal dominant
- incidence 1:33,000
- characterized by predisposition to form intracranial, spinal tumors
- diagnosed when either bilateral vestibular schwannomas are found, or a first-degree relative with NF-2 and either a neurofibroma, meningioma, glioma, or schwannoma is found
- also associated with posterior subcapsular cataracts
- treatment consists of monitoring for tumor development and surgery

In neurocutaneous syndromes, the younger the child at presentation, the more likely they are to develop mental retardation

Respirology

Approach to Dyspnea

- determine if patient is sick or not sick; ABCs
- history: onset, previous episodes, precipitating events, associated symptoms, past medical/family history of respiratory disease
- physical exam: vitals, SpO₂, evidence of cyanosis, respiratory, cardiovascular
- investigations: CBC and differential, electrolytes, BUN, Cr, NP swab, ABG, CXR, ECG (based on clinical findings)

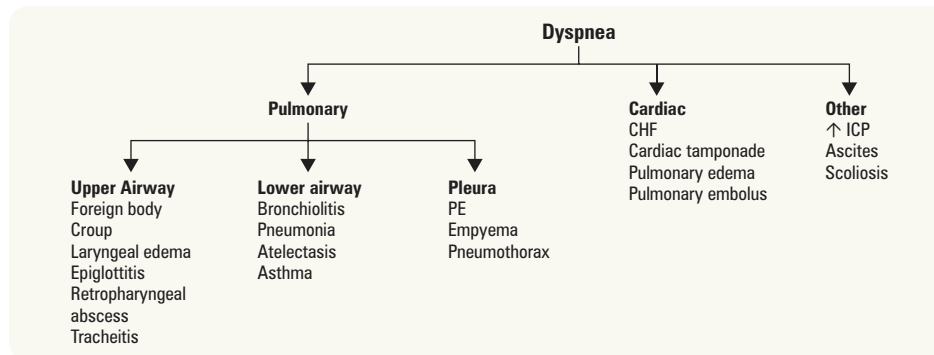

Figure 16. Approach to dyspnea in childhood

Upper Respiratory Tract Diseases

- see [Otolaryngology](#), OT45
- diseases above the thoracic inlet characterized by inspiratory stridor, hoarseness, and suprasternal retractions
- differential diagnosis of stridor: croup, bacterial tracheitis, epiglottitis, foreign body aspiration, subglottic stenosis (congenital or iatrogenic), laryngomalacia/tracheomalacia (collapse of airway cartilage on inspiration)

Table 44. Common Upper Respiratory Tract Infections in Children

	Croup (Laryngotracheobronchitis)	Bacterial Tracheitis	Epiglottitis
Anatomy	Subglottic laryngitis	Subglottic tracheitis	Supraglottic laryngitis
Epidemiology	Common in children <6 yr, with peak incidence between 7-36 mo Common in fall and early winter	Rare All age groups	Very rare – due to Hib vaccination Usually older (2-6 yr)
Etiology	Parainfluenza (75%) Influenza A and B RSV Adenovirus	<i>S. aureus</i> <i>H. influenzae</i> α -hemolytic strep Pneumococcus <i>M. catarrhalis</i>	<i>H. influenzae</i> β -hemolytic strep
Clinical Presentation	Common prodrome: rhinorrhea, pharyngitis, cough \pm low-grade fever Hoarse voice Barking cough Stridor Worse at night	Similar symptoms as croup, but more rapid deterioration with high fever Toxic appearance Does not respond to croup treatments	Toxic appearance Rapid progression 4 Ds – drooling, dysphagia, dysphonia, distress Stridor Tripod position Sternal recession Anxious Fever ($>102.2^{\circ}\text{F}/39^{\circ}\text{C}$)
Investigations	Clinical diagnosis CXR in atypical presentation: “steeple sign” from subglottic narrowing	Clinical diagnosis Endoscopy: definitive diagnosis	Clinical diagnosis Avoid examining the throat to prevent further respiratory exacerbation
Treatment	No evidence for humidified O ₂ Dexamethasone: PO 1 dose Racemic epinephrine: nebulized, 1-3 doses, q1-2h Intubation if unresponsive to treatment	Usually requires intubation IV antibiotics	Intubation Antibiotics Prevented with Hib vaccine

Lower Respiratory Tract Diseases

- obstruction of airways below thoracic inlet, produces more expiratory sounds
- classic symptom: wheezing

Differential Diagnosis of Wheezing

- common: asthma (recurrent wheezing episodes, identifiable triggers, typically over 6 yr), bronchiolitis (first episode of wheezing, usually under 1 yr), recurrent aspiration (often neurological impairment), pneumonia (fever, cough, malaise)
- uncommon: foreign body (acute unilateral wheezing and coughing), CF (prolonged wheezing, unresponsive to therapy), bronchopulmonary dysplasia (often develops after prolonged ventilation in the newborn)
- rare: CHF, mediastinal mass, bronchiolitis obliterans, tracheobronchial anomalies

Pneumonia

Etiology

- inflammation of pulmonary tissue, associated with consolidation of alveolar spaces

Clinical Presentation

- incidence is greatest in first year of life with viral causes being most common in children <5 yr
- cough, wheeze, stridor, fever, tachypnea
- CXR: diffuse, streaky infiltrates bilaterally
- bacterial causes may present with cough, fever, chills, dyspnea, more dramatic CXR changes (e.g. lobar consolidation, pleural effusion)

Management

- supportive therapy: hydration, antipyretics, humidified O₂

Table 45. Common Causes and Treatment of Pneumonia at Different Ages

Age	Bacterial	Viral	Atypical Bacteria	Treatment
Neonates	GBS <i>E. coli</i> <i>Listeria</i>	CMV Herpes virus Enterovirus	<i>Mycoplasma hominis</i> <i>Ureaplasma urealyticum</i>	Ampicillin + gentamicin / tobramycin (add erythromycin if suspect <i>Chlamydia</i>)
1-3 mo	<i>S. aureus</i> <i>H. influenzae</i> <i>S. pneumoniae</i> <i>B. pertussis</i>	CMV, RSV Influenza Parainfluenza	<i>Chlamydia trachomatis</i> <i>Ureaplasma urealyticum</i>	Cefuroxime OR ampicillin ± erythromycin OR clarithromycin
3 mo-5 yr	<i>S. pneumoniae</i> <i>S. aureus</i> <i>H. influenzae</i> GAS	RSV Adenovirus Influenza	<i>Mycoplasma pneumoniae</i> TB	Amoxicillin (if mild) OR ampicillin OR cefuroxime
>5 yr	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>S. aureus</i>	Influenza Varicella Adenovirus	<i>Mycoplasma pneumoniae</i> <i>Chlamydia pneumoniae</i> TB <i>Legionella pneumophila</i>	Erythromycin OR clarithromycin (1st line) OR ampicillin OR cefuroxime

Bronchiolitis

Definition

- LRTI that has wheezing and signs of respiratory distress

Epidemiology

- the most common LRTI in infants, affects 50% of children in first 2 yr of life; peak incidence at 6 mo, winter or early spring
- increased incidence of asthma in later life

Etiology

- RSV (>50%), parainfluenza, influenza, rhinovirus, adenovirus, *M. pneumoniae* (rare)

Clinical Presentation

- prodrome of URTI with cough and fever
- feeding difficulties, irritability
- wheezing, crackles, respiratory distress, tachypnea, tachycardia, retractions, poor air entry; symptoms often peak at 3-4 d

Investigations

- CXR (only in severe disease, poor response to therapy, chronic episode): air trapping, peribronchial thickening, atelectasis, increased linear markings
- NP swab: direct detection of viral antigen (immunofluorescence)
- WBC can be normal

Treatment

- self-limiting disease with peak symptoms usually lasting 2-3 wk
- mild to moderate distress
 - supportive: PO or IV hydration, antipyretics for fever, regular or humidified high flow O₂
- severe distress
 - as above ± intubation and ventilation as needed
 - consider rebetol (Ribavirin®) in high risk groups: bronchopulmonary dysplasia, CHD, congenital lung disease, immunodeficient
- monthly RSV-Ig or palivizumab (monoclonal antibody against the F-glycoprotein of RSV) is protective against severe disease in high risk groups; case fatality rate <1%
- antibiotics have no therapeutic value unless there is secondary bacterial pneumonia
- indications for hospitalization
 - hypoxia: O₂ saturation <92% on initial presentation
 - persistent resting tachypnea >60/min and retractions after several salbutamol masks
 - past history of chronic lung disease, hemodynamically significant cardiac disease, neuromuscular problem, immunocompromised
 - young infants <6 mo old (unless extremely mild)
 - significant feeding problems
 - social problem (e.g. inadequate care at home)

Bronchodilators for Bronchiolitis

Cochrane DB Syst Rev 2010;12:CD001266

Study: Meta-analysis of prospective, randomized, double-blinded, placebo-controlled trials.

Patients: 1,912 infants (28 trials) up to 24 mo old with bronchiolitis.

Intervention: Bronchodilators (including albuterol, salbutamol, terbutaline, ipratropium bromide, and adrenergic agents) given oral, subcutaneous, or nebulized vs. placebo.

Main Outcome: Oxygen saturation.

Results: No clinically significant difference for infants treated with bronchodilators vs. placebo for bronchiolitis. Given the costs and side effects, it is not recommended to use bronchodilators as management for bronchiolitis in infants.

Children with bronchiolitis do not respond to ipratropium bromide (Atrovent®) or steroids

Asthma

Definition

- see [Respirology, R7](#)
- characterized by recurrent episodes of airway hyperreactivity, bronchospasm, and inflammation; reversible small airway obstruction
- very common, presents most often in early childhood
- associated with other atopic diseases such as allergic rhinitis or atopic dermatitis

Clinical Presentation

- episodic bouts of wheezing, dyspnea, tachypnea, cough (usually at night/early morning, with activity, or cold exposure)
- physical exam may reveal hyper-resonant chest, prolonged expiration, wheeze

Triggers

- URTI (viral or *Mycoplasma*), weather (cold exposure, humidity changes), allergens (pets), irritants (cigarette smoke), exercise, emotional stress, drugs (ASA, β-blockers)

Classification

- mild: occasional attacks of wheezing or coughing (<2/wk); symptoms respond quickly to inhaled bronchodilator; never needs systemic corticosteroids
- moderate: more frequent episodes with symptoms persisting and chronic cough; decreased exercise tolerance; sometimes needs systemic corticosteroids
- severe: daily and nocturnal symptoms; frequent ED visits and hospitalizations; usually needs systemic corticosteroids

Management

- acute
 - O₂ (keep O₂ saturation ≥90%) and fluids if dehydrated
 - β₂-agonists: salbutamol (Ventolin®) MDI + spacer 4-8 puffs every 20 min for 3 doses, then every 1-4 h as needed; nebulized 0.15 mg/kg (minimum 2.5 mg) every 20 min for 3 doses then 0.15-0.3 mg/kg every 1-4 h as needed or 0.5 mg/kg continuous nebulization
 - ipratropium bromide (Atrovent®) if severe: MDI + spacer, 4-8 puffs every 20 min as needed up to 3 h; nebulized 0.25-0.5 mg every 20 min for 3 doses, then as needed
 - steroids: prednisone (1-2 mg/kg x 5 d) or dexamethasone (0.3 mg/kg/d x 5 d or 0.6 mg/kg/d x 2 d); in severe disease, use IV steroids
 - continue to observe; can discharge patient if asymptomatic for 2-4 h after last dose
- chronic
 - step-wise approach for management for ages 0-11; ≥12 yr follow adult guidelines
 - step 1 for intermittent asthma; steps 2-6 for persistent asthma requiring daily medication (step up or down based on patient's asthma control):
 - ♦ step 1: short acting β₂-agonists (SABA) PRN

National Heart, Lung, and Blood Institute Guidelines for Well-Controlled Asthma

- Daytime symptoms ≤2 d/wk
- Night time symptoms <1 night/mo
- Normal physical activity
- Mild and infrequent exacerbations
- No work/school absenteeism
- Need for β-agonist ≤2 doses/wk
- FEV₁ or peak expiratory flow >80% of personal best
- FEV₁/FVC >80%
- Exacerbations requiring oral systemic corticosteroids 0-1/yr

- step 2: low-dose inhaled corticosteroids (ICS) preferred; alternative: cromolyn or montelukast (or LTRA, nedocromil, or theophylline for ages 5-11)
- step 3: medium-dose ICS (OR low-dose ICS + long acting β 2-agonist (LABA) for ages 5-11)
- step 4: medium-dose ICS + LABA or monteleukast
- step 5: high-dose ICS + LABA or monteleukast
- step 6: high-dose ICS + LABA or monteleukast + oral systemic corticosteroids
- for ages 5-11: may substitute LABA for LTRA or theophylline, do not use monteleukast
- at all steps
 - patient education, environmental control, management of comorbidities
 - quick relief medication: SABA as needed
 - consider injection immunotherapy for steps 2-4
- indications for hospitalization
 - decision to hospitalize is based on duration of symptoms, severity of symptoms, severity of obstruction, response to ED treatment, course and severity of previous exacerbations, medication use at time of exacerbation, access to medical care/medications, adequacy of home support, and presence of psychiatric illness
 - individualized decision to admit to ward: FEV1 or PEF <70%; ongoing mild-moderate symptoms despite ED treatment
 - admit to ICU: FEV1 or PEF <40%, $PCO_2 \geq 42$ mmHg, physical exam shows severe symptoms, drowsiness, confusion

Cystic Fibrosis

- see [Respirology, R12](#)

Etiology

- 1 per 3,000 live births, mostly Caucasians
- autosomal recessive, *CFTR* gene found on chromosome 7 ($\Delta F508$ mutation in 70%, but >1,600 different mutations identified) resulting in a dysfunctional chloride channel on the apical membrane of cells
- leads to relative dehydration of airway secretions, resulting in impaired mucociliary transport and airway obstruction

Clinical Presentation

- neonatal: meconium ileus, prolonged jaundice, antenatal bowel perforation
- infancy: pancreatic insufficiency with steatorrhea and FTT (despite voracious appetite), anemia, hypoproteinemia, hyponatremia
- childhood: heat intolerance, wheezing or chronic cough, recurrent chest infections (*S. aureus*, *P. aeruginosa*, *H. influenzae*), hemoptysis, nasal polyps, distal intestinal obstruction syndrome, rectal prolapse, clubbing of fingers
- older patients: COPD, infertility (males), decreased fertility (female)

Investigations

- sweat chloride test x 2 (>60 mEq/L)
 - false positive tests: malnutrition, atopic dermatitis, hypothyroidism, hypoparathyroidism, GSD, adrenal insufficiency, G6PD, Klinefelter syndrome, technical issues, autonomic dysfunction, familial cholestasis syndrome
 - false negative tests: technical problem with test, malnutrition, skin edema, mineralocorticoids

Management

- nutritional counseling: high calorie diet, pancreatic enzyme replacements, fat soluble vitamin supplements
- management of chest disease: physiotherapy, postural drainage, exercise, bronchodilators, aerosolized DNAase and inhaled hypertonic saline, antibiotics (e.g. cephalosporin, cloxacillin, ciprofloxacin, inhaled tobramycin depending on sputum C&S), lung transplantation
- genetic counseling

Complications

- respiratory failure, pneumothorax (poor prognostic sign), cor pulmonale (late), pancreatic fibrosis with DM, gallstones, cirrhosis with portal HTN, infertility (male)
- early death (current median survival in the US is 37.4 yr)

CF Presenting Signs

CF PANCREAS

Chronic cough and wheezing
FTT

Pancreatic insufficiency (symptoms of malabsorption such as steatorrhea)

Alkalosis and hypotonic dehydration

Neonatal intestinal obstruction

(meconium ileus)/Nasal polyps

Clubbing of fingers/Chest radiograph with characteristic changes

Rectal prolapse

Electrolyte elevation in sweat, salty skin

Absence or congenital atresia of vas deferens

Sputum with *S. aureus* or *P. aeruginosa* (mucoid)

- Pancreatic dysfunction – determined by 3 d fecal fat collection
- Genetics – useful where sweat chloride test is equivocal

Rheumatology

Evaluation of Limb Pain

Table 46. Differential Diagnosis of Limb Pain

Cause	<3 yr	3-10 yr	>10 yr
Trauma	x	x	x
Infectious			
Septic arthritis	x	x	x
Osteomyelitis	x	x	x
Inflammatory			
Transient synovitis	x	x	
JIA	x	x	x
Spondyloarthritis		x	x
SLE		x	x
Dermatomyositis		x	x
HSP		x	x
Anatomic/Orthopedic			
Legg-Calvé-Perthes disease		x	x
Slipped capital femoral epiphysis			x
Osgood-Schlatter disease			x
Neoplastic			
Leukemia	x	x	x
Neuroblastoma	x	x	x
Bone tumor		x	x
Hematologic			
Hemophilia (hemarthrosis)	x	x	x
Sickle cell anemia	x	x	x
Pain Syndromes			
Growing pains		x	x
Fibromyalgia		x	x
Reflex sympathetic dystrophy			x

Red Flags for Limb Pain

Fever, pinpoint pain/tenderness, pain out of proportion to degree of inflammation, night pain, weight loss, erythema

- must rule out infection, malignancy, and acute orthopedic conditions

History

- demographics (age, gender)
- pattern of onset and progression of symptoms (including acuity and chronicity)
- morning stiffness, limp/weight-bearing status, night pain
- joint involvement (type, distribution) ± spine (axial) involvement
- extra-articular manifestations and systemic symptoms
- functional status – activities of daily living
- family history (arthritis, IBD, psoriasis, spondyloarthropathies, uveitis, bleeding disorders, sickle cell anemia)
- past medical illness, intercurrent infection, travel, sick contact history, joint injury

Physical Exam

- growth parameters
- screening examination (pediatric gait, arms, legs, spine exam)
- joint exam: inspection/palpation (swelling, erythema, warmth, tenderness, deformity), ROM
- adjacent structures (bone, tendon, muscle, skin)
- leg length
- neurologic exam

Investigations

- basic: CBC and differential, blood smear, ESR, CRP, x-ray
- as indicated: blood (ANA, RF, culture, viral/bacterial serology, CK, PTT, sickle cell screen, immunoglobulins, complement), urinalysis, synovial fluid (cell count, Gram stain, culture), TB skin test, imaging, bone marrow aspiration, slit lamp exam

Growing Pains

Epidemiology

- age 2-12 yr, M=F

Clinical Presentation

- diagnosis of exclusion
- intermittent, non-articular pain in childhood with *normal physical exam findings*
- pain at night, often limited to the calf, shin, or thigh; typically short-lived and bilateral
- relieved by heat, massage, mild analgesics
- child is well, asymptomatic during the day, no functional limitation
- possible family history of growing pains

Management

- lab investigations not necessary if typical presentation; reassurance and supportive management

Transient Synovitis of the Hip

- benign, self-limited disorder, usually occurs after URTI, pharyngitis, AOM

Epidemiology

- age 3-10 yr, M>F

Clinical Presentation

- afebrile or low-grade fever, pain typically occurs in hips, knees (referred from hip); painful limp but full ROM (pain not as pronounced as in joint or bone infections)
- symptoms resolve over 7-10 d

Investigations

- WBC within normal limits; ESR and CRP may be mildly elevated
- joint effusions may be seen on imaging
- diagnosis of exclusion (rule out septic arthritis and osteomyelitis)

Treatment

- symptomatic and anti-inflammatory medications

Septic Arthritis and Osteomyelitis

- **MEDICAL EMERGENCY**
- see [Orthopedics](#), OR10

Table 47. Microorganisms and Treatment Involved in Septic Arthritis/Osteomyelitis

Age	Pathogens	Treatment
Neonate	GBS, <i>S. aureus</i> , Gram negative bacilli	cloxacillin + aminoglycoside or cefotaxime
Infant (1-3 mo)	<i>Strep. spp.</i> , <i>Staph. spp.</i> , <i>H. influenzae</i> Pathogens as per neonate	cloxacillin + cefotaxime
Child	<i>S. aureus</i> , <i>S. pneumoniae</i> , GAS	cefazolin
Adolescent	As above; also <i>N. gonorrhoeae</i>	cefazolin
Sickle cell disease	As above; also <i>Salmonella</i>	cefotaxime

GAS = group A Strep; GBS = group B Strep

Adapted from: Tse SML, Laxer RM. *Pediatrics in Review* 2006;27:170-179

Juvenile Idiopathic Arthritis

- a heterogeneous group of conditions characterized by persistent arthritis in children <16 yr
- diagnosis: arthritis in ≥1 joint(s); duration ≥6 wk; onset age <16 yr old; exclusion of other causes of arthritis; classification defined by features/number of joints affected in the first 6 mo of onset

Systemic Arthritis (Still's Disease)

- onset at any age, M=F
- once or twice daily fever spikes ($>101.3^{\circ}\text{F}$) ≥ 2 d/wk; children usually acutely unwell during fever episodes
- extra-articular features: erythematous "salmon-colored" maculopapular rash, lymphadenopathy, hepatosplenomegaly, leukocytosis, thrombocytosis, anemia, serositis

- arthritis may occur weeks to months later
- high ESR, CRP, WBC, platelet count

Oligoarticular Arthritis (1-4 joints)

- onset early childhood, F>M
- persistent: affects no more than 4 joints during the disease course
- extended: affects more than 4 joints after the first 6 mo
- typically affects large joints: knees > ankles, elbows, wrists; hip involvement unusual
- ANA positive ~60-80%, RF negative
- screening eye exams for asymptomatic anterior uveitis (occurs in ~30%)
- complications: knee flexion contracture, quadriceps atrophy, leg-length discrepancy, growth disturbances

Polyarticular Arthritis (5 or more joints)

- RF negative
 - onset: 2-4 yr and 6-12 yr, F>M
 - symmetrical involvement of large and small joints of hands and feet, TMJ, cervical spine
- RF positive
 - onset: late childhood/early adolescence, F>M
 - similar to the aggressive form of adult rheumatoid arthritis
 - severe, rapidly destructive, symmetrical arthritis of large and small joints
 - may have rheumatoid nodules at pressure points (elbows, knees)
 - unremitting disease, persists into adulthood

Enthesitis-Related Arthritis

- onset: late childhood/adolescence, M>F
- arthritis and/or enthesitis (inflammation at the site where tendons or ligaments attach to the bone)
- weight bearing joints, especially hip and intertarsal joints
- risk of developing ankylosing spondylitis in adulthood

Psoriatic Arthritis

- onset: 2-4 yr and 9-11 yr, F>M
- arthritis and psoriasis OR arthritis and at least two of
 - dactylitis, nail abnormalities, or family history of psoriasis in a 1st degree relative
 - asymmetric or symmetric small or large joint involvement

Management

- goals of therapy: eliminate inflammation, prevent joint damage, promote normal growth and development as well as normal function, minimize medication toxicity
- exercise to maintain ROM and muscle strength
- multidisciplinary approach: OT/PT, social work, orthopedics, ophthalmology, rheumatology
- 1st line drug therapy: NSAIDs, intra-articular corticosteroids
- 2nd line drug therapy: DMARDs (methotrexate, sulfasalazine, leflunamide), corticosteroids (acute management of severe arthritis, systemic symptoms of JIA, topical eye drops for uveitis), biologic agents

Reactive Arthritis

- see [Rheumatology, RH24](#)
- arthritis (typically the knee) follows bacterial infection, especially with *Salmonella*, *Shigella*, *Yersinia*, *Campylobacter*, *Chlamydia*, and most commonly *Streptococcus* (post-streptococcal reactive arthritis)
- typically resolves spontaneously
- may progress to chronic illness or Reiter's syndrome (urethritis, conjunctivitis)

Lyme Arthritis

- see [Infectious Diseases, ID23](#)
- caused by spirochete *Borrelia burgdorferi*
- incidence highest among 5-10 yr olds
- do not treat children <8 yr old with doxycycline (may cause permanent tooth discoloration)

Systemic Lupus Erythematosus

- see [Rheumatology, RH11](#)
- autoimmune illness affecting multiple organ systems
- incidence 1/1,000, more commonly age >10, F:M = 10:1
- childhood-onset SLE vs. adult-onset SLE: children have more active disease, are more likely to have renal disease, and children receive more intensive drug therapy and have a poorer prognosis

Vasculitides

HENOCH-SCHÖNLEIN PURPURA

- most common vasculitis of childhood, peak incidence 4-10 yr, M:F = 2:1
- vasculitis of small vessels
- often have history of URTI 1-3 wk before onset of symptoms

Clinical Presentation

- clinical triad: 1) palpable purpura, 2) abdominal pain, 3) arthritis
- skin: palpable, non-thrombocytopenic purpura in lower extremities and buttocks, edema, scrotal swelling
- joints: arthritis/arthralgia involving large joints associated with painful edema
- GI: abdominal pain, GI bleeding, intussusception
- renal: microscopic hematuria, IgA nephropathy, proteinuria, HTN, renal failure in <5%

Management

- mainly supportive
- anti-inflammatory medications for joint pain, corticosteroids for select patients
- monitor for protein on urinalysis every month for 6 mo, checking for renal disease, which may develop late (immunosuppressive therapy if severe)

Prognosis

- self-limited, resolves within 4 wk
- recurrence in about one-third of patients
- long-term prognosis dependent on severity of nephritis

KAWASAKI DISEASE

- acute vasculitis of unknown etiology (likely triggered by infection)
- medium-sized vasculitis with predilection for coronary arteries
- most common cause of acquired heart disease in children in developed countries
- peak age: 3 mo-5 yr; Asians > Blacks > Caucasians

Diagnostic Criteria

- fever persisting ≥ 5 d AND ≥ 4 of the following features
 1. bilateral, non-exudative conjunctival injection
 2. oral mucous membrane changes (fissured lips, strawberry tongue, injected pharynx)
 3. changes of the peripheral extremities
 - ♦ acute phase: edema of hands, feet, palms, or soles
 - ♦ subacute phase: periungual desquamation
 4. polymorphous rash
 5. cervical lymphadenopathy >1.5 cm in diameter (usually unilateral)
- exclusion of other diseases (e.g. scarlet fever, measles)
- atypical Kawasaki disease: fever persisting ≥ 5 d and 2-3 of the above criteria
 - further evaluation dictated by CRP, ESR, and supplemental laboratory criteria

Management

- high (anti-inflammatory) dose of ASA while febrile
- low (anti-platelet) dose of ASA in subacute phase until platelets normalize, or longer if coronary artery involvement
- IVIg (2 g/kg) within 10 d of onset reduces risk of coronary aneurysm formation
- baseline 2D-Echo and follow up periodic 2D-Echo (usually at 6 wk)

Complications

- coronary artery vasculitis with aneurysm formation occurs in 20-25% of untreated children, <5% if receive IVIg within 10 d of fever
- 50% of aneurysms regress within 2 yr
- anticoagulation for multiple or large coronary aneurysms
- risk factors for coronary disease: male, age <1 or >9 yr, fever >10 d, Asian or Hispanic ethnicity, thrombocytopenia, hyponatremia

Diagnostic Criteria for Kawasaki Disease

Warm CREAM

Fever ≥ 5 d with ≥ 4 of:

Conjunctivitis

Rash

Edema/Erythema (hands and feet)

Adenopathy

Mucosal involvement

Common Medications

Table 48. Commonly Used Medications in Pediatrics

Drug Name	Dosing Schedule	Indications	Comments
acetaminophen (Tylenol®)	10-15 mg/kg/dose PO q4-6h prn	Analgesic, antipyretic	Not to exceed 60 mg/kg/d in neonates or 75 mg/kg/d in older children to a max of 4 g/d Causes hepatotoxicity at high doses
amoxicillin (Amoxil®)	80-90 mg/kg/d PO divided q8h	Otitis media	
dexamethasone	0.6 mg/kg PO x 1 0.3 mg/kg/d PO for 5 d	Croup Acute asthma	
fluticasone (Flovent®)	Moderate dose – 250-500 µg/d divided bid High dose – > 500 µg/d divided bid	Asthma	
ibuprofen (Advil®)	5-10 mg/kg/dose PO q6-8h	Analgesic, antipyretic	Cautious use in patients with liver impairment, history of GI bleeding or ulcers
iron	6 mg/kg/d elemental iron OD or divided tid	Anemia	SE: dark stool, constipation, dark urine
omeprazole		GERD	SE: headache, diarrhea, nausea, abdominal pain
ondansetron		Post-operative N/V Gastroenteritis Cyclic vomiting	SE: QTc prolongation, orally disintegrating tablets contain phenylalanine (caution in PKU patients)
phenobarbital	3-5 mg/kg/d PO OD or bid	Seizures	SE: CNS depression
polyethylene glycol 3350 (PEG)	Disimpaction: 1-1.5 g/kg/d x 3 d Maintenance: starting dose at 0.4-1 g/kg		
prednisone/ prednisilone	1-2 mg/kg/d PO x 5 d 3-4 mg/kg/d PO then taper to 1-2 mg/kg/d PO once platelet count >30 x 10 ⁹ /L 60 mg/m ² /d PO	Asthma ITP Nephrotic syndrome	Oral prednisone is bitter tasting, consider using prednisilone
salbutamol (Ventolin®)	0.01-0.03 mL/kg/dose in 3 mL NS via nebulizer q0.5-4h prn 100-200 µg/dose prn, max 4-8 puffs frequency q4h	Acute asthma Maintenance treatment for asthma	Can cause tachycardia, hypokalemia, restlessness

Skin Lesions and Masses

Differential Diagnosis of Skin Lesions/Masses

- for background information and medical management (see [Dermatology, D5](#))
- for biopsy techniques, see [Skin Biopsy Types and Techniques, PL7](#)

Surgical Management of Malignant Skin Lesions

- surgical treatment for all malignant skin lesions involve total excision of the primary lesion
- excision margin of lesion depends on the diameter and depth
- for decisions regarding reconstruction using flaps or skin grafts, see [Reconstruction, PL11](#)

Precursors of Malignant Lesions

Table 1. Precursors

Basal Cell Carcinoma	Squamous Cell Carcinoma	Malignant Melanoma
Nevus sebaceous of Jadassohn	Actinic keratosis Bowen's disease Bowenoid papulosis Paget's disease Leukoplakia Erythroplasia	Dysplastic nevus Lentigo maligna Giant congenital nevus

Surgical Margins

Table 2. Surgical Margins for Basal Cell Carcinoma

Diameter of Lesion	Surgical Margins
≤2 cm	3 mm
>2 cm	5 mm

Table 3. Surgical Margins for Squamous Cell Carcinoma

Diameter or Location of Lesion	Surgical Margins
≤2 cm*	4 mm*
>2 cm	6 mm
High risk (facial)	6 mm
Low risk (elsewhere)	4 mm

*For a high risk lesion that is <2 cm in diameter, use a 6 mm margin

Table 4. Surgical Margins for Malignant Melanoma

Depth of Lesion	Surgical Margins
<i>In situ</i>	0.5 cm
<1 mm	1 cm
1-4 mm	2 cm
≥2 mm	Minimum 2 cm

Traumatic tattoos are permanent discolorations resulting from new skin growth over foreign material or dirt left behind in the dermis. Copious irrigation and debridement should be done ASAP

Basic Surgical Techniques

Sutures and Suturing

ANESTHESIA

- debride and irrigate before injecting anesthetic
- toxicity of mixtures (i.e. lidocaine + bupivacaine) is no greater than its individual components

Table 5. Toxic Limit and Duration of Action (1 cc of 1% solution contains 10 mg lidocaine)

	Without Epinephrine	With Epinephrine (vasoconstrictor, limits bleeding)
Lidocaine (Xylocaine®)	5 mg/kg, lasts 45-60 min	7 mg/kg, lasts 2-6 h
Bupivacaine (Marcaine®) for longer analgesic effect	2 mg/kg, lasts 2-4 h	3 mg/kg, lasts 3-7 h

IRRIGATION AND DEBRIDEMENT

- irrigate copiously with a physiologic solution such as Ringer's lactate or normal saline to remove surface clots, foreign material, and bacteria
- debride all obviously devitalized tissue, irregular or ragged wounds must be excised to produce sharp wound edges that will assist healing when approximated

SUTURES

- use of a particular suture material is highly dependent on surgeon preference
- suture material divided into absorbable vs. non absorbable and monofilament vs. braided

Table 6. Suture Materials: Absorbable vs. Non-absorbable and Monofilament vs. Multifilament

Suture Materials	Uses	Examples	Notes
Absorbable	Deep sutures under short-term tension Skin closure in children	Plain gut®, Vicryl®, Polysorb®	loses at least 50% of their strength in 4 wk; eventually absorbed
Non-Absorbable	Skin closure (when trauma) Sites of long-term tension	Nylon, polypropylene (Prolene), stainless steel	Lower likelihood of wound dehiscence, more difficult to tie
Monofilament	Contaminated and infected wounds (lower likelihood of bacterial trapping in suture material)	Monosof®, Monocryl®, Biosyn®	Slides through tissue with less friction; more memory/stiffness
Multifilament	AVOID in contaminated wounds (increased likelihood of bacterial trapping)	Vicryl® and Silk	Less memory/stiffness thus easier to work with

BASIC SUTURING TECHNIQUES

Basic Suture Methods

- simple interrupted: can be used in almost all situations
- sub-cuticular: good cosmetic result but weak, used in combination with deep sutures; not used in trauma
- vertical mattress: for areas difficult to evert (e.g. dorsum of the hand)
- horizontal mattress: everting, time saving
- continuous over and over (i.e. "running", "baseball stitch"): time saving, good for hemostasis

Basic Principles

- minimize tissue trauma: follow curve of needle, insert and exit at 90 degrees to the wound edge, handle wound edges gently (use toothed forceps), use just enough tension to approximate edges (do not strangulate)
- use the finest needle and suture possible
- ensure good cosmesis

Other Skin Closure Materials

- tapes: may be indicated for superficial wounds and those with opposable edges. Tape cannot be used on actively bleeding wounds. When placed across the incision, will prevent surface marks and can be used primarily or after surface sutures have been removed. Tape burns may occur if there is excessive tension or swelling around the incision
- skin adhesives: e.g. 2-octylcyanoacrylate (e.g. Dermabond®) works well on small areas without much tension or shearing; may cause irreversible tattooing
- staples: steel-titanium alloys that incite minimal tissue reaction (healing is comparable to wounds closed by suture)

**Figure 12. Basic suture methods**

Steps to Ensuring Good Suturing Cosmesis

- Incisions should be made along relaxed skin tension lines
- Attain close apposition of wound edges
- Minimize tension on skin by closing in layers
- Evert wound edges
- Use appropriately sized suture for skin closure (5-0, 6-0 on face; 3-0, 4-0 elsewhere)
- Ensure equal width and depth of tissue on both sides
- Remove sutures within 5-7 d from the face, 10-14 d from scalp/torso/extremities

Excision

- plan your incision along relaxed skin tension lines to minimize appearance of scar
- use elliptical incision to prevent “dog ears” (heaped up skin at end of incision) so the length of the ellipse should be 3x the width
- if needed, undermine skin edges to decrease wound tension
- use layered closure including dermal sutures when wound is deeper than superficial (decreases tension)

Skin Biopsy Types and Techniques

SHAVE BIOPSY

- used for superficial lesions where sampling of the full thickness of the dermis is not necessary
- most suitable lesions for shave biopsies are either elevated above the skin or have pathology confined to the epidermis (e.g. seborrheic or actinic keratoses, skin tags, warts, and superficial basal cell or squamous cell carcinomas)
- rapid, requires little training, and does not require sutures for closure
- will leave a circular scar
- can leave an indented scar
- heals by secondary intent
- should not be used for pigmented lesions – an unsuspected melanoma cannot be properly staged if partially removed

INCISIONAL BIOPSY

- can either be a punch biopsy
- or can be an ellipse including the lesion
- gives pathologists a portion of the lesion and the border with normal skin too

PUNCH BIOPSY

- involves the removal of a core-shaped piece of tissue, performed with round, disposable knives ranging in diameter from 2-10 mm
- allows sampling of the deep dermis
- can be used for the diagnosis and treatment of small pigmented lesions and atypical moles
- punch biopsy wounds can be closed with suture or left to heal by secondary intention. Punches greater than 3 mm may produce scarring and are best closed with one or two sutures
- has low incidence of infection, bleeding, nonhealing, significant scarring

EXCISIONAL BIOPSY

- performed for lesions that require complete removal for diagnostic or therapeutic purposes
- performed for lesions that cannot be adequately punch biopsied due to size, depth, or location
- requires the greatest amount of expertise and time
- always requires sutures for closure

TECHNIQUE

General

- all biopsies performed in clinic are done using aseptic technique, but are not sterile
- sterile gloves are indicated for biopsies and excisions in all patients

Preparing the Site

- common skin antiseptics (betadine, chlorhexidine) can be used to prepare the biopsy site
- chlorhexidine is used in concentrations ranging from 0.5-4%. This higher concentration cannot be used on the face as it could get into the eyes or ears and may burn or cause damage; most chlorhexidine preps also contain alcohol which can be flammable, so allow to dry before the biopsy and certainly before using any cautery
- mark the intended lesion and surgical margins with a surgical marker since they may be temporarily obliterated following injection of the anesthetic
- for all biopsies, a sterile drape technique is indicated. A fenestrated surgical drape is placed around the biopsy site after the area is cleansed and anesthetized

Anesthesia

- most commonly used local anesthetic is 1% or 2% lidocaine (with epinephrine)
- small amounts of epinephrine are added to constrict blood vessels, decrease bleeding, prolong anesthesia, and limit lidocaine toxicity. The local with epinephrine can be injected directly into the lesion
- local anesthetics with epinephrine may be used anywhere in the body (including the digits – except if the digits have been significantly injured and could have vascular compromise – e.g. saw injury)
- a field block should be performed for larger lesions by placing a ring of anesthetic around the surgical site, advancing and injecting through a site that has been previously anesthetized

Figure 13. Incision of lesions along relaxed skin tension lines

Relaxed Skin Tension Lines

Natural skin/wrinkle lines with minimal linear tension. Placing incisions parallel to relaxed skin tension lines minimizes widening/hypertrophy, and helps to camouflage scars

Wounds

Causal Conditions

- laceration: cut or torn tissue
- abrasion: superficial skin layer is removed, variable depth
- contusion: injury caused by forceful blow to the skin and soft tissue; entire outer layer of skin intact yet injured
- avulsion: tissue/limb forcefully separated from surrounding tissue, either partially or fully; “de-gloving”
- puncture wounds: opening relatively small as compared with depth (e.g. needle)
 - includes bite wounds
- crush injuries: caused by compression
- thermal and chemical wounds

Principles of Wound Healing

- wound: disruption of the normal anatomical relationships of tissue as a result of injury

STAGES OF WOUND HEALING

- growth factors released by tissues play an important role
- scar is mature once it has completed the final stage, usually after 1 yr

FACTORS INFLUENCING WOUND HEALING

Local (reversible/controllable)

- mechanical (local trauma, tension)
- blood supply (ischemia/circulation)
- temperature
- technique and suture materials
- retained foreign body
- infection
- hematoma/seroma (↑ infection rate)
- venous HTN
- peripheral vascular disease

General (often irreversible)

- age
- nutrition (protein, vitamin C, O₂)
- smoking
- chronic illness (e.g. DM, cancer, CVD)
- immunosuppression (steroids, chemo, radiation)
- collagen vascular disease
- tissue irradiation

Myofibroblasts are the cells responsible for wound contraction; they do this at a rate of less than 0.75 mm/d

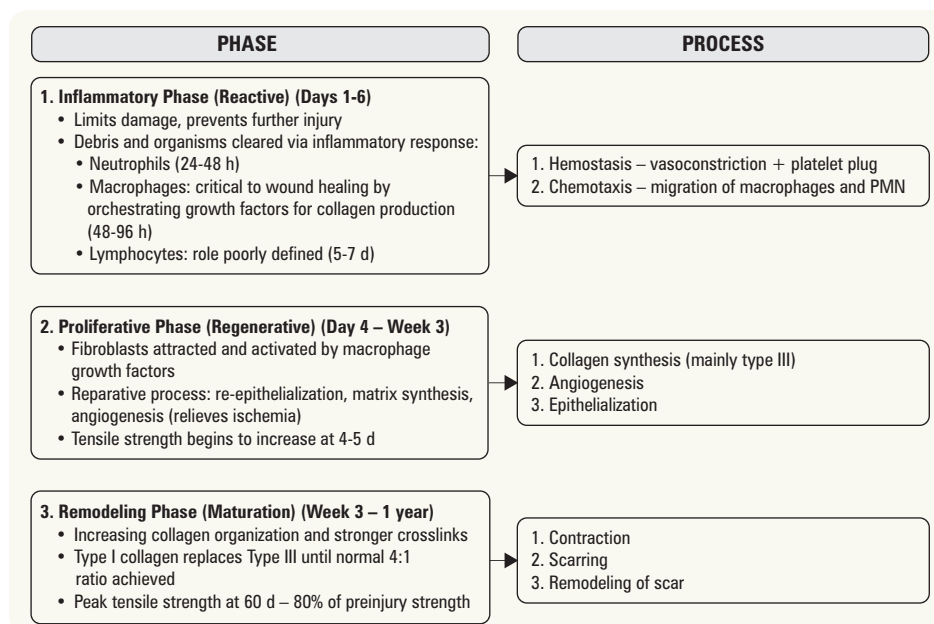

Figure 14. Stages of wound healing

ABNORMAL HEALING

Hypertrophic Scar

- scar remains roughly within boundaries of original injury
- red, raised, widened, frequently pruritic
- usually caused by excess tension on a wound or delayed closure (as in burn wounds)
- common sites: back, shoulder, sternum, angle of mandible
- treatment: pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision if other options fail (however, may still recur), fractional carbon dioxide ablative laser
- typically improves with time

Keloid Scar

- scar extends beyond boundaries of original injury
- frequently pruritic, often painful; collagen in whorls rather than bundles
- common sites: sternum, deltoid, earlobe; more common in darker skinned people
- treatment: pressure garments, silicone gel sheeting, corticosteroid injection, radiation therapy ± surgical excision as a last resort
- unlike hypertrophic scar, this is due to a derangement in normal wound healing caused by over-active fibroblasts due to excessive transforming growth factor-beta expression

Chronic Wound

- fails to heal primarily within 4-6 wk
- common chronic wounds include diabetic, pressure and venous stasis ulcers
- treatment: may heal with meticulous wound care; may also require surgical intervention
- Marjolin's ulcer: squamous cell carcinoma arising in a chronic wound secondary to genetic changes caused by chronic inflammation → consider biopsy of chronic wound

WOUND CLOSURE

Primary (1°) Closure (First Intention)

- definition: wound closure by direct approximation of edges within hours of wound creation (i.e. with sutures, staples, skin graft, etc.)
- indication: recent (<6 h, longer with facial wounds), clean wounds
- contraindications: animal/human bites (except on face), crush injuries, infection, long time lapse since injury (>6-8 h), retained foreign body

Secondary (2°) Closure/Spontaneous Healing (Second Intention)

- definition: wound left open to heal spontaneously (epithelialization 1 mm/d from wound margins in concentric pattern), contraction (myofibroblasts) and granulation – maintained in inflammatory phase until wound closed; requires dressing changes; inferior cosmetic result
- indication: when 1° closure not possible or indicated (see [Primary Closure](#))

Tertiary (3°) Closure/Delayed Primary Closure (Third Intention)

- definition: intentionally interrupt healing process (e.g. with packing), then wound can be closed at 4-10 d post-injury after granulation tissue has formed and there is <10⁵ bacteria/gram of tissue
- indication: contaminated (high bacterial count), long time lapse since initial injury, severe crush component with significant tissue devitalization, closure of fasciotomy wounds
- prolongation of inflammatory phase decreases bacterial count and lessens chance of infection after closure

Contaminated and Infected Wounds

Definitions

- contamination: the presence of non-replicating microorganisms within a wound
- colonization: the presence of replicating microorganisms within a wound
- infection: greater than 10⁵ microorganisms in a wound without intact epithelium, a wound may also be infected with small amounts of a very virulent organism (e.g. GBS)

Management of Acute Contaminated Wound (<24 h)

- cleanse and irrigate open wound with physiologic solution (NS or RL)
- evaluate for injury to underlying structures (vessels, nerve, tendon and bone)
- control active bleeding
- debridement: removal of foreign material, devitalized tissue, old blood
 - surgical debridement: blade and irrigation if indicated
- systemic antibiotics are commonly indicated for obvious infection, wound older than 8 h, severely contaminated, human/animal bites, immunocompromised, involvement of deeper structures (e.g. joints, fractures)
- ± tetanus toxoid 0.5 mL IM ± tetanus immunoglobulin 250 U deep IM (see [Table 7](#) and [Table 8](#))

Risk Factors for Infection

- Virulence of the infecting microorganism
- Amount of bacteria present
- Host resistance

- \pm post-exposure treatment of
 - hepatitis B, HIV, hepatitis C (if titres confirmed at 6 mo)
- re-evaluate in 24-48 h for signs of deep infection
 - open infected portion of wound by removing sutures if evidence of infection (i.e. erythema, warmth, pain, discharge)

Table 7. Risks for Tetanus

Wound Characteristics	Tetanus-Prone	Not Tetanus-Prone
Time since injury	> 6 h	< 6 h
Depth of injury	> 1 cm	< 1 cm
Mechanism of Injury	Crush, burn, gunshot, frostbite, puncture through clothing, farming injury	Sharp cut (e.g. clean knife, clean glass)
Devitalized tissue	Present	Not present
Contamination (e.g. soil, dirt, saliva, grass)	Yes	No
Retained foreign body	Yes	No

Table 8. Tetanus Immunization Recommendations

History of Tetanus Immunization	Clean, Minor Wounds		All Other Wounds	
	Td or Tdap*	Tig**	Td or Tdap	Tig
Uncertain or <3 doses of immunization	Yes	No	Yes	Yes
3 doses received in immunization series	No~	No	No§	No¶

* 0.5 mL of combined tetanus and diphtheria toxoids \pm acellular pertussis

~ Yes, if >10 yr since last booster

¶ Yes, if immunocompromised

** Tetanus immune globulin, 250 U given at a separate site from Td/Tdap

§ Yes, if >5 yr since last booster

Management of Contaminated Wounds (>24 h, including Ulcers)

- irrigation and debridement
 - traumatic tattooing can occur if foreign materials left in wound
- systemic antibiotics indicated if there is concern of infection (e.g. redness, swelling, pain, clinically unwell)
- topical antimicrobials: beneficial for minor wounds, but no additional benefit for wounds requiring systemic antibiotics. May aid in healing of chronic wounds
- closure: final closure via secondary intention (most common), delayed wound closure (3° closure), skin graft or flap; successful closure depends on bacterial count of $\leq 10^5/\text{cm}^3$ prior to closure and frequent dressing changes

BITES

- see [Emergency Medicine, ER46](#)

Dog and Cat Bites

- pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*
- investigations: same as for human bites
- treatment: Clavulin® (500 mg PO q8h started immediately – amoxicillin + clavulanic acid)
 - consider rabies prophylaxis if animal has symptoms of rabies or unknown animal
 - ♦ \pm rabies Ig (20 IU/kg around wound, or IM) and 1 of the 3 types of rabies vaccines (1.0 mL IM in deltoid, repeat on days 3, 7, 14, 28)
 - aggressive irrigation with debridement
 - healing by secondary intention is mainstay of treatment
 - only consider primary closure for bite wounds on the face; otherwise primary closure is contraindicated
 - contact Public Health if animal status unknown

Human Bites

- pathogens: *Staphylococcus* > α -hemolytic *Streptococcus* > *Eikenella corrodens* > Bacteroides
- mechanism: most commonly over dorsum of MCP from a punch in mouth; “fight-bite”
- serious, as mouth has 10^9 microorganisms/mL, which get trapped in joint space when fist unclenches and overlying skin forms an air-tight covering ideal for anaerobic growth – can lead to septic arthritis
- investigations
 - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
 - culture for aerobic and anaerobic organisms, Gram stain

- **treatment**

- urgent surgical exploration of joint, drainage and debridement of infected tissue
- wound must be copiously irrigated
- Clavulin® 500 mg PO q8h, clindamycin 300 mg PO q6h + ciprofloxacin 500 mg PO q12h (if allergic to penicillin) + secondary closure
- splint

Dressings

- dressing selection depends on the wound characteristics
 - as the wound progresses through healing it will require different types of dressings, therefore, routine inspection is recommended
 - principles of dressings
 - ♦ moist vs. dry wounds
 - purpose of dressings should be to keep wound appropriately moist (i.e. moistening dry wounds or removing excess exudate/blood from wet wounds)
 - ♦ clean vs. infected wounds
 - clean wounds can be dressed with petroleum based gauze, which is non-adhering to epithelializing tissue; requires secondary dressing
 - infected wounds can be dressed with iodine gauze, silver-containing, or antimicrobial dressings
 - ♦ wide-based vs. cavitary/tunneling wounds
 - cavitary or tunnelling wounds (i.e. through a fascial layer) can be packed with saline-soaked (non-infected), betadine or chlorpactin-soaked (infected) ribbon gauze, or other easily retrievable one-piece moisture providing dressing

Table 9. Recommended Dressings for Wound Type

Wound Depth	Exudate Level	Dressing Material
Superficial	Lightly exuding	Films (Opsite®), hydrogels (Intrasite®, Nu-gel®, Duoderm®)
	Any exudate level	Contact layers
Superficial to Deep	Light to moderately exuding wounds	Amorphous gels, hydrogels, hydrocolloids (Duoderm®, Tegaderm®), collagen, hypertonic saline gauze (Mesalt®)
	Moderately to heavily exuding wounds	Foams (Mepilex®, Allevyn®), alginates (Sorbsan®, Kaltostat®), hypertonic saline gauze, hydrofiber (Aquacel®)

Table adapted from Grabb & Smith's Plastic Surgery, 6th ed. Chapter 3, Table 3.3

Reconstruction

SKIN GRAFTS

Definition

- skin that is harvested from a donor site and transferred to the recipient site and that does not carry its own blood supply. Survival requires diffusion of nutrients during the first 24-48 h (imbibition) followed by blood vessel connection between the donor site and graft (inosculation). They are classified according to the depth of dermis they contain: full thickness (entire epidermis + dermis) vs. split-thickness (epidermis + partial dermis)

Donor Site Selection

- must consider size, hair pattern, texture, thickness of skin, and color (facial grafts best if taken from "blush zones" above clavicle e.g. pre/post auricular or neck)
- partial thickness grafts usually taken from inconspicuous areas (e.g. buttocks, lateral thighs, etc.)

Partial Thickness Skin Graft Survival

- 3 phases of skin graft "take"
 1. plasmatic imbibition: diffusion of nutrition from recipient site (first 48 h)
 2. inosculation: vessels in graft connect with those in recipient bed (day 2-3)
 3. neovascular ingrowth: graft revascularized (day 3-5)
- requirements for survival
 - bed: well-vascularized (unsuitable: bone, tendon, heavily irradiated, infected wounds, etc.)
 - contact between graft and recipient bed: fully immobile (decreased shearing and hematoma formation)
 - staples, sutures, splinting, and appropriate dressings (pressure) are used to prevent movement of graft and hematoma or seroma formation
 - site: low bacterial count ($<10^5/\text{cm}^3$, to prevent infection)

Reconstruction Ladder (in the order of increasing complexity of treatment)

- Dressings
- Primary closure
- Delayed closure
- Split thickness graft
- Full thickness graft
- Tissue expansion
- Random pattern flap
- Pedicle flap
- Free flap

Classification of Skin Grafts

1. by species
 - autograft: from same individual
 - allograft (homograft): from same species, different individual
 - xenograft (heterograft): from different species (e.g. porcine)
2. by thickness

Table 10. Skin Grafts

	Split Thickness Skin Graft	Full Thickness Skin Graft
Definition	Epidermis and part of dermis	Epidermis and all of dermis
Donor Site	More sites	Limited donor sites (full thickness skin loss, must be closed 1° or with STSG)
Healing of Donor Site	Re-epithelialization via dermal appendages in graft and wound edges	Primary closure
Re-harvesting	~10 d (faster on scalp)	N/A
Graft Take	Easier; shorter nutrient diffusion distance	Lower rate of survival (thicker, slower vascularization)
Contraction	Less 1° contraction, greater 2° contraction (less with thicker graft)	Greater 1° contraction, less 2° contraction
Aesthetic	Poor	Good
Comments	Can be meshed for greater area Allows for extravasation of blood/serum	May use on face and fingers
Advantages	Takes well in less favorable conditions, can cover a larger area	Resists contraction, texture/pigment more normal
Disadvantages	Contracts significantly, abnormal pigmentation, high susceptibility to trauma	Requires well vascularized bed Must remove fat from graft before application
Uses	Large areas of skin, granulating tissue beds, burns	Face (color match), site where thick skin or decreased contracture is desired (e.g. finger)

Graft Contraction

- Primary: immediate reduction in size upon harvesting
- Secondary: reduction in size once graft placed on wound bed

- mesh graft
 - **advantages**
 - ♦ prevents accumulation of fluids (e.g. hematoma, seroma)
 - ♦ covers a larger area
 - **disadvantages**
 - ♦ poor cosmesis (“reptilian” appearance)
 - ♦ has significant contractures
- common reasons for graft loss: hematoma/seroma, infection, mechanical force (e.g. shearing, pressure)

OTHER GRAFTS

Table 11. Various Tissue Grafts

Graft Type	Use	Preferred Donor Site
Bone	Repair rigid defects	Cranial, rib, iliac, fibula
Cartilage	Restore contour of ear and nose	Ear, nasal septum, costal cartilage
Tendon	Repair damaged tendon	Palmaris longus, plantaris (present in 85% population)
Nerve	Conduit for regeneration across nerve gap	Sural, antebrachial cutaneous, medial brachial cutaneous
Vessel	Bridge vascular gaps	Forearm or foot vessels for small vessels, saphenous vein for larger vessels
Dermis	Contour restoration (\pm fat for bulk)	Thick skin of buttock or abdomen
Fat	Contour restoration	Abdomen, any area with fat available

FLAPS

- **definition:** tissue transferred from one site to another with a known blood supply (random, pedicled or named); not dependent on neovascularization, unlike a graft
- **may consist of:** skin, subcutaneous tissue, fascia, muscle, bone, other tissue (e.g. omentum)
- **classification:** based on blood supply to skin (random, axial) and anatomic location (local, regional, distant)
- **indications for flaps**
 - reconstruction: replaces tissue loss due to trauma or surgery
 - provides skin and temporary soft tissue coverage through which surgery can be carried out later
 - improves blood supply to poorly vascularized bed (e.g. bone)
- **complications:** flap loss due to hematoma, seroma, infection, poor flap design, extrinsic compression (dressing too tight) or vascular failure/thrombosis, fat necrosis (in free flaps)

Random Pattern Flaps

- blood supply by dermal and subdermal plexus to skin and subdermal tissue with random vascular supply
- limited length:width ratio to ensure adequate blood supply (typically 2:1)
- flap choice is often a combination of available tissue, location of reconstruction site with respect to donor site, and surgeon preference
- **types**
 - **rotation:** cover wounds of various sizes; common use: sacral pressure sores
 - **transposition:** smaller in size compared to rotation flaps and advancement flaps; commonly used on certain areas of the face using adjacent areas of excess skin laxity
 - **Z-plasty:** used to reorient a scar, lengthen the line of a scar or to break up a scar
 - **advancement flaps (V-Y, Y-V)**
 - ♦ single/bipedicle V-Y flaps: wounds with lax surrounding tissue; the pedicle is the deep tissue underlying the flap

Figure 15. Wound care flaps – random pattern

Axial Pattern Flaps (Arterialized)

- flap contains a well defined artery and vein
- allows greater length:width ratio (5-6:1)
- **types**
 - **peninsular flap:** skin and vessel intact in pedicle
 - **island flap:** vessel intact, pedicle is better defined
 - **free flap:** vascular supply anastomosed at recipient site by microsurgical techniques
- can be sub-classified according to tissue content of flap:
 - e.g. musculocutaneous/myocutaneous (e.g. transverse rectus abdominal myocutaneous) vs. fasciocutaneous

Free Flaps

- transplanting expendable donor tissue from one part of the body to another by isolating and dividing a dominant artery and veins to a flap and performing a microscopic anastomosis between these and the vessels in the recipient wound
- survival rates >95%
- **types:** muscle and skin (common), bone, jejunum, omentum
 - e.g. radial forearm, scapular, latissimus dorsi

Table 12. Free Flap Characteristics

Characteristic	Normal	Arterial Insufficiency	Venous Insufficiency
Color	Pink	Pale	Purple or blue
Temperature	Warm	Cool	Warm or cool
Arterial Pulse (Doppler)	+	±	±
Turgor	Soft, but with tissue turgor	Decreased	Increased (i.e. tense)

Figure 16. Peninsular axial pattern flap

Figure 17. Island axial pattern flap

Soft Tissue Infections

Table 13. Classification of Soft Tissue Infections by Depth

Erysipelas	Superficial with subcutaneous tissue involvement
Cellulitis	Full thickness with subcutaneous tissue involvement
Fasciitis	Fascia
Myositis	Muscle

Erysipelas

Definition

- acute skin infection that is more superficial than cellulitis

Etiology

- typically caused by Group A β -hemolytic *Streptococcus*

Clinical Features

- intense erythema, induration, and **sharply demarcated borders** (differentiates it from other skin infections)

Treatment

- penicillin or first generation cephalosporin (e.g. cefazolin or cephalexin)

Cellulitis

Definition

- non-suppurative infection of skin and subcutaneous tissues

Etiology

- skin flora most common organisms: *S. aureus*, β -hemolytic *Streptococcus*
- immunocompromised: Gram-negative rods and fungi

Clinical Features

- source of infection
 - trauma, recent surgery
 - PVD, DM – cracked skin in feet/toes
 - foreign bodies (IV, orthopaedic pins)
- systemic symptoms (fever, chills, malaise)
- pain, tenderness, edema, erythema with poorly defined margins, regional lymphadenopathy
- can lead to ascending lymphangitis (visible red streaking in skin proximal to area of cellulitis)

Investigations

- CBC, blood cultures
- culture and Gram stain wound/aspirate from wound if open wound
- plain radiographs if suspect foreign body or abscess or to rule out gas (if worried about a deeper infection, e.g. fasciitis) or rule out bone invasion (osteomyelitis)

Treatment

- antibiotics: first line – cephalexin 500 mg PO q6h or cloxacillin 500 mg PO q6h x 7 d; if complicated (e.g. lymphangitis, DM) consider IV cefazolin 1-2 g q8h penicillin
- outline area of erythema to monitor success of treatment
- immobilize and splint (hands)

Cellulitis vs. Erysipelas
Cellulitis: indistinct borders
Erysipelas: sharp borders

Necrotizing Fasciitis

Definition

- rapidly spreading, very painful infection of the deep fascia with necrosis of tissues
- some bacteria create gas that can be felt as crepitus and be seen on x-rays
- infection spreads rapidly along deep fascial plane and is **limb and life threatening**

Etiology

- Type I: polymicrobial (less aggressive)
- Type II: monomicrobial, usually β -hemolytic *Streptococcus*

Clinical Features

- **pain out of proportion to clinical findings and beyond border of erythema**, edema, tenderness, \pm crepitus (subcutaneous gas from anaerobes) \pm fever
- infection spreads very rapidly
- hyponatremia and hyperglycemia are common findings
- patients may look deceptively well at first, but may rapidly become very sick/toxic
- late findings
 - skin turns dusky blue and black (secondary to thrombosis and necrosis)
 - induration, formation of bullae
 - cutaneous gangrene, subcutaneous emphysema

Investigations

- **a clinical diagnosis**
- CT scan only if suspect it is not necrotizing fasciitis (looking for abscess, gas collection, myonecrosis and possible source of infection)
- severely elevated CK: usually means myonecrosis (late sign)
- hemostat easily passed along fascial plane; fascial biopsy to rule out in equivocal situations

Treatment

- vigorous resuscitation (ABCs)
- urgent surgical debridement: remove all necrotic tissue, copious irrigation
- IV antibiotics: as appropriate for clinical scenario; consider penicillin 4 million IU IV q4h and clindamycin 900 mg IV q6h until final cultures available; clindamycin targets the toxin produced
- possible role for IVIg (especially in Group A strep, adjuvant treatment on a case by case basis)
- urgent consultation with infectious disease specialist is recommended

Ulcers

Lower Limb Ulcers

Traumatic Ulcers (Acute)

- failure of lesions to heal, usually due to compromised blood supply and unstable scar
- usually over bony prominence \pm edema \pm pigmentation changes \pm pain
- treatment: debridement of ulcer and compromised tissue, left to heal via secondary intention with dressings, may need reconstruction with local or distant flap in select cases, vascular status of limb must be assessed clinically and via vascular studies (i.e. sonographically)

Non-Traumatic Ulcers (Chronic)

Table 14. Venous vs. Arterial vs. Diabetic Ulcers

Characteristic	Venous (70% of vascular ulcers)	Arterial	Diabetic
Cause	Valvular incompetence Venous HTN	2° to small and/or large vessel disease (be aware of risk factors)	Peripheral neuropathy: decreased sensation Atherosclerosis: decreased regional blood flow
History	Dependent edema, trauma Rapid onset \pm thrombophlebitis, varicosities	Arteriosclerosis, claudication Usually > 45 yr Slow progression	DM Peripheral neuropathy
Common Distribution	Medial malleolus ("Gaiter" locations)	Distal locations (e.g. toes)	Pressure point distribution
Appearance	Yellow exudates Granulation tissue Varicose veins Brown discoloration of surrounding skin	Pale/white, necrotic base \pm dry eschar covering	Necrotic base
Wound Margins	Irregular	Even ("punched out")	Irregular or "punched out" or deep
Depth	Superficial	Deep	Superficial/deep
Surrounding Skin	Venous stasis discoloration (brown)	Thin shiny dry skin, hairless, cool	Thin dry skin \pm hyperkeratotic border Hypersensitive/ischemic
Pulses	Normal distal pulses	Decreased or no distal pulses	Decreased pulses likely
Vascular Exam	ABI > 0.9 Doppler; abnormal venous system	ABI < 0.9 Pallor on elevation, rubor on dependency Delayed venous filling	ABI is inaccurately high Usually associated with arterial disease

ABI in diabetics can be falsely normal due to incompressible arteries secondary to plaques/calcification

All chronic ulcers require vascular studies, and a vascular consult, to assess for venous insufficiency, to rule in/out arterial pathology and to find out the potential role of vascular surgical management

Table 14. Venous vs. Arterial vs. Diabetic Ulcers (continued)

Characteristic	Venous (70% vascular ulcers)	Arterial	Diabetic
Pain	Moderately painful Increased with leg dependency, decreased with elevation No rest pain	Extremely painful Decreased with dependency, increased with leg elevation and exercise (claudication) Rest pain	Painless No claudication or rest pain Associated paresthesia, anesthesia
Treatment	Leg elevation, rest Compression at 30 mmHg (stockings or elastic bandages) Moist wound dressings ± topical, systemic antibiotics ± skin grafts	Rest, no elevation, no compression Moist wound dressing ± topical and/or systemic antibiotics Modify risk factors (smoking, diet, exercise, etc.) Vascular surgical consultation (angioplasty or bypass) Treat underlying conditions (DM, proximal arterial occlusion, etc.)	Control DM Careful wound care Foot care Orthotics Early intervention for infections (topical and/or systemic antibiotics) Vascular surgical consultation

Pressure Ulcers

Common Sites

- over bony prominences; 95% on lower body

Stages of Development

1. hyperemia: disappears 1 h after pressure removed
2. ischemia: follows 2-6 h of pressure
3. necrosis: follows >6 h of pressure
4. ulcer: necrotic area breaks down – N.B. skin is like tip of an iceberg

Classification (National Pressure Ulcer Advisory Panel 2007)

- Stage I: nonblanchable erythema present >1 h after pressure relief, skin intact
- Stage II: partial-thickness skin loss
- Stage III: full-thickness skin loss into subcutaneous tissue, but not through fascia
- Stage IV: through fascia into muscle, bone, tendon, or joint
 - if an eschar is present, must fully debride before staging possible

Prevention

- good nursing care (clean dry skin, frequent repositioning), special beds or mattress (Kin Air®), proper nutrition, activity, early identification of individuals at risk (e.g. immobility, incontinence, paraplegia, etc.)

Treatment

- depends on individual patient and condition
- treat underlying medical issues including nutrition
- continue with preventative measures (pressure relief)
- wound debridement, moisture retentive or antimicrobial dressing, regular reassessment
- topical antimicrobials at treating physician's discretion, systemic antibiotics for infections
- resect osteomyelitis and treat with 6 wk of antibiotics before final flap coverage
- assess for possible reconstruction after infection eradicated and clean wound bed ($<10^5$ colony-forming unit)

Complications

- cellulitis, osteomyelitis, sepsis, gangrene

Burns

Burn Injuries

Causal Conditions

- thermal (flame contact, scald)
- chemical
- radiation (UV, medical/therapeutic)
- electrical

Most Common Etiology

- children: scald burns
- adults: flame burns

Table 15. Skin Function and Burn Injury

Skin Function	Consequence of Burn Injury	Intervention Required
Thermoregulation	Prone to lose body heat	Must keep patient covered and warm
Control of fluid loss	Loss of large amounts of water and protein from the skin and other body tissues	Adequate fluid resuscitation is imperative
Mechanical barrier to bacterial invasion and immunological organ	High risk of infection	Antibiotic ointments (systemic if signs of specific infection present) Tetanus prophylaxis if necessary

Pathophysiology of Burn Wounds

- amount of tissue destruction is based on temperature, time of exposure, and specific heat of the causative agent
- zone of hyperemia:** vasodilation from inflammation; entirely viable, cells recover within 7 d; contributes to systemic consequences seen with major burns
- zone of stasis (edema):** decreased perfusion; microvascular sludging and thrombosis of vessels results in progressive tissue necrosis → cellular death in 24-48 h without proper treatment
 - factors favoring cell survival: moist, aseptic environment, rich blood supply
 - zone where appropriate early intervention has most profound effect in minimizing injury
- zone of coagulation (ischemia):** no blood flow to tissue → irreversible cell damage → cellular death/necrosis

**Figure 18. Zones of thermal injury**

Diagnosis and Prognosis

- burn size
 - % of TBSA burned: rule of 9s for 2° and 3° burns only (children <10 yr old use Lund-Browder chart)
 - for patchy burns, surface area covered by patient's palm (fingers closed) represents approximately 1% of TBSA
- age: more complications if <3 or >60 yr old
- depth: difficult to assess initially – history of etiologic agent and time of exposure helpful (see Table 16)
- location: face and neck, hands, feet, perineum are critical areas requiring special care of a burn unit (see *Indications for Transfer to Burn Center*, PL18)
- inhalation injury: can severely compromise respiratory system due to sloughing of the epithelium that blocks gas exchange at the alveolus; also significant swelling of the intraoral and laryngeal mucosa from the thermal injury as well as during massive resuscitation.
- associated injuries (e.g. fractures)
- comorbid factors (e.g. concurrent disability, alcoholism, seizure disorders, chronic renal failure) can exacerbate extent of injury

Prognosis best determined by:

- burn size (TBSA)
- age of patient
- presence/absence of inhalational injury

**Figure 19. Rule of 9s for TBSA**

Prognosis best determined by burn size (TBSA), age of patient, presence/absence of inhalation injury

Circumferential burns can restrict respiratory excursion and/or blood flow to extremities and require escharotomy

TBSA does not include areas with 1° burns

Figure 20. Lund-Browder diagram

Table 16. Burn Depth (1st, 2nd, 3rd degree)

Nomenclature	Traditional Nomenclature	Depth	Clinical Features
Erythema/Superficial	First degree	Epidermis	Painful, sensation intact, erythema, blanchable
Superficial-Partial Thickness	Second degree	Into superficial dermis	Painful, sensation intact, erythema, blisters with clear fluid, blanchable, hair follicles present
Deep-Partial Thickness	Second degree	Into deep (reticular) dermis	Insensate, difficult to distinguish from full thickness, does not blanch, some hair follicles still attached, softer than full thickness burn
Full Thickness	Third degree Fourth degree	Through epidermis and dermis Injury to underlying tissue structures (e.g. muscle, bone)	Insensate (nerve endings destroyed), hard leathery eschar that is black, gray, white, or cherry red in color, hairs do not stay attached, may see thrombosed veins

Indications for Transfer to Burn Center

American Burn Association Criteria

- patients with partial or full-thickness burns that involve the hands, feet, genitalia, face, eyes, ears and/or major joints or perineum
- partial thickness burns $\geq 20\%$ TBSA in patients aged 10-50 yr old
- partial thickness burns $\geq 10\%$ TBSA in children aged ≤ 10 or adults aged ≥ 50 yr old
- full thickness burns $\geq 5\%$ TBSA in patients of all ages
- electrical burns, including lightening (internal injury underestimated by TBSA)
- chemical burns
- inhalation injury (high risk of mortality and may lead to respiratory distress)
- burn injuries in patients with medical comorbidities, could complicate management and recovery
- any patient with simultaneous trauma plus burns should be stabilized for trauma first, then triaged appropriately to burn center
- any patients with burn injury and who will require special emotional, social, and rehabilitation intervention
- children with burns in a hospital not equipped with pediatric care specialists

Acute Care of Burn Patients

- adhere to ATLS protocol
- resuscitation using Parkland formula to restore plasma volume and cardiac output and should only be used in burns 30% or greater TBSA
 - 4 cc RL/kg/% TBSA over first 24 h (1/2 within first 8 h of sustaining burn, 1/2 in next 16 h); if resuscitation is greater than 6cc/kg/%TBSA, reevaluate as this can create significant complications (compartment syndrome of extremities as well as abdomen which can impair ventilation); reasonable to supplement colloid in setting of excessive resuscitation
- extra fluid administration required if
 - burn >80% TBSA
 - 4° burns
 - associated traumatic injury
 - electrical burn
 - inhalation injury
 - delayed start of resuscitation
 - pediatric burns
- monitor resuscitation
 - urine output is best measure: maintain at >0.5 cc/kg/h (adults) and 1.0 cc/kg/h (children <12 yr)
 - maintain a clear sensorium, HR <120/min, MAP >70 mmHg
 - urine output will often lag early in the resuscitation
 - trend other signs of resuscitation, such as lactate, base deficit, CVP, mixed or central venous O₂
- burn specific care
 - relieve respiratory distress: intubation and/or escharotomy (see sidebar)
 - prevent and/or treat burn shock: at least 2 large bore IVs in non-burned area; place early central line and a-line if large burn identify and treat immediate life-threatening conditions (e.g. inhalation injury, CO poisoning)
 - determine TBSA affected first, since depth is difficult to determine initially (easier to determine after 24 h)
- tetanus prophylaxis if needed
 - all patients with burns >10% TBSA, or deeper than superficial partial thickness, need 0.5 cc tetanus toxoid
 - also give 250 U of tetanus Ig if prior immunization is absent/unclear, or the last booster >10 yr ago
- baseline laboratory studies (Hb, U/A, BUN, CXR, electrolytes, ECG, cross-match, ABG, carboxyhemoglobin)
- cleanse, debride, and treat the burn injury (antimicrobial dressings)
- early excision and grafting important for outcome

Respiratory Problems

- 3 major causes
 - burn eschar encircling chest
 - ♦ distress may be apparent immediately
 - ♦ perform escharotomy to relieve constriction
 - CO poisoning
 - ♦ may present immediately or later
 - ♦ treat with 100% O₂ (decreases half-life of carboxyhemoglobin from 210 to 59 min) until carboxyHb <10%;. can use hyperbaric chamber for very high levels if patient is otherwise stable
 - smoke inhalation leading to pulmonary injury
 - ♦ chemical injury to alveolar basement membrane and pulmonary edema (insidious onset)
 - ♦ risk of pulmonary insufficiency (up to 48 h) and pulmonary edema (48-72 h)
 - ♦ watch for secondary bronchopneumonia (3-25 d) leading to progressive pulmonary insufficiency
 - ♦ intubate patient with any signs of inhalation injuries

Burn Wound Healing

Table 17. Burn Shock Resuscitation (Parkland Formula)

Hour 0-24	4 cc RL/kg/% TBSA with 1/2 of total in first 8 h from time of injury and 1/2 of total in next 16 h from time of injury
Hour 24-30	0.35-0.5 cc plasma/kg/%TBSA, or decrease fluids by 1/3 from first 24 h assuming urine output remains stable
>Hour 30	D5W at rate to maintain normal serum sodium

*Do not forget to add maintenance fluid to resuscitation

Signs of CO Poisoning

- Headache
- Confusion
- Coma
- Arrhythmias

Inhalation Injuries 101

- Indicators of inhalation injury
 - Injury in a closed space
 - Facial burn
 - Singed nasal hair/eyebrows
 - Soot around nares/oral cavity
 - Hoarseness
 - Conjunctivitis
 - Tachypnea
 - Carbon particles in sputum
 - Elevated blood CO levels (i.e. brighter red)
- Suspected inhalation injury requires immediate intubation due to impending airway edema; failure to diagnose inhalation injury can result in airway swelling and obstruction, which, if untreated, can lead to death
- Neither CXR or ABG can be used to rule out inhalation injury
- Direct bronchoscopy now used for diagnosis

Table 18. Burn Wound Healing

Depth	Healing
First degree	No scarring; complete healing
Second degree (Superficial partial)	Spontaneously re-epithelialize in 7 to 14 d from retained epidermal structures ± residual skin discoloration Hypertrophic scarring uncommon; grafting rarely required
Deep second degree (Deep partial)	Re-epithelialize in 14-35 d from retained epidermal structures Hypertrophic scarring frequent Grafting recommended to expedite healing
Third degree (Full thickness)	Re-epithelialize from the wound edge Grafting/flap necessary to replace dermal integrity, limit hypertrophic scarring
Fourth degree	Often results in amputations If not requiring amputation, needs flap for coverage after debridement (do not re-epithelialize – cannot graft)

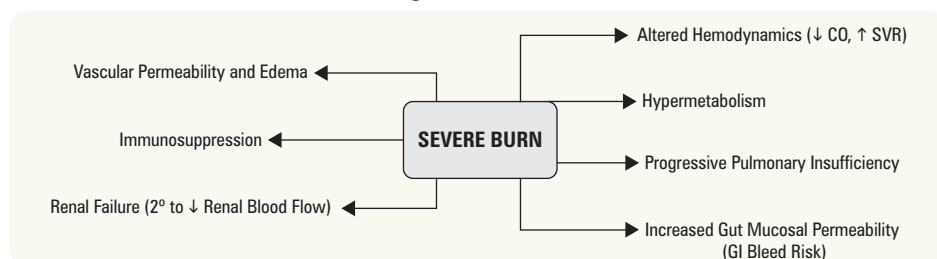

Treatment

- 3 stages
 1. assessment: depth determined
 2. management: specific to depth of burn and associated injuries
 3. rehabilitation
- first degree
 - treatment aimed at comfort
 - ♦ topical creams (pain control, keep skin moist) ± aloe
 - ♦ oral NSAIDs (pain control)
- superficial second degree
 - daily dressing changes with topical antibiotics, polysporin, may use a temporary biological or synthetic covering to close the wound
- deep second degree and third degree
 - prevent infection and sepsis (significant cause of death in burn patients)
 - ♦ most common organisms: *S. aureus*, *P. aeruginosa* and *C. albicans*
 - day 1-3 (rare): Gram-positive
 - day 3-5: Gram-negative (*Proteus*, *Klebsiella*)
 - ♦ topical antimicrobials: prevent bacterial infection (from skin flora, gut flora or caregiver) and secondary sepsis
 - remove dead tissue
 - ♦ surgically debride necrotic tissue, excise to viable (bleeding) tissue

Table 19. Topical Antibiotic Therapy for Burns

Antibiotic	Pain with Application	Penetration	Adverse Effects
Silver nitrate (0.5% solution)	None	Minimal	Stains (black), leaches sodium and magnesium from wounds
Nanocrystalline silver-coated dressing (Acticoat®)	None or transient	Medium, does not penetrate eschar; preferred over silver sulfadiazine and silver nitrate	May stain, producing a pseudoeschar or facial discoloration (argyria-like symptoms); raised liver enzymes
Silver sulfadiazine (cream) (Silvadene®)	Minimal	Medium, does not penetrate eschar	Slowed healing, leukopenia, mild inhibition of epithelialization
Mafenide acetate (solution/cream) (Sulfamylon®)	Moderate	Well, penetrates eschar	Mild inhibition of epithelialization, may cause metabolic acidosis with wide application

- early excision and grafting is the mainstay of treatment
- initial dressing should decrease bacterial proliferation
- indication for skin graft: deep 2° or 3° burn that is > size of a quarter
- prevention of wound contractures: pressure dressings, joint splints, early physiotherapy

Other Considerations in Burn Management**Figure 21. Systemic effects of severe burns**

- nutrition
 - hypermetabolism: TBSA >40% have BMR 2-2.5x predicted
 - calories, vitamin C, vitamin A, Ca^{2+} , Zn^{2+} , Fe^{2+}
- immunosuppression and sepsis
 - must keep bacterial count $<10^5$ bacteria/g of tissue (blood culture may not be positive)
 - signs of sepsis: sudden onset of hyper/hypothermia, unexpected CHF or pulmonary edema, development of ARDS, ileus >48 h post-burn, mental status changes, azotemia, thrombocytopenia, hypofibrinogenemia, hyper/hypoglycemia (especially if burn >40% TBSA)
- oxandralone has been shown to help with burn induced hypermetabolism in burns over 30% TBSA; continue for up to 6 mo
- GI bleed may occur with burns >40% TBSA (usually subclinical)
 - treatment: tube feeding or NPO, antacids, H_2 blockers (preventative)
- renal failure secondary to under resuscitation, drugs, myoglobin, etc.
- progressive pulmonary insufficiency
 - can occur after: smoke inhalation, pneumonia, cardiac decompensation, sepsis
- wound contracture and hypertrophic scarring
 - largely preventable with timely wound closure, splinting, pressure garments and physiotherapy; can be treated with fractional ablative CO_2 laser

Special Considerations

CHEMICAL BURNS

- major categories: acid burns, alkaline burns, phosphorous burns, chemical injection injuries
- common agents: cement, hydrofluoric acid, phenol, tar
- mechanism of injury: chemical solutions coagulate tissue protein leading to necrosis
 - acids → coagulation necrosis
 - alkalines → saponification followed by liquefactive necrosis
- severity related to: type of chemical (alkali worse than acid), temperature, volume, concentration, contact time, site affected, mechanism of chemical action, degree of tissue penetration
- burns are deeper than they initially appear and may progress with time

Treatment (General)

- ABCs, monitoring
- remove contaminated clothing and brush off any dry powders before irrigation
- irrigation with water for 1-2 h under low pressure (contraindicated in heavy metal burns, such as sodium, potassium, magnesium, and lithium; in these cases soak in mineral oil instead)
- inspect eyes, if affected: wash with saline and refer to ophthalmology
- inspect nails, hair and webspaces
- correct metabolic abnormalities and tetanus prophylaxis if necessary
- local wound care 12 h after initial dilution (debridement)
- wound closure same as for thermal burn
- beware of underestimated fluid resuscitation, renal, liver, and pulmonary damage

Special Burns and Treatments

Acid Burn	Water irrigation, followed by dilute solution of sodium bicarbonate
Hydrofluoroic Acid	Water irrigation; clip fingernails to avoid acid trapping; topical calcium gel ± subcutaneous injection of calcium gluconate ± 10% calcium gluconate IV depending on amount of exposure and pain
Sulfuric Acid	Treat with soap/lime prior to irrigation, as direct water exposure produces extreme heat
Tar	Remove with repeated application of petroleum-based antibiotic ointments (e.g. Polysporin®)

ELECTRICAL BURNS

- depth of burn depends on voltage and resistance of the tissue (injury more severe in tissues with high resistance)
- often presents as small punctate burns on skin with extensive deep tissue damage which requires debridement
- electrical burns require ongoing monitoring as latent injuries can occur
- watch for system specific damages and abnormalities
 - abdominal: intraperitoneal damage
 - bone: fractures and dislocations especially of the spine and shoulder
 - cardiopulmonary: anoxia, ventricular fibrillation, arrhythmias
 - muscle: myoglobinuria indicates significant muscle damage → compartment syndrome
 - neurological: seizures and spinal cord damage
 - ophthalmology: ocular compartment syndrome and cataract formation (late complication)
 - renal: ATN resulting from toxic levels of myoglobin and hemoglobin
 - vascular: vessel thrombosis → tissue necrosis (increased Cr, K^+ and acidity), decrease in RBC (beware of hemorrhages/delayed vessel rupture)

Tissue Resistance to Electrical Current:

nerve < vessel/blood < muscle < skin
< tendon < fat < bone

Treatment

- ABCs, primary and secondary survey, treat associated injuries
- beware of cardiac arrhythmias (need to keep for monitoring)
- monitor: cardiac arrhythmia, hemochromogenuria, compartment syndrome, urine output
- wound management: topical agent with good penetrating ability (silver sulfadiazine or mafenide acetate)
- debride non-viable tissue early and repeat prn (every 48 h) to prevent sepsis
- amputations frequently required

FROSTBITE

- see [Emergency Medicine, ER45](#)

High pressure injection injury is deceptively benign-looking (small pinpoint hole on finger pad) often with few clinical signs. Intense pain and tenderness, along the course the foreign material traveled, is present a few hours after the injury. Definitive treatment is exposure and removal of foreign material

Allen's Test: while patient's hand is firmly closed, occlude both radial and ulnar arteries; once fist is open, release either artery and assess collateral flow

Approach to Hand Lacerations

TIN AX

Tetanus prophylaxis
Irrigate with NS (Copious irrigation and debridement in a timely manner)
NPO (only if deeper structures are cut – i.e. needs an operation)
Antibiotic prophylaxis (controversial – most require no ABx)
X-rays

Figure 22. Testing profundus (FDP) – inserts at distal phalanx

Figure 23. Testing superficialis (FDS) – inserts at middle phalanx

Hand

Traumatic Hand

Table 20. Key Features of the History and Physical Exam of the Injured Hand in the Emergency Department

HISTORY		
Key Questions	Age Hand dominance Occupation Time and place of accident Mechanism of injury Tetanus status	
PHYSICAL EXAM		
	Structure	Examination
Observation	Position of finger Deformity Bruising or swelling Sweating pattern Anatomical structures beneath	Abnormal cadence (fingers normally slightly flexed), scissoring Bony or specific (e.g. mallet, swan neck) May indicate underlying skeletal injury May indicate denervation If open laceration, need to explore within wound (under sterile conditions)
Vascular Status	Radial and ulnar arteries Digital arteries Temperature and skin turgor	Allen's Test Capillary refill (<2-3 s) For each test, need to compare both sides
Sensory (refer to Figure 4)	Median nerve Ulnar nerve Radial nerve Digital nerves	Dorsal radial tip of index finger Dorsal ulnar tip of little finger Dorsal web space of the thumb 2 point discrimination of each finger
Motor Function	Median nerve Ulnar nerve Radial nerve	Extrinsic muscles: flex DIP of index finger ("OK sign") Intrinsic muscles: thumb to ceiling with palm up Extrinsic muscles: flex DIP of little finger Intrinsic muscles: abduct index finger ("Peace sign") or patient able to hold piece of paper between adducted fingers and resist pulling Extrinsic muscles: extend thumb ("thumb's up") and wrist
Range of Motion	Tendons, bones, joints, nerves	Assess active and passive range of motion of wrist extension/flexion/ulnar/radial deviation, finger abduction/adduction/flexion/extension, thumb flexion/extension/abduction/adduction/circumflexion
Tendons	FDP FDS	Stabilize PIP in extension, ask patient to flex fingers (at DIP) Stabilize non-exam fingers in extension (neutralizes FDP) and ask patient to flex examination finger
Palpation	Bones Joints	Focal tenderness or abnormal alignment Instability may indicate ligamentous injury or dislocation

General Management

Nerves

- test the nerve function **BEFORE** putting in local anesthesia
- direct repair for a clean injury within 14 d and without concurrent major injuries → otherwise secondary repair
- epineural repair of digital nerves with minimal tension
- post-operative: dress wound, elevate hand and immobilize
- Tinel's sign (cutaneous percussion over the repaired nerve) produces paresthesias and defines level of nerve regeneration
 - Wallerian degeneration occurs in the first 2 wk, which is why there is no Tinel's sign till after this time period
 - a peripheral nerve regenerates at 1 mm/d
 - paresthesias felt at area of percussion because re-growth of myelin (Schwann cells) is slower than axonal re-growth → percussion on exposed free-end of axon generates paresthesia

Vessels

- often associated with nerve injury (anatomical proximity)
- control bleeding with direct pressure and hand elevation
- if digit devascularized, optimal repair within 6 h
- dress, immobilize, and splint hand with finger tips visible
- monitor color, capillary refill, skin turgor, fingertip temperature post-revascularization

Tendons

- most tendon lacerations require primary repair
- many extensors are repaired in the emergency room, flexors are repaired in the operating room within 2 wk
- avoid excessive immobilization (specific protocols for flexors, 2-3 wk for extensors) to minimize stiffness and facilitate rehabilitation

Bones

- see *Fractures and Dislocations*, PL25

Nailbed

- remove nail to examine underlying nailbed under digital block anesthesia
- irrigate wound and nail thoroughly
- suture repair of nailbed with catgut suture
- replace cleaned nail, which acts as splint for any underlying distal phalangeal fracture and prevents adhesion formation between nail fold and nailbed

Hand Exam

- Never blindly clamp a bleeding vessel as nerves are often found in close association with vessels
- Never explore any volar hand wound in the ER
- Arterial bleeding from a volar digital laceration may indicate nerve laceration (nerves in digits are superficial to arteries)

Compartment Syndrome

Watch out for these signs with a closed or open injury: tense, painful extremity (worse on passive stretch), parasthesia/paralysis, pallor, distal pulselessness (often late in process), and contracture (irreversible ischemia). Intracompartmental pressures can be measured (normal pressure = up to 12 mmHg), but a clinical diagnosis is an indication for an emergent fasciotomy; if untreated, end result is ischemic contracture of the extremity (Volkmann's contracture).

Hand Infections

Principles

- trauma is most common cause
- 5 cardinal signs: *rubor* (red), *calor* (hot), *tumor* (swollen), *dolor* (painful) and *functio laesa* (loss of function)
- 90% caused by Gram-positive organisms
- most common organisms (in order) – *S. aureus*, *S. viridans*, Group A *Streptococcus*, *S. epidermidis*, and *Bacteroides melaninogenicus* (MRSA is becoming more common)

TYPES OF INFECTIONS

Deep Palmar Space Infections

- uncommon, there are 9 spaces in the hand, the most commonly involved are thenar or mid-palm space (treated in the OR)

Felon

- **definition:** subcutaneous abscess in the fingertip that commonly occurs following a puncture wound into the pad of digit; may be associated with osteomyelitis (akin to compartment syndrome and can lead to skin necrosis)
- **treatment:** elevation, warm soaks, cloxacillin 500 mg PO q6h (if in early stage); if obvious abscess then I&D, cultures/gram stain, PO cloxacillin

Flexor Tendon Sheath Infection

- *Staphylococcus* > *Streptococcus* > Gram-negative rods
- **definition:** acute suppurative tenosynovitis commonly caused by a penetrating injury and can lead to tendon necrosis and rupture if not treated
- **clinical features:** Kanavel's 4 cardinal signs
 1. point tenderness along flexor tendon sheath (earliest and the most important)

2. severe pain on passive extension of DIP (second most important)
3. fusiform swelling of entire digit
4. flexed posture (increased comfort)

- **treatment**

- OR incision and drainage, irrigation, IV antibiotics, and resting hand splint until infection resolves

Herpetic Whitlow

- HSV-1, HSV-2
- **definition:** painful vesicle(s) around fingertip
 - often found in medical/dental personnel and children
- **clinical features:** can be associated with fever, malaise and lymphadenopathy
 - patient is infectious until lesion has completely healed
- **treatment:** routine culture and viral prep protection (cover), consider oral acyclovir; do not break blisters, as this can spread infection

Paronychia

- acute = *Staphylococcus*; chronic = *Candida*
- **definition:** infection (granulation tissue) of soft tissue around fingernail (beneath eponychial fold)
- **etiology**
 - acute paronychia: a “hangnail”, artificial nails, and nail biting
 - chronic paronychia: prolonged exposure to moisture
- **treatment**
 - acute paronychia: warm compresses and cephalexin 500 mg PO q6h if caught early and drainage if abscess present – can usually drain with a #11 blade directed into the abscess from underneath the paronychia fold
 - chronic paronychia: anti-fungals with possible debridement and marsupialization, removal of nail plate

Amputations

Hand or Finger

- emergency management: injured patient and amputated part require attention
 - **patient:** x-rays, NPO, clean wound and irrigate with NS, dress stump with nonadherent, cover with dry sterile dressing, tetanus and antibiotic prophylaxis (cephalosporin/erythromycin)
 - **amputated part:** x-rays, gently irrigate with RL, wrap amputated part in a NS/RL soaked sterile gauze and place inside waterproof plastic bag, place in a container, then place container on ice
- **indications for replantation**
 - **age:** children often better results than adults
 - **level of injury:** proximal, thumb and multiple digit amputations are higher priority
 - **nature of injury:** clean cut injuries have higher successful replantation rate; avulsion and crush injuries are relative contraindications to replant
- if replant contraindicated manage stump with revision amputation
 - would only allow a fingertip injury to heal by secondary intention

Tendons

Common Extensor Tendon Deformities

Table 21. Extensor Tendon Deformities

Injury	Definition	Zone	Etiology/Clinical Features	Treatment
Mallet Finger	DIP flexed with loss of active extension	1	Forced flexion of the extended DIP leading to extensor tendon rupture at DIP (e.g. sudden blow to tip of the finger)	Splint DIP in extension for 6 wk followed by 2 wk of night splinting; if inadequate improvement after 6 wk, check splinting routine and recommend 4 more wk of continuous splinting
Boutonniere Deformity	PIP flexed, DIP hyperextended	3	Injury or disease affecting the extensor tendon insertion into the dorsal base of the middle phalanx Associated with RA or trauma (laceration, volar dislocation, acute forceful flexion of PIP)	Splint PIP in extension and allow active DIP motion
Swan Neck Deformity	PIP hyperextended, DIP flexed	3	Trauma (PIP volar plate injury) Associated with RA and old, untreated mallet deformity	Splint to prevent PIP hyperextension or DIP flexion Consider arthrodesis/arthroplasty

Figure 24. Zone of extensor tendon injury (odd numbered zones fall over a joint)

Figure 25. Mallet finger deformity

Figure 26. Boutonniere deformity

Figure 27. Swan neck deformity

De Quervain's Tenosynovitis (zone 7; most common cause of radial wrist pain)

- **definition:** inflammation in 1st extensor compartment (APL and EPB)
- **clinical features**
 - +ve Finkelstein's test (pain over the radial styloid induced by making fist, with thumb in palm, and ulnar deviation of wrist)
 - pain localized to the 1st extensor compartment
 - tenderness and crepitation over radial styloid may be present
 - differentiate from CMC joint arthritis (CMC joint arthritis will have a positive grind test, whereby crepitus and pain are elicited by axial pressure to the thumb)
- **treatment**
 - mild: NSAIDs, splinting and steroid injection into the tendon sheath (successful in over 60% of cases)
 - severe: surgical release of stenotic tendon sheaths (APL and EPB); remember there may be 2 or more sheaths

Ganglion Cyst (zone 7)

- **definition**
 - fluid-filled synovial lining that protrudes between carpal bones or from a tendon sheath; most commonly carpal in origin
 - most common soft tissue tumor of hand and wrist (60% of masses)
- **clinical features**
 - most common around scapholunate ligament junction
 - 3 times more common in women than in men
 - more common in younger individuals
 - can be large or small – may drain internally so size may wax and wane
 - often non-tender although tenderness increased when cyst smaller (from increased pressure within smaller cyst sac)
- **treatment**
 - conservative treatment: watch and wait
 - aspiration (recurrence rate 65%)
 - consider operative excision of cyst and stalk (recurrence is possible)
 - steroids if painful

Common Flexor Tendon Deformities

- flexor tendon zones (important for prognosis of tendon lacerations)
- "no-man's land"
 - between distal palmar crease and mid-middle phalanx
 - zone where superficialis and profundus lie ensheathed together
 - recovery of glide very difficult after injury

Stenosing Tenosynovitis (trigger finger/thumb)

- **definition:** inflammation of synovium causes size discrepancy between tendon and sheath/pulley (most commonly at A-1 pulley) = locking of thumb or finger in flexion/extension
- **etiology:** idiopathic or associated with RA, DM, hypothyroidism and gout
- **clinical features**
 - thumb, ring and long fingers most commonly affected
 - patient complains of catching, snapping or locking of affected finger
 - tenderness to palpation/nodule at palmar aspect of MCP over A-1 pulley
 - women are 4 times more likely than men to be affected
- **conservative treatment**
 - NSAIDs
 - steroid injection
 - surgical flexor tendon release
 - injections less likely to be successful in patients with DM or symptoms greater than 6 mo
- **surgical treatment**
 - incise A-1 flexor tendon pulley to permit unrestricted, full active finger motion

A-2 and A-4 pulleys are most important for function; prevent bowstringing of tendons

Figure 28. Zones of the flexor tendons

Fractures and Dislocations

- for fracture principles, see [Orthopedics](#), OR5

FRACTURES

- about 90% of hand fractures are stable in flexion (lock/prevent extension)
- **position of function** (like a hand holding a pop can)
 - wrist extension 15°
 - MCP flexion 45°
 - IP flexion (slight)
 - thumb abduction/rotation
 - contraindications: post repair of flexor tendons, median/ulnar nerve injury

Figure 29. Position of function

- **position of safety**
 - wrist extension 45° (position most beneficial for hand function if immobilized)
 - MCP flexion 60° (maximal collateral ligament stretch)
 - PIP and DIP in full extension (maximal volar plate origin stretch)
 - thumb abduction and opposition (functional position)
- stiffness secondary to immobilization is the most important complication; Tx = early motion

Distal Phalanx Fractures

- most commonly fractured bone in the hand
- usual mechanism is crush injury and thus accompanied by soft tissue injury
- subungual hematoma is common and must be decompressed if painful or nail removed
- treatment consists of 3 wk of digital splinting (with IP joint movement preserved)

Proximal and Middle Phalanx Fractures

- check for: rotation, scissoring (overlap of fingers on making a fist), shortening of digit
- undisplaced or minimally displaced: closed reduction (if extra-articular) buddy tape to neighbouring stable digit, elevate hand, motion in guarded fashion early, splinted for **2-3 wk**
- displaced, non-reducible, not stable with closed reduction, or rotational or scissoring deformity: percutaneous pins (K-wires) or ORIF, and splint

Metacarpal Fractures

- generally accept varying degrees of deviation before reduction required: up to 10° (D2), 20° (D3), 30° (D4), or 40° (D5)
- **Boxer's fracture (extra-articular)**: acute angulation of neck of metacarpal of little finger into palm
 - mechanism: blow on the distal-dorsal aspect of closed fist
 - loss of prominence of metacarpal head, volar displacement of head
 - check for scissoring of fingers on making a fist
 - up to 30-40° angulation may be acceptable
 - closed reduction should be considered to decrease the angle
 - if stable ulnar gutter splint for 2-3 wk with PIP and DIP free
- **Bennett's fracture (intra-articular)**: fracture/dislocation of the base of the thumb metacarpal
 - unstable fracture
 - abductor pollicis longus pulls MC shaft proximally and radially causing adduction of thumb
 - treat with percutaneous pinning, thumb spica x 6 wk
- **Rolando's fracture (intra-articular)**: T- or Y-shaped fracture of the base of the thumb metacarpal
 - treat with ORIF with K-wire

DISLOCATIONS

- must be reduced as soon as possible
- dislocation vs. subluxation
 - dislocation: severe injury where articular surfaces of a joint are no longer in contact with one another
 - subluxation: articular surfaces of a joint are partially out of place, but then go back into place (partial dislocation)

PIP and DIP Dislocations (PIP more common than DIP)

- usually dorsal dislocation (commonly from hyperextension)
- if closed dislocation: closed reduction and splinting (30° flexion for PIP and full extension for DIP) or buddy taping and early mobilization (prolonged immobilization causes stiffness)
- open injuries are treated with wound care, closed or open reduction and antibiotics

MCP Dislocations (relatively rare)

- dorsal dislocations much more common than volar dislocations
- dorsal dislocation of proximal phalanx on metacarpal head; most commonly index finger (hyperextension)
- two types of dorsal dislocation
 - simple (reducible with manipulation): treat with **2-4 wk** of splinting at 30° MCP flexion
 - complex (volar plate blocks reduction): treat with open reduction and A1 pulley release + extension-blocking splint at 30° flexion (2 wk) then 10° flexion (2 wk)

Ulnar Collateral Ligament (UCL) Injury

- forced abduction of thumb (e.g. ski pole injury)
- **skier's thumb**: acute UCL injury
- **gamekeepers thumb**: chronic UCL injury
- **evaluation**: radially deviate joint in full extension and at 30° flexion and compare with non-injured hand. UCL rupture is presumed if injured side deviates more than 30° in full extension or more than 15° in flexion
- **Stener's lesion**: the UCL has bony attachments to the adductor aponeurosis and the proximal ligament can displace while the distal attachment remains deep to the aponeurosis, forming a barrier that blocks healing and leads to chronic instability; requires surgery

Figure 30. Position of safety

Figure 31. Boxer's fracture

Figure 32. Bennett's fracture

Figure 33. Rolando's fracture

Dupuytren's Disease

Definition

- contraction of longitudinal palmar fascia, forming nodules (usually painless), fibrous cords and eventually flexion contractures at the MCP and interphalangeal joints
- flexor tendons not involved
- Dupuytren's diathesis: early age of onset, strong family history, and involvement of sites other than palmar aspect of hand

Epidemiology

- genetic disorder, unusual in patients from African and Asian countries, high incidence in northern Europeans, men > women, often presents in 5th-7th decade of life, associated with but not caused by alcohol use and DM

Clinical Features

- order of digit involvement (most common to least common): ring > little > long > thumb > index
- may also involve feet (Ledderhose's) and penis (Peyronie's – see [Urology, U29](#))

Treatment

- stages
 1. palmar pit or nodule: no surgery
 2. palpable band/cord with no limitation of extension of either MCP or PIP: no surgery
 3. lack of extension at MCP or PIP: surgical fasciectomy indicated
 4. irreversible periarticular joint changes/scarring: surgical treatment possible but poorer prognosis compared to stage 3
- indications for percutaneous release
 - functional impairment
 - MCP contractures >30°
 - any PIP contracture
 - rapidly progressive disease
- may recur, especially in Dupuytren's diathesis

Figure 34. Dupuytren's disease

Carpal Tunnel Syndrome

Definition

- median nerve compression at the level of the flexor retinaculum as opposed to pronator teres syndrome

Etiology

- median nerve entrapment at wrist
- primary cause is idiopathic
- secondary causes: space occupying lesions (tumors, hypertrophic synovial tissue, fracture callus, and osteophytes), metabolic and physiological (pregnancy, hypothyroidism, acromegaly, and RA), infections, neuropathies (associated with DM or alcoholism), and familial disorders
- job/hobby related repetitive trauma, especially forced wrist flexion

Epidemiology

- female:male = 4:1, **most common entrapment neuropathy**

Clinical Features

- sensory loss in median nerve distribution i.e. radial 3.5 digits (see [Figure 4](#))
- discriminative touch often lost first
- classically, patient awakened at night with numb/painful hand, relieved by shaking/dangling/rubbing
- decreased light touch and 2-point discrimination, especially fingertips
- advanced cases: thenar wasting/weakness
- ± Tinel's sign (tingling sensation on percussion of nerve)
- ± Phalen's sign (wrist flexion induces symptoms)

Investigations

- clinical diagnosis
- NCV and EMG may confirm, but do not exclude, the diagnosis

Treatment

- avoid repetitive wrist and hand motion, wrist splints when repetitive wrist motion required
- conservative: night time splinting to keep wrist in neutral position
- medical: NSAIDs, local corticosteroids injection, oral corticosteroids
- surgical decompression: transverse carpal ligament incision to decompress median nerve
- indications for surgery: numbness and tingling ± sensory loss, weakness ± muscle atrophy, unresponsive to conservative measures
- complications of surgery: injury to median motor branch, palmar cutaneous branch or superficial transverse vascular arch, local pain (pillar pain), and scar formation

Accuracy of the Clinical Assessment for Carpal Tunnel Syndrome

- Phalen's:
 - Sensitivity: 0.75 Specificity: 0.47
- Tinel's:
 - Sensitivity: 0.60 Specificity: 0.67
- Carpal Tunnel Compression Test:
 - Sensitivity: 0.87 Specificity: 0.90

Hand Surgery Update 1996;223

Development and Validation of Diagnostic Criteria for Carpal Tunnel Syndrome

J Hand Surg 2006;31:919-924

Purpose: To develop a clinical diagnostic criteria for carpal tunnel syndrome that modeled the clinical diagnostic practices of experts.

Methods: Out of 57 clinical findings associated with CTS, eight were ranked highly by a panel of expert clinicians. Using 256 case histories, a panel of experts decided whether a case did or did not have a diagnosis of CTS. This diagnosis represented the dependent variable for a logistic regression model, to which the eight clinical findings were applied. The regression model was then validated against the consensus of a second panel on the diagnosis of CTS for the case histories.

Results/Conclusions: The correlation between the probability of CTS predicted by the regression model and the panel of clinicians was 0.71. Clinical diagnostic criteria that contributed significantly to the model were:

1. Numbness and tingling in median nerve distribution
2. Nocturnal numbness
3. Weakness and/or atrophy of the thenar musculature
4. Tinel's sign
5. Phalen's test
6. Loss of 2-point discrimination

Rheumatoid Hand

- see [Rheumatology](#), RH5

Radiographic Evolution of the Rheumatoid Hand

Earliest sign: erosion of the ulnar styloid
Progression: characterized by symmetrical joint space narrowing and erosions of the carpal bones, MCP and PIP (with DIP relatively spared)
Late stage: Swan neck and Boutonniere deformities

Brachial Plexus

Etiology

- common causes of brachial plexus injury: complication of childbirth and trauma
- other causes of injury: compression from tumors, ectopic ribs

Common Palsies

Table 22. Named Neonatal Palsies of the Brachial Plexus

Palsy	Location of Injury	Mechanism of Injury	Features
Duchenne-Erb Palsy	Upper brachial plexus (C5-C6)	Head/shoulder distraction (e.g. motorcycle)	Waiter's tip deformity (shoulder internal rotation, elbow extension, wrist flexion)
Klumpke's Palsy	Lower brachial plexus (C7-T1)	Traction on abducted arm	May include Horner's syndrome ("claw hand")

Differential Diagnosis

- trauma (blunt, penetrating)
- thoracic outlet syndrome
 - neurogenic: associated with cervical rib; compression of C8/T1
 - vascular: pain or sensory symptoms without cervical rib; cessation of radial pulse with provocative maneuvers
- tumor
 - schwannoma: well-defined margins makes it easier for total resection
 - neurofibromas: associated with neurofibromatosis type I
 - other: e.g. Pancoast syndrome (apical lung tumor)
- neuropathy (compressive, post-irradiation, viral, diabetic, idiopathic)

Investigations

- EMG
- MRI: gold standard for identifying soft tissue masses
- CT myelogram: better than MRI for identification of nerve root avulsion and identification of pseudomeningocele. Important for pre-operative identification of patients likely to require neurotisation procedures (especially for patients with blunt trauma)

Management

Table 23. Management of Brachial Plexus Injuries

	Type	Treatment
Non-Penetrating Trauma	Concussive/compressive	Usually improves (unless expanding mass, e.g. hematoma)
	Traction/stretch	If no continued insult, follow for 3-4 mo for improvement
	Obstetric palsy	Surgery if no significant improvement and/or residual paresis at 6 mo of age
Penetrating Trauma	Sharp or vascular injury	Explore immediately in OR

Craniofacial Injuries

- low velocity vs. high velocity injuries determine degree of damage
- fractures cause bruising, swelling and tenderness → loss of function
- frequency: nasal > zygomatic > mandibular > maxillary
- management: can wait 5-10 d for swelling to decrease before ORIF required

Approach to Facial Injuries

- ATLS protocol
- inspect, palpate, clinical assessment for injury to underlying structures (e.g. facial nerve)
- visual assessment
- tetanus prophylaxis
- radiological evaluation
- wound irrigation with NS/RL and remove foreign materials
- conservative debridement of detached or nonviable tissue
- repair when patient's general condition allows (soft tissue injury: <8 h preferable)

Investigations

- CT
 - axial and coronal (specifically request 1.5 mm cuts): for fractures of upper and middle face (not good for mandible)
 - indicated for high velocity trauma, complex facial fractures, orbital floor, panface fractures, pre-operative assessment
- panorex radiograph: shows entire upper and lower jaw; best for isolated mandible fracture as patient must be able to sit

Table 24. Imaging of the Craniofacial Skeleton

Structure	Appropriate Imaging
Mandible	Panoramic (panorex)* CT *
Zygomatic and Orbital Bones	CT scan* Water's view (occipitomental, A-P "from below"), Town's, AP
Nasal Bones	No x-ray required – clinical
Maxilla	CT scan* – axial and coronal

*Gold standard

Treatment

- consultation when indicated (dentistry, ophthalmology)
- re-establish normal occlusion
- pursue normal eye function
- restore stability of face and appearance

Complications

- diplopia/enophthalmos/blindness
- intracranial pathology such as CSF leak, bleeding and SIADH
- sinusitis
- functional abnormalities (i.e. malocclusion)
- infection – extremely rare
- poor cosmesis; need for 2^o surgery
- septal hematoma and septal necrosis

Mandibular Fractures

- always two points of injury since it is a ring structure (includes fractures and dislocations)
- commonly at sites of weakness (condylar neck, angle of mandible, region of 3rd molar or canine tooth)

Etiology

- anterior force: bilateral fractures
- lateral force: ipsilateral subcondylar and contralateral angle or body fracture
- note: classified as open if fracture into tooth bearing area (alveolus)

Clinical Features

- pain, swelling, difficulty opening mouth ("trismus")
- malocclusion, asymmetry of dental arch
- damaged, loose, or lost teeth
- palpable "step" along mandible
- numbness in V3 distribution
- intra-oral lacerations or hematoma (sublingual)
- chin deviating toward side of a fractured condyle
- bilateral condyle fractures will have anterior open bite

Patients with major facial injuries are at risk of developing upper airway obstruction (displaced blood clots, teeth or fracture fragments; swelling of pharynx and larynx; loss of support of hyomandibular complex → retroposition of tongue); also at risk of ocular injury

Facial Transplantation: The First 9 Yr

Lancet 2014;S0140:6736

Since the first facial transplantation in 2005, 28 have been done worldwide. The majority are partial facial skin allografts. Indications for facial transplantation include animal bites, neurofibromatosis, burns, trauma, and cancer.

Results/Conclusions: Restoration of motor function generally takes 6-8 mo, whereas sensory recovery may occur in a few weeks. All patients regained motor and sensory function and a high level of independence and improved quality of life. Acute rejection commonly occurs within the first year but is controlled with pulse dose corticosteroids and no cases of chronic rejection or graft-versus-host disease have been reported. Face transplantation has emerged as a viable and successful option to restore appearance and function of patients with severe, devastating facial injuries.

Suspect C-spine injury with any facial trauma. C-spine evaluation before radiographs are ordered

Consider intracranial trauma; rule out skull fracture

Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF otorrhea/rhinorrhea

Facial bone injuries with orbit involved require ophthalmology consult

Classification

Table 25. Mandibular Fracture Classifications by Anatomic Region (refer to Figure 35)

	Areas/Boundaries
Symphysis	Midline of the mandible; between the central incisors from the alveolar process through the inferior border of the mandible
Body*	From the symphysis to the distal alveolar border of the third molar
Angle	Triangular region between the anterior border of the masseter and the posterosuperior insertion of the masseter distal to the third molar
Ramus	Part of the mandible that extends posteriosuperiorly into the condylar and coronoid processes
Condylar	Area of condylar process of mandible
Subcondylar	Area below the condylar neck (i.e. sigmoid notch) of the mandible
Coronoid Process	Area of the coronoid process of mandible

*Most common mandibular fracture type

Treatment

- maxillary and mandibular arch bars wired together (intramaxillary fixation) or ORIF
- antibiotics to cover against *S. aureus* and anaerobes

Complications

- malocclusion, malunion
- tooth loss, and possible sensation loss
- TMJ ankylosis

Figure 35. Mandibular fracture

Maxillary Fractures

Table 26. Le Fort Classification (refer to Figure 36)

	Le Fort I	Le Fort II	Le Fort III
Alternative Name	Guérin fracture	Pyramidal fracture	Craniofacial dysjunction
Type of Fracture	Horizontal	Pyramidal	Transverse
Structures Involved	Piriform aperture Maxillary sinus Pterygoid plates	Nasal bones Medial orbital wall Maxilla Pterygoid plates	Nasofrontal suture Zygomatofrontal suture Zygomatic arch Pterygoid plates
Anatomical Result	Maxilla divided into 2 segments	Maxillary teeth separated from face	Detach entire midfacial skeleton from cranial base

Figure 36. Le Fort fractures

Nasal Fractures

Etiology

- lateral force → more common, good prognosis
- anterior force → can produce more serious injuries
- most common facial fracture

Clinical Features

- epistaxis/hemorrhage, deviation/flattening of nose, swelling, periorbital ecchymosis, tenderness over nasal dorsum, crepitus, septal hematoma, respiratory obstruction, subconjunctival hemorrhage
- depression and splaying of nasal bones causing a saddle deformity
- important to clinically assess for naso-orbital ethmoid fractures

Treatment

- in the absence of complications, no treatment required
- closed reduction with Asch or Walsham forceps under anesthesia, pack nostrils with Adaptic®, nasal splint for 7 d
- best reduction immediately (<6 h) or when swelling subsides (5-7 d)
- rhinoplasty may be necessary later for residual deformity (30%)

Always drain septal hematomas as this is a cause of septal necrosis with perforation (saddle nose deformity)

Naso-Orbital Ethmoid Fractures

Etiology

- fractures of the nasal and ethmoid bones of the medial orbit
- problematic and may lead to greatest change in facial appearance
- Markowitz-Manson classification
 - Type 1: Single, central fragment, medial canthal ligament intact
 - Type 2: Comminuted central fragment, medial canthal ligament intact
 - Type 3: Severe comminution of central fragment and disrupted medial canthal ligament

Clinical Presentation

- telecanthus (increased intercanthal distance secondary to medial canthal ligament disruption)
- orbital rim step-off
- similar to nasal fractures

Treatment

- surgical repair to restore intercanthal distance, nasal projection and orbital anatomy

Zygomatic Fractures

- 3 categories
 1. fracture restricted to zygomatic arch
 2. depressed fracture of zygomatic complex (zygoma)
 3. unstable fracture of zygomatic complex (tetrapod fracture) – separations occur at maxilla, frontal bone, temporal bone and orbital rim

Clinical Features

- flattening of malar prominence (view from above)
- pain over fractures on palpation
- numbness in V2 distribution (infraorbital and superior dental nerves)
- palpable step deformity in bony orbital rim (especially inferiorly)
- often associated with fractures of the orbital floor
- ipsilateral epistaxis; trismus (lock jaw)

Treatment

- if undisplaced, stable and no symptoms, then soft diet; no treatment necessary
- ophthalmologic evaluation if suspected orbital injury
- uncomplicated zygomatic arch fractures can be elevated using Gillies approach: leverage on the anterior part of the zygomatic arch via a temporal incision; stabilization often unnecessary
- ORIF for displaced or unstable fractures of zygomatic complex

Figure 37. Zygomatic fractures

Orbital Floor Fractures

- see [Ophthalmology, OP43](#)

Definition

- fracture of floor of orbit ± intact infraorbital rim
- may be associated with nasoethmoid fracture

Etiology

- blunt force to eyeball → sudden increase in intra-orbital pressure (e.g. baseball or fist)

Clinical Features

- **check visual fields and acuity for injury to globe**
- periorbital edema and bruising, subconjunctival hemorrhage
- ptosis, exophthalmos, exorbitism, or enophthalmos
- orbital rim step-offs with possible infraorbital nerve anesthesia
- vertical dystopia (abnormal displacement of the entire orbital cone in the vertical plane); diplopia looking up or down (entrapment of inferior rectus), limited EOM
- orbital entrapment
 - clinical diagnosis that is a surgical emergency
 - diplopia with vertical gaze; limited EOM
 - severe pain or nausea and vomiting with eye movement
 - requires urgent ophthalmology evaluation and surgical repair

Figure 38. Blow-out fracture

Investigations

- CT (diagnostic): axial and coronal views
- diagnostic manoeuvre for entrapment is **forced duction** test (pulling on inferior rectus muscle with forceps to ensure full ROM) under anesthesia

Treatment

- surgical repair indicated if: urgent repair for entrapment, floor defect >1 cm, any size defect with enophthalmos or persistent diplopia (>10 d)
- reconstruction of orbital floor with bone graft or alloplastic material
- ophthalmologic evaluation suggested

Complications

- persistent diplopia
- enophthalmos

Superior Orbital Fissure Syndrome

- fracture of SOF causing ptosis, proptosis, anesthesia in V1 distribution, and painful ophthalmoplegia (paralysis of CN III, IV, VI)
- uncommon complication seen in Le Fort II and III fractures (1/130)
- recovery time reported as 4.8-23 wk following operative reduction of fractures

Orbital Apex Syndrome

- fracture through optic canal with involvement of CN II at apex of orbit
- symptoms are the same as SOF syndrome plus vision loss
- treatment is urgent decompression of fracture in optic canal or steroids (emergency)

Diplopia can present late in orbital blow-out fractures

Breast Surgery

Breast Reconstruction

- integral part of breast cancer treatment
- two basic methods: implants (1-stage or 2-stage) or autologous tissue
- may also require breast balancing procedure and nipple areola reconstruction

Pre-Reconstruction Considerations

- radiation: treatment before and after mastectomy is a relative contraindication to alloplastic reconstruction
- recipient tissue: skin sparing mastectomy allows for the use of implants without tissue expanders (1-stage process)
- donor tissue: limited availability of suitable donor tissue (lack of tissue, scar, previous surgery that interferes with blood supply) may prevent the use of autologous tissue reconstruction
- timing (immediate vs. delayed)
- contralateral breast: may not be possible to reconstruct a breast of the same size or shape as the contralateral breast. Breast reduction or mastopexy may be considered in opposite breast (see Table 28)
- other considerations: patient's age and comorbidities, prognosis, body weight, characteristics of chest wall and patient's attitude

Patients may require a balancing procedure on contralateral side

Table 27. Options for Breast Reconstruction

Procedure	Definition	Surgical Details	Other Comments
Alloplastic (Implant based)	Use of synthetic material (silicone or saline implants)	<i>With expanders</i> (2 stages): Use tissue expanders before replacement with implants to help facilitate breast ptosis <i>Without expanders</i> (1 stage): In skin-sparing mastectomy, enough skin is available for immediate placement of implant (may require acellular dermal matrix if implant size and muscle size is a mismatch)	Complications: capsular contraction (foreign body reaction to implants), rupture or leakage of implant, increased risk of infection, 35% revision rate over 5 yr
Autologous Tissue	Use of patient's own tissue	Many flap options: DIEP, TRAM, latissimus dorsi, SIEA, SGAP, and IGAP	Offers reduced long-term morbidity and natural consistency
Nipple Areola Reconstruction	Final stage of breast reconstruction	Usually require tattooing for areola reconstruction Local vs. distant flap/graft: 1. Local: fish tail or skate flap most common; these flaps allow simultaneous nipple and areola reconstruction 2. Distant: opposite nipple, earlobe, abdominal skin, costal cartilage, labia	Usually performed 3 mo post-reconstruction

Breast Tissue Expanders

- placement: sub-pectoral, total submuscular (pectoral/serratus)
- size: depends on contralateral breast and desired size
 - generally over-expanded to facilitate ptosis
- timing of expansion: begins when wound fully healed (usually 2 wk post-operative), and implants are expanded weekly or bi-weekly until complete (up to 3 mo); expanders are exchanged for implants after another 3 mo for consolidation of expanded skin

Arterial blood supply to the breast

- internal thoracic*
- external thoracic*
- lateral thoracic
 - thoracoacromial
 - intercostals
 - thoracodorsal

* also provide arterial blood supply to nipple-areola complex

Pedicle Designs

- inferior pedicle technique
- superior pedicle
- central pedicle/mound
- medial pedicle

Breast Reduction

- reduction mammoplasty performed for relief of physical symptoms (e.g. shoulder groove, neck pain, back pain, shoulder pain, mastodynia), and to improve breast size and shape
- key steps of procedure
 - incisions: circular around the areola, vertical from areola incision to infra-mammary fold, along the natural infra-mammary fold
 - removal of fat, breast tissue, and excess skin
 - possible need to move nipple and areola complex to higher position
- complications: infection, hemorrhage, decreased nipple sensation, inability to breast feed, breast/nipple asymmetry, nipple loss (partial or complete), skin loss/necrosis, fat necrosis

Breast Cancer Detection and Survival among Women with Cosmetic Breast Implants: Systematic Review and Meta-Analysis of Observational Studies

BMJ 2013;346:f2399

Purpose: To determine if breast augmentation for cosmetic purposes affects stage at diagnosis and post-diagnosis survival compared with women with no implants.

Methods: Systematic review of observational studies with two meta-analyses.

Results: Meta-analysis examining breast CA stage: odds ratio 1.26 for non-localized stage breast CA at diagnosis comparing women with and without implants (12 studies, 95% CI 0.99-1.6; $p=0.058$).

Meta-analysis examining post-diagnosis survival: reduced survival after breast CA among women with implants compared with women without implants (5 studies, hazard ratio for breast CA specific mortality 1.38, CI 1.08-1.75).

Conclusions: Although findings need to be interpreted with caution, research published to date suggests that cosmetic breast augmentation may adversely affect survival of women subsequently diagnosed with breast CA.

Aesthetic Surgery

Aesthetic Procedures

Table 28. Aesthetic Procedures

Location	Procedure	Description
Head/ Neck	Hair transplants	Aesthetic improvement of hair growth patterns using grafts or flaps
	Otoplasty	Surgical correction of protruding ears
	Brow lift	Surgical procedure to lift low brows
Face	Rhytidectomy	Surgical procedure to reduce wrinkling and sagging of the face and neck; "face lift"
	Blepharoplasty	Surgical procedure to shape or modify the appearance of eyelids by removing excess eyelid skin ± fat pads
	Rhinoplasty	Intranasal surgical reconstruction of the nose
	Genioplasty	Chin augmentation via osteotomy or synthetic implant to improve contour
	Lip augmentation	Procedure to create fuller lips and to reduce wrinkles around the mouth using collagen injections, fat transferred from other body parts, or implantable materials
Skin	Chemical peel	Application of one or more exfoliating agents to the skin resulting in destruction of portions of the epidermis and/or dermis with subsequent tissue regeneration
	Dermabrasion	Skin re-surfacing by sanding with a rapidly rotating abrasive tool; often used to reduce scars, irregular skin surfaces and fine lines
	Laser resurfacing	Application of laser to the skin which ultimately results in collagen reconfiguration and subsequent skin shrinking and tightening; often used to reduce scars and wrinkles
	Injectable fillers	An injectable substance is used to decrease frown lines, wrinkles, and nasolabial folds; substances include collagen, fat, hyaluronic acid, and calcium hydroxyapatite
Other	Abdominoplasty	Removal of excess skin and repair of rectus muscle laxity (rectus diastasis); "tummy tuck"
	Breast augmentation	Surgical breast enhancement with silicone or saline implants
	Calf augmentation	Augmentation of calf muscle with implants
	Liposuction	Surgical removal of adipose tissue for body contouring (not a weight loss procedure)
	Mastopexy	Surgical breast lift to elevate breast mound and tighten the skin envelope in ptotic breasts
	Breast reduction	Surgical breast reduction for relief of physical symptoms
	Sclerotherapy	Injection with a sclerosant to treat telangiectasias and varicose veins
	Gynecomastia	Excessive development of male mammary glands Treated with traditional or ultrasound-assisted liposuction

Figure 39. Augmentation mammoplasty: incision lines and implant placement

Pediatric Plastic Surgery

Craniofacial Anomalies

Table 29. Pediatric Craniofacial Anomalies

	Definition	Epidemiology	Clinical Features	Treatment
Cleft Lip	Failure of fusion of maxillary and medial nasal processes M:F = 2:1	1 in 1,000 live births (1 in 800 Caucasians, increased in Asians, decreased in Blacks) More common on the left (cleft of left lip/palate in boys has hereditary component)	Classified as incomplete/complete and uni/bilateral 2/3 cases: unilateral, left-sided, male	Surgery (3 mo): Millard, Tennison-Randall, or Fisher subunit repair corrections usually required later on (especially for nasal deformity)
Cleft Palate	Failure of fusion of lateral palatine/median palatine processes and nasal septum	Isolated cleft palate: 0.5 per 1,000 (no racial variation) F > M	Classified as incomplete/complete and uni/bilateral Isolated (common in females) or in conjunction with cleft lip (common in males)	Special bottles for feeding Speech pathologist Surgery (6-9 mo): Von Langenbeck or Furlow Z-Plasty ENT consult – often recurrent otitis media, requiring myringotomy tubes
Craniosynostosis	Premature fusion of ≥ 1 cranial sutures Primary – abnormal suture, no known cause This may limit brain growth perpendicular to the suture and cause compensatory growth parallel to the fused suture	1 in 2,000 live newborns; M:F = 52:48 Syndromes include: Crouzon's, Apert's, Saethre-Chotzen, Carpenter's, Pfeiffer's Jackson-Weiss and Boston-type syndromes	Syndromic – associated with genetic mutation Secondary (to microcephaly, hyperthyroid, rickets, etc.) Dx: irregular head shape, craniofacial abnormalities, x-ray	Multidisciplinary team (including neurosurgery, ENT, genetics, dentistry, pediatrics, SLP) Early surgery prevents secondary deformities \uparrow ICP is an indication for emergent surgery ICU bed may be required post-surgically

Figure 40. Types of cleft lips and palates

Congenital Hand Anomalies

Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies

Classification	Example	Features	Treatment
Failure of Formation	Transverse absence (congenital amputation)	At any level (often below elbow/wrist)	Early prosthesis
	Longitudinal absence (phocomelia)	Absent humerus Thalidomide association	
	Radial deficiency (radial club hand)	Radial deviation Thumb hypoplasia M > F	Physiotherapy + splinting Soft tissue release if splinting fails Distraction osteogenesis (Ilizarov) \pm wedge osteotomy Tendon transfer Pollicization
	Thumb hypoplasia	Degree ranges from small thumb with all components to complete absence	Depends on degree – may involve no treatment, webspace deepening, tendon transfer, or pollicization of index finger
	Ulnar club hand	Rare, compared to radial club hand Stable wrist	Splinting and soft-tissue stretching therapies Soft-tissue release (if above fails) Correction of angulation (Ilizarov distraction)
	Cleft hand	Autosomal dominant Often functionally normal (depending on degree)	First web space syndactyly release Osteotomy/tendon transfer of thumb (if hypoplastic)

Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies (continued)

Classification	Example	Features	Treatment
Failure of Differentiation/ Separation	Syndactyly	Fusion of ≥ 2 digits 1/3,000 live births M:F = 2:1 Classified as partial/complete Simple (skin only) vs. complex (osseous or cartilaginous bridges)	Surgical separation before 6-12 mo of age Usually good result
	Symbrachydactyly	Short fingers with short nails at fingertips	Digital separation (more difficult) Webspace deepening
	Camptodactyly	Congenital flexion contracture (usually at PIP, especially 5th digit)	Early splinting Volar release Arthroplasty (rarely)
	Clinodactyly	Radial or ulnar deviation Often middle phalanx	None (usually); if severe, osteotomy with grafting
Duplication	Polydactyly	Congenital duplication of digits May be radial (increased in Aboriginals and Asians) or central or ulnar (increased in Blacks)	Amputation of least functional digit Usually >1 yr of age (when functional status can be assessed)
Overgrowth	Macrodactyly	Rare	None (if mild) Soft tissue/bony reduction
Undergrowth	Brachydactyly	Short phalanges	Removal of non-functional stumps Osteotomies/tendon transfers Distraction osteogenesis Phalangeal/free toe transfer
	Symbrachydactyly (brachysyndactyly)	Short webbed fingers	As above + syndactyly release
Constriction Band Syndrome	i.e. amniotic (annular) band syndrome	Variety of presentations	Urgent release for acute, progressive edema distal to band in newborn Other reconstruction is case-specific
Generalized Skeletal Abnormality	Achondroplasia, Marfan's, Madelung's	Variety of presentations	Treatment depends on etiology

Historical Context of Public Health

- see [Ethical, Legal, and Organizational Medicine, ELOAM2](#) for Legal Foundation

Definitions

- **population health**
 - health of the population as measured by health status indicators (e.g. life expectancy, low birth weight rates)
 - influenced by: physical, biological, social, environmental, and economic factors; personal health behaviors; health care services
 - refers to the prevailing or desired level of health in the population of a specific country/region/subset of population
 - considered to be more complex than the aggregate health status of individuals within a population
- **public health**
 - organized collective efforts of society to protect, promote, and restore the health of the public and prevent illness, injury, and premature death
 - refers to the practices, programs, policies, institutions, and disciplines required to achieve the desired state of population health
- **public health and preventive medicine** (formerly called community medicine)
 - the postgraduate study of health and disease in the population or a specified community
 - goal: to identify and address health problems and evaluate the extent to which health services and others address these issues

Source: Last JM. *A Dictionary of Epidemiology*, 4th ed. New York: Oxford University Press, 2001

Historical Perspective

Over the last century, Public Health has evolved through three main epidemiological phases:

- **Infectious diseases:** controlled in the more developed world but an issue in less developed countries (e.g. polio, malaria)
- **Chronic diseases:** chronic diseases and other noncommunicable conditions have increased morbidity and mortality (e.g. heart disease and cancer due to risk factors and/or exposures)
- **Re-emerging infectious diseases:** new or re-emergent infections emerge due to unfamiliar or new pathogens, inefficient or inappropriate antibiotic use, travel, and global warming (e.g. HIV, drug resistant TB and malaria)

Determinants of Health

- Income and social status
- Social support networks
- Education and literacy
- Employment and working conditions
- Social environment
- Physical environment
- Personal health practices and coping skills
- Healthy child development
- Biology and genetic endowment
- Health services
- Gender
- Culture

Source: Public Health Agency of Canada

Equity Assumes Three Elements

1. **Equality:** the movement for women's equality seeks to gain equal access to educational or employment opportunities;
2. **Fairness:** a person of African descent should get a job, not because he is black, but because he has the right qualifications;
3. **Avoidability:** there is recognition that something can and should be done to redress situations in which inequities arise

Determinants of Health

Concepts of Health

- **wellness:** state of dynamic physical, mental, social, and spiritual well-being that enables a person to achieve full potential and have an enjoyable life
- **disease:** abnormal, medically-defined changes in the structure or function of the human body
- **illness:** an individual's experience or subjective perception of a lack of physical or mental well-being and consequent inability to function normally in social roles
- **illness behavior:** an individual's actions in response to their illness, including whether they seek health care and whether they comply with the subsequent recommendations
- **sickness:** socially and culturally held conceptions of health conditions that may influence how the patient reacts
- **impairment:** any loss or abnormality of psychological, physiological, or anatomical structure or function
- **disability:** any restriction or lack of ability to perform an activity within the range considered normal for a human being
- **handicap:** the disadvantage for an individual arising due to impairment and disability
 - limits or prevents the fulfillment of an individual's normal role as determined by society and depends on age, sex, social, and cultural factors
 - changes the individual's relationship with the physical and social environment
- **health equity:** when all people have "the opportunity to attain their full health potential" and no one is "disadvantaged from achieving this potential because of their social position or other socially determined circumstance." Differs from health equality. Health inequities are those which are considered unjust and/or avoidable
- **health equality:** defined as where populations have equal or similar health status. Health inequalities are systematic differences in health status that occur among population groups

Determinants of Health

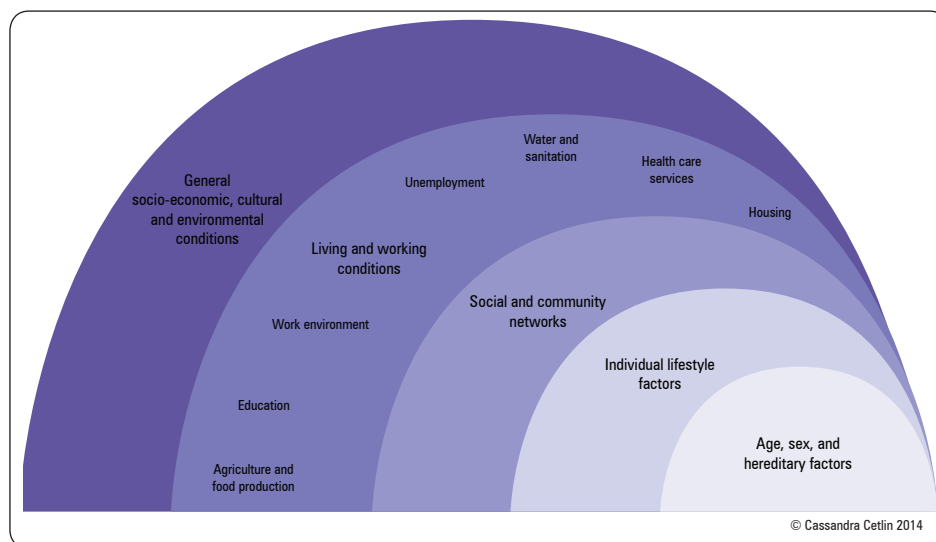

Figure 1. Population health model

Adapted from: Dahlgren G, Whitehead M. European strategies for tackling social inequities in health: Leveling up Part 2. World Health Organization, 2006

Definitions of Health

- First multidimensional definition of health, as defined by the WHO in 1948: "state of complete physical, mental and social well-being and not merely the absence of disease or infirmity"
- WHO updated the definition (socio-ecological definition) of health in 1986: "The ability to identify and to realize aspirations, to satisfy needs, and to change or cope with the environment. Health is therefore a resource for everyday life, not the objective of living. Health is a positive concept emphasizing social and personal resources, as well as physical capacities" (Ottawa Charter for Health Promotion)
- Other definitions of health have since been proposed that incorporate other dimensions of health (e.g. "Health is a social, economic, and political issue and above all a fundamental human right" – The People's Charter for Health)

Vulnerable Populations

Table 1. Health Determinants of Vulnerable Populations

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behavior	Population-Specific Interventions
Indigenous Peoples	Persons having origins in any of the original peoples of North America and who maintains tribal affiliation or community attachment	Low income Family violence Low education status Unemployment Homelessness Longer length of disability	Crowded housing Inefficient ventilation Environmental toxins (botulism) TB declining but prevalence higher than rest of population	Smoking Substance misuse Excessive gambling Poor nutrition Sedentary lifestyle High BMI Higher risk of suicide	Mental health awareness Indigenous-specific diabetes initiatives Substance abuse treatment programs
Isolated Seniors	Individuals > 65 yr	Elder abuse Lack of emotional support	Low hazard tolerance Institutionalization Mobility issues	Inactivity Polypharmacy Medical comorbidities	Aging in place of choice Falls and injury prevention Mental health promotion Preventing abuse and neglect
Children in Poverty	Based on Low Income Cut Offs (LICO) LICO is an income threshold below which a family will likely devote a larger share of its income on the necessities of food, shelter and clothing than the average family	Low income Family dysfunction Lack of educational opportunities	Housing availability Unsafe housing Lack of recreational space	Poor supervision Food insecurity High risk behaviors	Improvements in family income most significant Early childhood education
People with Disabilities	Includes impairments, activity limitations, and participation restrictions	Low income Low education status Discrimination	Institutionalization Barriers to access Transportation challenges	Substance misuse Poor nutrition Inactivity Dependency for ADLs	Transportation support Multidisciplinary care Unique support for individuals with specific disabilities (e.g. Trisomy 21)
New Immigrants	Person born outside of the United States who has been granted the right to live in United States permanently by immigration authorities	Access to community services Cultural perspectives	Diseases and conditions in country of origin (e.g. smoke from wood fires, incidence of TB, etc.)	Employment, ESL Healthy Newcomer Effect (health worsens over time to match that of the general population) Cultural or religious expectations	Women's health Mental health Infectious diseases (syphilis blood test, CXR, HIV) Dental and vision screening Vaccinations Cancer screening

New Immigrants to the United States

Mandatory medical exams on entry to the United States by a designated medical practitioner:

- Complete medical examination for all persons of all ages
- Chest x-ray and report for persons 15 yr of age and over
- Urinalysis for persons 5 yr of age and over
- Syphilis serology for persons 15 yr of age and over
- HIV testing no longer be required as of 2010
- Serum creatinine if the applicant has HTN (resting blood pressure greater than 140/90 mmHg), a history of treated HTN, diabetes, autoimmune disorder, persistent proteinuria, or kidney disorder

Table 1. Health Determinants of Vulnerable Populations (continued)

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behavior	Population-Specific Interventions
Homeless Persons	An individual who lacks permanent housing	Low income Mental illness	Exposure to temperature extremes Infections such as West Nile Virus	Substance misuse Violence	Safe housing Addictions support Mental health
Refugee Health	Forced to flee country of origin because of a well-founded fear of persecution and given protection by the Government of the United States <i>Refugee claimant:</i> Arrive in United States and ask to be considered refugee	Post-traumatic stress disorders Depression Adjustment problems IFH (Interim Federal Health) for refugee claimants, health coverage 1 yr for medical necessities, specifically does not cover screening or preventative care Additionally IFH will restrict coverage for individuals from designated countries of origin (DCO) whose applications were placed after Dec 15, 2012	Diseases and conditions in country of origin (e.g. malaria, TB, onchocerciasis, etc.) Direct and indirect effects of war	Employment ESL Longstanding prior lack of access to health care (chronically neglected problems) Cultural or religious expectations	Vaccinations Women's health Mental health Infectious diseases Dental and vision screening Political advocacy

Note: this chart delineates the major challenges faced by each group, but the issues listed are not unique to each population

Disease Prevention

Disease Prevention Strategies

- measures aimed at preventing the occurrence, interrupting through early detection and treatment, or slowing the progression of disease/mitigating the sequelae

Primary Prevention

- implemented to prevent disease from occurring
- immunization programs exist in most countries to address major causes of pediatric morbidity and mortality that are preventable by vaccines, e.g. measles, diphtheria, pertussis, tetanus, polio, and tuberculosis (not routine in the U.S.)
- additional immunizations are offered in US depending on jurisdiction: mumps, rubella, rotavirus, hepatitis B, *Haemophilus influenzae* type B, varicella, HPV, conjugated pneumococcal and meningococcal vaccines (see [Pediatrics, P3](#))

Secondary Prevention (Screening)

- presumptive identification (not diagnosis) of unrecognized disease or defect by the application of tests, examinations, or other procedures which can be applied rapidly
- types of screening**
 - mass screening: screening all members of a population for a disease (e.g. phenylketonuria (PKU) and hypothyroidism in all newborns)
 - selective screening: screening of a specific subgroup of the population at risk for a disease (e.g. mammography in women >50 yr old)
 - multiphasic screening: the use of many measurements and investigations to look for many disease entities (e.g. periodic health exam)

Table 2. Ideal Criteria for Screening Tests

Disease	Test	Health Care System
Causes significant suffering and/or death Natural history must be understood Must have an asymptomatic stage that can be detected by a test Early detection and intervention must result in improved outcomes Incidence is not too high or too low	High specificity and sensitivity Safe, rapid, easy, relatively inexpensive Acceptable to providers and to population	Adequate capacity for reporting, follow-up, and treatment of positive screens Cost effective Sustainable program Clear policy guidelines

Tertiary Prevention

- treatment and rehabilitation of disease after it has been diagnosed so as to prevent progression and permanent disability (e.g. HbA1c, eye, and foot monitoring for diabetes)

Disease Prevention Strategies

- Primary:** before disease occurs (e.g. immunizations, seatbelt use, smoking cessation programs for lung cancer prevention)
- Secondary:** early detection of disease (e.g. mammography, routine Pap smears)
- Tertiary:** treatment and rehabilitation of existing disease (e.g. ACE inhibitor for HTN)

Within these three stages of prevention there can be both:

- Passive prevention:** measures that operate without the person's active involvement (e.g. airbags in cars)
- Active prevention:** measures that a person must do on their own (e.g. wearing a seatbelt)

Health Promotion Strategies

Table 3. Disease Prevention vs. Health Promotion Approach

Disease Prevention	Health Promotion
Health = absence of disease	Health = positive and multidimensional concept
Medical model (passive role)	Participatory model of health
Aimed mainly at high-risk groups in the population	Aimed at the population in its total environment
One-shot strategy, aimed at a specific pathology	Diverse and complementary strategies aimed at a network of issues/determinants
Directive and persuasive strategies enforced in target groups	Facilitating and enabling approaches by incentives offered to the population
Focused mostly on individuals and groups of subjects	Focused on a person's health status and environment
Led by professional groups from health disciplines	Led by non-professional organizations, civic groups, local, municipal, regional, and national governments

Source: Shah CP. Public Health and Preventive Medicine in Canada, 5th ed. Toronto: Elsevier, 2003

Healthy Public Policy

- characterized by an explicit concern for health and equity in all areas of policy and by an accountability for health impact
- main aim: to create a supportive environment to enable people to lead healthy lives, thereby making healthy choices easier for citizens
- government sectors must take into account health as an essential factor when formulating policy and should be accountable for the health consequences of their policy decisions
- methods
 - fiscal: imposing additional costs (e.g. taxes on tobacco and alcohol)
 - legislative: implementing legal deterrents (e.g. smoking bans, legal alcohol drinking age)
 - social: improving health beyond providing universally funded health care (e.g. providing affordable housing)

Source: International Conference on Health Promotion, Adelaide, South Australia (1998)

Behavior Change

- health education serves to
 - increase knowledge and skills
 - encourage positive behavior changes and discourage unhealthy choices
- health education is an important component of eliciting behavior change
- behavior is a result of three factors
 1. predisposing factors: knowledge, attitude, beliefs, values, intentions
 2. enabling factors: skills, supports
 3. reinforcing factors: health care professionals and the social context of family and community
- **Health Belief Model** (1975)
 - behaviors undertaken by individuals in order to remain healthy are a function of a set of interacting beliefs
 - beliefs include an individual's perception of his or her susceptibility to a disease, the severity of the disease, and the benefits and costs of health-related actions
 - beliefs are modified by socio-demographic and psychosocial variables
 - individuals must believe that the action will have positive consequences
 - individuals must be in a state of readiness
 - behavior can be stimulated by cues to action, which are specific events that can encourage preventive health decisions and actions (e.g. physician recommendation, public advertising)
- **Stages of Change Model**
 - provides a framework in which the Health Belief Model is applied to facilitating behavior change (e.g. quitting smoking)

Jakarta Declaration on Health Promotion into the 21st Century (WHO 1997)

- Reiterated the commitment to health promotion
- First of the health promotion conferences to involve the private sector
- Formally cited poverty as the greatest threat to health
- Priorities for health promotion:
 - Promote social responsibility for health
 - Increase investments for health development
 - Consolidate and expand partnerships for health
 - Increase community capacity and empower the individual
 - Secure an infrastructure for health promotion

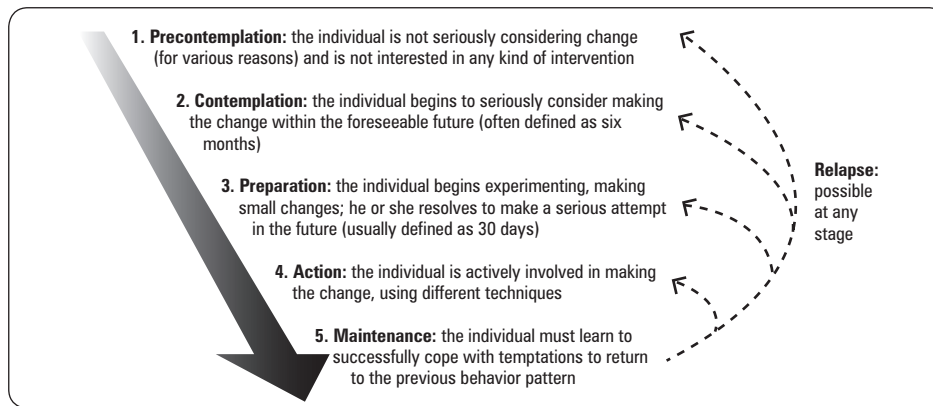

Figure 2. Stages of change model

Source: Prochaska JO, DiClemente CC, Norcross JC. In Search of how people change. Applications to addictive behaviors. *Am Psychol* 1992;47:1102-1114

Risk Reduction Strategies

- **risk reduction:** lower the risk to health without eliminating it (e.g. avoiding sun to lower risk of skin cancer)
- **harm reduction:** tolerance of some degree of risk behavior, while aiming to minimize the adverse outcomes associated with these behaviors (e.g. needle exchange programs)

Example of Harm Reduction Strategy Summary of Findings from the Evaluation of a Pilot Medically Supervised Safer Injecting Facility

CMAJ 2006;175:1399-1404

Background: This study discusses the outcomes among a population of illicit injection drug users (IDUs) after initiating a supervised safe injecting facility in Vancouver, September 2003. Legal exemption by the Canadian government was granted such that an evaluation of its results be conducted over a 3 yr period.

Study Population: IDUs of the Vancouver area were allowed to inject previously obtained illicit drugs under the supervision of nurses and physicians. IDUs were offered addiction counseling and supports for appropriate community resources. A random sample of 670 IDUs was recruited and monitored from Dec 2003-July 2004.

Results: Characteristics of IDUs who used the safe injecting facility included age <30 yr, history of public drug use, homelessness, daily heroin and/or cocaine injection, and recent history of overdose. Mean measures of public order problems were taken 6 wk before and 12 wk after initiation of the safer injection facility. It was found that the mean number of IDUs injecting daily in public, along with the mean number of publically discarded syringes were reduced by approximately half.

Conclusions: Overall it has been found that the safer injecting facility in Vancouver has been successful in attracting IDUs at increased risk of HIV, overdose, and public injection of substances. This has resulted in lower incidences of public drug use, publicly discarded syringes and sharing of needles. Other studies associated with this one have demonstrated that there has been no increase in the drug dealing, drug related crimes, or rates of new IDUs in the area surrounding the safer injecting facility.

Principles of Standardization

- When comparing an outcome (e.g. mortality) in two populations that differ in terms of characteristics known to influence that outcome (e.g. age), standardization is used to control for the effect of that factor
- **Standardization is either direct or indirect:**
 - **Indirect standardization:** expressed as standardized outcome ratio. For example a standardized mortality ratio (SMR) is calculated using age specific rates for a reference population as well as age structure and total cases for a sample/known population e.g. A SMR of 100 signifies that deaths are at the expected level, a SMR of 110 indicates a death rate 10% higher than expected
 - **Direct standardization:** expressed as a rate: using age specific rates in a known/sample population against a standard population

Measurements of Health and Disease in a Population

Life Expectancy

- the expected number of years that an individual will live based on standardized death rates for the population
- usually qualified by country, gender, and age

Crude Death Rate

- mortality rate from all causes of death per 1,000 in the population

Age Standardized Rate

- adjustment of the crude rate of a health-related event using a "standard" population
- standard population is one with a known number of persons in each age and sex group
- standardization prevents bias which could be made by comparing crude rates from two dissimilar populations (e.g. crude death rates over a number of decades are not comparable as the population age distribution has changed with time)

Standardized Mortality Rate

- the ratio of the observed (actual) number of deaths to the expected number of deaths for a group (e.g. age, race, gender, etc.)
- useful for comparing populations that are significantly different in some aspect (e.g. the causes of death in more and less developed countries)

Infant Mortality Rate (IMR)

- number of deaths among children under 1 yr of age reported during a given time period divided by the number of live births reported during the same time period and expressed per 1,000 live births per year

Maternal Mortality Rate (MMR)

- number of deaths of women during pregnancy and due to puerperal causes per 100,000 live births per year

Proportional Mortality Ratio (PMR)

- proportion of all deaths in a specified population over a given period of time attributable to a specific cause
 - each cause is expressed as a percentage of all deaths, with the sum of all causes adding to 100%

Potential Years of Life Lost (PYLL)

- calculated for a population using the difference between the actual age at death and a standard/expected age at death
- increased weighting of mortality at a younger age

Disability Adjusted Life Year (DALY)

- quantitative indicator of the burden of diseases that reflects the total amount of disability-free life years lost
- includes loss from premature mortality and loss due to a degree of disability over a specific period of time; these disabilities can be physical or mental

Quality Adjusted Life Year (QALY)

- a value from 0 to 1 assigned to a year of life based on perceived quality of life; a year in "perfect" health is considered equal to 1 QALY, the value of a year in ill health would be lowered based on the burden of disease
- it is possible to have "states worse than death" for example QALY <0 for extremely serious conditions

Epidemiology

**Population**

- a collection of individuals who share a common trait (most commonly applied to a geographic area but it could be another factor such as ethnic group)

Sample

- a selection of individuals from a population or set of observations
- types
 - random: all are equally likely to be selected
 - systematic: an algorithm is used to select a subset
 - stratified: separate representations of more than one subgroup
 - cluster: grouped in space/time to reduce costs
 - convenience: non-random inclusion, usually volunteers

Sample Size

- sample size contributes to the statistical precision of the observed estimate
- increasing the sample size decreases the probability of type I and type II errors

Bias

- non-random error leading to a deviation of inferences or results from the truth
- any trend in the collection, analysis, interpretation, publication, or review of data that can lead to conclusions that are systematically different from the truth
 - **lead-time:** time between early diagnosis with screening, and when diagnosis would have been made without screening
 - **lead-time bias:** over-estimation of survival when the estimate is made from the time of screening, instead of the later time when the disease would have been diagnosed without screening
 - **incidence-prevalence bias:** when prevalent cases include long-term survivors who have a better prognosis than some incident cases
 - **length-time bias:** overestimation of the survival time due to the sampling of prevalent as opposed to incident cases
 - ♦ selection of prevalent cases will favor the over-inclusion of longer-living cases rather than newly-diagnosed incident cases, some of whom may have short survival times
 - **sampling bias:** occurs with the selection of a sample that does not truly represent the population
 - ♦ sampling procedures should be chosen to prevent or minimize bias
 - **recall bias:** when individuals with a disease are more prone to recalling or believing they were exposed to a possible causal factor than those who are free of disease

**Incidence and Prevalence**

$$\text{Incidence} = \frac{\text{\# of new cases in a time interval}}{\text{total population at risk}}$$

(measures the rate of new infections)

$$\text{Prevalence} = \frac{\text{\# of existing cases at a point in time}}{\text{total population at risk}}$$

(measures the frequency of disease at a point in time)

Figure 3. Lead time bias

Confounder

- a variable that is related to both the exposure and outcome but is not measured or is not distributed equally between groups
- distorts the apparent effect of an exposure or risk because it may not be possible to separate/control for the contribution of a single causal factor to an effect (e.g. late maternal age could be a confounder in an investigation of birth order >4 and risk of developing Trisomy 21)

Prevalence

- total number of cases in a population over a defined period of time
- two forms of prevalence
 - point prevalence:** attempts to measure the frequency of all disease at one specific point in time, therefore knowledge of the time of onset of disease is not required
 - period prevalence:** measure constructed from prevalence at a point in time, plus new cases and recurrences over a defined period of time
- depends on **incidence rate** and disease duration from onset to termination (cure or death)
- favors the inclusion of chronic over acute cases and may be used to present a biased picture of the disease
- prevalence studies are cross-sectional and cannot be used for causal inferences
- prevalence figures are useful for determining the extent of a disease and can aid in the rational planning of facilities and services

Sensitivity

- proportion of people with disease who are correctly identified by having a positive test

Specificity

- proportion of people without disease who are correctly identified by having a negative test

Pre-Test Probability

- an estimate of the likelihood a particular patient has a given disease based on known factors

Post-Test Probability

- a revision of the probability of disease after a patient has been interviewed and examined
- calculation process can be more explicit using results from epidemiologic studies, knowledge of the accuracy of tests, and Bayes' theorem
- the post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
 - after each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

Disease (e.g. lung CA)				
		Present	Absent	Total
Exposure (e.g. smoking)	Present	A	B	A + B
	Absent	C	D	C + D
	Total	A + C	B + D	A + B + C + D

Case-Control Study

$$\text{odds ratio (OR)} = \frac{A}{B} \div \frac{C}{D} = \frac{A \times D}{B \times C}$$

Cohort Study

$$\frac{A}{A+B} = \text{incidence rate of disease in smokers} \quad \frac{C}{C+D} = \text{incidence rate of disease in non-smokers}$$

$$\text{relative risk (RR)} = \frac{A}{A+B} \div \frac{C}{C+D} \quad \text{attributable risk (AR)} = \frac{A}{A+B} - \frac{C}{C+D}$$

Figure 5. Results tabulation by study design

Numbers from Collins J, Lieberman D, Durbin T, et al. Accuracy of screening for fecal occult blood on a single stool sample obtained by digital rectal examination: a comparison with recommended sampling practice. *Ann Intern Med* 2005;142:81-85

SPIN: use a **SP**ecific test to rule **IN** a hypothesis. Note that specific tests have very few false positives. If you get a positive test, it is likely a true positive

SNOUT: use a **SEN**sitive test to rule **OUT** a hypothesis. Note that sensitive tests have very few false negatives. If you get a negative test, it is likely a true negative

Figure 4. Understanding sensitivity and specificity

Figure 4a. Hypothetical population

Figure 4b. Results of diagnostic test on hypothetical population

Figure 4c. Sensitivity of test (e.g. 24/30 = 80% sensitive)

Figure 4d. Specificity of test (e.g. 56/70 = 80% specific)

Source: Loong TW. Understanding sensitivity and specificity with the right side of the brain. *BMJ* 2003;327:716-719

Sensitivity and specificity are characteristics of the test

LR depends on the test characteristics, not the prevalence

PPV and NPV depend on the prevalence of the disease in the population

TP = True positive TN = True negative FP = False positive FN = False negative

		Disease	
		Present	Negative
Test Result	Positive	TP	FP
	Negative	FN	TN

Sensitivity = $TP/(TP+FN)$

Specificity = $TN/(TN+FP)$

Likelihood Ratio (LR)

- Likelihood that a given test result would be expected in a patient with disease compared with the likelihood that the same result would be expected in a patient without disease
- LR+ indicates how much the probability of disease increases if the test is positive
- LR- indicates how much the probability of disease decreases if the test is negative

$$LR+ = \frac{\text{Sensitivity}}{1 - \text{Specificity}} = \frac{TP/(TP+FN)}{FP/(TN+FP)} \quad LR- = \frac{1 - \text{Sensitivity}}{\text{Specificity}} = \frac{FN/(TP+FN)}{TN/(TN+FP)}$$

Positive Predictive Value (PPV)

- Proportion of people with a positive test who have the disease

$$PPV = \frac{TP}{TP + FP}$$

Negative Predictive Value (NPV)

- Proportion of people with a negative test who are free of disease

$$NPV = \frac{TN}{TN + FN}$$

Pre-Test Probability

- An estimate of the likelihood a particular patient has a given disease based on known factors such as clinical assessment prevalence of disease in the population. Together with a post-test probability this can be used to interpret a diagnostic test or a series of tests

$$\text{Pre-Test Odds} = \frac{\text{Prevalence}}{1 - \text{Prevalence}}$$

Post-Test Probability

- A revision of the probability of disease after a patient has been examined or a diagnostic test has been conducted
- Calculation process can be more explicit using results from epidemiologic studies, knowledge of the accuracy of tests and Bayes' theorem
- The post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
- After each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

$$\text{Post-Test Odds} = \text{Pre-Test Odds} \times LR$$

$$\text{Post-Test Probability} = \frac{\text{Post-test odds}}{\text{Post-test odds} + 1}$$

Intention-To-Treat (ITT)

- A strategy for analyzing data in which all participants are included in the group to which they were assigned, whether or not they completed the requirements of that group
- This is to limit the bias introduced by issues of compliance and to simulate real world situations in which not all patients/providers adhere to the study allocation protocol

Relative Risk (RR)

- Ratio of the incidence of a health outcome among the exposed population to the incidence of the health outcome in the non-exposed population

$$\text{Relative Risk (RR)} = \frac{PPV}{1 - NPV} = \frac{TP/(TP+FP)}{FN/(TN+FN)}$$

Attributable Risk (AR)

- Rate of a health outcome attributable to a hypothetical risk factor for that outcome
- [incidence in exposed population] - [incidence in non-exposed]
- Attributable risk assumes causation

$$\text{Attributable Risk} = PPV - (1 - NPV) = [TP/(TP+FP)] - [FN/(TN+FN)]$$

		Advanced Neoplasia	
		Present	Negative
Test Result	Positive	68	147
	Negative	216	2234
Total		284	2381

Sensitivity = $68/284 = 23.9\%$

Specificity = $2234/2381 = 93.8\%$

$$LR+ = \frac{0.239}{1 - 0.938} = 3.85$$

$$LR- = \frac{1 - 0.239}{0.938} = 0.81$$

$$PPV = \frac{68}{(68 + 147)} = 31.6\%$$

$$NPV = \frac{2234}{(2234 + 216)} = 91.2\%$$

Odds Ratio (OR)

- Statistic based on the ratio of two odds, used for estimating the strength of association of a factor
- Statistically significant OR above 1.0 indicates an elevated risk among those exposed beyond chance (N.B. Clinical significance set using additional criteria)
- Statistically significant OR lower than 1.0 indicates that the exposure may be protective beyond chance

Figure 6. Clinical epidemiology definitions and practical example using FOBT testing in advanced colon cancer

Effectiveness of Interventions

DEFINITIONS

Relative Risk Reduction (RRR)

- proportional reduction in rates of adverse outcomes between experimental and control participants in a trial

Absolute Risk Reduction (ARR)

- absolute arithmetic difference in rates of adverse outcomes between experimental and control participants in a trial
- it is hypothesized that events will occur more often in control group than in experimental group where the intervention is protective (e.g. a vaccine)

Absolute Risk Increase (ARI)

- absolute arithmetic difference in rates of adverse outcomes between control and experimental participants in a trial
- it is hypothesized that events will occur more often in experimental group than in control group when the intervention is harmful (e.g. alcohol excess)

Number Needed to Treat (NNT)

- number of patients who need to be treated to achieve one additional favorable outcome
- only one of many factors that should be taken into account in clinical or health system decision making (e.g. must take into account cost, ease, feasibility of intervention)
 - a condition with death as a potential outcome can have a higher NNT (and be acceptable), as compared to an intervention to prevent an outcome with low morbidity, in which a low NNT would be necessary

Number Needed to Harm (NNH)

- number of patients who, if they received the experimental treatment, would lead to one additional patient being harmed, compared with patients who received the control treatment

Adherence (Formerly Compliance)

- degree to which a patient follows a treatment plan

Effectiveness, Efficacy, Efficiency

- three measurements indicating the relative value (beneficial effects vs. harmful effects) of an intervention
 - efficacy:** the extent to which a specific intervention produces a beneficial result under ideal conditions
 - ideally, based on the results of a randomized control trial (the theoretical impact)
 - effectiveness:** measures the benefit of an intervention under usual conditions of clinical care
 - considers both the efficacy of an intervention and its actual impact on the real world, taking into account access to the intervention, whether it is offered to those who can benefit from it, its proper administration, acceptance of intervention, and degree of adherence to intervention
 - efficiency:** a measure of economy of an intervention with known effectiveness
 - considers the optimal use of resources (e.g. money, time, personnel, equipment, etc.)

Equations to Assess Effectiveness

CER = control group event rate
 EER = experimental group event rate
 $RRR = (CER - EER) / CER$
 $ARR = CER - EER$
 $ARI = EER - CER$
 $NNT = 1 / ARR$
 $NNH = 1 / ARI$

Beware

Do not be swayed by a large RRR, as it may appear to be large if event rate is small to begin with. In these cases ARR is more important (e.g. a drug which lowers an event which occurs in 0.1% of a population to 0.05% can boast a RRR of 50%, and yet the ARR is only 0.05%, which is not nearly as impressive)

Types of Study Design

Qualitative vs. Quantitative

Table 4. Qualitative vs. Quantitative Study Designs

Qualitative	Quantitative
Generates hypothesis (Why? What does it mean?)	Tests hypothesis (What? How much/many?)
Inductive (specific to general): "bottom up" Observation → pattern → tentative hypothesis → theory	Deductive (general to specific): "top down" Theory → hypothesis → observation → confirmation
Sampling approach to obtain representative coverage of ideas or concepts	Sampling approach to obtain representative coverage of people in the population
Narrative: rich, contextual, and detailed information from a small number of participants	Numeric: frequency, severity, and associations from a large number of participants

Source: Adapted from <http://phprimer.afmc.ca>

Quantitative Research Methods

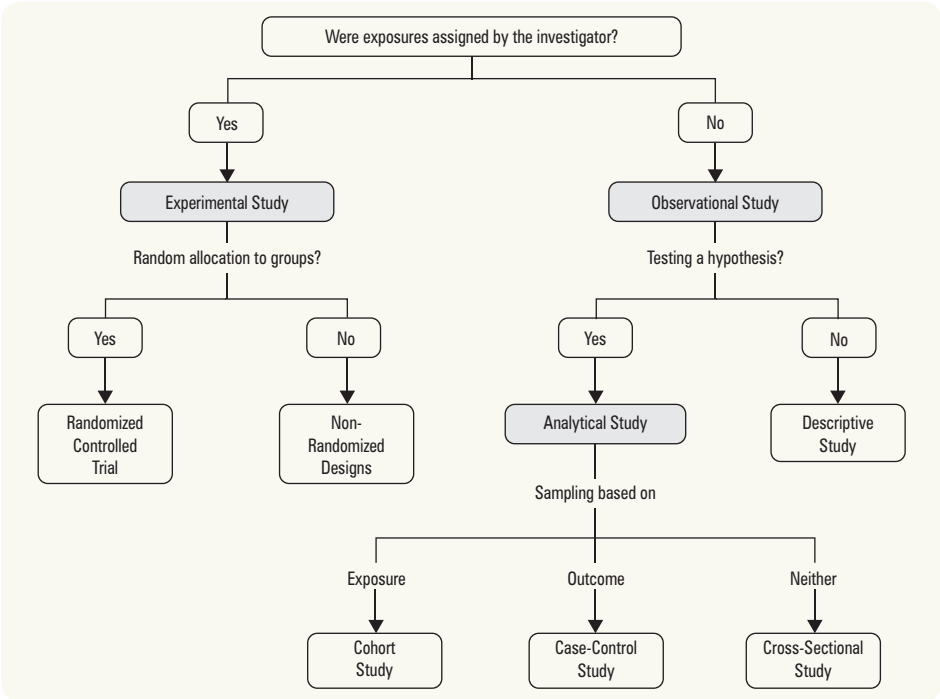

Figure 7. Quantitative study designs Source: Adapted from <http://phprimer.afmc.ca>

Observational Study Designs

- observational studies involve neither the manipulation of the exposure of interest nor randomization of the study subjects
- there are two main subtypes of observational studies: descriptive and analytic studies

Descriptive Studies

- describe the events and rates of disease with respect to person, place and time and to estimate disease frequency and time trends
- first sets of studies and are used to generate an etiologic hypothesis, not test a hypothesis

Analytic Studies

- observational studies used to test a specific hypothesis
- includes ecological studies, cohort studies, case-control studies, and cross-sectional studies

Table 5. Observational Study Designs

Type of Study	Ecological	Cross-Sectional	Case-Control (Figure 8)	Cohort (Figure 9)
Definition	Units of analysis are populations or groups of people, rather than individuals	Assessment of individuals with respect to presence and absence of exposures and diseases at the same point in time	Samples a group of people who already have a particular outcome (cases) and compares them to a similar sample group without that outcome (controls)	Subjects are sampled and, as a group, classified on the basis of presence or absence of exposure to a particular risk factor
Subjects	Population (e.g. geographic areas)	Population (sample)	Two study sample populations are compared: cases and controls	One or more cohorts Cohort: group of people with common characteristics (e.g. year of birth) Divided into measured exposed vs. non-exposed groups

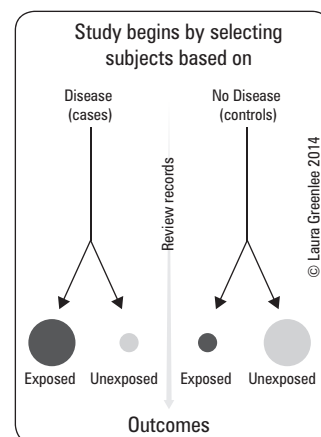

Formulating a Research Question
PICO
Patient Characteristics
Intervention of Interest
Comparison Group or Control Group
Outcome that you are trying to prevent or achieve

Table 5. Observational Study Designs (continued)

Type of Study	Ecological	Cross-Sectional	Case-Control (Figure 8)	Cohort (Figure 9)
Methods	Descriptions of the average exposure or risk of disease for a population	Collect information from each person at one particular time Tabulate the numbers in groups (e.g. by presence or absence of disease/factor of interest) Make 2 x 2 table and compare groups Estimate prevalence	Ask cases and controls about exposures Select all the cases of a specific disease during a specific time frame Representative of spectrum of clinical disease Select control(s) Represent the general population To minimize risk of bias, may select more than one control group and/or match controls to cases (e.g. age, gender) Association can be concluded between the risk factor and the disease (odds ratio) Estimate incidence	Subjects are followed for a specific period of time to determine development of disease in each exposure group Prospective: measuring from the exposure to the future outcomes – looking forward Retrospective: measuring from outcomes to possible risk factors or protective factors – looking back Collect information on factors from all persons at the beginning of the study Tabulate the number of persons who develop the disease or other measured outcomes of morbidity Provides estimates of incidence, relative risk, attributable risk
Advantages	Quick, easy to do Uses readily available data Generates hypothesis	Determines association between variables Quick and uses limited resources Surveys with validated questions allows comparison between studies	Used when disease in population is rare (less than 10% of population) due to increased efficiency Less costly and time consuming	Shows an association between a factor and an outcome/several outcomes Stronger evidence for causation
Disadvantages	Poor generalizability to individual level (not direct assessment of causal relationship) Ecological fallacy: an incorrect inference about individuals in the population	Does not allow for assessment of temporal relationship or causation between variables Recall bias (see PH7)	Recall bias (see PH7) Confounding Selection bias for controls Only one outcome can be measured	By itself, cannot establish causation Confounding factors are common as the cohort self-selects the exposure, or unknown/unmeasured factors are associated with the measured exposure Cost and duration of time needed to follow cohort
Examples	A study looking at the association between smoking rates and lung cancer rates in different countries at the population level without individual data on both factors	A study that examines the distribution of BMI by age in New York at a particular point in time	A famous case control study is by Sir Richard Doll who demonstrated the link between tobacco smoking exposure and lung cancer cases at the individual level	A famous cohort study is the Framingham Heart Study, which assessed the long-term cardiovascular risks of diet, exercise, medications such as ASA, etc.

An example of an ecological fallacy would be concluding that red wine drinking leads to lower risk of death from CVS disease after an ecological study shows that France has a higher rate of red wine consumption and a lower rate of death from CVS causes

**Figure 8. Case-control study**Adapted from <http://phprimer.afmc.ca>**Figure 9. Cohort study**Adapted from <http://phprimer.afmc.ca>

Experimental Study Designs

- not discussed here are non-randomized control trials (e.g. allocation by clinic or other non-random basis – performed when randomization is not possible) and clinical trials (test treatments or laboratory tests in human subjects)

RANDOMIZED CONTROLLED TRIAL (RCT)

Definition

- subjects are assigned by random allocation to two or more groups, one of which is the control group, the other group(s) receive(s) an experimental intervention

Subjects

- individuals are separated into groups by a random process to ensure as much as possible equal distribution of known and unknown factors except for the experimental exposure (e.g. the treatment)

Methods

- random allocation of individuals into two or more treatment groups through a centralized concealed process
- method of assessment to reduce bias
 - **single-blind:** subject does not know group assignment (intervention or placebo)
 - **double-blind:** subject and observer both unaware of group assignment
 - **triple-blind:** subject, observer, and analyst unaware of group assignment (rarely done)
- one group receives placebo or standard therapy
- one or more groups receive(s) the intervention(s) under study
- the outcome is measured and the groups are compared
- all other conditions are kept the same between groups

Advantages

- “gold standard” of studies, upon which the practice of EBM is founded
- provides the strongest evidence for effectiveness of intervention
- with sufficient sample size and appropriate randomization, threats to validity are minimized
- allows prospective assessment of the effects of intervention while minimizing bias

Disadvantages

- some exposures are not amenable to randomization (e.g. cannot randomize subjects to poverty/wealth or to harmful exposures such as smoking) due to ethical or feasibility concerns
- difficult to randomly allocate groups (e.g. communities, neighbourhoods)
- difficult to study rare events, since RCTs would require extremely large sample sizes
- costly

Refer to the Cochrane Collaboration for a glossary of terms. <http://www.cochrane.org/glossary>

An example of an RCT is the SPARCL trial, which demonstrated intense lipid-lowering with atorvastatin reduces the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis when compared to placebo

Methods of Analysis

Distributions

- distribution describes the probability of events
- normal (Gaussian) or non-normal (skewed, bimodal, etc.)
- characteristics of the normal distribution
 - mean = median = mode
 - 67% of observations fall within one standard deviation of the mean
 - 95% of observations fall within two standard deviations of the mean
- measures of central tendency
 - **mean:** sum of all observations divided by total number of variables
 - **median:** value at the 50th percentile, this is a better reflection of the central tendency for a skewed distribution
 - **mode:** most frequently observed value in a series
- measures of dispersion
 - **range:** the largest value minus the smallest value
 - **variance:** a measure of the spread of data
 - **standard deviation:** the average distance of data points from the mean (the positive square root of variance)
- given the mean and standard deviation of a normal or binomial distribution curve, a description of the entire distribution of data is obtained

Figure 10. Distribution curves

Example Calculation

Data set: 17, 14, 17, 10, 7
 Mean = $(17 + 14 + 17 + 10 + 7) \div 5 = 13$
 Median (write the list in order, median is the number in the middle)
 = 7, 10, 14, 17, 17 = 14
 Mode (number repeated more often)
 = 17
 Range = $17 - 7 = 10$
 Variance = $[(17 - 13)^2 + (14 - 13)^2 + (17 - 13)^2 + (10 - 13)^2 + (7 - 13)^2] \div 5 = 15.6$
 Standard Deviation = 3.95
 $\sqrt{\text{variance}} = \sqrt{15.6} = 3.95$

Type I (α) Error

“There Is An Effect” where in reality there is none

Data Analysis

Statistical Hypotheses

- **null (H_0)**
 - no relationship exists between the two stated variables (i.e. no association between the hypothesized exposure and the outcome)
- **alternative (H_1)**
 - a relationship does exist between the two stated variables

Type I Error (α Error)

- the null hypothesis is falsely rejected (i.e. concluding an intervention X is effective when it is not, or declaring an observed difference to be real rather than by chance)
- the probability of this error is denoted by the p-value
- studies tend to be designed to minimize this type of error, since a type I error can have larger clinical significance than a type II error

Type II Error (β Error)

- the null hypothesis is falsely accepted (i.e. stating intervention X is not effective when it is, or declaring an observed difference/effect to have occurred by chance when it is present)

- higher level of error is acceptable for most studies
- can also be used to calculate statistical power

Power

- probability of correctly rejecting a null hypothesis when it is in fact false (i.e. the probability of finding a specified difference to be statistically significant at a given p-value)
- power increases with an increase in sample size
- power = $1 - \beta$, and is therefore equal to the probability of a true positive result

Statistical Significance

- the probability that the statistical association found between the variables is due to random chance alone (i.e. that there is no association)
- the preset probability is set sufficiently low that one would act on the result; frequently $p=0.05$
- when statistical tests result in a probability less than the preset limit, the results are said to be statistically significant (i.e. $p<0.05$)

Clinical Significance

- measure of clinical usefulness (e.g. 1 mmHg BP reduction may be statistically significant, but may not be clinically significant)
- depends on factors such as cost, availability, patient compliance, and side effects in addition to statistical significance

Trend

- an observed directional relationship that does not meet criteria for statistical significance and thus should be interpreted with caution

Confidence Interval (CI)

- provides a range of values within which the true population result (e.g. the mean) lies
- frequently reported as 95% CI (i.e. one can be 95% certain that the true value is within this data range)
- bounded by the upper and lower confidence limits

A wider confidence interval implies more variance than a tighter confidence interval

Data

- information collected from a sample of a population
- there are 2 overall classes of data listed with examples
 - **discrete**
 - ♦ categorical (e.g. gender, marital status)
 - ♦ ordinal (e.g. low, medium, high)
 - **continuous** (e.g. serum cholesterol, hemoglobin, age)

Accuracy

- how closely a measurement approaches the true value

Reliability

- how consistent a measurement is when performed by different observers under the same conditions or by the same observer under different conditions

Validity

- extent to which a measurement approaches what it is designed to measure
- determined by the accuracy and reliability of a test

Internal Validity

- degree to which the findings of the sample truly represent the findings in the study population
- dependent on the precision and accuracy

External Validity

- degree to which the results of the study can be generalized to other situations or populations

Figure 11. Accuracy vs. reliability

Common Statistical Tests

Table 6. Statistical Tests

	Z-Test (known as T-Test for samples <30)	Analysis of Variance (ANOVA)	Chi-Squared Test (χ^2)	Linear Regression	Logistic Regression
What are you trying to show?	Compare the mean values of an outcome variable between two groups (e.g. difference in average BP between men and women)	Compare the mean values of an outcome variable between two or more groups (e.g. difference in average BP between persons in three towns)	Test the correspondence between a theoretical frequency distribution and an observed frequency distribution (e.g. if one sample of 20 patients is 30% hypertensive and another comparison group of 25 patients is 60% hypertensive, a chi-squared test determines if this variation is more than expected due to chance alone)	Looks at associations between two or more continuous variables (e.g. age and blood pressure)	Shows how a change in one explanatory variable affects the status (e.g. ill vs. non-ill) of the outcome variable
What kind of data do you have in your study?	Data on two groups	Mean of groups (one or more) Overall mean of an entire sample	Data on two or more populations and two or more outcome measures	Data on at least one population	Data on at least one population
What kind of variables do you measure?					
Dependent Variable	Continuous data	Continuous data	Categorical (2 or more)	Continuous	Categorical (discrete outcomes usually dichotomous)
Independent Variable	Categorical (2 only)	Categorical (2 or more)	Categorical (2 or more)	Continuous	Continuous/categorical
Assumptions		"Normal" distribution	None	Dependent variable has "normal" distribution Linear relationship between variables	None

Causation

Criteria for Causation (Sir Bradford Hill)

1. **strength of association:** the frequency with which the factor is found in the disease and the frequency with which it occurs in the absence of disease
2. **consistency:** is it the same outcome with different populations or study design?
3. **specificity:** is the association particular to your intervention and measured outcome?
4. **temporal relationship:** did the exposure occur before the onset of the disease?
5. **biological gradient:** finding a quantitative relationship between the factor and the frequency (e.g. dose response relationship)
6. **biological plausibility:** does the association/causation make biological sense?
7. **coherence:** can the relationship be explained/accounted for based on what we know about the laws of science, logic, etc.?
8. **experimental evidence:** experiment that investigates what happens when the suspected offending agent is removed (e.g. is there improvement?)
9. **analogy:** do other established associations provide a model for this type of the relationship?

Note: Not all criteria must be fulfilled to establish scientific causation, and the modern practice of EBM emphasizes 'experimental evidence' as superior to other criteria for experimental causation review. However many causation questions in health cannot be answered with experimental methods.

- visit <http://phprimer.afmc.ca> and refer to Table 5.4: Criteria for inferring a causal relationship from the AFMC Primer on Population Health

Beware:

Correlation \neq Causation

e.g. There is evidence of a direct correlation between the amount of ice cream sold and the amount of deaths in swimming pools. Of course, ice cream does not cause drowning, rather, they both increase in the summer

Criteria for Causation

ACCESS PTB

Analogy
Consistency
Coherence
Experimental evidence
Strength of association
Specificity
Plausibility
Temporal relationship
Biological gradient

Assessing Evidence

- critical appraisal is the process of systematically examining research evidence to assess validity, results, and relevance before using it to inform a decision

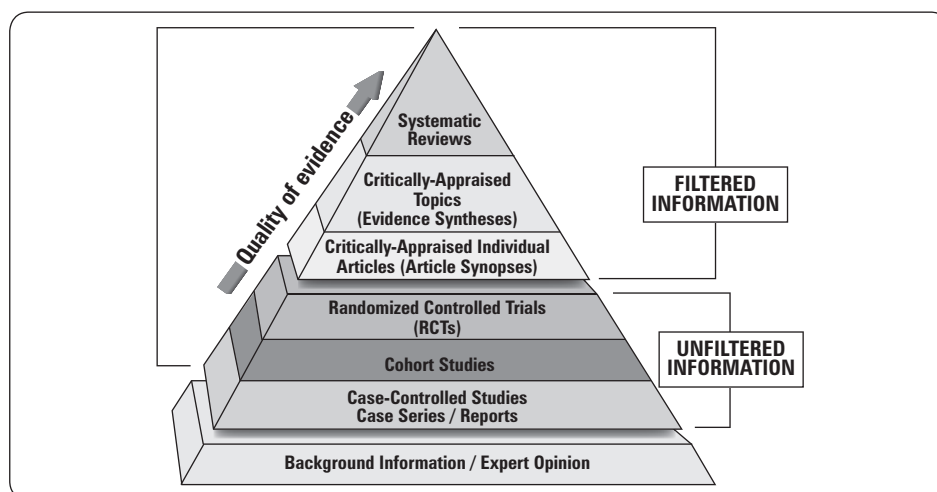

Figure 12. Pyramid of pre-appraised evidence

Produced by Glover J, Izzo D, Odato K, Wang L. Trustees of Dartmouth College & Yale University. All rights reserved. © Copyright 2006

A. Are the results of the study valid?

- see below for classifications of evidence that has already been assessed; see sidebar for assessing primary studies

B. What are the results?

- what was the impact of the treatment effect?
- how precise was the estimate of treatment effect?
- what were the confidence intervals and power of the study?

C. Will the results help me in caring for my patients?

- are the results clinically significant?
- can I apply the results to my patient population?
- were all clinically important outcomes considered?
- are the likely treatment benefits worth the potential harm and costs?

Validity

- The degree to which the outcome observed in the study can be attributed to the intervention

5 Questions About the Validity of Primary Studies

- Were the patients randomized?
- Was the follow-up of patients sufficiently long and complete?
- Were all patients analyzed in the groups to which they were randomized?
- Were the groups treated equally except for the intervention?
- Were the patients and clinicians kept blind to treatment?

Other Questions to Consider

- Were the groups similar (i.e. demographics, prognostic factors) at the start of the trial?
- Were the appropriate and valid exposure and outcome measures obtained?
- Were outcome assessors aware of group allocation?
- Was contamination reported?
- Were ethical issues continuously upheld?

Analysis

Per-Protocol Analysis (PP)

Strategy of analysis in which only patients who complete the entire study are counted towards the results

Intention-to-Treat Analysis (ITT)

When groups are analyzed exactly as they existed upon randomization (i.e. using data from all patients, including those who did not complete the study)

Levels of Evidence: Classifications Cited in Guidelines/Consensus Statements

Level I evidence: based on RCTs (or meta-analysis of RCTs) big enough to have low risk of incorporating FP or FN results

Level II evidence: based on RCTs too small to provide Level I evidence; may show positive trends that are non-significant, or have a high risk of FN results

Level III evidence: based on non-randomized, controlled or cohort studies; case series; case-controlled; or cross-sectional studies

Level IV evidence: based on opinion of respected authorities or expert committees, as published consensus conferences/guidelines

Level V evidence: opinions of the individuals who have written/reviewed the guidelines (i.e. Level IV evidence), based on experience/knowledge of literature/peer discussion

Notes: These 5 levels of evidence are not direct evaluations of evidence quality or credibility; they reflect the nature of the evidence. While RCTs tend to be most credible (with <III), level III evidence gains credibility when multiple studies from different locations and/or time periods report consistent findings. Level IV and V evidence reflects decision-making that is necessary but in the absence of published evidence.

Figure 13. Levels of evidence classifications

Note: this is only one method of classifying evidence. Various systems exist, but operate within the same premise that certain types of evidence carry more weight than others

META-ANALYSIS

Definition

- a form of statistical analysis that combines the results of independent studies addressing a common research hypothesis, as identified through systematic review, into one large study

Subjects

- combination of all the subjects used in original studies

Methods

- selection of relevant studies from the published literature which meet quality criteria
- statistical models used to combine the results of each independent study
- provides a summary statistic of overall results as well as graphic representation of included studies

Advantages

- attempts to overcome the problem of reduced power due to small sample sizes of individual studies
- ability to control for inter-study variation

Disadvantages

- sources of bias may not be controlled for
- reliance on published studies may increase the potential conclusion of an effect as it can be difficult to publish studies that show no significant results (publication bias)
- the decision to include/reject a particular study is subjective

An example of a meta-analysis is one that includes the full set of reported studies based on compiling and analyzing data from eligible RCTs, which compare the effects of ACEI, CCBs, and other antihypertensive agents on mortality and major cardiovascular events

Health Services Research

Continuous Quality Improvement

Quality Improvement

- method of evaluating and improving processes; focusing more on systems and systematic biases, which are thought to be the cause of variation in quality, as opposed to individuals
- taking measures to increase efficiency of action with the purpose of achieving optimal quality

Quality Assurance

- management system to assure the quality of health care provided by workers and received by patients
- constantly aims to improve standards and the frequency of attaining those standards
- **five-stage process of quality assurance**
 1. establishment of functional goals
 2. implementation of procedures to achieve those goals
 3. regular assessment of performance relative to the goals
 4. proposal of solutions to close the gap between performance and goals
 5. documentation and reporting of this assessment activity

Quality Control

- method of maintaining standards by reviewing the quality of all factors involved in the process

Continuous Quality Improvement

- management approach to improve and maintain quality via continuous assessment of potential defects, followed by action to improve process, avoid decrease in quality or correcting process in early stages
- continuous feed-forward process

Quality Management

- encompasses quality assurance, quality control, and quality improvement to achieve consistent quality

Total Quality Management

- management philosophy for improving quality while controlling costs
- focusing on the system rather than the individual, to ensure decisions are made to support quality and remove barriers to quality inherent in bureaucratic, hierarchical systems

Audit

- process of systematic examination of a quality system carried out by internal or external quality auditors
- to determine whether quality processes and results comply with goals, and whether processes have been implemented effectively

Systems Analyses Tools

1. **5 Whys:** brainstorming to simplify the process of change; continue asking 'why' until the root of the problem is discovered
2. **Ishikawa Diagrams (i.e. Fishbone Diagrams):** identify generic categories of problems that have an overall contribution on the effect

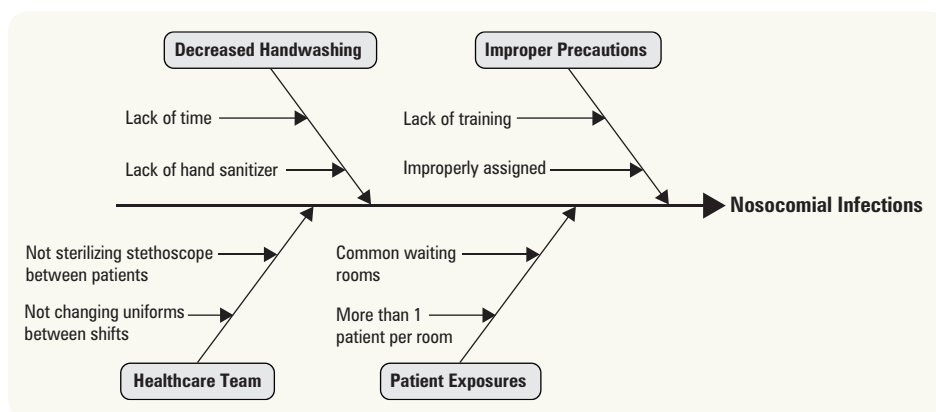

Figure 14. Ishikawa diagram

3. **Defect check sheets:** consider all defects and tally up the number of times the defect occurs

4. **Pareto Chart:** x vs. y chart; x-axis = defect categories, y-axis = frequency; plot cumulative frequency on the right y-axis

- purpose is to highlight most important among large set of factors contributing to defects/poor quality

Precede-Proceed Model

- tool for designing, implementing, and evaluating health interventions/programs

Table 7. Precede-Proceed Model

PRECEDE Phase	PROCEED Phase
Phase 1 – Identify the ultimate desired result	Phase 5 – Implementation (design and conduct the intervention)
Phase 2 – Identify and set priorities among health issues and their behavioural and environmental determinants	Phase 6 – Process Evaluation (determine if the program is implemented as planned)
Phase 3 – Identify the predisposing, enabling, and reinforcing factors that affect the behaviors and environmental determinants	Phase 7 – Impact Evaluation (measure intermediate objectives – predisposing, enabling, and reinforcing factors)
Phase 4 – Identify the administrative and policy factors that influence what can be implemented	Phase 8 – Outcome Evaluation (measure desired result)

Cost Analysis

Cost-Benefit Analysis (CBA)

- a process of, either explicitly or implicitly, weighing the total expected costs against the total expected benefits of one or more actions in order to choose the best or most profitable option
- all costs are adjusted for the time value of money so that costs that may change over time are expressed on a common basis in terms of their present value

Cost Effectiveness Analysis (CEA)

- a comparison of the relative expenditure (costs) and outcomes (effects) of two or more courses of action
- cost effectiveness analysis is often used where a full cost benefit analysis is inappropriate
- a CEA is commonly expressed in terms of a ratio: the denominator is a gain in health from a measure (e.g. years of life, premature births averted, sight-years gained) and the numerator is the cost of the health gain
- the most commonly used outcome measure is quality-adjusted life years (QALY), see PH7

Outbreak of Infectious Diseases

Definitions

Outbreak

- occurrence of new cases clearly in excess of the baseline frequency of the disease in a defined community or population over a given period of time
- synonymous with epidemic, although generally considered to be an epidemic that is localized, has an acute onset, or is relatively short in duration

Epidemic

- any disease, infectious or chronic, occurring at a greater frequency than usually expected in a defined community or institutional population over a given time period (i.e. excessive rate of disease)

Endemic

- constant presence of disease or infectious agent in a given geographic area or population subgroup (i.e. usual rate of disease)

Pandemic

- epidemic over a wide area, crossing international boundaries, and affecting a large number of people

Attack Rate

- cumulative incidence of infection within a defined group observed during a specific period of time in an epidemic
- calculated by dividing the total number of people who develop clinical disease by the population at risk, usually expressed as a percentage

Secondary Attack Rate

- number of cases among contacts occurring within the incubation period following exposure to the primary case, in relation to the total exposed contacts
- infectiousness reflects the ease of disease transmission and is usually measured by the secondary attack rate

Pathogenicity Rate

- power of an organism to produce clinical disease in those that are affected

Virulence

- severity of the disease produced by the organism in a given host
- expressed as the ratio of the number of cases of severe and fatal infection to the total number of clinically affected

Case-Fatality Rate

- proportion of individuals contracting a disease who die as a result of that disease
- most frequently applied to a specific outbreak of acute disease in which all patients have been followed for an adequate period of time to include all attributable deaths
- must be clearly differentiated from the mortality rate

Mortality Rate/Crude Death Rate

- estimation of the portion of the population that dies during a specified period from all causes of death

All-Cause Mortality Rate by Age Group

- estimation of the portion of the population in a given age group that dies during a specified period from all causes of death for that age group

Morbidity Rate

- estimation of the portion of the population that suffers illness or ill health during a specified period

**Infection Control Precautions**
(see [Infectious Diseases](#), ID6)**Contact** (impetigo, chicken pox, warts)

- Wash hands
- Gloves
- Gown
- Wipe equipment after use

Airborne (TB)

- Contact precautions PLUS
- N95 mask (fit tested)
- Negative pressure room

Droplet (influenza, mumps, pneumonia)

- Contact precautions PLUS
- Goggles/face shield
- Surgical mask

Source: Public Health Ontario. http://www.publichealthontario.ca/en/eRepository/IPAC_Clinical_Office_Practice_2013.pdf
<http://www.oahpp.ca/resources/documents/pidac/Routine%20Practices%20and%20Additional%20Precautions.pdf>

Steps to Control an Outbreak

1. Define the Problem

- is it an outbreak?

2. Appraise Existing Data and Institute a Surveillance System

- **case definition:** formulated from the most common symptoms or signs; definition includes the likely date of onset of illness of the first case (e.g. any person with onset of fever higher than 101.3°F and cough within past 28 d)
- **active surveillance:** identify those who may have been exposed to the infectious agent and who fit the case definition through active efforts, including:
 - contacting emergency rooms, physicians' offices, local schools
 - obtaining records from health units, such as mortality or laboratory records

3. Formulate Hypotheses and Implement Initial Control Measures

- track outbreak evolution to develop hypotheses about potential source and populations at risk
- case management depends on symptoms, suspected agent, population at risk, and location

**Active Surveillance**

Outreach such as visits or phone calls by the public health/surveillance authority to detect unreported cases (e.g. an infection control nurse goes to the ward and reviews temperature charts to see if any patient has a nosocomial infection)

Passive Surveillance

A surveillance system where the public health/surveillance authority depends on others to submit standardized forms or other means of reporting cases (e.g. ward staff notify infection control when new cases of nosocomial infections are discovered)

- population management requires public health services in the community and infection control teams in hospitals to disseminate information about
 - risk reduction
 - personal preventative measures (e.g. post-exposure prophylaxis)
 - decreasing risk of propagation (e.g. quarantine)

4. Test the Hypothesis through Analysis of Surveillance Data or Special Studies

- analyze outbreak surveillance data
- generate epidemic curves
 - usually a frequency histogram, with the number of cases plotted on the vertical axis and dates or times of onset along the horizontal axis
 - curve can indicate whether the epidemic (outbreak) has a common source or whether it is propagated
 - **point source epidemic:** exposure is brief and essentially simultaneous
 - **extended source epidemic:** exposure lasts for a period of days to weeks and may be continuous (no irregular peaks) or intermittent (irregularly spaced peaks)
 - **propagated epidemic:** begins with only a few exposed persons but is maintained by person-to-person transmission (e.g. measles/influenza); epidemic curve shows a series of peaks
- use epidemic curves, cross-sectional studies, and/or case-control studies to evaluate hypotheses about cause of outbreak

5. Draw Conclusions and Re-Adjust Hypothesis and Control Measures

- establish cause of outbreak with further epidemiologic investigation and revise initial control measures accordingly

6. Plan for Long-Term Prevention and Control

- implement prevention measures to avoid similar future incidents
 - strengthen resistance of hosts (e.g. immunization)
 - interrupt modes of transmission in environment (e.g. improvements in food processing)
- communicate outbreak prevention and control strategies to the public

Figure 15. Epidemic curves

Figure 15a. Point source epidemic curve

Figure 15b. Extended continuous source epidemic curve

Figure 15c. Propagated source epidemic curve

Environmental Health

Definition

- study of conditions in the natural and human-made environment that influence human health and well-being
- environmental exposures
 - four main reservoirs: air, food, water, and soil
 - three main routes: inhalation, ingestion, or absorption (skin)
 - usually divided into two main settings
 - ♦ workplace (including schools): may see high level exposure in healthy individuals (see *Occupational Health*, PH23)
 - ♦ non-workplace: generally low level but chronic exposure; population at risk includes extremes of age, developing fetuses, and ill or immunocompromised individuals
- health impacts of the environment also include factors such as urban planning and how individuals interact with the built environment (e.g. safe pedestrian and bicycle paths are neighborhood features that can facilitate more active lifestyles among residents)

Environmental Health Jurisdiction

Table 8. Environmental Health Jurisdiction

Public Health Unit	Enforcement of water and food safety regulations (including restaurant food safety) Sanitation Assessment of local environmental risks Monitoring and follow-up of reportable diseases
Municipal Government	Waste disposal Recycling Water and sewage treatment/collection/distribution
State Government	Water and air quality standards Industrial emission regulation Toxic waste disposal
Federal Government	Designating and regulating toxic substances Regulating food products Setting policy for pollutants that can travel across provincial boundaries
International	Multilateral agreements (e.g. Kyoto Protocol, UN Convention on Climate Change, International Joint Commission)

Risk Assessment

Hazard Identification

- what is the hazard involved?
- assess potential hazards by taking an environmental health history

Risk Characterization

- is the identified agent likely to elicit the patient's current symptoms?
- review known health impacts of the hazard and identify specific properties that contribute to or diminish adverse effects (e.g. evaluate threshold levels)

Exposure Assessment

- is the patient's exposure to the environmental agent sufficient to have caused the current symptoms?
- quantify exposure through direct measurement or by reviewing frequency and nature of contact with hazard

Taking an Environmental Health History

CH₂OPD₂

Community

Home

Hobbies

Occupation

Personal habits

Diet

Drugs

Air

Physical Contaminants

- sound waves
 - ionizing radiation
 - radon is naturally produced by soil containing uranium or radium, can contaminate indoor air and is associated with a small proportion of lung cancers
- ultraviolet radiation is increasing due to ozone layer destruction and increases risk of skin cancer
 - non-ionizing radiation
 - visible light, infrared, microwave

Chemical Contaminants

- ground-level ozone
 - main component of smog with levels increasing in major cities
 - worsens asthma, irritates upper airway
- carbon monoxide (fossil fuel-related, common byproduct of combustion)
 - aggravates cardiac disease at low levels
 - headache, nausea, dizziness at moderate levels
 - fatal at high levels
- sulphur dioxide (fossil fuel-related), nitrogen oxides
 - contribute to acid rain and exacerbate breathing difficulties
- organic compounds at high levels (e.g. benzene, methylene chloride, tetrachloroethylene)
 - tend to be fat-soluble, easily absorbed through skin and difficult to excrete
- heavy metals emissions (e.g. nickel, cadmium, chromium)
 - variety of health effects: upper airway disease, asthma, decreased lung function
- second-hand tobacco smoke
 - respiratory problems, increase risk of lung cancer
 - particulates associated with decreased lung function, asthma, upper airway irritation

Biological Contaminants

- molds thrive in moist areas; 10-15% of the population allergic
- bacteria survive as spores and aerosols, can be distributed through ventilation systems (e.g. *Legionella*)
- dust mites (year-round) and pollens (seasonal) can trigger upper and lower-airway symptoms

Climate Change

- anthropogenic greenhouse gas emissions (e.g. carbon dioxide, methane) leading to adverse changes in the global environment
 - increased extreme weather conditions (e.g. floods, hurricanes, heat waves)
 - increased distribution of disease vectors (e.g. mosquitoes and malaria)

Effects of Ionizing Radiation

α -particles are larger and damage the skin and bronchial lining (airway irritation)

β -particles are smaller and cause deeper damage (alveoli)

BPA, the Toxin Concern of 2009

Bisphenol A (BPA) is a chemical compound found in some hard, clear, lightweight plastics and resins. According to the NIH, animal studies suggest that ingested BPA may imitate estrogen and other hormones. In October 2008, Canada became the first country in the world to ban the import and sale of polycarbonate baby bottles containing BPA, stating that although exposure levels are below levels that cause negative effects, current safety margins need to be higher. The US FDA does not consider normal exposure to BPA to be a hazard, however the NIH has some concern that fetuses, infants, and children exposed to BPA may be at increased risk for early-onset puberty, prostate, and breast cancer

Water

Biological Contaminants

- mostly due to human and animal waste
- rural inhabitants at higher risk
- bacteria: *Escherichia coli* (e.g. Walkerton, ON), *Salmonella*, *Pseudomonas*, *Shigella*
- protozoa: *Giardia*, *Cryptosporidium* (e.g. North Battleford, SK)

Chemical/Industrial Contaminants

- chlorination by-products (e.g. chloroform can cause cancer at high levels)
- volatile organic compounds, heavy metals, pesticides, and other industrial waste products can be present in groundwater
- fluoride at high levels (greater than that of municipal fluoridation) can cause skeletal fluorosis

Soil

- contamination sources: rupture of underground storage tanks, use of pesticides and herbicides, percolation of contaminated water runoffs, leaching of wastes from landfills, dust from smelting and coal burning power plants, residue of industrial waste/development (e.g. urban agriculture), lead deposition, leakage of transformers
- most common chemicals: petroleum hydrocarbons, solvents, lead, pesticides, motor oil, other industrial waste products
- health effects
 - infants and toddlers at highest risk of exposure due to hand-mouth behaviors
 - dependent on contaminant: leukemia, kidney damage, liver toxicity, neuromuscular blockade, developmental damage to the brain and nervous system, skin rash, eye irritation, headache, N/V, fatigue
- biological contamination: tetanus, *Pseudomonas*

Food

Table 9. Comparison of Select Biological Contaminants of Food and Effects on Human Health

	Source	Effects
<i>Salmonella</i>	Raw eggs, poultry, meat	GI symptoms
<i>Campylobacter</i>	Raw poultry, raw milk	Joint pain, GI symptoms
<i>Escherichia coli</i>	Various including meat, sprouts Primarily undercooked hamburger meat	Watery or bloody diarrhea, HUS
<i>Listeria monocytogenes</i>	Unpasteurized cheeses, prepared salads, cold cuts	Listeriosis: nausea, vomiting, fever, headache, rarely meningitis or encephalitis
<i>Clostridium botulinum</i>	Unpasteurized honey, canned foods	Dizziness, weakness, respiratory failure, GI symptoms: thirst, nausea, constipation
Prion (BSE)	Beef and beef products	Creutzfeldt-Jakob disease

BSE = bovine spongiform encephalopathy

- other biological food contaminants include
 - viruses, mold toxins (e.g. aflatoxin has been associated with liver cancer), parasites (e.g. Toxoplasmosis, tapeworm), paralytic and shellfish poisoning (rare), genetically modified organisms (controversial as to health risks/benefits)

Chemical Contaminants

many persistent organic pollutants are fat-soluble and undergo bioamplification

- drugs (antibiotics, hormones)
- inadequately prepared herbal medications
- food additives and preservatives
 - nitrites highest in cured meats; can be converted to carcinogenic nitrosamines
 - sulphites commonly used as preservatives; associated with sulphite allergy (hives, nausea, shock)
- pesticide residues
 - older pesticides (e.g. DDT) have considerable human health effects
- polychlorinated biphenyls (PCBs)
 - effects (severe acne, numbness, muscle spasm, bronchitis) much more likely to be seen in occupationally exposed individuals than in the general population
- dioxins and furans
 - levels highest in fish and marine mammals, also present in breast milk
 - can cause immunosuppression, liver disease, respiratory disease

To Fluoridate or Not

At the recommended concentration of 0.8-1.0 mg/L, fluoride reduces cavities by 18-40%, and there is little risk of fluorosis unless other exposures (e.g. toothpaste, rinses, mouthwash, etc.) are swallowed. Opposition raises concerns that the intake is not easily controlled, and that children, and others may be more susceptible to health problems. However, public health experts strongly support fluoridation as an effective measure to prevent dental caries at the community level and reduce dental health inequities

The Walkerton Tragedy

In May 2000, the drinking water system in the town of Walkerton, ON, became contaminated with *Escherichia coli* O157:H7 and *Campylobacter jejuni*. Over 2,300 individuals became ill; 27 people developed hemolytic uremic syndrome and 7 individuals died in the outbreak

Source: Ministry of the Attorney General. Report of the Walkerton inquiry. Ontario, 2002

Honey and Botulism

Although exceedingly rare, infant botulism has been documented as a form of food poisoning from *C. botulinum* found in honey. When an infant swallows spores of this bacterium, they grow and produce a toxin in the baby's intestine. By the time an infant is 1, its gut has a healthy colony of "good" bacteria that prevents this from occurring

Organic Foods

- Organic foods are not free of synthetic pesticide residues but typically contain smaller amounts compared to conventionally grown foods
- Currently, there has not been strong evidence to suggest that eating organic foods is safer or more nutritious compared to eating conventionally grown food

Source: Organic foods. *Ann Intern Med* 2012; 157:348-66. Health Canada. Pesticides and food, 2011. UpToDate. Organic foods and children, 2009

Heavy Metal Toxicity

Mechanism

- after exposure, superabundant metals bind to proteins, alter their enzymatic activity, and lead to diffuse disease manifestations

Predisposing Factors in At-Risk Groups

- children: hand-to-mouth, incomplete blood-brain barrier
- pregnant women and developing fetus: heavy metals cross placenta; mothers release heavy metal stores at times of calcium stress
- adults: occupation, hobbies, environment (home, country)

Etiology

- iatrogenic (e.g. gold treatment for rheumatoid arthritis, lithium treatment for bipolar affective disorder)
- inhalation (e.g. zinc oxide, lead, gasoline fumes)
- ingestion (e.g. lead paint, mercury in fish, folk remedies)
- industry (e.g. methyl mercury industrial spill caused Minamata disease)

Treatment

- generalized workup: symptoms are usually wide-ranging and non-specific
- chelation therapy (e.g. dimercaprol)

Occupational Health

- occupational health is the maintenance and promotion of health in the work environment
- services encompass health promotion and protection (primary prevention), disease prevention (secondary prevention), and treatment and rehabilitation (tertiary prevention)
- general bias towards reporting occupational injuries vs. occupational disease, as occupational disease is harder to identify

Workplace Health Promotion and Protection

- take action in the workplace so the worker is protected from injury or illness
 - identifying workplace hazards (e.g. through material safety data sheets [MSDS])
 - assessing risk
 - reducing exposure
 - ♦ **source:** substituting a less toxic chemical
 - ♦ **path:** enclosing a source of noise in a sound-proof room
 - ♦ **worker:** personal protection equipment (e.g. reflective vests, helmets)
 - ♦ **worker education:** emergency protocols, material safety education
 - ♦ **rotation of workers:** decrease exposure for each worker but more workers exposed

Occupational Health Statistics

- 4,628 fatal work injuries in the United States in 2012; rate = 3.4/100,000 workers

Reducing Exposure in the Workplace

- Engineering controls – most preferred
- Administrative/work practices
- Personal protective equipment – least preferred due to adherence challenges

Workplace Disease Prevention

- monitor workers' health to prevent the development of disease
 - periodic examinations to facilitate pre-symptomatic diagnosis (e.g. screening for lead exposure); substance misuse screening where performance impairment is suspected

Workplace Treatment and Rehabilitation

- treat injury or illness with safe return to the workplace
- may require rehabilitation, retraining, change in job duties, and/or workers' compensation

Workplace Legislation

- Department of Labor (DOL) administers and enforces more than 180 federal laws that cover many workplace activities for about 10 million employers and 125 million workers
- the Occupational Safety and Health (OSH) Act is administered by the Occupational Safety and Health Administration (OSHA)
- safety and health conditions in most private and public industries are regulated by OSHA or OSHA-approved state programs

- employers must comply with the General Duty Clause of the OSH Act, which requires employers to keep their workplace free of serious recognized hazards
- compliance duties owed to each employee include the provision of personal protective equipment and training as necessary
- employees retain the right to
 - ask OSHA to inspect their workplace
 - use their rights under the law without retaliation and discrimination
 - receive information and training about hazards, methods to prevent harm, and the OSHA standards that apply to their workplace. The training must be in a language you can understand
 - get copies of test results done to find hazards in the workplace
 - review records of work-related injuries and illnesses
 - get copies of their medical records
- OSHA enforces the Act through workplace inspections and investigations

Taking an Occupational Health History

- current and previous job duties
- exposures
 - identification: screen for chemical, metal, dust, biological, and physical hazards as well as psychological stressors; review relevant workplace MSDS
 - assessment: duration, concentration, route, exposure controls (e.g. ventilation, personal protective equipment)
- temporal relationship: changes in symptoms in relationship to work environment
- presence of similar symptoms in co-workers
- non-work exposures: home, neighborhood, hobbies

Taking an Occupational Health History

WHACS

What do you do?

How do you do it?

Are you concerned about any particular exposures on or off the job?

Co-workers or others with similar problems?

Satisfied with your job?

J Occup Environ Med 1998;40:680-684

Occupational Hazards

Table 10. Occupational Hazards

Physical	Chemical	Biological	Psychosocial
<ul style="list-style-type: none"> • Trauma (fractures, lacerations) • Noise (hearing loss) • Temperature (heat cramps, heat exhaustion, heat stroke) • Air pressure (barotrauma, decompression sickness) • Ergonomic <ul style="list-style-type: none"> • Repetitive use/overuse injuries, excessive force, awkward postures, poorly designed physical work environment • Tenosynovitis, bursitis, carpal tunnel syndrome • Radiation <ul style="list-style-type: none"> • Non-ionizing: visible light, infrared • Ionizing: UV, x-rays, γ rays • Electricity 	<ul style="list-style-type: none"> • Organic solvents (e.g. benzene, methyl alcohol; most toxic is carbon tetrachloride) • Mineral dusts (e.g. silica leads to silicosis and predisposition to TB, asbestos leads to diffuse fibrosis and mesothelioma, coal leads to pneumoconiosis) • Heavy metals (e.g. nickel, cadmium, mercury, lead) <ul style="list-style-type: none"> • Lead is ubiquitous and can cause severe disability • Gases (e.g. halogen gases, sulphur dioxide, carbon monoxide, nitrogen oxides) • Second-hand smoke (causal factor for lung cancer, lung disease, heart disease, asthma exacerbations; may be linked to miscarriage) <ul style="list-style-type: none"> • Exposure restricted in most municipal, provincial, and federal jurisdictions • Skin diseases (major portion of compensations, e.g. contact dermatitis, occupational acne, pigmentation disorders) 	<ul style="list-style-type: none"> • Exposure to bacteria, viruses, fungi, protozoa, Rickettsia • Blood should be considered a potentially toxic substance due to blood-borne infectious diseases (e.g. HIV, hepatitis B) • Consider exposure to disease in endemic countries, travelers from endemic countries, or recent travel history in the setting of acute onset of symptoms (e.g. SARS, TB) 	<ul style="list-style-type: none"> • Workload, responsibility, fear of job loss, geographical isolation, shift work, harassment (sexual/non-sexual) • Incurs high cost from absenteeism, poor productivity, mental illness (e.g. post-traumatic stress disorder)

Appendix – Reportable Diseases

As an essential part of the health system, physicians are required by law to report certain diseases to public health for the following reasons:

1. to control the outbreak
 - if the disease presents an outbreak threat (e.g. measles, *Salmonella*, respiratory diseases in institutions)
2. to prevent spread
 - if the disease presents a significant threat to individuals or a subset of the population (e.g. Lassa Fever)
3. for surveillance
 - if the disease is preventable with immunization (e.g. polio, diphtheria, congenital rubella)
4. if infected individuals require education, treatment and/or partner notification (e.g. gonorrhea, TB)
5. reporting details (website, office, etc.)
 - some are more urgent than others (must contact MOH)
 - physicians should also report unlisted diseases that appear in clusters

The following list is based on the reportable diseases in the province of Ontario, Canada for 2014
(Each state will have its own similar legislation)

Source: Health Protection and Promotion Act, O. Reg. 559/91, amended to O. Reg. 49/07.

Acquired Immunodeficiency Syndrome (AIDS)	<i>Haemophilus influenzae b</i> disease, invasive	Rabies
Acute flaccid paralysis <15 yr	Hantavirus pulmonary syndrome	Respiratory infection outbreaks in institutions
Amoebiasis	Hemorrhagic fevers, including:	Rubella
Anthrax	i. Ebola virus disease	Rubella, congenital syndrome
Botulism	ii. Marburg virus disease	
Brucellosis	iii. Other viral causes	Salmonellosis
	Hepatitis, viral:	Severe Acute Respiratory Syndrome (SARS)
<i>Campylobacter</i> enteritis	i. Hepatitis A	Shigellosis
Chancroid	ii. Hepatitis B	Smallpox
Chickenpox (Varicella)	iii. Hepatitis C	Streptococcal infections, Group A
<i>Chlamydia trachomatis</i> infections	iv. Hepatitis D (Delta hepatitis)	invasive
Cholera	Herpes, neonatal	Streptococcal infections, Group B
<i>Clostridium difficile</i> associated disease (CDAD) outbreaks in public hospitals	Human Immunodeficiency Virus (HIV)	neonatal
Cryptosporidiosis	Influenza	Syphilis
Cyclosporiasis		
Cytomegalovirus infection, congenital	Lassa Fever	Tetanus
	Legionellosis	Transmissible spongiform encephalopathy, including:
Diphtheria	Leprosy	i. Creutzfeldt-Jakob disease, all types
	Listeriosis	ii. Gerstmann-Sträussler-Scheinker syndrome
Encephalitis, including:	Lyme Disease	iii. Fatal familial insomnia
i. Primary, viral	Malaria	iv. Kuru
ii. Post-infectious	Measles	Trichinosis
iii. Vaccine-related	Meningitis, acute:	Tuberculosis, active and latent
iv. Subacute sclerosing panencephalitis	i. Bacterial	Tularemia
v. Unspecified	ii. Viral	Typhoid Fever
Food poisoning, all causes	iii. Other	
	Meningococcal disease, invasive	Verotoxin-producing <i>E. coli</i> infection
Gastroenteritis, institutional outbreaks	Mumps	indicator conditions, including
Giardiasis, except asymptomatic cases		Hemolytic Uremic Syndrome (HUS)
Gonorrhea	Ophthalmia neonatorum	
		West Nile Virus illness, including:
	Paralytic shellfish poisoning	i. West Nile fever
	Paratyphoid fever	ii. West Nile neurological manifestations
	Pertussis (whooping cough)	
	Plague	Yellow Fever
	Pneumococcal disease, invasive	Yersiniosis
	Poliomyelitis, acute	
	Psittacosis/Ornithosis	
	Q Fever

Acronyms

5-HT	serotonin	CT	cognitive therapy	MAOI	monoamine oxidase inhibitor	OCPD	obsessive-compulsive personality disorder
ACh	acetylcholine	CTO	community treatment order	MDD	major depressive disorder	ODD	oppositional defiant disorder
ACT	assertive community treatment	DA	dopamine	MDE	major depressive episode	PD	personality disorder
ADHD	attention deficit hyperactivity disorder	DZ	dizygotic	MET	motivational enhancement therapy	PDD	pervasive developmental disorder
AN	anorexia nervosa	ECT	electroconvulsive therapy	MSE	mental status examination	PTSD	post-traumatic stress disorder
ASD	autism spectrum disorder	EPS	extrapyramidal symptoms	MST	magnetic stimulation therapy	rTMS	repetitive transcranial magnetic stimulation
ASPD	antisocial personality disorder	ERP	exposure with response prevention	MZ	monozygotic	SNRI	serotonin and norepinephrine reuptake inhibitors
BN	bulimia nervosa	EtOH	ethanol/alcohol	NA	Narcotics Anonymous	SSRI	selective serotonin reuptake inhibitor
CBT	cognitive behavioral therapy	GAD	generalized anxiety disorder	NMS	neuroleptic malignant syndrome	TCA	tricyclic antidepressant
CD	conduct disorder	GMC	general medical condition	NOS	not otherwise specified		
CRA	community reinforcement approach	IPT	interpersonal therapy	OCD	obsessive-compulsive disorder		

Suicide

Epidemiology

- attempted:completed = 20:1
- M:F = 1:4 for attempts, 3:1 for completed

Risk Factors

- epidemiologic factors
 - age: increases after age 14, second most common cause of death for ages 15-24, highest rates in persons >65 yr
 - sex: male
 - marital status: widowed/divorced
 - living situation: alone; no children <18 yr old in the household
 - other: stressful life events, access to firearms
- psychiatric disorders
 - mood disorders (15% lifetime risk in depression; higher in bipolar)
 - anxiety disorders (especially panic disorder)
 - schizophrenia (10-15% risk)
 - substance abuse (especially alcohol – 15% lifetime risk)
 - eating disorders (5% lifetime risk)
 - adjustment disorder
 - conduct disorder
 - personality disorders (borderline, antisocial)
- past history
 - prior suicide attempt
 - family history of suicide attempt/completion

Clinical Presentation

- symptoms associated with suicide
 - hopelessness
 - anhedonia
 - insomnia
 - severe anxiety
 - impaired concentration
 - psychomotor agitation
 - panic attacks

Approach

Every Patient: “Have you had any thoughts of wanting to hurt or kill yourself?”

- passive ideation: would rather not be alive but has no active plan for suicide
 - ♦ e.g. “I’d rather not wake up” or “I would not mind if a car hit me”
- active ideation
 - ♦ e.g. “I think about killing myself”
- plan: “Do you have a plan as to how you would end your life?”
- intent: “You talk about wanting to die, but are you planning to do this?” or “What has stopped you from ending your life?”
- past attempts: highest risk if previous attempt in past year
 - ♦ ask about lethality, outcome, medical intervention

Assessment of Suicidal Ideation

- onset and frequency of thoughts: “When did this start?” or “How often do you have these thoughts?”
- control over suicidal ideation: “Can you stop the thoughts or call someone for help?”
- lethality: “Do you want to end your life?” or “What do you think would happen if you actually took those pills?”
- access to means: “How will you get a gun?” or “Which bridge do you think you would go to?”

Suicide Risk Factors

SAD PERSONS

Sex (male)
 Age >60 yr old
 Depression
 Previous attempts
 Ethanol abuse
 Rational thinking loss (delusions, hallucinations, hopelessness)
 Suicide in family
 Organized plan
 No spouse (no support systems)
 Serious illness, intractable pain

Suicidal Ideation Assessment

- Asking patients about suicide will not give them the idea or the incentive to commit suicide
- The best predictor of completed suicide is a history of attempted suicide
- The most common psychiatric disorders associated with completed suicide are mood disorders and alcohol abuse

- time and place: "Have you picked a date and place? Is it in an isolated location?"
- provocative factors: "What makes you feel worse (e.g. being alone)?"
- protective factors: "What keeps you alive (e.g. friends, family, pets, faith, therapist)?"
- final arrangements: "Have you written a suicide note? Made a will? Given away your belongings?"
- practiced suicide or aborted attempts: "Have you ever put the gun to your head?" "Held the medications in your hand?" "Stood at the bridge?"
- ambivalence: "There must be a part of you that wants to live, after all you came here for help"

Assessment of Suicide Attempt

- setting (isolated vs. others present/chance of discovery)
- planned vs. impulsive attempt, triggers/stressors
- substance use/intoxication
- medical attention (brought in by another person vs. brought in by self to ED)
- time lag from suicide attempt to ED arrival
- expectation of lethality, dying
- reaction to survival (guilt/remorse vs. disappointment/self-blame)

Management

- proper documentation of the clinical encounter and rationale for management is essential
- higher risk (hospitalization needs to be strongly considered)
 - patients with a plan, access to lethal means, recent social stressors, and symptoms suggestive of a psychiatric disorder
 - do not leave patient alone; remove potentially dangerous objects from room
 - if patient refuses to be hospitalized, consider involuntary admission as per state specific statutes
- lower risk
 - patients who are not actively suicidal, with no plan or access to lethal means
 - discuss protective factors and supports in their life, remind them of what they live for, promote survival skills that helped them through previous suicide attempts
 - make a safety plan and an agreement that they will
 - ♦ not harm themselves
 - ♦ avoid alcohol, drugs, and situations that may trigger suicidal thoughts
 - ♦ follow-up with you at a designated time
 - ♦ contact a health care worker, call a crisis line, or go to an emergency department if they feel unsafe or if their suicidal feelings return or intensify
- depression: consider hospitalization if symptoms severe or if psychotic features are present; otherwise outpatient treatment with good supports and SSRIs/SNRIs
- alcohol-related: usually resolves with abstinence for a few days; if not, suspect depression
- personality disorders: crisis intervention/confrontation, may or may not hospitalize
- schizophrenia/psychosis: hospitalization might be necessary
- parasuicide/self-mutilation: long-term psychotherapy with brief crisis intervention when necessary

Psychotic Disorders

Definition

- characterized by a significant impairment in reality testing
 - delusions or hallucinations (with/without insight into their pathological nature)
 - behaving in a disorganized way so that it is reasonable to infer that reality testing is disturbed

Table 1. Differentiating Psychotic Disorders

Disorder	Psychotic Symptoms	Duration
Brief Psychotic Disorder	≥1 positive symptoms of criterion A	<1 mo
Schizophreniform Disorder	Criterion A	1-6 mo
Schizophrenia	Criterion A	>6 mo
Schizoaffective Disorder	≥2 wk (with no mood symptoms)	>1 mo
Delusional Disorder	Non-bizarre delusions, hallucinations	>1 mo
2° to Substance Intoxication/Withdrawal	Criterion A	During intoxication or ≤1 mo after withdrawal
2° to Mood Disorder	Delusions/hallucinations (mood congruent)	Psychosis may be present for the duration of the mood episode

Figure 1. Differentiating psychotic disorders with duration

Delusions: fixed, false beliefs
Hallucinations: perceptual experiences without an external stimulus

Differential Diagnosis of Psychosis

- primary psychotic disorders: schizophrenia, schizophreniform, brief psychotic, schizoaffective, delusional disorder
- mood disorders: depression with psychotic features, bipolar disorder (manic or depressive episode with psychotic features)
- personality disorders: schizotypal, schizoid, borderline, paranoid, obsessive-compulsive
- general medical conditions: tumor, head trauma, dementia, delirium, metabolic, infection, stroke, temporal lobe epilepsy
- substance-induced psychosis: intoxication or withdrawal, prescribed medications, toxins

Schizophrenia

DSM-5 Diagnostic Criteria for Schizophrenia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- two (or more) of the following, each present for a significant portion of time during a 1 mo period (or less if successfully treated). At least one of these must be (1), (2), or (3)
 - delusions
 - hallucinations
 - disorganized speech (e.g. frequent derailment or incoherence)
 - grossly disorganized or catatonic behavior
 - negative symptoms (i.e. diminished emotional expression or avolition)
 - for a significant portion of time since the onset of the disturbance, level of functioning in one or more major areas (e.g. work, interpersonal relations, self-care) is markedly below the level achieved prior to the onset (or when the onset is in childhood or adolescence, there is failure to achieve expected level of interpersonal, academic, or occupational functioning)
 - continuous signs of the disturbance persist for at least 6 mo. This 6 mo period must include at least 1 mo of symptoms (or less if successfully treated) that meet Criterion A (i.e. active-phase symptoms) and may include periods of prodromal or residual symptoms. During these prodromal or residual periods, the signs of the disturbance may be manifested by only negative symptoms or by two or more symptoms listed in Criterion A present in an attenuated form (e.g. odd beliefs, unusual perceptual experiences)
 - schizoaffective disorder and depressive or bipolar disorder with psychotic features have been ruled out because either 1) no major depressive or manic episodes have occurred concurrently with the active-phase symptoms, or 2) if mood episodes have occurred during active-phase symptoms, they have been present for a minority of the total duration of the active and residual periods of the illness
 - the disturbance is not attributable to the physiological effects of a substance (e.g. drug of abuse, a medication) or another medical condition
 - if there is a history of autism spectrum disorder or a communication disorder of childhood onset, the additional diagnosis of schizophrenia is made only if prominent delusions or hallucinations, in addition to the other required symptoms of schizophrenia are also present for at least 1 mo (or less if successfully treated)
- **specifiers:** type of episode (e.g. first episode, multiple episodes, continuous), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis

Epidemiology

- prevalence: 0.3-0.7%, M:F = 1:1
- mean age of onset: females late-20s; males early- to mid-20s
- suicide risk: 5-6% die by suicide, 20% attempt suicide

Etiology

- multifactorial: disorder is a result of interaction between both biological and environmental factors
 - genetic: 40% concordance in monozygotic (MZ) twins; 46% if both parents have schizophrenia; 10% of dizygotic (DZ) twins, siblings, children affected
 - neurochemistry ("dopamine hypothesis"): excess activity in the mesolimbic dopamine pathway may mediate the positive symptoms of psychosis while decreased dopamine in the prefrontal cortex may mediate negative and cognitive symptoms. GABA, glutamate, and ACh dysfunction are also thought to be involved
 - neuroanatomy: decreased frontal lobe function; asymmetric temporal/limbic function; decreased basal ganglia function; subtle changes in thalamus, cortex, corpus callosum, and ventricles; cytoarchitectural abnormalities
 - neuroendocrinology: abnormal growth hormone, prolactin, cortisol, and ACTH

Management of Acute Psychosis and Mania

- Ensure safety of self, patient, and other patients
- Have an exit strategy
- Decrease stimulation
- Assume a non-threatening stance
- IM medications (benzodiazepine + antipsychotic) often needed as patient may refuse oral medication
- Physical restraints may be necessary
- Do not use antidepressants or stimulants

Relationship Between Duration of Untreated Psychosis (DUP) and Outcome in First-Episode Schizophrenia

Am J Psychiatry 2005;162:1785-1804

Purpose: To review the association between DUP and symptom severity at first treatment contact, and between DUP and treatment outcomes.

Study Characteristics: Critical review and meta-analysis of 43 studies with 4,177 patients.

Participants: Patients with non-affective psychotic disorders at or close to first treatment.

Results: Shorter DUP was associated with greater response to antipsychotic treatment, as measured by global psychopathology, positive symptoms, negative symptoms, and functional outcomes. At the time of treatment initiation, longer DUP was associated with the severity of negative symptoms but not with the severity of positive symptoms, global psychopathology, or neurocognitive function.

Conclusions: DUP may be a potentially modifiable prognostic factor.

- neuropsychology: global defects seen in attention, language, and memory suggest lack of connectivity of neural networks
- environmental: indirect evidence of cannabis use, geographical variance, winter season of birth, obstetrical complications, and prenatal viral exposure

Pathophysiology

- neurodegenerative theory
 - natural history may be a rapid or gradual decline in function and ability to communicate
 - glutamate system may mediate progressive degeneration by excitotoxic mechanism which leads to production of free radicals
- neurodevelopmental theory: abnormal development of the brain from prenatal life
 - neurons fail to migrate correctly, make inappropriate connections, and break down in later life
 - inappropriate apoptosis during neurodevelopment resulting in faulty connections between neurons

Comorbidity

- substance-related disorders
- anxiety disorders
- decreased life expectancy because of associated medical conditions (e.g. weight gain, diabetes, metabolic syndrome, CV/pulmonary disease)

Management of Schizophrenia

- biological
 - acute treatment and maintenance with antipsychotics ± anticonvulsants ± anxiolytics
- psychosocial
 - psychotherapy (individual, family, group): supportive, CBT
 - ACT: mobile mental health teams that provide individualized treatment in the community and help patients with medication adherence, basic living skills, social support, job placements, and community resources
 - social skills training, employment programs, disability benefits
 - housing (group home, boarding home, transitional home)

Course and Prognosis

- the majority of individuals display some type of prodromal phase
- course is variable: some individuals have exacerbations and remissions and others remain chronically ill; accurate prediction of the long-term outcome is not possible
- negative symptoms may be prominent early in the illness and may become more prominent and more disabling later on; positive symptoms appear and typically diminish with treatment
- over time: 1/3 improve, 1/3 remain the same, 1/3 worsen

Good Prognostic Factors

- Acute onset
- Shorter duration of prodrome
- Female gender
- Good cognitive functioning
- Good premorbid functioning
- No family history
- Presence of affective symptoms
- Absence of structural brain abnormalities
- Good response to drugs
- Good support system

Schizophreniform Disorder

- **diagnosis:** criteria A, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 mo but <6 mo
 - if the symptoms have extended past 6 mo the diagnosis becomes schizophrenia
 - **specifiers:** with/without good prognostic features (e.g. acute onset, confusion, good premorbid functioning, absence of blunt/flat affect), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis
- **treatment:** similar to acute schizophrenia
- **prognosis:** better than schizophrenia; begins and ends more abruptly; good pre- and post-morbid function

Brief Psychotic Disorder

- **diagnosis:** criteria A1-A4, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 d, but <1 mo with eventual full return to premorbid level of functioning
 - **specifiers:** with/without marked stressors, with postpartum onset, with catatonia, current severity
- can occur after a stressful event or postpartum
- **treatment:** secure environment, antipsychotics, anxiolytics
- **prognosis:** good, self-limiting, should return to pre-morbid function within 1 mo

Schizoaffective Disorder

DSM-5 Diagnostic Criteria for Schizoaffective Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. an uninterrupted period of illness during which there is a major mood episode concurrent with Criterion A of schizophrenia
- B. delusions or hallucinations for 2 or more wk in the absence of a major mood episode during the lifetime duration of the illness
- C. symptoms that meet criteria for a major mood episode are present for the majority of the total duration of the active and residual periods of the illness
- D. the disturbance is not attributable to the effects of a substance or another medical condition
- **specifiers:** bipolar type, depressive type, with catatonia, type of episode, severity
- one-third as prevalent as schizophrenia; schizoaffective disorder bipolar type more common in young adults, schizoaffective disorder depressive type more common in older adults
- depressive symptoms correlated with higher suicide risk
- **treatment:** antipsychotics, mood stabilizers, antidepressants
- **prognosis:** between that of schizophrenia and of mood disorder

Non-bizarre delusions involve situations that could occur in real life (e.g. being followed, poisoned, loved at a distance)

Delusional Disorder

DSM-5 Diagnostic Criteria for Delusional Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. the presence of one (or more) delusions with a duration of ≥ 1 mo
- B. criterion A for schizophrenia has never been met
- **Note:** hallucinations, if present, are not prominent and are related to the delusional theme
- C. apart from the impact of the delusion(s) or its ramifications, functioning is not markedly impaired, and behavior is not obviously bizarre or odd
- D. if manic or major depressive episodes have occurred, these have been brief relative to the duration of the delusional periods
- E. the disturbance is not attributable to the physiological effects of a substance or another medical condition and is not better explained by another mental disorder
- **subtypes:** erotomanic, grandiose, jealous, persecutory, somatic, mixed, unspecified
 - further specify: bizarre content, type of episode (e.g. first episode, multiple episode), severity
- **treatment:** psychotherapy, antipsychotics, antidepressants
- **prognosis:** chronic, unremitting course but high level of functioning; a portion will progress to schizophrenia

Mood Disorders

Definitions

- mood disorders are defined by the presence of mood episodes
- mood episodes represent a combination of symptoms comprising a predominant mood state that is abnormal in quality or duration (e.g. major depressive, manic, mixed, hypomanic)
- types of mood disorders include
 - depressive (major depressive disorder, persistent depressive disorder)
 - bipolar (bipolar I/II disorder, cyclothymia)
 - secondary to GMC, substances, medications

Medical Workup of Mood Disorder

- **routine screening:** physical exam, CBC, thyroid function test, electrolytes, extended electrolytes, urinalysis, drug screen
- **additional screening:** neurological consultation, chest x-ray, ECG, CT

Mood Episodes

DSM-5 Criteria for Major Depressive Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. ≥ 5 of the following symptoms have been present during the same 2-wk period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure (anhedonia)
 - **Note:** Do not include symptoms that are clearly attributable to another medical condition
 - depressed mood most of the day, nearly every day, as indicated by either subjective report or observation made by others

Criteria for Depression (≥ 5)

MSIGECAPS

Mood: depressed
 Sleep: increased/decreased
 Interest: decreased
 Guilt
 Energy: decreased
 Concentration: decreased
 Appetite: increased/decreased
 Psychomotor: agitation/retardation
 Suicidal ideation

- markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day
 - significant and unintentional weight loss/weight gain, or decrease/increase in appetite nearly every day
 - insomnia or hypersomnia nearly every day
 - psychomotor agitation or retardation nearly every day
 - fatigue or loss of energy nearly every day
 - feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
 - diminished ability to think or concentrate, or indecisiveness, nearly every day
 - recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide
- B. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- C. the episode is not attributable to the direct physiological effects of a substance or a GMC

DSM-5 Criteria for Manic Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. a distinct period of abnormally and persistently elevated, expansive, or irritable mood and abnormally and persistently increased goal-directed activity or energy, lasting ≥ 1 wk and present most of the day, nearly every day (or any duration if hospitalization is necessary)
- B. during the period of mood disturbance and increased energy or activity, ≥ 3 of the following symptoms have persisted (4 if the mood is only irritable) and have been present to a significant degree and represent a noticeable change from usual behavior:
- inflated self-esteem or grandiosity
 - decreased need for sleep (e.g. feels rested after only 3 h of sleep)
 - more talkative than usual or pressure to keep talking
 - flight of ideas or subjective experience that thoughts are racing
 - distractibility (i.e. attention too easily drawn to unimportant or irrelevant external stimuli)
 - increase in goal-directed activity (either socially, at work or school, or sexually) or psychomotor agitation
 - excessive involvement in pleasurable activities that have a high potential for painful consequences (e.g. engaging in unrestrained shopping sprees, sexual indiscretions, or foolish business investments)
- C. the mood disturbance is sufficiently severe to cause marked impairment in social or occupational functioning or to necessitate hospitalization to prevent harm to self or others, or there are psychotic features
- D. the episode is not attributable to the physiological effects of a substance or another medical condition

Note: A full manic episode that emerges during antidepressant treatment but persists at a fully syndromal level beyond the physiological effect of that treatment is sufficient evidence for a manic episode, and therefore, a bipolar I diagnosis

Note: Criteria A-D constitute a manic episode. At least one lifetime manic episode is required for the diagnosis of bipolar I disorder

Criteria for Mania (≥ 3)

GST PAID

Grandiosity
 Sleep (decreased need)
 Talkative
 Pleasurable activities, Painful consequences
 Activity
 Ideas (flight of)
 Distractible

Hypomanic Episode

- criterion A and B of a manic episode is met, but duration is ≥ 4 d
- episode associated with an uncharacteristic change in functioning that is observable by others
- change in function is not severe enough to cause marked impairment in social or occupational functioning or to necessitate hospitalization
- absence of psychotic features

Depressive Disorders

MAJOR DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Major Depressive Disorder (MDD), Single Episode (vs. Recurrent)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. presence of a single MDE (vs. recurrent, which requires presence of two or more MDEs; to be considered separate episodes, there must be an interval of at least 2 consecutive mo in which criteria are not met for a MDE)
- B. the MDE is not better accounted for by schizoaffective disorder and is not superimposed on schizophrenia, schizophreniform disorder, delusional disorder, or psychotic disorder NOS
- C. there has never been a manic episode or a hypomanic episode

- **Note:** this exclusion does not apply if all of the manic-like, or hypomanic-like episodes are substance or treatment-induced or are due to the direct physiological effects of another medical condition
- **specifiers:** with anxious distress, mixed features, melancholic features, atypical features, mood-congruent psychotic features, mood-incongruent psychotic features, catatonia, peripartum onset, seasonal pattern

Epidemiology

- prevalence: 12.2%
 - lifetime prevalence: male 2.9%, female 5%
 - annual prevalence: peak prevalence age 15-25 yr (M:F = 1:2)

Etiology

- biological
 - genetic: 65-75% MZ twins; 14-19% DZ twins
 - neurotransmitter dysfunction: decreased activity of 5HT, NE, and DA at the level of the synapse; changes in GABA and glutamate; changes in brain circuitry
 - neuroendocrine dysfunction: increased production of corticotropins causing excessive HPA axis activity
 - neuroanatomy: smaller frontal lobes and hippocampal volume; increased ventricle sizes
 - neurophysiologic: decreased REM latency and slow-wave sleep; increased REM length
 - secondary to another medical condition
- psychosocial
 - psychodynamic (e.g. low self-esteem)
 - cognitive (e.g. negative thinking)
 - environmental factors (e.g. job loss, bereavement, history of abuse, early life adversity)
 - comorbid psychiatric diagnoses (e.g. anxiety, substance abuse, developmental disability, dementia, eating disorder)

Risk Factors

- sex: F>M
- age: onset between 25-50 yr of age
- family history: depression, alcohol abuse, sociopathy
- childhood experiences: loss of parent before age 11, negative home environment (abuse, neglect)
- personality: insecure, dependent, obsessional
- recent stressors: illness, financial, legal
- postpartum <6 mo
- lack of intimate, confiding relationships or social isolation

Treatment

- biological: antidepressants primarily; could also consider lithium, antipsychotics, anxiolytics, light therapy, ECT, rTMS
- psychological
 - individual therapy (psychodynamic, interpersonal, CBT), family therapy, group therapy
- social: vocational rehabilitation, social skills training
- experimental: MST, deep brain stimulation, vagal nerve stimulation
- studies suggest CBT with pharmacotherapy results in better outcomes

Prognosis

- one year after diagnosis of a MDE without treatment: 40% of individuals still have symptoms that are sufficiently severe to meet criteria for a full MDE, 20% continue to have some symptoms that no longer meet criteria for a MDE, 40% have no mood disorder

PERSISTENT DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Persistent Depressive Disorder

Note: in DSM-IV-TR this was referred to as Dysthymia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- depressed mood for most of the day, for more days than not, as indicated either by subjective account or observation by others, for ≥ 2 yr
Note: In children and adolescents, mood can be irritable and duration must be at least 1 yr
- presence, while depressed, of ≥ 2 of the following
 - poor appetite or overeating
 - insomnia or hypersomnia
 - low energy or fatigue
 - low self-esteem
 - poor concentration or difficulty making decisions
 - feelings of hopelessness

Antidepressants for Depression in Medical Illness

Cochrane DB Syst Rev 2010; Issue 3

This systematic review and meta-analysis of 51 RCTs (3,603 patients) compared antidepressants to placebo in patients with a physical disorder (e.g. cancer, MI) who have been diagnosed as depressed (including major depression, adjustment disorder, and dysthymia).

Conclusions: Antidepressants, including SSRIs and TCAs, cause a significant improvement in patients with a physical illness, as compared to placebo.

- C. during the 2 yr period (1 yr for children or adolescents) of the disturbance, the person has never been without the symptoms in criteria A and B for more than 2 mo at a time
- D. criteria for a major depressive disorder may be continuously present for 2 yr
- E. there has never been a manic episode or a hypomanic episode, and criteria have never been met for cyclothymic disorder
- F. the disturbance is not better explained by a persistent schizoaffective disorder, schizophrenia, delusional disorder, or other specified or unspecified schizophrenia spectrum and other psychotic disorder
- G. the symptoms are not due to the direct physiological effects of a substance or another medical condition
- H. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Epidemiology

- point prevalence: 3%; life prevalence: 6%; M:F = 1:2-3

Treatment

- psychological
 - principal treatment for persistent depressive disorder
 - individual, group, and family therapy
- biological
 - antidepressant therapy (SSRIs/SNRIs) as an outpatient

Bipolar Disorders

BIPOLAR I / BIPOLAR II DISORDER**Definition**

- Bipolar I Disorder
 - disorder in which at least one manic episode has occurred
 - commonly accompanied by at least 1 MDE but not required for diagnosis
- Bipolar II Disorder
 - disorder in which there is at least 1 MDE and at least 1 hypomanic episode
 - no past manic or mixed episodes

Epidemiology

- prevalence: 0.6-0.9%; M:F = 1:1
- age of onset: teens to 20s

Risk Factors

- high SES
- genetic: 60-65% of bipolar patients have family history of major mood disorders

Classification

- classification of bipolar disorder involves describing the current or most recent mood episode as either manic, hypomanic, or depressed. The same specifiers for MDD can be used

Treatment

- **biological:** lithium, anticonvulsants, antipsychotics, ECT; monotherapy with antidepressants should be avoided
- **psychological:** supportive or psychodynamic psychotherapy, CBT, IPT or interpersonal social rhythm therapy, family focused treatment
- **social:** vocational rehabilitation, consider leave of absence from school/work, assess capacity to manage finances, drug and EtOH cessation, sleep hygiene, social skills training, education for family members

Course and Prognosis

- high suicide rate (15% mortality from suicide)
- relapsing and remitting course with alternating manic and depressive episodes; depressive symptoms tend to occur more frequently and last longer than manic episodes
- patients spend almost half of their lives symptomatic
- may switch rapidly between depression and mania without any period of euthymia in between
- high recurrence rate for mania – 90% will have a subsequent episode in the next 5 yr

Patients with bipolar disorder are at higher risk for suicide when they switch from mania to depression, especially as they become aware of consequences of their behavior during the manic episode

Treatment of bipolar depression must be done extremely cautiously, as a switch from depression to mania can result; monotherapy with antidepressants should be avoided

CYCLOTHYMIA

Diagnosis

- presence of numerous periods of hypomanic and depressive symptoms (not meeting criteria for full hypomanic episode or MDE) for ≥ 2 yr; never without symptoms for >2 mo
- never have met criteria for MDE, manic or hypomanic episodes
- symptoms are not due to the direct physiological effects of a substance or GMC
- symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Treatment

- similar to Bipolar I: mood stabilizer \pm psychotherapy

Anxiety Disorders

Definition

- anxiety is a universal human characteristic involving tension, apprehension, or even terror
- serves as an adaptive mechanism to warn about an external threat by activating the sympathetic nervous system (fight or flight)
- manifestations of anxiety can be described through
 - physiology: main brain structure involved is the amygdala (fear conditioning); neurotransmitters involved include 5-HT, cholecystokinin, epinephrine, norepinephrine, DA
 - psychology: one's perception of a given situation is distorted which causes one to believe it is threatening in some way
 - behavior: once feeling threatened, one responds by escaping or facing the situation, thereby causing a disruption in daily functioning
- anxiety becomes pathological when
 - fear is greatly out of proportion to risk/severity of threat
 - response continues beyond existence of threat or becomes generalized to other similar or dissimilar situations
 - social or occupational functioning is impaired

Differential Diagnosis

Table 2. Differential Diagnosis of Anxiety Disorders

Cardiovascular	Post-MI, arrhythmia, congestive heart failure, pulmonary embolus, mitral valve prolapse
Respiratory	Asthma, COPD, pneumonia, hyperventilation
Endocrine	Hyperthyroidism, pheochromocytoma, hypoglycemia, hyperadrenalism, hyperparathyroidism
Metabolic	Vitamin B ₁₂ deficiency, porphyria
Neurologic	Neoplasm, vestibular dysfunction, encephalitis
Substance-Induced	Intoxication (caffeine, amphetamines, cocaine, thyroid preparations, OTC for colds/decongestants), withdrawal (benzodiazepines, alcohol)
Other Psychiatric Disorders	Psychotic disorders, mood disorders, personality disorders (OCPD), somatoform disorders

Medical Workup of Anxiety Disorder

- routine screening: physical exam, CBC, thyroid function test, electrolytes, urinalysis, urine drug screening
- additional screening: neurological consultation, chest x-ray, ECG, CT

Panic Disorder

DSM-5 Diagnostic Criteria for Panic Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. recurrent unexpected panic attacks; a panic attack is an abrupt surge of intense fear or intense discomfort that reaches a peak within minutes, and during which time four (or more) of the following symptoms occur
 - palpitations, pounding heart, or accelerated heart rate
 - sweating
 - trembling or shaking
 - sensations of shortness of breath or smothering
 - feelings of choking
 - chest pain or discomfort
 - nausea or abdominal distress

- feeling dizzy, unsteady, light-headed, or faint
 - chills or heat sensations
 - paresthesias (numbness or tingling sensations)
 - derealization (feelings of unreality) or depersonalization (being detached from oneself)
 - fear of losing control or “going crazy”
 - fear of dying
- B. at least one of the attacks has been followed by ≥ 1 mo of one or both of the following
- persistent concern or worry about additional panic attacks or their consequences
 - a significant maladaptive change in behavior related to the attacks
- C. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- D. the disturbance is not better explained by another mental disorder

Epidemiology

- prevalence: 2-5% (one of the top five most common reasons to see a family doctor); M:F = 1:2-3
- onset: average early-mid 20s, familial pattern

Treatment

- psychological
 - CBT: interoceptive exposure (eliciting symptoms of a panic attack and learning to tolerate the symptoms without coping strategies); cognitive restructuring (addressing underlying beliefs regarding the panic attacks), relaxation techniques (visualization, box-breathing)
- pharmacological
 - SSRIs: fluoxetine, citalopram, paroxetine, fluvoxamine, sertraline
 - SNRI: venlafaxine
 - with SSRI/SNRIs start with low doses, titrate up slowly
 - anxiety disorders often require treatment at higher doses for a longer period of time than depression (i.e. full response may take up to 12 wk)
 - to prevent non-compliance due to physical side effects, explain symptoms to expect prior to initiation of therapy
 - other antidepressants (TCAs, mirtazapine, MAOIs)
 - ♦ consider avoiding bupropion due to stimulating effects
 - benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn use)

Prognosis

- 6-10 yr post-treatment: 30% well, 40-50% improved, 20-30% no change or worse
- clinical course: chronic, but episodic with psychosocial stressors

Criteria for Panic Disorder (≥ 4)

STUDENTS FEAR the 3 Cs

Sweating

Trembling

Unsteadiness, dizziness

Depersonalization, Derealization

Excessive heart rate, palpitations

Nausea

Tingling

Shortness of breath

Fear of dying, losing control, going crazy

3 Cs: Chest pain, Chills, Choking

Panic Attack vs. Panic Disorder

Panic disorder consists of panic attacks + other criteria

Panic attack is not a codable disorder and can occur in the context of many different disorders

Starting Medication for Anxiety

Start low, go slow, aim high and explain symptoms to expect prior to initiation of therapy

Agoraphobia

DSM-5 Diagnostic Criteria for Agoraphobia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. marked fear or anxiety about two (or more) of the following five situations
- using public transportation
 - being in open spaces
 - being in enclosed places
 - standing in line or being in a crowd
 - being outside of the home alone
- B. the individual fears or avoids these situations because of thoughts that escape might be difficult or help might not be available in the event of developing panic-like symptoms or other incapacitating or embarrassing symptoms
- C. the agoraphobic situations almost always provoke fear or anxiety
- D. the agoraphobic situations are actively avoided, require the presence of a companion, or are endured with intense fear or anxiety
- E. the fear or anxiety is out of proportion to the actual danger posed by the agoraphobic situations and to the sociocultural context
- F. the fear, anxiety, or avoidance is persistent, typically lasting for ≥ 6 mo
- G. the fear, anxiety, or avoidance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
- H. if another medical condition is present, the fear, anxiety, or avoidance is clearly excessive
- I. the fear, anxiety, or avoidance is not better explained by the symptoms of another mental disorder and are not related exclusively to obsessions, perceived defects or flaws in physical appearance, reminders of traumatic events, or fear of separation
- Note:** agoraphobia is diagnosed irrespective of the presence of panic disorder. If an individual's presentation meets criteria for panic disorder and agoraphobia, both diagnoses should be assigned
- **treatment:** as per panic disorder

Generalized Anxiety Disorder

DSM-5 Diagnostic Criteria for Generalized Anxiety Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. excessive anxiety and worry (apprehensive expectation), occurring more days than not for at least 6 mo, about a number of events or activities (such as work or school performance)
- B. the individual finds it difficult to control the worry
- C. the anxiety and worry are associated with three (or more) of the following six symptoms (with at least some symptoms having been present for more days than not for the past 6 mo)
 - 1. restlessness or feeling keyed up or on edge
 - 2. being easily fatigued
 - 3. difficulty concentrating or mind going blank
 - 4. irritability
 - 5. muscle tension
 - 6. sleep disturbance (difficulty falling or staying asleep, or restless, unsatisfying sleep)
- D. the anxiety, worry, or physical symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- E. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- F. the disturbance is not better explained by another mental disorder

Criteria for GAD (≥ 3)

BE SKIM

Blank mind
Easily fatigued
Sleep disturbance
Keyed up
Irritability
Muscle tension

Epidemiology

- 1 yr prevalence: 3-8%; M:F = 1:2
 - if considering only those receiving inpatient treatment, ratio is 1:1
- most commonly presents in early adulthood

Treatment

- lifestyle: caffeine and EtOH avoidance, sleep hygiene
- psychological: CBT including relaxation techniques, mindfulness
- biological
 - SSRIs and SNRIs are 1st line (paroxetine, escitalopram, sertraline, venlafaxine XL)
 - 2nd line: bupropion (caution due to stimulating effects), buspirone (tid dosing)
 - add-on benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn)
 - β -blockers not recommended

Prognosis

- chronically anxious adults become less so with age
- depends on pre-morbid personality functioning, stability of relationships, work, and severity of environmental stress
- difficult to treat

Phobic Disorders

Specific Phobia

- definition: marked and persistent fear that is excessive or unreasonable, cued by presence or anticipation of a specific object or situation
- lifetime prevalence 12-16%; M:F ratio variable
- types: animal/insect, environment (heights, storms), blood/injection/injury, situational (airplane, closed spaces), other (loud noise, clowns)

Social Phobia (Social Anxiety Disorder)

- definition: marked and persistent fear of social or performance situations in which one is exposed to unfamiliar people or to possible scrutiny by others; fearing he/she will act in a way that may be humiliating or embarrassing (e.g. public speaking, initiating or maintaining conversation, dating, eating in public)
- 12 mo prevalence rate may be as high as 7%; F>M

Diagnostic Criteria for Phobic Disorders

- exposure to stimulus almost invariably provokes an immediate anxiety response; may present as a panic attack
- person recognizes fear as excessive or unreasonable
- situations are avoided or endured with anxiety/distress
- significant interference with daily routine, occupational/social functioning, and/or marked distress

Treatment

- psychological
 - cognitive behavior therapy (focusing on both *in vivo* and virtual exposure therapy, gradually facing feared situations)
 - behavioral therapy is more efficacious than medication
- biological
 - SSRIs/SNRIs
 - β -blockers or benzodiazepines in acute situations (e.g. public speaking)

Prognosis

- chronic

Obsessive-Compulsive Disorder

DSM-5 Diagnostic Criteria for Obsessive-Compulsive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. presence of obsessions, compulsions, or both
- obsessions are defined by (1) and (2)
 1. recurrent and persistent thoughts, urges, or images that are experienced, at some time during the disturbance, as intrusive and unwanted, and that in most individuals cause marked anxiety or distress
 2. the individual attempts to ignore or suppress such thoughts, urges, or images, or to neutralize them with some other thought or action (i.e. by performing a compulsion)
 - compulsions are defined by (1) and (2)
 1. repetitive behaviors (e.g. hand washing, ordering, checking) or mental acts (e.g. praying, counting, repeating words silently) that the individual feels driven to perform in response to an obsession or according to rules that must be applied rigidly
 2. the behaviors or mental acts are aimed at preventing or reducing anxiety or distress, or preventing some dreaded event or situation; however, these behaviors or mental acts are not connected in a realistic way with what they are designed to neutralize or prevent, or are clearly excessive
- B. the obsessions or compulsions are time-consuming (e.g. take >1 h/d) or cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- C. the obsessive-compulsive symptoms are not attributable to the physiological effects
- D. the disturbance is not better explained by the symptoms of another mental disorder

Epidemiology

- 12 mo prevalence 1.1-1.8%; females affected at slightly higher rates than males
- rate of OCD in first-degree relatives is higher than in the general population

Treatment

- CBT: exposure with response prevention (ERP) – involves exposure to feared situations with the addition of preventing the compulsive behaviors; cognitive strategies include challenging underlying beliefs
- pharmacotherapy: SSRIs/SNRIs, clomipramine; adjunctive risperidone

Prognosis

- tends to be refractory and chronic

Trauma- and Stressor-Related Disorders

Post-Traumatic Stress Disorder

DSM-5 Diagnostic Criteria for Post-Traumatic Stress Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. exposure to actual or threatened death, serious injury, or sexual violence in one (or more) of the following ways
1. directly experiencing the traumatic event(s)
 2. witnessing, in person, the event(s) as it occurred to others
 3. learning that the traumatic event(s) occurred to a close family member or close friend. In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental
 4. experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g. first responders collecting human remains; police officers repeatedly exposed to details of child abuse)

**Acute Stress Disorder**

- May be a precursor to PTSD
- Similar symptoms to PTSD
- Symptoms persist 3 d after a trauma until 1 mo after the exposure

- B. presence of one (or more) of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred
1. recurrent, involuntary, and intrusive distressing memories of the traumatic event(s)
 2. recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s)
 3. dissociative reactions (e.g. flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring
 4. intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
 5. marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
- C. persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following
1. avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
 2. avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
- D. negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. inability to remember an important aspect of the traumatic event(s)
 2. persistent and exaggerated negative beliefs or expectations about oneself, others, or the world
 3. persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others
 4. persistent negative emotional state (e.g. fear, horror, anger, guilt, or shame)
 5. markedly diminished interest or participation in significant activities
 6. feelings of detachment or estrangement from others
 7. persistent inability to experience positive emotions
- E. marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. irritable behavior and angry outbursts (with little or no provocation) typically expressed as verbal or physical aggression toward people or objects
 2. reckless or self-destructive behavior
 3. hypervigilance
 4. exaggerated startle response
 5. problems with concentration
 6. sleep disturbance (e.g. difficulty falling or staying asleep or restless sleep)
- F. duration of the disturbance (criteria B, C, D, and E) is >1 mo
- G. the disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
- H. the disturbance is not attributable to the physiological effects of a substance or another medical condition

**Criteria for Post-Traumatic Stress Disorder****TRAUMA**

Traumatic event

Re-experience the event

Avoidance of stimuli associated with the trauma

Unable to function

More than a Month

Arousal increased

+ negative alterations in cognition and mood

Epidemiology

- lifetime prevalence (DSM-IV criteria): 8.7%
- men's trauma is most commonly combat experience/physical assault; women's trauma is usually physical or sexual assault

Treatment

- CBT: exposure therapy, challenge dysfunctional beliefs, emotional regulation techniques (e.g. breathing, relaxation)
- biological
 - SSRIs
 - benzodiazepines (for acute anxiety)
 - adjunctive atypical antipsychotics (risperidone, olanzapine)
- Eye Movement Desensitization and Reprocessing (EMDR): an experimental method of reprocessing memories of distressing events by recounting them while using a form of dual attention stimulation such as eye movements, bilateral sound, or bilateral tactile stimulation (its use is controversial because of limited evidence)

Complications

- substance abuse, relationship difficulties, depression, impaired social and occupational functioning disorders, personality disorders

Adjustment Disorder

DSM-5 Diagnostic Criteria for Adjustment Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. the development of emotional or behavioral symptoms in response to an identifiable stressor(s) occurring within 3 mo of the onset of the stressor(s)
- B. these symptoms or behaviors are clinically significant as evidenced by either of the following:
 - marked distress that is in excess of what would be expected from exposure to the stressor
 - significant impairment in social or occupational (academic) functioning
- C. the stress-related disturbance does not meet criteria for another mental disorder and is not merely an exacerbation of a pre-existing mental disorder
- D. the symptoms do not represent normal bereavement
- E. once the stressor (or its consequences) has terminated, the symptoms do not persist for more than an additional 6 mo
- **specifiers:** with depressed mood, with anxiety, with mixed anxiety/depression, with conduct disturbance, with mixed disturbance of conduct/emotions, unspecified

Classification

- types of stressors
 - single (e.g. termination of romantic relationship)
 - multiple (e.g. marked business difficulties and marital problems)
 - recurrent (e.g. seasonal business crises)
 - continuous (e.g. living in a crime-ridden neighborhood)
 - developmental events (e.g. going to school, leaving parental home, getting married, becoming a parent, failing to attain occupational goals, retirement)

Epidemiology

- M=F

Treatment

- brief psychotherapy (group, individual), crisis intervention
- biological
 - benzodiazepines may be used for those with anxiety symptoms (short-term, low-dose, regular schedule)
 - SSRIs for both depression and anxiety symptoms

Bereavement

Clinical Presentation

- length and characteristics of “normal” bereavement are variable between individuals/cultures
- may present with symptoms of MDE/MDD but individual regards depressed mood as normal
- presence of following symptoms may indicate abnormal grief/presence of MDD
 - guilt about things other than actions taken or not taken by the survivor at the time of death
 - thoughts of death other than the survivor feeling that they would be better off dead or should have died with the deceased person; morbid preoccupation with worthlessness
 - marked psychomotor retardation; prolonged and marked functional impairment
 - hallucinatory experiences other than thinking that the survivor hears the voice of or transiently sees the image of the deceased person
- after 12 mo, if patient continues to yearn/long for the deceased, experience intense sorrow/emotional pain in response to the death, remain preoccupied with the deceased or with their circumstance of death, then may start to consider a diagnosis of “persistent complex bereavement disorder”

Risk Factors for Poor Bereavement Outcome

- Poor social supports
- Unanticipated death or lack of preparation for death
- Highly dependent relationship with deceased
- High initial distress
- Other concurrent stresses and losses
- Death of a child
- Pre-existing psychiatric disorders, especially depression and separation anxiety

Neurocognitive Disorders

Delirium

- see [Neurology](#), N19 and [Geriatric Medicine](#), GM3

DSM-5 Diagnostic Criteria for Delirium

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- a disturbance in attention (i.e. reduced ability to direct, focus, sustain, and shift attention) and awareness (reduced orientation to the environment)
- the disturbance develops over a short period of time (usually hours to a few days), represents a change from baseline attention and awareness, and tends to fluctuate in severity during the course of a day
- an additional disturbance in cognition (e.g. memory deficit, disorientation, language, visuospatial ability, or perception)
- the disturbances in criteria A and C are not better explained by another preexisting, established, or evolving neurocognitive disorder and do not occur in the context of a severely reduced level of arousal, such as coma
- there is evidence from the history, physical exam, or laboratory findings that the disturbance is a direct physiological consequence of another medical condition, substance intoxication or withdrawal (i.e. due to a drug of abuse or to a medication), or exposure to a toxin, or is due to multiple etiologies

Clinical Presentation and Assessment

- common symptoms
 - wandering attention
 - distractibility
 - disorientation (time, place, rarely person)
 - misinterpretations, illusions, hallucinations
 - speech/language disturbances (dysarthria, dysnomia, dysgraphia)
 - affective symptoms (anxiety, fear, depression, irritability, anger, euphoria, apathy)
 - shifts in psychomotor activity (groping/picking at clothes, attempts to get out of bed when unsafe, sudden movements, sluggishness, lethargy)
- Folstein Mini Mental Status Exam is helpful to assess baseline of altered mental state (i.e. score will improve as symptoms resolve)

Risk Factors

- hospitalization (incidence 10-56%)
- nursing home residents (incidence 60%)
- polypharmacy (e.g. anticholinergic)
- childhood (e.g. febrile illness, anticholinergic use)
- old age (especially males)
- severe illness (e.g. cancer, AIDS)
- pre-existing cognitive impairment or brain pathology
- recent anesthesia
- substance abuse

Etiology (I WATCH DEATH)

- Infectious (encephalitis, meningitis, UTI, pneumonia)
- Withdrawal (alcohol, barbiturates, benzodiazepines)
- Acute metabolic disorder (electrolyte imbalance, hepatic or renal failure)
- Trauma (head injury, post-operative)
- CNS pathology (stroke, hemorrhage, tumor, seizure disorder, Parkinson's)
- Hypoxia (anemia, cardiac failure, pulmonary embolus)
- Deficiencies (vitamin B₁₂, folic acid, thiamine)
- Endocrinopathies (thyroid, glucose, parathyroid, adrenal)
- Acute vascular (shock, vasculitis, hypertensive encephalopathy)
- Toxins: substance use, sedatives, opioids (especially morphine), anesthetics, anticholinergics, anticonvulsants, dopaminergic agents, steroids, insulin, glyburide, antibiotics (especially quinolones), NSAIDs
- Heavy metals (arsenic, lead, mercury)

Investigations

- standard: CBC and differential, electrolytes, Ca²⁺, PO₄³⁻, Mg²⁺, glucose, ESR, LFTs, Cr, BUN, TSH, vitamin B₁₂, folate, albumin, urine C&S, R&M
- as indicated: ECG, CXR, CT head, toxicology/heavy metal screen, VDRL, HIV, LP, EEG (typically abnormal: generalized slowing or fast activity), blood cultures
- indications for CT head: focal neurological deficit, acute change in status, anticoagulant use, acute incontinence, gait abnormality, history of cancer

Management

- intrinsic
 - identify and treat underlying cause immediately
 - stop all non-essential medications
 - maintain nutrition, hydration, electrolyte balance and monitor vitals
- extrinsic
 - environment should be quiet and well lit
 - optimize hearing and vision
 - room near nursing station for closer observation; constant care if patient jumping out of bed, pulling out lines
 - family member present for reassurance and re-orientation
 - calendar, clock for orientation cues
- biological
 - low dose antipsychotics
 - haloperidol has the most evidence; reasonable alternatives include risperidone, olanzapine, or quetiapine
 - benzodiazepines only to be used in alcohol withdrawal delirium; otherwise, can worsen delirium
- physical restraints if patient becomes violent

Prognosis

- up to 50% 1 yr mortality rate after episode of delirium

Major Neurocognitive Disorder/Dementia

- see [Neurology, N19](#)

DSM-5 Diagnostic Criteria for Major Neurocognitive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- evidence of significant cognitive decline from a previous level of performance in one or more cognitive domains (complex attention, executive function, learning and memory, language, perceptual-motor, or social cognition) based on
 - concern of the individual, a knowledgeable informant, or the clinician that there has been a significant decline in cognitive function; *and*
 - a substantial impairment in cognitive performance, preferably documented by standardized neuropsychological testing or, in its absence, another quantified clinical assessment
 - the cognitive deficits interfere with independence in everyday activities (i.e. at a minimum, requiring assistance with complex instrumental activities of daily living such as paying bills or managing medications)
 - the cognitive deficits do not occur exclusively in the context of a delirium
 - the cognitive deficits are not better explained by another mental disorder (e.g. major depressive disorder, schizophrenia)
- **specify** whether due to

Alzheimer's disease	Traumatic brain injury	Huntington's disease
Frontotemporal lobar degeneration	Substance/medication use	Another medical condition
Lewy body disease	HIV infection	Multiple etiologies
Vascular disease	Prion disease	Unspecified
	Parkinson's disease	

Epidemiology

- prevalence increases with age: 10% in patients >65 yr of age; 25% in patients >85 yr of age
- prevalence is increased in people with Down's syndrome and head trauma
- Alzheimer's disease comprises >50% of cases; vascular causes comprise approximately 15% of cases (other causes of dementia neurocognitive disorder – see [Neurology, N19](#))
- average duration of illness from onset of symptoms to death is 8-10 yr

Subtypes

- with or without behavioral disturbance (e.g. wandering, agitation)
- early onset: age of onset <65 yr
- late onset: age of onset >65 yr

Investigations (Rule Out Reversible Causes)

- standard: see *Delirium*
- as indicated: VDRL, HIV, SPECT, CT head in dementia

Most Common Types of Dementia

- Alzheimer's dementia
- Vascular dementia
- Lewy body dementia
- Fronto-temporal dementia

The 4 As of Dementia

Amnesia
Aphasia
Apraxia
Agnosia

- indications for CT head: same as for delirium, plus: age <60, rapid onset (unexplained decline in cognition or function over 1-2 mo), dementia of relatively short duration (<2 yr), recent significant head trauma, unexplained neurological symptoms (new onset of severe headache/seizures)

Management

- see [Neurology, N22](#) for further management
- treat underlying medical problems and prevent others
- provide orientation cues for patient (e.g. clock, calendar)
- provide education and support for patient and family (e.g. day programs, respite care, support groups, home care)
- consider long-term care plan (nursing home) and power of attorney/living will
- inform Ministry of Transportation about patient's inability to drive safely
- consider pharmacological therapy
 - cholinesterase inhibitors (e.g. donepezil [Aricept®]) for mild to severe disease
 - NMDA receptor antagonist (e.g. memantine) for moderate to severe disease
 - low-dose neuroleptics (e.g. risperidone, quetiapine), antidepressants or trazodone if behavioral or emotional symptoms prominent – start low and go slow
 - reassess pharmacological therapy every 3 mo

Table 3. Comparison of Dementia, Delirium, and Pseudodementia of Depression

	Dementia/Major Neurocognitive Disorder	Delirium	Pseudodementia of Depression
Onset	Gradual/step-wise decline	Acute (h-d)	Subacute
Duration	Months-years	Days-weeks	Variable
Natural History	Progressive Usually irreversible	Fluctuating, reversible High morbidity/mortality in very old	Recurrent Usually reversible
Level of Consciousness	Normal	Fluctuating (over 24 h)	Normal
Attention	Not initially affected	Decreased (wandering, easy distraction)	Difficulty concentrating
Orientation	Intact initially	Impaired (usually to time and place), fluctuates	Intact
Behavior	Disinhibition, impairment in ADL/IADL, personality change, loss of social graces	Severe agitation/retardation	Importuning, self-harm/suicide
Psychomotor	Normal	Fluctuates between extremes	Slowing
Sleep Wake Cycle	Fragmented sleep at night	Reversed sleep wake cycle	Early morning awakening
Mood and Affect	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
Cognition	Decreased executive functioning, paucity of thought	Fluctuating preceded by mood changes	Fluctuating
Memory Loss	Recent, eventually remote	Marked recent	Recent
Language	Agnosia, aphasia, decreased comprehension, repetition, speech (echolalia, palilalia)	Dysnomia, dysgraphia, speech rambling, irrelevant, incoherent, subject changes	Not affected
Delusions	Compensatory	Nightmarish and poorly formed	Nihilistic, somatic
Hallucinations	Variable	Visual common	Less common, auditory predominates
Quality of Hallucinations	Vacuous/bland	Frightening/bizarre	Self-deprecatory
Medical Status	Variable	Acute illness, drug toxicity	Rule out systemic illness, medications

Substance-Related and Addictive Disorders

Epidemiology

- 47% of those with substance abuse have mental health problems
- 29% of those with a mental health disorder have a substance use disorder
- 47% of those with schizophrenia and 25% of those with an anxiety disorder have a substance use disorder

Substance Use Disorders

- substance use disorders are measured on a continuum from mild to severe; 2-3 criteria is required for a mild substance use disorder diagnosis, 4-5 is moderate, and 6-7 is severe
- each specific substance can be addressed as a separate use disorder (e.g. alcohol use disorder, stimulant use disorder) and diagnosed utilizing the same overarching criteria
- criteria for substance use disorders
 - hazardous use

- social/interpersonal problems related to use
- neglected major roles to use
- withdrawal
- tolerance
- use large amounts/longer
- repeated attempts to quit/control use
- use for longer duration/larger amount than intended
- physical/psychological problems related to use
- activities given up to use
- cravings

Classification of Substances

Depressants	Alcohol, Opioids, Barbiturates, Benzodiazepines, GHB
Stimulants	Amphetamines, Methylphenidate, Cocaine
Hallucinogens	Cannabis, LSD, PCP, Ketamine, Psilocybin

Nicotine

- see [Family Medicine](#), FM10

Alcohol

- see [Family Medicine](#), FM12 and [Emergency Medicine](#), ER53

History

- CAGE: validated screening questionnaire
 - C ever felt the need to Cut down on drinking?
 - A ever felt Annoyed at criticism of your drinking?
 - G ever feel Guilty about your drinking?
 - E ever need a drink first thing in morning (Eye opener)?
 - for men, a score of ≥ 2 is a positive screen; for women, a score of ≥ 1 is a positive screen
 - if positive CAGE, then assess further to distinguish between problem drinking and alcohol dependence

General Assessment

- When was your last drink?
- Do you have to drink more to get the same effect?
- Do you get shaky or nauseous when you stop drinking?
- Have you ever had a withdrawal seizure?
- How much time and effort do you put into obtaining alcohol?
- Has your drinking affected your ability to work, go to school, or have relationships?
- Have you suffered any legal consequences?
- Has your drinking caused any medical problems?

Table 4. Canada's Low-Risk Alcohol Drinking Guidelines

Moderate Drinking		
Men: 3 or less/d (≤ 15 /wk)	Women: 2 or less/d (≤ 10 /wk)	Elderly: 1 or less/d

Alcohol Intoxication

- legal limit for impaired driving is 10.6 mmol/L (50 mg/dL) reached by 2-3 drinks/h for men and 1-2 drinks/h for women
- coma can occur with >60 mmol/L (non-tolerant drinkers) and 90-120 mmol/L (tolerant drinkers)

Alcohol Withdrawal

- occurs within 12-48 h after prolonged heavy drinking and can be life-threatening
- alcohol withdrawal can be described as having 4 stages, however not all stages may be experienced
 - stage 1 (onset 12-18 h after last drink): "the shakes" tremor, sweating, agitation, anorexia, cramps, diarrhea, sleep disturbance
 - stage 2 (onset 7-38 h): alcohol withdrawal seizures, usually tonic-clonic, nonfocal and brief
 - stage 3 (onset 48 h): visual, auditory, olfactory or tactile hallucinations
 - stage 4 (onset 3-5 d): delirium tremens, confusion, delusions, hallucinations, agitation, tremors, autonomic hyperactivity (fever, tachycardia, HTN)
- course: almost completely reversible in young; elderly often left with cognitive deficits
- mortality rate 20% if untreated

Make sure to ask about other alcohols: mouthwash, rubbing alcohol, methanol, ethylene glycol, aftershave (may be used as a cheaper alternative)

A "Standard Drink"

Spirit (40%): 1.5 oz. or 43 mL
 Table Wine (12%): 5 oz. or 142 mL
 Fortified Wine (18%): 3 oz. or 85 mL
 Regular Beer (5%): 12 oz. or 341 mL

OR

1 pint of beer = 1.5 SD
 1 bottle of wine = 5 SD
 1 "mickey" = 8 SD
 "26-er" = 17 SD
 "40 oz." = 27 SD

Delirium Tremens (Alcohol Withdrawal Delirium)

- Autonomic hyperactivity (diaphoresis, tachycardia, increased respiration)
- Hand tremor
- Insomnia
- Psychomotor agitation
- Anxiety
- Nausea or vomiting
- Tonic-clonic seizures
- Visual/tactile/auditory hallucinations
- Persecutory delusions

Management of Alcohol Withdrawal

- monitor using the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-A) scoring system
 - areas of assessment include
 - ♦ nausea and vomiting
 - ♦ tactile disturbances
 - ♦ tremor
 - ♦ auditory disturbances
 - ♦ agitation
 - ♦ paroxysmal sweats
 - ♦ visual disturbances
 - ♦ anxiety
 - ♦ headache, fullness in head
 - ♦ orientation and clouding of sensorium
 - all categories are scored from 0-7 (except: orientation/sensorium 0-4), maximum score of 67
 - ♦ mild <10
 - ♦ moderate 10-20
 - ♦ severe >20

Table 5. CIWA-A Scale Treatment Protocol for Alcohol Withdrawal

Basic Protocol	Diazepam 20 mg PO q1-2h prn until CIWA-A <10 points Observe 1-2 h after last dose and re-assess on CIWA-A scale Thiamine 100 mg IM then 100 mg PO OD for 3 d Supportive care (hydration and nutrition)
History of Withdrawal Seizures	Diazepam 20 mg PO q1h for minimum of three doses regardless of subsequent CIWA scores
If age >65 or patient has severe liver disease, severe asthma or respiratory failure	Use a short acting benzodiazepine Lorazepam PO/SL/IM 1-4 mg q1-2h
If Hallucinations are present	Haloperidol 2-5 mg IM/PO q1-4h – max 5 doses/d or atypical antipsychotics (olanzapine, risperidone) Diazepam 20 mg x 3 doses as seizure prophylaxis (haloperidol lowers seizure threshold)
Admit to Hospital if	Still in withdrawal after >80 mg of diazepam Delirium tremens, recurrent arrhythmias, or multiple seizures Medically ill or unsafe to discharge home

Wernicke-Korsakoff Syndrome

- alcohol-induced amnesic disorders due to thiamine deficiency
- necrotic lesions: mammillary bodies, thalamus, brainstem
- Wernicke's encephalopathy (acute and reversible): triad of nystagmus (CN VI palsy), ataxia, and confusion
- Korsakoff's syndrome (chronic and only 20% reversible with treatment): anterograde amnesia and confabulations; cannot occur during an acute delirium or dementia and must persist beyond usual duration of intoxication/withdrawal
- management
 - Wernicke's: thiamine 100 mg PO OD x 1-2 wk
 - Korsakoff's: thiamine 100 mg PO bid/tid x 3-12 mo

Treatment of Alcohol Use Disorder

- **non-pharmacological**
 - psychotherapy: motivational enhancement therapy (MET; increasing motivation to change), CBT (assertiveness training, increasing social support, planning leisure activities), marital and family therapy
 - behavior therapy: contingency management, community reinforcement approach (CRA)
 - supportive services: counseling, detoxification centers, Alcoholics Anonymous
 - inpatient programs (e.g. 28-day programs)
 - ♦ individual readiness for change must always be considered with non-pharmacological interventions (see Prochaska's Stages of Change Model, [Population Health and Epidemiology, PH6](#))
- **pharmacological**
 - naltrexone (Revia®): opioid antagonist, shown to be successful in reducing the "high" associated with alcohol, moderately effective in reducing cravings, frequency or intensity of alcohol binges
 - disulfiram (Antabuse®): blocks oxidation of alcohol (blocks acetaldehyde dehydrogenase); with alcohol consumption, acetaldehyde accumulates to cause a toxic reaction (vomiting, tachycardia, death); if patient relapses, must wait 48 h before restarting Antabuse®
 - acamprostate (Campral®): NMDA glutamate receptor antagonist; useful in maintaining abstinence and decreasing cravings

Opioids

- types of opioids: heroin, morphine, oxycodone, Tylenol #3* (codeine), hydromorphone
- major risks associated with the use of contaminated needles: increased risk of hepatitis B and C, bacterial endocarditis, HIV/AIDS

Acute Intoxication

- direct effect on receptors in CNS resulting in decreased pain perception, sedation, decreased sex drive, nausea/vomiting, decreased GI motility (constipation and anorexia), and respiratory depression

Toxic Reaction

- typical syndrome includes shallow respirations, miosis, bradycardia, hypothermia, decreased level of consciousness
- management
 - ABCs
 - IV glucose
 - naloxone hydrochloride (Narcan®): 0.4 mg up to 2 mg IV for diagnosis
 - treatment: intubation and mechanical ventilation, ± naloxone drip, until patient alert without naloxone (>48 h with long-acting opioids)
- caution with longer half-life; may need to observe for toxic reaction for at least 24 h

Withdrawal

- symptoms: depression, insomnia, drug-craving, myalgias, nausea, chills, autonomic instability (lacrimation, rhinorrhea, piloerection)
- onset: 6-12 h; duration: 5-10 d
- complications: loss of tolerance (overdose on relapse), miscarriage, premature labor
- management: long-acting oral opioids (methadone, buprenorphine), α-adrenergic agonists (clonidine)

Treatment of Opioid Use Disorder

- psychosocial treatment (e.g. Narcotics Anonymous) usually emphasize total abstinence
- naltrexone or naloxone (opioid antagonists) may also be used to extinguish drug-seeking behavior
- long-term treatment may include withdrawal maintenance treatment with methadone or buprenorphine
- Suboxone® formulation includes naloxone in addition to buprenorphine, in an effort to prevent injection of the drug. When naloxone is injected, it will precipitate opiate withdrawal and block the opiate effect of buprenorphine, however it will not have this antagonist action when taken sublingually

Opioid Antagonists: Naltrexone vs. Naloxone

Naltrexone (Revia®)

- Used for opioid and EtOH dependence
- Long half life (h)

Naloxone (Narcan®):

- Used for life-threatening CNS/respiratory depression in opioid overdose
- Short half life (<1 h)
- Very fast acting (min)
- High affinity for opioid receptor
- Induces opioid withdrawal symptoms

Cocaine

- street names: blow, C, coke, crack, flake, freebase, rock, snow
- alkaloid extracted from leaves of the coca plant; blocks presynaptic uptake of dopamine (causing euphoria), norepinephrine and epinephrine (causing vasospasm, HTN)
- self-administered by inhalation or intravenous route

Intoxication

- elation, euphoria, pressured speech, restlessness, sympathetic stimulation (e.g. tachycardia, mydriasis, sweating)
- prolonged use may result in paranoia and psychosis

Overdose

- medical emergency: HTN, tachycardia, tonic-clonic seizures, dyspnea, and ventricular arrhythmias
- treatment with IV diazepam to control seizures and propranolol or labetalol to manage HTN and arrhythmias

Withdrawal

- initial "crash" (1-48 h): increased sleep, increased appetite
- withdrawal (1-10 wk): dysphoric mood plus fatigue, irritability, vivid unpleasant dreams, insomnia or hypersomnia, psychomotor agitation or retardation
- complications: relapse, suicide (significant increase in suicide during withdrawal period)
- management: supportive management

Treatment of Cocaine Use Disorder

- psychotherapy, group therapy, NA, and behavior modification useful in maintaining abstinence

Common Presentations of Drug Use

System	Findings
General	Weight loss (especially cocaine, heroin) Injected conjunctiva (cannabis) Pinpoint pupils (opioids) Track marks (injection drugs)
MSK	Trauma
GI	Viral hepatitis (injection drugs) Unexplained elevations in ALT (injection drugs)
Behavioral	Missed appointments Non-compliance Drug-seeking (especially benzodiazepines, opioids)
Psychological	Insomnia Fatigue Depression Flat affect (benzodiazepines, barbiturates) Paranoia (cocaine) Psychosis (cocaine, cannabis, hallucinogens)
Social	Marital discord Family violence Work/school Absenteeism and poor performance

Complications

- cardiovascular: arrhythmias, MI, CVA, ruptured AAA
- neurologic: seizures
- psychiatric: psychosis, paranoia, delirium, suicidal ideation

Amphetamines

- intoxication characterized by euphoria, improved concentration, sympathetic and behavioral hyperactivity and at high doses can cause coma
- chronic use can produce a paranoid psychosis which can resemble schizophrenia with agitation, paranoia, delusions and hallucinations
- withdrawal symptoms include dysphoria, fatigue, and restlessness
- treatment of stimulant psychosis: antipsychotics

Cannabis

- cannabis (marijuana) is the most commonly used illicit drug
- psychoactive substance: delta-9-tetrahydrocannabinol (Δ^9 -THC)
- intoxication characterized by tachycardia, conjunctival vascular engorgement, dry mouth, altered sensorium, increased appetite, increased sense of well-being, euphoria/laughter, muscle relaxation, impaired performance on psychomotor tasks including driving
- high doses can cause depersonalization, paranoia, anxiety and may trigger psychosis and schizophrenia if predisposed
- chronic use associated with tolerance and an apathetic, amotivational state
- cessation does produce a significant withdrawal phenomenon
- treatment of cannabis use disorder: behavioral and psychological interventions to maintain an abstinent state

Hallucinogens

- types of hallucinogens: LSD, mescaline, psilocybin mushrooms, PCP, salvia
- LSD is a highly potent drug; intoxication characterized by tachycardia, HTN, mydriasis, tremor, hyperpyrexia, and a variety of perceptual and mood changes
- high doses can cause depersonalization, paranoia, and anxiety
- no specific withdrawal syndrome characterized
- treatment of agitation and psychosis: support, reassurance, diminished stimulation; benzodiazepines or high potency antipsychotics seldom required

“Club Drugs”

Table 6. The Mechanism and Effects of Common “Club Drugs”

Drug	Mechanism	Effect	Adverse Effects
MDMA (“Ecstasy”, “X”, “E”)	Acts on serotonergic and dopaminergic pathways, properties of a hallucinogen and stimulant	Enhanced sensorium; feelings of well-being, empathy	Sweating, tachycardia fatigue, muscle spasms (especially jaw clenching), ataxia, hyperthermia, arrhythmias, DIC, rhabdomyolysis, renal failure, seizures, death
Gamma Hydroxybutyrate (GHB, “G”, “Liquid Ecstasy”)	Biphasic dopamine response (inhibition then release) and releases opiate-like substance	Euphoric effects, increased aggression, impaired judgment	Sweating, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, severe withdrawal from abrupt cessation of high doses: tremor, seizures, psychosis
Flunitrazepam (Rohypnol®, “Roofies”, “Rope”, “The Forget Pill”)	Potent benzodiazepine, rapid oral absorption	Sedation, psychomotor impairment, amnesic effects, decreased sexual inhibition	CNS depression with EtOH
Ketamine (“Special K”, “Kit-Kat”)	NMDA receptor antagonist, rapid-acting general anesthetic used in pediatrics and by veterinarians	“Dissociative” state, profound amnesia/analgesia; hallucinations and sympathomimetic effects	Psychological distress, accidents due to intensity of experience and lack of bodily control, in overdose, decreased LOC, respiratory depression, catatonia

Medical Uses of Marijuana

- Anorexia-cachexia (AIDS, cancer)
- Spasticity, muscle spasms (multiple sclerosis, spinal cord injury)
- Levodopa-induced dyskinesia (Parkinson's Disease)
- Controlling tics and obsessive-compulsive behavior (Tourette's syndrome)
- Reducing intra-ocular pressure (glaucoma)

Cannabis Use and Risk of Psychotic or Affective Mental Health Outcomes: A Systematic Review

The Lancet 2007;370:319-328

Purpose: To review the evidence for cannabis use and occurrence of psychotic or affective mental health outcomes.

Study Characteristics: A meta-analysis of 35 population-based longitudinal studies, or case-control studies nested within longitudinal designs.

Results: There was an increased risk of any psychotic outcome in individuals who had ever used cannabis (pooled adjusted odds ratio = 1.41, 95% CI 1.20-1.65). Findings were consistent with a dose-response effect, with greater risk in people who used cannabis more frequently (2.09, 95% CI 1.54-2.84). Findings for depression, suicidal thoughts, and anxiety outcomes were less consistent. In both cases (psychotic and affective outcomes), a substantial confounding effect was present.

Conclusions: The findings are consistent with the view that cannabis increases risk of psychotic outcomes independent of transient intoxication effects, although evidence is less strong for affective outcomes. Although cannabis use and the development of psychosis are strongly associated, it is difficult to determine causality and it is possible that the association results from confounding factors or bias. The authors did conclude that there is sufficient evidence to warn young people that using cannabis could increase their risk of developing a psychotic illness later in life.

Date Rape Drugs

- GHB
- Flunitrazepam (Rohypnol®)
- Ketamine

Formication

Tactile hallucination that insects or snakes are crawling over or under the skin (especially associated with crystal meth use)

Pharm Party

An increasing trend among teenagers where assorted prescription medications are brought to a party and ingested at random

Table 6. The Mechanism and Effects of Common "Club Drugs" (continued)

Drug	Mechanism	Effect	Adverse Effects
Methamphetamine ("speed", "meth", "chalk", "ice", "crystal")	Amphetamine stimulant, induces norepinephrine, dopamine, and serotonin release	Rush begins in min, effects last 6-8 h, increased activity, decreased appetite, general sense of well-being, tolerance occurs quickly, users often binge and crash	Short-term use: high agitation, rage, violent behavior, occasionally hyperthermia and convulsions Long-term use: addiction, anxiety, confusion, insomnia, paranoia, auditory and tactile hallucinations (especially formication), delusions, mood disturbance, suicidal and homicidal thoughts, stroke, may be contaminated with lead, and IV users may present with acute lead poisoning
Phencyclidine ("PCP", "angel dust")	Not understood, used by veterinarians to immobilize large animals	Amnestic, euphoric, hallucinatory state	Horizontal/vertical nystagmus, myoclonus, ataxia, autonomic instability (treat with diazepam IV), prolonged agitated psychosis (treat with haloperidol); high risk for suicide; violence towards others High dose can cause coma

Somatic Symptom and Related Disorders

General Characteristics

- physical signs and symptoms lacking a known medical basis in the presence of psychological factors that are judged to be important in the initiation, exacerbation, or maintenance of the disturbance
- cause significant distress or impairment in functioning
- symptoms are produced unconsciously and are not the result of malingering or factitious disorder
- primary gain: somatic symptom represents a symbolic resolution of an unconscious psychological conflict; serves to reduce anxiety and conflict with no external incentive
- secondary gain: the sick role; external benefits obtained or unpleasant duties avoided (e.g. work)

Management of Somatic Symptom and Related Disorders

- brief frequent visits
- limit number of physicians involved in care
- focus on psychosocial not physical symptoms
- minimize medical investigations; coordinate necessary investigations
- psychotherapy: CBT, biofeedback, conflict resolution
- minimize psychotropic drugs: anxiolytics in short-term only, antidepressants for depressive and anxiety symptoms

Malingering: intentional production of false or grossly exaggerated physical or psychological symptoms, motivated by external reward (e.g. avoiding work, obtaining financial compensation, or obtaining drugs)

Factitious Disorder: intentional production or feigning of physical or psychological signs or symptoms

Somatic Symptom Disorder

DSM-5 Diagnostic Criteria for Somatic Symptom Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- one or more somatic symptoms that are distressing or result in significant disruption of daily life
 - excessive thoughts, feelings, or behaviors related to the somatic symptoms or associated health concerns as manifested by at least one of the following
 - disproportionate and persistent thoughts about the seriousness of one's symptoms
 - persistently high level of anxiety about health or symptoms
 - excessive time and energy devoted to these symptoms or health concerns
 - although any one somatic symptom may not be continuously present, the state of being symptomatic is persistent (typically >6 mo)
- symptoms may or may not be associated with another medical condition
 - lifetime prevalence may be around 5-7% in the general adult population
 - females tend to report more somatic symptoms than males do, cultural factors may influence sex ratio
 - complications: anxiety, depression, unnecessary medications or surgery
 - often a misdiagnosis for an insidious illness so rule out all organic illnesses (e.g. multiple sclerosis)

Illness Anxiety Disorder (formerly Hypochondriasis)

- preoccupation with fear of having, or the idea that one has, a serious disease based on a misinterpretation of one or more bodily signs or symptoms
- evidence does not support diagnosis of a physical disorder
- fear of having a disease despite medical reassurance
- belief is not of delusional intensity (as in delusional disorder, somatic type) as person acknowledges unrealistic interpretation
- duration is ≥ 6 mo; onset in 3rd-4th decade of life
- community prevalence 1.1-4.5%; prevalence in general medical practice 4-9%; higher in psychiatric settings
- role for SSRIs due to anxiety

Conversion Disorder (Functional Neurological Symptom Disorder)

- one or more symptoms or deficits affecting voluntary motor or sensory function that mimic a neurological or GMC (e.g. impaired co-ordination, local paralysis, double vision, seizures, or convulsions)
- does not need to be preceded by a psychological event as per previous DSM criteria
- 2-5/100,000 in general population; 5% of referrals to neurology clinics
- more common in rural populations and in individuals with little medical knowledge
- spontaneous remission in 95% of acute cases, 50% of chronic cases (>6 mo)

Dissociative Disorders

Definition

- dissociation so severe that the usually integrated functions of consciousness and perception of self break down
- sudden or gradual onset, transient or chronic course
- symptoms cause distress or impaired functioning
- differential diagnosis: PTSD, acute stress disorder, somatization disorder, substance abuse, GMC (e.g. complex/partial seizures)

Table 7. Dissociative Disorders

	Amnesia	Fugue	Identity Disorder	Depersonalization/Derealization Disorder
Diagnosis	Inability to recall important personal information, usually of a traumatic or stressful nature; may be localized, selective, or generalized	Sudden, unexpected travel away from home or workplace with inability to recall some or all of one's past; may assume new identity	Two or more distinct personalities that take control of an individual's behavior; amnesia regarding personal history (i.e. Multiple Personality Disorder)	Persistent or recurrent experiences of feeling detached from one's mental processes or body (i.e. like being in a dream)
Epidemiology	6% prevalence Increased in survivors of trauma (war, abuse)	0.2% prevalence May occur under traumatic circumstances (combat, rape, natural disasters)	1.3% prevalence, M:F=1.3:9 May have history of physical or sexual abuse	Rare disorder Approximately 50% of adults have experienced a single brief episode of depersonalization, precipitated by extreme stress
Treatment	Psychotherapy, hypnosis No proven role for barbiturates/ pharmacologically-assisted interviewing	Usually spontaneous recovery Psychotherapy, hypnosis Ensure stability and safety No proven role for barbiturates/ pharmacologically-assisted interviewing	Three stages: symptom stabilization, attention to trauma, reintegration Psychotherapy, hypnosis Symptom-oriented adjuvants (antidepressants, anxiolytics) No proven role for barbiturates/ pharmacologically-assisted interviewing	Psychotherapy Pharmacotherapy: clonazepam, fluoxetine, clomipramine

Sleep Disorders

- see [Neurology](#), N45

Criteria for Diagnosis

- causes significant distress or impairment in functioning
- not due to medications, drugs, or a GMC

Nocturnal Myoclonus

- middle-aged and elderly
- myoclonic jerks every 20-40 s
- bed partner complaints
- treatment: benzodiazepines (clonazepam, nitrazepam)

Narcolepsy

- see [Neurology](#), N47

Primary Insomnia

- see [Family Medicine](#), FM47

Sleep Apnea

- see [Respirology](#), R31

Sexuality and Gender

Gender Dysphoria

- refers to the distress that may coincide with conflict between one's experienced/expressed gender and one's assigned gender
- **typical presentation**
 - strong and persistent cross-gender identification
 - desire to be rid of primary/secondary sex characteristics and to gain the primary/secondary sex characteristics of their identified gender
 - repeated stated desire or insistence that one is of the opposite sex
 - preference for cross-dressing, cross-gender roles in make-believe play
 - intense desire to participate in the stereotypical games and pastimes of the opposite sex
 - strong preference for playmates of the opposite sex
 - significant distress or impairment in functioning and persistent discomfort with his or her sex or gender role
- **treatment**
 - psychotherapy
 - hormonal therapy
 - sexual reassignment surgery

Paraphilic Disorders

- **definition:** intense and persistent sexual interest other than sexual interest in genital stimulation or preparatory fondling with phenotypically normal, physically mature, consenting human partners
- **paraphilic disorder:** paraphilia that causes distress or functional impairment to the individual, or a paraphilia whose realization entails personal harm, or risk of harm to others
- **subtypes:** voyeuristic, exhibitionistic, frotteuristic, sexual masochism, sexual sadism, pedophilic, fetishistic, transvestic, other specified paraphilic disorder, unspecified paraphilic disorder
- rarely self-referred; come to medical attention through interpersonal or legal conflict
- person usually has more than one paraphilia; 5% of paraphilias attributed to women
- **typical presentation**
 - begins in childhood or early adolescence; increasing in complexity and stability with age
 - chronic, decreases with advancing age but may increase with stress
- **treatment**
 - anti-androgen drugs
 - behavior modification
 - psychotherapy

SEXUAL DYSFUNCTION

- see [Gynecology](#), GY30 and [Urology](#), U30

Eating Disorders

Epidemiology

- anorexia nervosa (AN): 1% of adolescent and young adult females; onset 13-20 yr old
- bulimia nervosa (BN): 2-4% of adolescent and young adult females; onset 16-18 yr old
- F:M=10:1; mortality 5-10%

Etiology

- multifactorial: psychological, sociological, and biological associations
- individual: perfectionism, lack of control in other life areas, history of sexual abuse
- personality: obsessive-compulsive, histrionic, borderline
- familial: maintenance of weight equilibrium and control in dysfunctional family
- cultural factors: prevalent in industrialized societies, idealization of thinness in the media
- genetic factors
 - AN: 6% prevalence in siblings, with one study of twin pairs finding concordance in 9 of 12 monozygotic pairs vs. concordance in 1 of 14 dizygotic pairs
 - BN: higher familial incidence of affective disorders than the general population

Risk Factors

- physical factors: obesity, chronic medical illness (e.g. DM)
- psychological factors: individuals who by career choice are expected to be thin, family history (mood disorders, eating disorders, substance abuse), history of sexual abuse, homosexual males, competitive athletes, concurrent associated mental illness (depression, OCD, anxiety disorder [especially panic and agoraphobia], substance abuse [specifically for BN])

Anorexia Nervosa

DSM-5 Diagnostic Criteria for Anorexia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- restriction of energy intake relative to requirements, leading to a significantly low body weight in the context of age, sex, developmental trajectory, and physical health. Significantly low weight is defined as a weight that is less than minimally normal or, for children and adolescents, less than that minimally expected
 - intense fear of gaining weight or of becoming fat, or persistent behavior that interferes with weight gain, even though at a significantly low weight
 - disturbance in the way in which one's body weight or shape is experienced, undue influence of body weight or shape on self-evaluation, or persistent lack of recognition of the seriousness of the current low body weight
- **specifiers:** partial remission, full remission, severity based on BMI (mild = BMI $>17 \text{ kg/m}^2$, moderate = BMI $16-16.99 \text{ kg/m}^2$, severe = BMI $15-15.99 \text{ kg/m}^2$, extreme = BMI $<15 \text{ kg/m}^2$), type (restricting = during last 3 mo no episodes of binge-eating or purging vs. binge-eating/purging type = in last 3 mo have participated in recurrent episodes of binge-eating/purging)

Athletic Triad

- Disordered eating
- Amenorrhea
- Osteoporosis

Some patients with insulin-dependant diabetes mellitus may stop their insulin in order to lose weight

Management

- outpatient programs and inpatient programs are available
- inpatient hospitalization for treatment of eating disorders is rarely on an acute basis (unless there is a concurrent psychiatric reason for emergent admission e.g. suicide risk)
- admit to a medical ward for hospitalization: $<65\%$ of standard body weight ($<85\%$ of standard body weight for adolescents), hypovolemia requiring intravenous fluid, heart rate $<40 \text{ bpm}$, abnormal serum chemistry or if actively suicidal
- agree on target body weight on admission and reassure this weight will not be surpassed
- psychotherapy (individual/group/family): address food and body perception, coping mechanisms, health effects
- monitor for complications of AN (see Table 8)
- monitor for refeeding syndrome
 - a potentially life-threatening metabolic response to refeeding in severely malnourished patients resulting in severe shifts in fluid and electrolyte levels
 - complications include hypophosphatemia, congestive heart failure, cardiac arrhythmias, delirium, and death
 - prevention: slow refeeding, gradual increase in nutrition, supplemental phosphorus, close monitoring of electrolytes and cardiac status

Prognosis

- early intervention much more effective (adolescent onset has much better prognosis than adult onset)
- 1 in 10 adolescents continue to have anorexia nervosa as adults
- with treatment, 70% resume a weight of at least 85% of expected levels and about 50% resume normal menstrual function
- eating peculiarities and associated psychiatric symptoms are common and persistent
- long-term mortality: 10-20% of patients hospitalized will die in next 10-30 yr (secondary to severe and chronic starvation, metabolic or cardiac catastrophes, with a significant proportion committing suicide)

Bulimia Nervosa

DSM-5 Diagnostic Criteria for Bulimia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. recurrent episodes of binge-eating; an episode of binge-eating is characterized by both of the following
 - eating, in a discrete period of time, an amount of food that is definitely larger than what most individuals would eat during a similar period of time and under similar circumstances
 - a sense of lack of control over eating during the episode
- B. recurrent inappropriate compensatory behavior in order to prevent weight gain, such as self-induced vomiting; misuse of laxatives, diuretics, enemas, or other medications, fasting, or excessive exercise
- C. the binge-eating and inappropriate compensatory behaviors both occur, on average, at least once a week for 3 mo
- D. self-evaluation is unduly influenced by body shape and weight
- E. the disturbance does not occur exclusively during episodes of AN
- **specifiers:** partial remission, full remission, severity (mild = 1-3 inappropriate compensatory behaviors/wk, moderate = 4-7 inappropriate compensatory behaviors/wk, severe = 8-13 inappropriate compensatory behaviors/wk, extreme = 14+ inappropriate compensatory behaviors/wk)

Associated Features

- fatigue and muscle weakness due to repetitive vomiting and fluid/electrolyte imbalance
- tooth decay
- swollen appearance around angle of jaw and puffiness of eye sockets due to fluid retention
- reddened knuckles, Russell's sign (knuckle callus from self-induced vomiting)
- trouble concentrating
- weight fluctuation over time

Management

- admission for significant electrolyte abnormalities
- biological: treatment of starvation effects, SSRIs
- psychological: develop trusting relationship with therapist to explore personal etiology and triggers, CBT, family therapy, recognition of health risks
- social: challenge destructive societal views of women, use of hospital environment to provide external patterning for normative eating behavior

Prognosis

- relapsing/remitting disease
- good prognostic factors: onset before age 15, achieving a healthy weight within 2 yr of treatment
- poor prognostic factors: later age of onset, previous hospitalizations, individual and familial disturbance
- 60% good treatment outcome, 30% intermediate outcome, 10% poor outcome

Avoidant/Restrictive Food Intake Disorder

- **definition:** eating/feeding disturbance to the point that there is persistent failure to meet appropriate nutritional and/or energy needs such that individual experiences significant weight loss/growth failure, have nutritional deficiencies, may become dependent on enteral feeding/oral nutritional supplementation, has a marked interference with psychosocial functioning
- **risk factors:** temperament (e.g. anxiety disorders), environment (e.g. familial anxiety), genetic (e.g. history of GI conditions)
- begins in infancy and can persist into adulthood
- **treatment**
 - watchful waiting
 - behavior modification
 - psychotherapy

Binge-Eating Disorder

- **definition:** recurrent episodes of binge-eating (as defined by criteria A of BN) that are associated with eating much more rapidly than normal, eating until feeling uncomfortably full, eating large amounts when not physically hungry, eating alone because embarrassed by how much one is eating, feeling disgusted with oneself/depressed/very guilty afterwards at least once/wk x 3 mo
- not associated with any compensatory behaviors
- dieting usually follows binge-eating (vs. BN where dysfunctional dieting typically precedes binge-eating)
- **epidemiology:** F:M = 2:1
- associated with health consequences (e.g. increased risk of weight gain, obesity)
- begins in adolescence or young-adulthood
- hallmark of treatment is CBT

Table 8. Physiologic Complications of Eating Disorders

System	Starvation/Restriction	Binge-Purge
General	Low BP, low HR, significant orthostatic changes ± syncopal episodes, low temperature, vitamin deficiencies	Russell's sign (knuckle callus) Parotid gland enlargement Perioral skin irritation Periocular and palatal petechiae Loss of dental enamel and caries Aspiration pneumonia Metabolic alkalosis secondary to hypokalemia and loss of acid
Endocrine	Primary or secondary amenorrhea, decreased T ₃ /T ₄	
Neurologic	Grand mal seizure (decreased Ca ²⁺ , Mg ²⁺ , PO ₄ ³⁻)	
Cutaneous	Dry skin, lanugo hair, hair loss or thinning, brittle nails, yellow skin from high carotene	
GI	Constipation, GERD, delayed gastric emptying	Acute gastric dilation/rupture, pancreatitis, GERD, hematemesis secondary to Mallory-Weiss tear
CVS	Arrhythmias, CHF	Arrhythmias, cardiomyopathy (from use of ipecac), sudden cardiac death (decreased K ⁺)
MSK	Osteoporosis secondary to hypogonadism	Muscle wasting
Renal	Pre-renal failure (hypovolemia), renal calculi	Renal failure (electrolyte disturbances)
Extremities	Pedal edema (decreased albumin)	Pedal edema (decreased albumin)
Lab Values	Starvation: decreased RBCs, decreased WBCs, decreased LH, decreased FSH, decreased estrogen, decreased testosterone, increased growth hormone, increased cholesterol Dehydration: increased BUN	Vomiting: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , decreased H ⁺ , increased amylase; hypokalemia with metabolic alkalosis Laxatives: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , increased H ⁺ ; metabolic acidosis

Personality Disorders

- an evolving personality disorder literature describes that personality is better understood using a trait-based dimensional approach rather than discrete categories, however the discrete categories still remain in the current DSM and will be referenced here

General Diagnostic Criteria

- an enduring pattern of inner experience and behavior that deviates markedly from the expectations of the individual's culture; manifested in two or more of: cognition, affect, interpersonal functioning, impulse control
- inflexible and pervasive across a range of situations
- pattern is stable and well established by adolescence or early adulthood
- associated with many complications, such as depression, suicide, violence, brief psychotic episodes, multiple drug use, and treatment resistance
- the mainstay of treatment is psychotherapy with the addition of pharmacotherapy to treat associated axis I disorders (i.e. depression, anxiety, substance abuse)
- main treatment for borderline personality disorder is dialectical behavioral therapy (consists of validating rather than blaming the patient, and replacing maladaptive behavior with adaptive behavior)

Borderline Personality Disorder

DESPAIRER

Disturbance of identity
Emotionally labile
Suicidal behavior
Paranoia or dissociation
Abandonment (fear of)
Impulsive
Relationships unstable
Emptiness (feelings of)
Rage (inappropriate)

*Created by Jason Caplan, MD

Antisocial Personality Disorder

CORRUPT

Cannot conform to law
Obligations ignored
Reckless disregard for safety
Remorselessness
Underhanded (deceitful)
Planning insufficient (impulsive)
Temper (irritable and aggressive)

Table 9. Classification and Diagnosis of Personality Disorders**Note:** For each personality disorder, the most recognizable feature is indicated in *italics*

Diagnostic Cluster	Diagnosis	
Cluster A "Mad" Patients seem odd, eccentric, withdrawn Familial association with psychotic disorders Common defense mechanisms: intellectualization, projection, magical thinking	Paranoid Personality Disorder (0.5-3%) <i>Pervasive distrust and suspiciousness of others, interpret motives as malevolent.</i> Blame problems on others and seem angry and hostile. Diagnosis requires 4 of: 1. Suspicious that others are exploiting or deceiving them 2. Pre-occupied with trustworthiness of acquaintances 3. Reluctant to confide in others 4. Interpret benign remarks as threatening, demeaning 5. Holds grudges 6. Perceives attacks on character and is quick to counterattack 7. Questions fidelity of partner without justification	Schizotypal Personality Disorder (3-5.6%) <i>Pattern of eccentric behaviors, peculiar thought patterns</i> Diagnosis requires 5 of: 1. Ideas of reference 2. Odd beliefs, magical thinking (inconsistent with cultural norms e.g. belief in telepathy, superstitions) 3. Unusual perceptual experiences (e.g. bodily illusions) 4. Suspiciousness 5. Inappropriate or restricted affect 6. Odd, eccentric appearance or behavior (e.g. involved in cults, strange religious practices) 7. Few close friends 8. Odd thinking, odd speech (e.g. vague, stereotyped) 9. Excessive social anxiety
	Schizoid Personality Disorder <i>Neither desires nor enjoys close relationships including being a part of a family; prefers to be alone. Lifelong pattern of social withdrawal. Seen as eccentric and reclusive with restricted affect.</i> Diagnosis requires 4 of: 1. Does not enjoy or desire close relationships 2. Chooses solitary activities 3. Little to no interest in sexual activity with others 4. Takes pleasure in few (if any) activities 5. Few or no close friends 6. Indifference to praise or criticism 7. Emotionally cold, detached, or has flattened affect	
Cluster B "Bad" Patients seem dramatic, emotional, inconsistent Familial association with mood disorders Common defense mechanisms: denial, acting out, regression (histrionic PD), splitting (borderline PD), projective identification, idealization/devaluation	Borderline Personality Disorder (2-4%) <i>Unstable moods and behavior, feel alone in the world, problems with self image. History of repeated suicide attempts, self-harm behaviors.</i> <i>**10% suicide rate**</i> Diagnosis requires 5 of: 1. Frantic efforts to avoid real or imagined abandonment 2. Unstable and intense relationships 3. Unstable sense of self 4. Impulsivity in two potentially harmful ways (sexual, drugs, spending) 5. Recurrent suicidal behavior/self-harm 6. Unstable mood/affect 7. General feelings of emptiness 8. Difficulty controlling anger 9. Transient dissociative symptoms or paranoid ideation associated with stress	Narcissistic Personality Disorder (2%) <i>Sense of superiority, needs constant admiration, lacks empathy, but with fragile sense of self</i> <i>Consider themselves "special" and will exploit others for personal gain</i> Diagnosis requires 5 of: 1. Exaggerated sense of self-importance (grandiosity) 2. Preoccupied with fantasies of unlimited success, power, beauty, love 3. Believes he/she is "special" and should associate with other "special" people 4. Requires excessive admiration 5. Sense of entitlement 6. Takes advantage of others 7. Lacks empathy 8. Envious of others or believes that others are envious of him/her 9. Arrogant attitudes
	Antisocial Personality Disorder (M: 3%, F: 1%) <i>Lack of remorse for actions, manipulative and deceitful, often violate the law. May appear charming on first impression. Pattern of disregard for others and violation of rights of others must be present before the age of 15, however, for the diagnosis of ASPD patients must be at least 18.</i> Diagnosis requires 3 of the following: 1. Failure to conform to social norms by committing unlawful acts 2. Deceitfulness, lying, manipulating others for personal gain 3. Impulsive, fails to plan ahead 4. Irritable, aggressive, repeated fights or assaults 5. Recklessness and disregard for personal safety, safety of others 6. Irresponsible, cannot sustain work 7. Lack of remorse for actions	Histrionic Personality Disorder (1.3-3%) <i>Attention-seeking behavior and excessively emotional. Are dramatic, flamboyant, and extroverted. Cannot form meaningful relationships. Often sexually inappropriate.</i> Diagnosis requires 5 of: 1. Not comfortable unless center of attention 2. Inappropriately sexually seductive 3. Uses physical appearance to attract attention 4. Speech is impressionistic, lacks detail 5. Theatrical and exaggerated expression of emotion 6. Easily influenced by others 7. Perceives relationships as more intimate than they actually are

Table 9. Classification and Diagnosis of Personality Disorders (continued)

Diagnostic Cluster	Diagnosis
Cluster C “Sad” Patients seem anxious, fearful Familial association with anxiety disorder Common defense mechanisms: isolation, avoidance, hypochondriasis	Avoidant Personality Disorder (0.5-1.6%) <i>Timid and socially awkward with a pervasive sense of inadequacy and fear of criticism. Fear of embarrassing or humiliating themselves in social situations so remain withdrawn and socially inhibited.</i> Diagnosis requires 4 of: 1. Avoids occupational activities that involve significant interpersonal contact for fear of criticism or rejection 2. Unwilling to get involved with people unless certain of being liked 3. Restrained in intimate relationships for fear of being shamed or ridiculed 4. Preoccupied with being rejected or criticized in social situations 5. Inhibited in new interpersonal situations due to fear of inadequacy 6. Views him or herself as inferior, socially inept or personally unappealing 7. Reluctant to engage in new activities for fear of embarrassment
	Dependent Personality Disorder (1.6-6.7%) <i>Pervasive and excessive need to be taken care of, excessive fear of separation, clinging and submissive behaviors. Difficulty making everyday decisions.</i> Diagnosis requires 5 of: 1. Difficulty making everyday decisions without advice and reassurance from others 2. Needs others to assume responsibility for most major areas of his/her life 3. Difficulty expressing disagreement 4. Difficulty initiating projects due to lack of self-confidence 5. Goes to excessive lengths to obtain support 6. Uncomfortable or helpless when alone because of fear of being unable to take care of him/herself 7. Urgently seeks another relationship as a source of care and support when a close relationship ends 8. Unrealistically preoccupied with fears of being left to take care of him/herself
	Obsessive-Compulsive Personality Disorder (3-10%) <i>Preoccupation with orderliness, perfectionism, and mental and interpersonal control. Is inflexible, closed-off, and inefficient.</i> Diagnosis requires 4 of: 1. Preoccupation with details, rules, lists, order, organization, or schedules to the extent that the point of an activity is lost 2. Perfectionism interferes with task completion 3. Excessively devoted to work to the exclusion of leisure activities and friendships 4. Inflexible about morality/ethics/values 5. Unable to discard worthless objects of no sentimental value 6. Reluctant to delegate tasks to others 7. Miserly spending style (money is hoarded for future disasters) 8. Rigid and stubborn

**OCPD vs. OCD**

	OCPD	OCD
Ego-Syntonic or Ego-Dystonic	Ego-syntonic	Ego-dystonic
Thought Content	Obsessional thinking, no compulsions, strict routine and rigidity in day-to-day matters	Obsessions and compulsions, rituals

Table 10. Key Differences Among Schizoid, Schizotypal, and Schizophrenia

	Schizoid	Schizotypal	Schizophrenia
Thought Form	Organized	Organized, but vague and circumstantial	Disorganized, tangential, loosening of associations
Thought Content	No psychosis	No psychosis, may have ideas of reference, paranoid ideation, odd beliefs and magical thinking	Psychosis, hallucinations
Relationships	Solitary, NO desire for social relationships	Lacks close relationships, INTERESTED in relationships but socially inept	Socially marginalized, but not by choice

**Obsessive-Compulsive Personality Disorder****SCRIMPER**

Stubborn
Cannot discard worthless objects
Rule obsessed
Inflexible
Miserly
Perfectionistic
Excludes leisure due to devotion to work
Reluctant to delegate to others

*Created by Jason Caplan, MD

**Dependent Personality Disorder****RELIANCE**

Reassurance required
Expressing disagreement difficult
Life responsibilities assumed by others
Initiating projects difficult
Alone (feels helpless and uncomfortable when alone)
Nurturance (goes to excessive lengths to obtain)
Companionship sought urgently
Exaggerated fears of being left to care for self

Child Psychiatry

Developmental Concepts

- **temperament:** innate psycho-physiological and behavioral characteristics of a child (e.g. emotionality, activity, and sociability); spectrum from “difficult” to “slow-to-warm-up” to “easy temperament”
- **parental fit:** the congruence between parenting style (authoritative, authoritarian, permissive) and child’s temperament
- **attachment:** special relationship between child and primary caretaker(s); develops during first year, best predictor of a child’s attachment style is their parent’s attachment style
- **separation anxiety** (10-18 mo): separation from attachment figure results in distress

Table 11. Attachment Models

Parent/Caregiver	Attachment Type	Features in Child
Loving, consistently available, sensitive, and receptive	Secure	Able to use caregiver to calm self
Rejecting, unavailable psychologically, insensitive responses	Insecure (avoidant)	Not reliant on caregiver for soothing
Inconsistent, insensitive responses, role reversal	Insecure (ambivalent/resistant)	
Frightening, dissociated, sexualized, or atypical	Disorganized	

HEADSSS Interview
 Home environment
 Education/Employment
 Activities
 Drugs/Diet
 Sex
 Safety
 Suicide/depression

Attachment type can be assessed in infants 10-18 mo of age using the Strange Situation test, in which the child is stressed by the caregiver being removed from the situation and the stranger staying. Attachment style is measured by the child's behavior during the reunion with the caregiver

Attachment problems may present as a child who is difficult to soothe, has difficulty sleeping, problems feeding, tantrums or behavioral problems

FDA advises that the use of SSRIs in youth <24 yr old associated with increased suicidal ideation; no studies show association to completed suicide

Irritable mood is a diagnostic feature unique to children and adolescents

Mood Disorders

MAJOR DEPRESSIVE DISORDER

Epidemiology

- pre-pubertal 1-2% (no gender differences); post-pubertal 4-18% (F:M = 2:1)

Clinical Presentation

- see *Adult Mood Disorders, PS6*
- physical factors: insomnia (children), hypersomnia (adolescents), somatic complaints, substance abuse
- psychological factors: irritability, boredom, anhedonia, low self-esteem, deterioration in academic performance, social withdrawal, lack of motivation
- comorbid diagnoses of anxiety, ADHD, conduct disorder, and eating disorders

Treatment

- majority never seek treatment
- individual (CBT, IPT)/family therapy and education, modified school program
- SSRIs (strongest evidence for fluoxetine)
- ECT: only in adolescents

Prognosis

- prolonged episodes, up to 1-2 yr
- adolescent onset predicts chronic mood disorder; up to 2/3 will have another depressive episode within 5 yr
- complications
 - negative impact on family and peer relationships
 - school failure
 - significantly increased risk of suicide attempt (10%) or completion (however suicide risk low for pre-pubertal children)
 - substance abuse

BIPOLAR DISORDER

Clinical Presentation

- see *Bipolar Disorder, PS9*
- mixed presentation and psychotic symptoms (hallucinations and delusions) more common in adolescent population than adult population
- unipolar depression may be an early sign of adult bipolar disorder
 - ~30% of psychotic depressed adolescents receive a bipolar diagnosis within 2 yr of presentation
 - associated with rapid onset of depression, psychomotor retardation, mood-congruent psychosis, affective illness in family, pharmacologically-induced mania

Treatment

- 1st line: mood stabilizers and/or antipsychotics
- 2nd line: antidepressants, benzodiazepines (careful of disinhibiting effect)

Anxiety Disorders

- prevalence 2-15%; F:M = 2:1

Clinical Presentation

- school problems, recurrent physical symptoms (abdominal pain, headaches) especially in mornings, social and relationship problems, social withdrawal and isolation, family conflict, irritability and mood symptoms, alcohol and drug use in adolescent

Treatment

- family psychotherapy, predictive and supportive environment
- CBT: child and parental education, relaxation techniques (e.g. deep breathing), exposure/desensitization, recognizing and correcting anxious thoughts
- pharmacotherapy: SSRIs (e.g. fluoxetine), benzodiazepines (e.g. clonazepam – use with caution, may have disinhibiting effect)
 - fluvoxamine and sertraline also have good evidence, particularly for OCD

SEPARATION ANXIETY DISORDER

Epidemiology

- prevalence: 4% of children/adolescents
- average onset is 7.5 yr old; average age at presentation is 10 yr old
- common for mother to have an anxiety or depressive disorder

Differential Diagnosis

- simple or social phobia, depression, learning disorder, truancy, conduct disorder, school-related problems (e.g. bullying)

Clinical Presentation

- excessive and developmentally inappropriate anxiety on separation from primary caregiver with physical or emotional distress for at least 4 wk
- school refusal (75%)
- persistent worry, refusal to sleep, clinging, nightmares, somatic symptoms
- comorbid major depression common (2/3)
- worry about something happening to parent or themselves if separated

Prognosis

- if inadequately treated early on, may present later in a more severe form
- may develop into panic disorder with/without agoraphobia

SOCIAL PHOBIA (SOCIAL ANXIETY DISORDER)

- must distinguish between shy child and child with social anxiety
 - diagnosis only if anxiety interferes significantly with daily routine, social life, academic functioning, or if markedly distressed
- features: temper tantrums, freezing, clinging behavior, mutism, excessively timid, stays on periphery, refuses to be involved in group play
- must be capable of developing social relationships
- must occur in settings with peers, not just adults

SELECTIVE MUTISM

- consistent failure to speak in specific social situations in which there is an expectation for speaking despite speaking in other situations
- the disturbance interferes with educational or occupational achievement or with social communication

PANIC DISORDER

- diagnostic criteria same as adults (see *Panic Disorder*, PS10)
- genetic/parental modeling/identification hypothesized as cause
- often parent with panic or depressive disorder

GENERALIZED ANXIETY DISORDER

- diagnostic criteria same as adults (see *Generalized Anxiety Disorder*, PS12)
 - **Note:** only 1 item is required in children for Criteria C
- often redo tasks, show dissatisfaction with their work, and tend to be perfectionistic
- often require reassurance and support to take on new tasks

SPECIFIC PHOBIA

- common phobias in childhood include a fear of heights, small animals, doctors, dentists, darkness, loud noises, thunder and lightning

Fluoxetine, Cognitive-Behavioral Therapy and Their Combination for Adolescents with Depression: Treatment for Adolescents with Depression Study (TADS) Randomized Controlled Trial

JAMA 2004;292:807-820

Study: Randomized controlled trial at 13 US academic and community clinics between spring 2000–summer 2003.

Patients: 439 patients ages 12–17 with a primary DSM IV diagnosis of major depressive disorder.

Outcomes: Children's Depression Rating Scale-Revised (CDRSR) total score.

Interventions: 12 wk of (1) fluoxetine (10–40 mg/d), (2) CBT, (3) CBT + fluoxetine (10–40 mg/d), or (4) placebo.

Results: Fluoxetine with CBT had a statistically significant CDRSR score as compared to placebo ($p=0.001$) with a 71% response rate. This combination was greater than fluoxetine alone ($p=0.02$), and CBT alone ($p=0.01$). Fluoxetine alone was greater than CBT alone ($p=0.01$).

Newer Generation Antidepressants for Depressive Disorders in Children and Adolescents

Cochrane DB Syst Rev 2012;11:CD004851

Study: Meta-analysis of 19 trials containing 3,335 participants (including RCTs, cross-over trials, and cluster trials).

Population: Children and adolescents aged 6–18 yr with diagnosed depressive disorder.

Interventions: Antidepressants, placebo.

Main Outcome Measure: Depression severity score.

Results: Children treated with an antidepressant had lower depression severity score and higher rates of response/remission. Children on antidepressants were also found to be at increased risk (58%) of suicide-related outcome (RR 1.58; 95% CI 1.02–2.45).

Conclusions: In children and adolescents, antidepressants are effective at treating depression, yet may cause a higher chance of suicide-related outcomes.

The shy child is quiet and reluctant to participate but slowly 'warms up'

Neurodevelopmental Disorders

Autism Spectrum Disorder

- M:F = 3-4:1 (except for Rett's with female predominance)

Diagnosis

- persistent deficits in social communication and interaction, manifested in three areas
 - social-emotional reciprocity, ranging, for example, from abnormal social approach and failure of normal back-and-forth conversation, to reduced sharing of interests, emotions, or affect, to failure to initiate or respond to social interactions
 - nonverbal communicative behaviors, ranging, for example, from poorly integrated verbal and nonverbal communication, to abnormalities in eye contact and body language or deficits in understanding and use of gestures, to a total lack of facial expressions and nonverbal communication
 - developing, maintaining, and understanding relationships, ranging, for example, from difficulties adjusting behavior to suit various social contexts; to difficulties in sharing imaginative play or in making friends, to absence of interest in peers
- restricted, repetitive patterns of behavior, interests, or activities. Two or more of: stereotyped or repetitive motor movements, insistence on sameness, highly restricted fixated interests, hyper/hypo-reactivity to sensory input
- symptoms must be present in early developmental period
- symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning
- not better explained by intellectual disability or global developmental delay
- **specifiers**
 - current severity: requiring very substantial support, requiring substantial support, requiring support
 - with or without accompanying language impairment
 - with or without accompanying intellectual impairment
 - associated with known medical or genetic condition or environmental factors (i.e. Rett's disorder)

Differential Diagnosis

- developmental disability, childhood schizophrenia, social phobia, OCD, communication disorder, non-verbal learning disorder, ADHD, abuse, hearing or visual impairment, seizure disorder, motor impairment

Management

- hearing test to rule out impairment
- psychological testing to assess intellectual functioning and learning
- chromosomal analysis to rule out abnormalities (e.g. Trisomy 21, Fragile X syndrome)
- rule out psychotic disorders, social problems, depression, anxiety, abuse

Treatment

- team-based: school, psychologist, occupational therapist, physiotherapist, speech and language therapy, audiology, pediatrics, psychiatry
- family education and support
- treat concomitant disorders such as tics, OCD, anxiety, depression, and seizure disorder
- behavior management, school programming
- pharmacotherapy: atypical antipsychotics (for aggression, agitation, self-mutilation, tics), SSRIs (for anxiety, depression), stimulants (for associated inattention and hyperactivity)

Prognosis

- variable, but improves with early intervention
- better if IQ >60 and able to communicate

Attention Deficit Hyperactivity Disorder

- prevalence: 5-12% of school-aged children; M:F = 4:1, although girls may be under-diagnosed
- girls tend to have inattentive/distractible symptoms; boys have impulsive/hyperactive symptoms

Etiology

- genetic: dopamine candidate genes, catecholamine/neuroanatomical hypothesis
- cognitive: developmental disability, inhibitory control and other errors of executive function
- arousal: alterations in the sensory system filters

Diagnosis

- differential: learning disorders, hearing/visual defects, thyroid, atopic conditions, congenital problems (fetal alcohol syndrome, Fragile X), lead poisoning, history of head injury, traumatic life events (abuse)
- diagnosis (3 subtypes)
 - **Combined Type:** 6 or more symptoms of inattention and 6 or more symptoms of hyperactivity-impulsivity
 - **Predominantly Inattentive Type:** 6 or more symptoms of inattention
 - **Predominantly Hyperactive-Impulsive Type:** 6 or more symptoms of hyperactivity-impulsivity
 - for older adolescents (>17 yr) or adults, 5 symptoms required
 - symptoms persist for >6 mo
 - onset before age 12
 - symptoms present in at least two settings (i.e. home, school, work)
 - interferes with academic, family, and social functioning
 - does not occur exclusively during the course of another psychiatric disorder

Table 12. Core Symptoms of ADHD (DSM-5)

Inattention	Hyperactivity	Impulsivity
Careless mistakes	Fidgets, squirms in seat	Blurts out answers before questions completed
Cannot sustain attention in tasks or play	Leaves seat when expected to remain seated	Difficulty awaiting turn
Does not listen when spoken to directly	Runs and climbs excessively	Interrupts/intrudes on others
Fails to complete tasks	Cannot play quietly	
Disorganized	"On the go", driven by a motor	
Avoids, dislikes tasks that require sustained mental effort	Talks excessively	
Loses things necessary for tasks or activities		
Distractible		
Forgetful		

Features

- average onset 3 yr old
- identification upon school entry
- rule out developmental delay, genetic syndromes, encephalopathies or toxins (alcohol, lead)
- risk of substance abuse, particularly cannabis and cocaine, depression, anxiety, academic failure, poor social skills, risk of comorbid CD and/or ODD, risk of adult ASPD
- associated with family history of ADHD, difficult temperamental characteristics

Treatment

- non-pharmacological: parent management, anger control strategies, positive reinforcement, social skills training, individual/family therapy, resource room, tutors, classroom intervention, exercise routines, extracurricular activities
- pharmacological
 - standard treatment
 - ♦ stimulants: methylphenidates (Ritalin®, Concerta® [long-acting]), Biphentin®
 - ♦ amphetamines: dextroamphetamine, mixed amphetamine salts (Adderall®), lisdexamfetamine (Vyvanse®)
 - ♦ SNRI: atomoxetine (Strattera®)
 - for comorbid symptoms: antidepressants, antipsychotics

Prognosis

- 65% continue into adulthood; secondary personality disorders and compensatory anxiety disorders are identifiable
- 70-80% continue into adolescence, but hyperactive symptoms usually abate

Observe child for "ATTENTION" features

A Systematic Review and Analysis of Long-Term Outcomes in Attention Deficit Hyperactivity Disorder: Effects of Treatment and Non-Treatment

BMC Med 2012;10:99

Study: Systematic review of 351 studies.

Purpose: To determine the long-term outcomes of ADHD and whether there is an effect on long-term outcomes with treatment.

Population: Patients with diagnosed or symptomatic presentation of ADHD.

Interventions: No treatment (control), treatment (pharmacological, non-pharmacological, and multi-modal).

Outcome Groups: Drug use/addictive behavior, academic outcomes, antisocial behavior, social function, occupation, self-esteem, driving outcomes, services use, obesity.

Results: Untreated participants with ADHD had poorer outcomes vs. non-ADHD participants in 74% (n=244) of studies, while 26% (n=89) showed similar outcomes. 72% (n=37) of studies showed a benefit from ADHD treatment vs. untreated ADHD and 28% (n=15) showed no benefit. Treatment of ADHD was found to be beneficial in studies looking at driving (100%), obesity (100%), self-esteem (90%), social function (83%), academic outcomes (71%), drug use/addictive behavior (67%), antisocial behavior (50%), and occupation (33%).

Conclusions: Overall, people with ADHD have poorer long-term outcomes than controls (those without ADHD). For those with ADHD, treatment improves long-term outcomes.

Disruptive, Impulse Control, and Conduct Disorder

Oppositional Defiant Disorder

- prevalence: 2-16%

Diagnosis

- pattern of negativistic/hostile and defiant behavior for ≥ 6 mo with ≥ 4 of
 - loses temper, argues with adults, defies adult rules, deliberately annoys, blames others, touchy/easily annoyed, angry and resentful, spiteful or vindictive
- behavior causes significant impairment in social, academic, or occupational functioning
- behaviors do not occur exclusively during the course of a psychotic or mood disorder
- criteria not met for conduct disorder (CD); if 18 yr or older, criteria not met for ASPD
- features that typically differentiate ODD from transient developmental stage: onset < 8 yr, chronic duration (> 6 mo), frequent intrusive behavior
- impact of ODD: poor school performance, few friends, strained parent/child relationships
- may progress to CD

Treatment

- establish boundaries
- parent management training and psychoeducation
- individual/family therapy
- pharmacotherapy for comorbid disorders
- school/day care interventions to help with behavior management

ODD kids "ARE BRATS"

Annoying
Resentful
Easily annoyed
Blames others
Rule breaker
Argues with adults
Temper
Spiteful/vindictive

Conduct Disorder

- prevalence: 1.5-3.4% (M:F = 4-12:1)

Etiology

- parental/familial factors: parental psychopathology (e.g. ASPD, substance abuse), child-rearing practices (e.g. child abuse, discipline), low socio-economic status (SES), family violence
- child factors: difficult temperament, ODD, learning problems, neurobiology

Diagnosis

- differential: ADHD, depression, head injury, substance abuse
- diagnosis: use multiple sources (Achenbach Child Behavioral Checklist, Teacher's Report Form)
 - pattern of behavior that violates rights of others and age appropriate social norms with ≥ 3 criteria noted in past 12 mo and ≥ 1 in past 6 mo
 - ♦ aggression to people and animals (bullying, physical fights, use of weapons, forced sex)
 - ♦ destruction of property, firesetting with intent to damage
 - ♦ deceitfulness or theft (breaking and entering, car theft)
 - ♦ violation of rules (out all night before age 13, runaway ≥ 2 times or for long periods of time, often truant from school before age 13)
 - disturbance causes clinically significant impairment in social, academic, or occupational functioning
 - if individual is 18 yr or older, criteria not met for ASPD
- diagnostic types
 - childhood onset: at least one criterion prior to age 10
 - ♦ poor prognosis: associated with ODD, aggressiveness, impulsiveness
 - adolescent onset: absence of any criteria until age 10
 - ♦ better prognosis; least aggressive, gang-related delinquency
 - mild, moderate, severe

Treatment

- early intervention necessary and more effective; long-term follow-up required
- parent management training, anger replacement training, CBT, family therapy, education/employment programs, social skills training, medications for aggressiveness or comorbid disorders
- pharmacotherapy is insufficient; mainly used for treatment of comorbid disorders

Prognosis

- poor prognostic indicators include early-age onset, high frequency and variety of behaviors, pervasiveness (i.e. in home, school, community), comorbid ADHD, early sexual activity, substance abuse
- 50% of CD children become adult ASPD

Conduct Disorder Diagnosis

TRAP

Theft: breaking and entering, deceiving, non-confrontational stealing
Rule breaking: running away, skipping school, out late
Aggression: people, animals, weapons, forced sex
Property destruction

Pharmacotherapy

Antipsychotics

- “antipsychotics” and “neuroleptics” are terms used interchangeably
- **indications:** schizophrenia and other psychotic disorders, mood disorders with or without psychosis, violent behavior, autism, Tourette's, dementia, OCD
- **onset:** immediate calming effect and decrease in agitation; thought disorder responds in 2-4 wk
- **rational use**
 - no reason to combine antipsychotics
 - choosing an antipsychotic
 - ♦ all antipsychotics are equally effective, except for clozapine (considered to be most effective in treatment-refractory psychosis)
 - ♦ atypical antipsychotics are as effective as typical or first generation antipsychotics but are thought to have better side effect profiles
 - ♦ choose a drug that the patient has responded to in the past or that was used successfully in a family member
 - route: PO, short-acting or long-acting depot IM injections, sublingual
 - duration: minimum 6 mo, usually for life

Long-Acting Preparations

- antipsychotics formulated in oil for IM injection
- received on an outpatient basis
- indications: individuals with schizophrenia or other chronic psychosis who relapse because of non-adherence
- dosing: start at low dosages, and then titrate every 2-4 wk to maximize safety and minimize side effects
- should be exposed to oral form prior to first injection
- side effects: risk of EPS, parkinsonism, increased risk of NMS

Table 13. Common Antipsychotic Agents

	Starting Dose	Maintenance	Maximum	Relative Potency (mg)
Typicals (in order of potency from high to low)				
Perphenazine (Trilafon®)	8-16 mg PO b/tid	4-8 mg PO t/qid	64 mg/d PO	10
Loxapine HCl (Loxitane®)	10 mg PO tid 12.5-50 mg IM q4-6h	60-100 mg/d PO	250 mg/d PO	10
Chlorpromazine (Thorazine®)	10-25 mg PO b/t/qid	400 mg/d PO	1000 mg/d PO	100
Atypicals (in order of potency from high to low)				
Risperidone (Risperdal®), Risperdal Consta® for IM long acting preparation, Risperdal® M-Tab for melting form – placed on tongue)	1-2 mg OD/bid	4-8 mg/d PO 25 mg IM q2wk	8 mg/d PO	2
Paliperidone (Invega®)	3 mg/d PO	3-12 mg/d PO	12 mg/d PO	4
Olanzapine (Zyprexa®), Zyprexa Zydis® for melting form – placed on tongue, Zyprexa Intramuscular®)	5 mg/d PO	10-20 mg/d PO	30 mg/d PO	5
Asenapine (Saphris®)	5 mg SL bid	5-10 mg SL bid	10 mg bid	5
Ziprasidone (Geodon®)	20 mg bid PO	40-80 mg bid PO	160 mg/d PO	6
Aripiprazole (Ablify®)	10-15 mg/d PO	10-15 mg/d PO	30 mg/d PO	7.5
Quetiapine (Seroquel®), Seroquel XR® for extended release)	25 mg PO bid	400-800 mg/d PO	800 mg/d PO	75
Clozapine (Clozaril®)	25 mg PO bid	300-600 mg/d PO	600 mg/d PO	100

Effectiveness of Antipsychotic Drugs in Patients with Chronic Schizophrenia

NEJM 2005;353:1209-23

Study: Randomized, double-blind, active-control trial with median follow-up of 6 mo.

Patients: 1,432 patients with a diagnosis of schizophrenia (as per DSM-IV criteria) and able to take antipsychotic medications (as determined by study doctors). Mean age 41, 74% male, 26% female.

Intervention: 1-4 capsules daily of olanzapine (20.1 mg), quetiapine (543.4 mg), risperidone (3.9 mg), perphenazine (20.8 mg), or ziprasidone (112.8 mg), with dosage at the discretion of the study doctor. Mean modal doses in parentheses.

Main Outcome: Discontinuation of treatment for any cause

Results: Olanzapine group had statistically significant lower rate of discontinuation for any cause (64%) from all others (quetiapine – 82%, risperidone – 74%, perphenazine – 75%, ziprasidone – 79%). There were no significant differences in time until discontinuation due to intolerable side effects, however, olanzapine was associated with a significantly higher rate of metabolic side effects.

Typical vs. Atypical Antipsychotics

	Typical	Atypical
Pros	Inexpensive Plenty of injectable forms available	Fewer EPS Low risk of tardive syndromes Mood stabilizing effects
Cons	More EPS Tardive syndromes in long-term Not mood stabilizing	Expensive Few injectable forms available Metabolic side effects (weight gain, hyperglycemia, lipid abnormalities, metabolic syndrome) Exacerbation (or new onset) of obsessive behavior

Table 14. Commonly Used Atypical Antipsychotics

	Risperidone (Risperdal®)	Olanzapine (Zyprexa®, Zydys®)	Quetiapine (Seroquel®)	Clozapine (Clozari®)	Aripiprazole (Abilify®)
Advantages	Lower incidence of EPS than typical antipsychotics at lower doses (<8 mg) Associated with less weight gain compared to clozapine and olanzapine	Better overall efficacy compared to haloperidol Well tolerated Low incidence of EPS and TD	Associated with less weight gain compared to clozapine and olanzapine Mood stabilizing	Most effective for treatment-resistant schizophrenia Does not worsen tardive symptoms; may treat them Approximately 50% of patients benefit, especially paranoid patients and those with onset after 20 yr	Less weight gain and risk of metabolic syndrome compared to olanzapine and a lower incidence of EPS compared to haloperidol
Disadvantages	SE: insomnia, agitation, EPS, H/A, anxiety, prolactin, postural hypotension, constipation, dizziness, weight gain	SE: mild sedation, insomnia, dizziness, minimal anticholinergic, early AST and ALT elevation, restlessness Weight gain associated with increased risk of DM and hyperlipidemia	SE: H/A, sedation, dizziness, constipation Most sedating of first line atypicals	SE: drowsiness/sedation, hypersalivation, tachycardia, dizziness, EPS, NMS 1% agranulocytosis	SE: H/A, agitation, anxiety, insomnia, weight gain, decreased serum prolactin levels
Comments	Quick dissolve (M-tabs), and long-acting (Consta®) formulations available	Quick dissolve formulation (Zydys®) used commonly in ER setting for better compliance IM form available		Weekly blood counts for at least 1 mo, then q2wk Do not use with drugs which may cause bone marrow suppression due to risk of agranulocytosis	

Note: Risk of weight gain: Clozapine > Olanzapine > Quetiapine > Risperidone

Table 15. Side Effects of Antipsychotics

System	Side Effects
Anticholinergic	Dry mouth, urinary retention, constipation, blurred vision, toxic-confusional states
α-Adrenergic Blockade	Orthostatic hypotension, impotence, failure to ejaculate
Dopaminergic Blockade	Extrapyramidal syndromes, galactorrhea, amenorrhea, impotence, weight gain
Anti-Histamine	Sedation
Hematologic	Agranulocytosis (clozapine)
Hypersensitivity Reactions	Liver dysfunction, blood dyscrasias, skin rashes, neuroleptic malignant syndrome, altered temperature regulation (hypothermia or hyperthermia)
Endocrine	Metabolic syndrome

Neuroleptic Malignant Syndrome

- **psychiatric emergency**
- due to massive dopamine blockade; increased incidence with high potency and depot neuroleptics
- **risk factors**
 - medication factors: sudden increase in dosage, starting a new drug
 - patient factors: medical illness, dehydration, exhaustion, poor nutrition, external heat load, male, young adults
- **clinical presentation**
 - mental status changes (usually occur first), fever, autonomic reactivity, rigidity
 - develops over 24-72 h
 - labs: increased creatine phosphokinase, leukocytosis, myoglobinuria
- **treatment:** discontinue drug, hydration, cooling blankets, dantrolene (hydrantoin derivative, used as a muscle relaxant), bromocriptine (DA agonist)
- **mortality:** 5%

Extrapyramidal Symptoms

- incidence related to increased dose and potency
- acute (early-onset; reversible) vs. tardive (late-onset; often irreversible)

Anticholinergic Effects

Red as a beet
Hot as a hare
Dry as a bone
Blind as a bat
Mad as a hatter

Metabolic and Cardiovascular Adverse Effects Associated with Antipsychotic Drugs

Nat Rev Endocrinol 2012;8:114-126

Study: Review.

Conclusions: All antipsychotics can cause cardiovascular and metabolic side effects, such as obesity, dyslipidemia, hyperglycemia and metabolic syndrome. Olanzapine and clozapine are most likely to cause these side effects. The mechanism that underlies the metabolic and cardiovascular effects is not fully understood, however, the histamine, dopamine, serotonin, and muscarinic receptors are implicated.

Table 16. Extrapyramidal Symptoms

	Dystonia	Akathisia	Pseudoparkinsonism	Dyskinesia
Acute or Tardive	Both	Both	Acute	Tardive
Risk Group	Acute: Young Asian and Black males	Elderly females	Elderly females	
Presentation	Sustained abnormal posture; torsions, twisting, contraction of muscle groups; muscle spasms (e.g. oculogyric crisis, laryngospasm, torticollis)	Motor restlessness; crawling sensation in legs relieved by walking; very distressing, increased risk of suicide and poor adherence	Tremor; rigidity (cogwheeling); akinesia; postural instability (decreased/absent arm-swing, stooped posture, shuffling gait, difficulty pivoting)	Purposeless, constant movements, involving facial and mouth musculature, or less commonly – the limbs
Onset	Acute: within 5 d Tardive: >90 d	Acute: within 10 d Tardive: >90 d	Acute: within 30 d	Tardive: >90 d
Treatment	Acute: benztropine or diphenhydramine	Acute: lorazepam, propranolol, or diphenhydramine; reduce or change neuroleptic to lower potency	Acute: benztropine (or benzodiazepine if side effects); reduce or change neuroleptic to lower potency	Tardive: no good treatment; may try clozapine; discontinue drug or reduce dose

Features of Neuroleptic Malignant Syndrome

FARM

Fever

Autonomic changes (e.g. increased HR/ BP, sweating)

Rigidity of muscles

Mental status changes (e.g. confusion)

FARM symptoms are also seen in Serotonin Syndrome (SS)

SS can be distinguished from NMS by the following:

SS	NMS
Twitchy, shivering, restless	Severe global rigidity
Flushed, sweaty	Pallor
Vomiting, diarrhea, abdominal pain	No GI symptoms

Antiparkinsonian Agents (Anticholinergic Agents)

- types
 - benztropine (Cogentin®) 2 mg PO, IM or IV OD (~1-6 mg)
 - amantadine (Symmetrel®) 100 mg PO bid (100-400 mg)
 - diphenhydramine (Benadryl®) 25-50 mg PO/IM qid
- do not always prescribe with neuroleptics
 - give antiparkinsonian agents only if at high risk for acute EPS or if acute EPS develops
- do not give for tardive syndromes because they worsen the condition

Antidepressants

- onset of effect
 - relief of neurovegetative symptoms: 1-3 wk
 - relief of emotional/cognitive symptoms: 2-6 wk
- may use mild stimulant (e.g. methylphenidate) for severe neurovegetative symptoms briefly and taper down as antidepressant effect increases
- taper TCAs slowly (over weeks-months) because they can cause withdrawal reactions
- tapering of any kind of antidepressant is usually required and based on the half-life of the medication and the patient's individual sensitivity
- it is important to be particularly vigilant over the first 2 wk of therapy as neurovegetative symptoms may start to resolve while emotional and cognitive symptoms may not (patients may be particularly at risk for suicidal behavior during this time)
- treatment of bipolar depression
 - monotherapy with antidepressants is not advisable as a switch from depression to mania can occur
 - patients with bipolar disorder should only be treated with an antidepressant if it is combined with a mood stabilizer or antipsychotic
 - for patients taking mood stabilizers or antipsychotics, consider adding or switching to lithium or lamotrigine, or adding an SSRI or bupropion

Selective Serotonin Reuptake Inhibitors (SSRIs)

vs. Other Antidepressants for Depression

Cochrane DB Syst Rev 2004; Issue 3

This systematic review of 98 RCTs compared the efficacy of SSRIs with other kinds of antidepressants in the treatment of patients with depressive disorders.

Conclusions: There is no significant difference in the effectiveness of SSRIs vs. TCAs. Consider relative patient acceptability, toxicity, and cost when choosing.

How Long to Treat?

6-12 mo: if first or second episode

2 yr: if third episode, elderly, psychotic features, refractory depression, >2 episodes in 5 yr

Table 17. Common Antidepressants

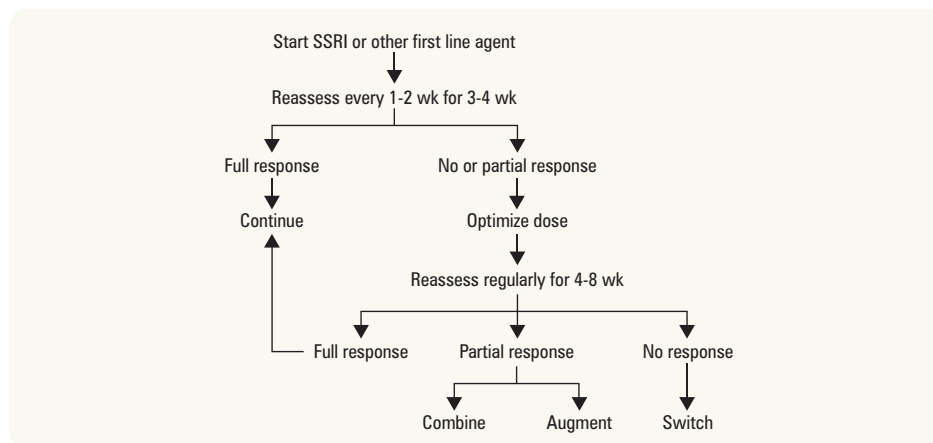

Class	Drug	Daily Starting Dose (mg)	Therapeutic Dose (mg)	Comments
SSRI	fluoxetine (Prozac®)	20	20-80	All SSRIs have similar effectiveness but consider side effect profiles and half-lives Sertraline, citalopram, and escitalopram have the least drug-interactions and are sleep-wake neutral Fluoxetine and paroxetine are the most activating drugs (recommend taking in the AM) Fluvoxamine is sedating (should be taken in PM)
	fluvoxamine (Luvox®)	50-100	150-300	
	paroxetine (Paxil®)	10	20-60	
	sertraline (Zoloft®)	50	50-200	
	citalopram (Celexa®)	20	20-40	
	escitalopram (Lexapro®)	10	10-20	

Table 17. Common Antidepressants (continued)

Class	Drug	Daily Starting Dose (mg)	Therapeutic Dose (mg)	Comments
SNRI	venlafaxine (Effexor®)	37.5-75	75-225	Causes less sexual dysfunction, weight gain, and sedation Increased risk of seizures at higher doses Contraindicated with history of seizure, stroke brain tumor, brain injury, closed head injury Not recommended for anxiety disorder treatment because of stimulating effects
	duloxetine (Cymbalta®)	40	40-60	
NDRI	bupropion (Wellbutrin®)	100	300-450	
TCA (3° Amines)	amitriptyline (Elavil®)	75-100	150-300	
	imipramine (Tofranil®)	75-100	150-300	
TCA (2° Amines)	nortriptyline (Aventyl®)	75-100	75-150	Useful in depression with prominent features of insomnia, agitation, or cachexia
	desipramine (Norpramin®)	100-200	150-300	
MAOI	phenelzine (Nardil®)	45	60-90	
	tranylcypromine (Parnate®)	30	10-60	
NASSA	mirtazapine (Remeron®)	15	15-45	

MAOI = monoamine oxidase inhibitors; NASSA = noradrenergic and specific serotonin antagonists; NDRI = norepinephrine and dopamine reuptake inhibitors; RIMA = reversible inhibition of MAO-A; SNRI = serotonin and norepinephrine reuptake inhibitors; SSRI = selective serotonin reuptake inhibitors; TCA = tricyclic antidepressants

Treatment Strategies for Refractory Depression

**Figure 2. Treatment of depression**

- **optimization:** ensuring adequate drug doses for the individual
- **augmentation:** the addition of a medication that is not considered an antidepressant to an antidepressant regimen (e.g. thyroid hormone, lithium, atypical antipsychotics)
- **combination:** the addition of another antidepressant to an existing treatment regimen (e.g. the addition of bupropion to an SSRI or SNRI)
- **substitute:** change in the primary antidepressant (within or outside a class)
- **note:** it is important to fully treat the symptoms of depression in order to decrease rates and severity of relapses

Psychopharmacology of SSRIs

Post-Synaptic Serotonin Receptor Stimulated	Effect/Side Effect
5HT1A centrally	<ul style="list-style-type: none"> • Relief of depression • Anxiolytic effect
5HT2A in spinal cord	<ul style="list-style-type: none"> • Sexual dysfunction: delayed ejaculation, anorgasmia, decreased interest/libido
5HT2C/5HT2A in brain	<ul style="list-style-type: none"> • Activation: anxiety, insomnia • Worst with fluoxetine, paroxetine • Warn patients anxiety may worsen in first 1-2 wk of treatment
5HT3A in gut	<ul style="list-style-type: none"> • GI upset: nausea, vomiting, bloating • Take with food

Table 18. Features of Commonly Used Antidepressant Classes

	TCA	SSRI	MAOI	SNRI
Considerations	OCD (clomipramine), melancholic depression	Anxiety states, OCD, eating disorders, seasonal depression, typical and atypical depression	For moderate/severe depression that does not respond to SSRI, atypical depression	Depression, anxiety disorders
Mode of Action	Block norepinephrine and serotonin reuptake	Block serotonin reuptake only	Irreversible inhibition of monoamine oxidase A and B Leads to ↑ norepinephrine and serotonin	Block norepinephrine and serotonin reuptake
Side Effects	Anticholinergic effects: (see Table 14) Noradrenergic effects: tremors, tachycardia, sweating, insomnia, erectile and ejaculation problems α -1 adrenergic effects: orthostatic hypotension Antihistamine effects: sedation, weight gain CNS: sedation, stimulation, ↓ seizure threshold CVS: ↑ HR, conduction delay	Fewer than TCA, therefore increased compliance CNS: restlessness, tremor, insomnia, headache, drowsiness GI: N/V, diarrhea, abdominal cramps, weight loss Sexual dysfunction: impotence, anorgasmia CVS: increased HR, conduction delay, serotonin syndrome, EPS, SIADH	Hypertensive crises with tyramine rich foods (e.g. wine, cheese), headache, flushes, palpitations, N/V, photophobia Dizziness, reflex tachycardia, postural hypotension, sedation, insomnia Weight gain Social dysfunction Energizing Minimal anticholinergic and antihistamine effects	Low dose side effects include insomnia (serotonergic) Higher dose side effects include: tremors, tachycardia, sweating, insomnia, dose-dependent increase in diastolic BP (noradrenergic)
Risk in Overdose	Toxic in OD 3 times therapeutic dose is lethal Presentation: anticholinergic effects, CNS stimulation, then depression and seizures ECG: prolonged QT (duration reflects severity) Treatment: activated charcoal, cathartics, supportive treatment, IV diazepam for seizure, physostigmine salicylate for coma Do not give ipecac, as can cause rapid neurologic deterioration and seizures	Relatively safe in OD	Toxic in OD, but wider margin of safety than TCA	Tachycardia and N/V seen in acute overdose
Drug Interactions	MAOI, SSRI EtOH	SSRIs inhibit P450 enzymes, therefore will affect levels of drugs metabolized by P450 system	EtOH Hypertensive crises with noradrenergic medications (e.g. TCA, decongestants, amphetamines) Serotonin syndrome with serotonergic drugs (e.g. SSRI, tryptophan, dextromethorphan)	MAOI, SSRI Does not seem to inhibit P450 system
	NDRI	RIMA	NASSA	
Considerations	Depression, seasonal depression	Depression unresponsive to other therapies	Useful in patients with insomnia, agitation or depression with cachexia	
Mode of Action	Block norepinephrine and dopamine reuptake	Reversible inhibitor of monoamine oxidase A Leads to ↑ norepinephrine and serotonin	Enhance central noradrenergic and serotonergic activity by inhibiting presynaptic α -2 adrenergic receptors	
Side Effects	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, HTN GI: dry mouth, N/V, constipation, ↓ appetite Other: agitation, anxiety, anaphylactoid reaction	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, hypotension GI: dry mouth, N/V, diarrhea, abdominal pain, dyspepsia GU: delayed ejaculation Other: diaphoresis	CNS: somnolence, dizziness, seizure (rare) Endocrine: ↑ cholesterol, ↑ triglycerides GI: constipation, ↑ ALT	
Risk in Overdose	Tremors and seizures seen in acute overdose	Risk of fatal overdose when combined with citalopram or clomipramine	Mild symptoms with overdose	
Drug Interactions	MAOI Drugs that reduce seizure threshold: antipsychotics, systemic steroids, quinolone antibiotics, antimalarial drugs	MAOI, SSRI, TCA Opioids	MAOI, SSRI, SNRI, RIMA	

Serotonin Syndrome

- thought to be due to over-stimulation of the serotonergic system
- can result from medication combinations such as SSRI+MAOI, SSRI+tryptophan, MAOI+meperidine, MAOI+tryptophan
- rare but potentially life-threatening adverse reaction to SSRIs, especially when switching from an SSRI to an MAOI
- symptoms include nausea, diarrhea, palpitations, chills, restlessness, confusion, and lethargy but can progress to myoclonus, hyperthermia, rigor and hypertonicity
- treatment: discontinue medication and administer emergency medical care as needed
- important to distinguish from NMS (see sidebar, PS38)

Discontinuation Syndrome

- caused by the abrupt cessation of an antidepressant
- observed most frequently with paroxetine, fluvoxamine, and venlafaxine
- symptoms usually begin within 1-3 d and include: anxiety, insomnia, irritability, mood lability, N/V, dizziness, headache, dystonia, tremor, chills, fatigue, lethargy, and myalgia
- treatment: symptoms may last between 1-3 wk, but can be relieved within 24 h by restarting antidepressant therapy at the same dose the patient was taking and initiating a slow taper over several weeks
- consider using a drug with a longer half-life such as fluoxetine

Symptoms of Antidepressant Discontinuation

FINISH

Flu-like symptoms
Insomnia
Nausea
Imbalance
Sensory disturbances
Hyperarousal (anxiety/agitation)

Sequenced Treatment Alternatives to Relieve Depression

Journal of Psychosocial Nursing 2008;46:21-24
Study: Prospective randomized anti-depressant treatment trial.

Patients: 4,000 patients with major depressive disorder.

Objective: To compare the efficacy and tolerability of various antidepressant therapies through four sequential treatment levels.

Intervention: Level 1-citalopram → if relapse → Level 2-citalopram + bupropion SR, sertraline, venlafaxine XR, or cognitive psychotherapy. Level 2A-switch to bupropion or venlafaxine XR. Level 3-either mirtazapine or nortriptyline + lithium, T3. Level 4-tranylcypromine or venlafaxine XR + mirtazapine.

Results: Remission rates were 28% for Level 1, 17% for Level 2, 12-25% for Level 3, and 7-14% for Level 4. When more treatment steps are required, there are lower remission rates, greater degrees of tolerance, and higher rates of relapse.

Long-term lithium use can lead to a nephropathy and diabetes insipidus in some patients

Lithium Side Effects

LITHIUM

Leukocytosis
Insipidus (diabetes)
Tremor, teratogenicity
Hypothyroidism
Increased weight
"V"omiting, nausea
Miscellaneous (e.g. ECG changes, acne)

Mood Stabilizers

First-Line

Lithium or Valproic Acid (± antipsychotic)

- before initiating, get baseline: CBC, ECG (if patient >45 yr old or cardiovascular risk), urinalysis, BUN, Cr, electrolytes, TSH
- before initiating lithium: screen for pregnancy, thyroid disease, seizure disorder, neurological, renal, cardiovascular diseases
- may need acute coverage with benzodiazepines or antipsychotics
- use carbamazepine in non-responders and rapid cycling bipolar disorder
- can combine lithium and carbamazepine or valproic acid safely in lithium non-responders
- olanzapine may be used as a mood stabilizer, in conjunction with other mood stabilizers
- lithium and lamotrigine have established antidepressant efficacy

Lithium Toxicity

- clinical diagnosis as toxicity can occur at therapeutic levels
- **common causes:** overdose, sodium/fluid loss, concurrent medical illness
- **clinical presentation**
 - GI: severe nausea/vomiting and diarrhea
 - cerebellar: ataxia, slurred speech, lack of coordination
 - cerebral: drowsiness, myoclonus, choreiform or Parkinsonian movements, upper motor neuron signs, seizures, delirium, coma
- **management**
 - discontinue lithium for several doses and begin again at a lower dose when lithium level has fallen to a non-toxic range
 - serum lithium levels, BUN, electrolytes
 - saline infusion
 - hemodialysis if lithium >2 mmol/L, coma, shock, severe dehydration, failure to respond to treatment after 24 h, or deterioration

Second-Line/Adjuvant Mood Stabilizers

Lithium, lamotrigine, divalproex, carbamazepine

Table 19. Commonly Used Mood Stabilizers

	Lithium	Lamotrigine (Lamictal®)	Divalproex (Depakote®)	Carbamazepine (Tegretol®)
Indications	Maintenance therapy of bipolar disorder Treatment of acute mania Augmentation of antidepressants in MDE and OCD Schizoaffective disorder Chronic aggression and antisocial behavior Recurrent depression	Maintenance treatment of bipolar disorder Treatment of bipolar depression	Maintenance therapy of bipolar disorder Treatment of acute mania Rapid cycling bipolar disorder Mixed phase/Dysphoric mania	Maintenance therapy of bipolar disorder Treatment of acute mania Rapid cycling bipolar disorder
Mode of Action	Unknown Therapeutic response within 7-14 d	May inhibit 5-HT ₃ receptors May potentiate DA activity	Depresses synaptic transmission Raises seizure threshold	Depresses synaptic transmission Raises seizure threshold
Dosage	Adult: 600-1500 mg/d Geriatric: 150-600 mg/d Usually daily dosing	Starting: 12.5-15 mg/d Daily dose: 100-200 mg/d Dose adjusted in patients taking other anticonvulsants	750-2500 mg/d Usually tid dosing	400-1600 mg/d Usually bid or tid dosing
Therapeutic Level	Adult: 0.8-1.0 mmol/L (1.0-1.25 mmol/L for acute mania) Geriatric: 0.5-0.8 mmol/L	Therapeutic plasma level not established Dosing based on therapeutic response	17-50 mmol/L	350-700 µmol/L
Monitoring	Monitor serum levels until therapeutic (always wait 12 h after dose) Then monitor biweekly or monthly until a steady state is reached, then q2mo Monitor thyroid function q6mo, creatinine q6mo, urinalysis q1yr	Monitor for suicidality, particularly when initiating treatment	LFTs weekly x 1 mo, then monthly, due to risk of liver dysfunction Watch for signs of liver dysfunction: nausea, edema, malaise	Weekly blood counts for first month, due to risk of agranulocytosis Watch for signs of blood dyscrasias: fever, rash, sore throat, easy bruising
Side Effects	GI: N/V, diarrhea, stomach pain GU: polyuria, polydipsia, GN, renal failure, nephrogenic DI CNS: fine tremor, lethargy, fatigue, headache Hematologic: reversible leukocytosis Other: teratogenic (Ebstein's anomaly), weight gain, edema, psoriasis, hypothyroidism, hair thinning, muscle weakness, ECG changes	GI: N/V, diarrhea CNS: ataxia, dizziness, diplopia, headache, somnolence Skin: rash (should discontinue drug because of risk of Stevens-Johnson syndrome), increased lamotrigine levels = increased risk of rash Other: anxiety	GI: liver dysfunction, N/V, diarrhea CNS: ataxia, drowsiness, tremor, sedation, cognitive blurring Other: hair loss, weight gain, transient thrombocytopenia, neural tube defects when used in pregnancy	GI: N/V, diarrhea, hepatic toxicity CNS: ataxia, dizziness, slurred speech, drowsiness, confusion, nystagmus, diplopia Hematologic: transient leukopenia (10%), agranulocytosis, aplastic anemia Skin: rash (5% risk; should discontinue drug because of risk of Stevens-Johnson syndrome) Other: neural tube defects when used in pregnancy
Interactions	NSAIDs decrease clearance		OCP	OCP

Anxiolytics

- anxiolytics mask or alleviate symptoms; they do not cure them
- **indications**
 - short-term treatment of transient forms of anxiety disorders, insomnia, alcohol withdrawal (especially delirium tremens), barbiturate withdrawal, organic brain syndrome (agitation in dementia), EPS and akathisia due to antipsychotics, seizure disorders, musculoskeletal disorders
- **relative contraindications**
 - major depression (except as an adjunct to other treatment), history of drug/alcohol abuse, pregnancy, breast feeding
- **mechanism of action**
 - benzodiazepines: potentiate binding of GABA to its receptors; results in decreased neuronal activity
 - buspirone: partial agonist of 5-HT_{1A} receptors

Benzodiazepines

- should be used for limited periods (weeks-months) to avoid dependence
- all benzodiazepines are sedating; be wary in use for the elderly
- have similar efficacy, so choice depends on half-life, metabolites and route of administration, OD or bid
- taper slowly over weeks-months because they can cause withdrawal reactions
 - low dose withdrawal: tachycardia, HTN, panic, insomnia, anxiety, impaired memory and concentration, perceptual disturbances
 - high dose withdrawal: hyperpyrexia, seizures, psychosis, death
- avoid alcohol because of potentiation of CNS depression; caution with drinking and use of machinery

- **side effects**
 - CNS: drowsiness, cognitive impairment, reduced motor coordination, memory impairment
 - physical dependence, tolerance
- **withdrawal**
 - symptoms: anxiety, insomnia, autonomic hyperactivity (less common)
 - onset: 1-2 d (short-acting), 2-4 d (long-acting)
 - duration: weeks-months
 - complications with above 50 mg diazepam/d: seizures, delirium, arrhythmias, psychosis
 - management: taper with long-acting benzodiazepine
 - similar to but less severe than alcohol withdrawal; can be fatal
- **overdose**
 - commonly used drug in overdose
 - ♦ overdose is rarely fatal
 - ♦ benzodiazepines are more dangerous and may cause death when combined with alcohol, other CNS depressants or TCAs

Benzodiazepine Antagonist – Flumazenil (Romazicon®)

- use for suspected benzodiazepine overdose
- specific antagonist at the benzodiazepine receptor site

Buspirone (Buspar®)

- **primary use:** GAD
- may be preferred over benzodiazepines because are non-sedating, no interaction with alcohol, does not alter seizure threshold, not prone to abuse
- **onset of action:** 2 wk
- **side effects:** dizziness, drowsiness, nausea, headache, nervousness, EPS

Table 20. Common Anxiolytics

Class	Drug	Dose Range (mg/d)	t _{1/2} (h)	Appropriate Use
Benzodiazepines				
Long-acting	clonazepam (Klonopin®)	0.25-4	18-50	Akathisia, generalized anxiety, seizure prevention, panic disorder
	diazepam (Valium®)	2-40	30-100	Generalized anxiety, seizure prevention, muscle relaxant, alcohol withdrawal
	chlordiazepoxide (Librium®)	5-300	30-100	Sleep, anxiety, alcohol withdrawal
	flurazepam (Dalmane®)	15-30	50-160	Sleep
Short-acting	alprazolam (Xanax®)	0.25-4.0	6-20	Panic disorder, high dependency rate
	lorazepam (Ativan®)	0.5-6.0	10-20	Sleep, generalized anxiety, akathisia, alcohol withdrawal, sublingual available for very rapid action
	oxazepam (Serax®)	10-120	8-12	Sleep, generalized anxiety, alcohol withdrawal
	temazepam (Restoril®)	7.5-30	8-20	Sleep
	triazolam (Halcion®)	0.125-0.5	1.5-5	Shortest t _{1/2} , rapid sleep, but rebound insomnia
Azapirones				
	buspirone (Buspar®)	20-60	2-11	Generalized anxiety
	eszopiclone (Lunestra®)	2-3	4-6	Sleep

Geriatric Benzodiazepines

LOT

Lorazepam

Oxazepam

Temazepam

Safe in liver disease because not metabolized by liver

Benzodiazepines used for Alcohol Withdrawal

- Diazepam 20 mg PO/IV q1h prn
- Lorazepam 2-5 mg PO/IV/SL for patients with liver disease, chronic lung disease, or elderly

ECT in Society

Prior to the 1940's, ECT was performed without the use of muscle relaxants, resulting in seizures with full-scale convulsions and rare but serious complications such as vertebral and long-bone fractures. This practice may have led to negative societal perceptions of ECT, further perpetuated by barbaric depictions in popular culture. Despite ongoing stigmatization, ECT as it is practiced today is an effective and safe option for patients struggling with mental illness

Efficacy of ECT in Depression: A Meta-Analytic Review

J of ECT 2004; 20:13-20

Study: Meta-analysis of randomized and non-randomized control trials.

Patients: Individuals with unipolar and bipolar depression.

Methods: MEDLINE search for relevant papers from 1966-2003.

Main Outcomes: The Hamilton Depression Rating scale was used to determine response to treatment. **Results:** ECT was found to be superior to simulated ECT, placebo, TCAs, MAOIs, and anti-depressants in general.

Summary: ECT is an efficacious treatment modality, particularly in severe and treatment-resistant depression.

Electroconvulsive Therapy

- induction of a grand mal seizure using an electrical pulse through the brain while the patient is under general anesthesia with a muscle relaxant
- unilateral vs. bilateral electrode placement
- **indications**
 - depression refractory to adequate pharmacological trial
 - high suicide risk
 - medical risk in addition to depression (dehydration, electrolytes, pregnancy)
 - previous good response to ECT
 - familial response to ECT
 - elderly
 - psychotic depression
 - catatonic features

- marked vegetative features
- acute schizophrenia unresponsive to medication
- mania unresponsive to medications
- **side effects:** risk of anesthesia, memory loss (may be retrograde and/or anterograde, tends to resolve by 6 to 9 mo, permanent impairment controversial), headaches, myalgias
- evidence that unilateral ECT causes less memory loss than bilateral but may not be as effective
- **contraindications:** increased intracranial pressure

Approach to the Respiratory Patient

Basic Anatomy Review

Figure 1. Lung lobes and bronchi

Respiration Pattern

Normal

Obstructive (prolonged expiration)

- Asthma, COPD

Bradypnea (slow respiratory rate)

- Drug-induced respiratory depression
- Diabetic coma (nonketotic)
- Increased ICP

Kussmaul's Breathing (fast and deep)

- Metabolic acidosis
- Exercise
- Anxiety

Biot's/Ataxic (irregular with long apneic periods)

- Drug-induced respiratory depression
- Increased ICP
- Brain damage, especially medullary

Cheyne-Stokes Breathing (changing rates and depths with apneic periods)

- Drug-induced respiratory depression
- Brain damage (especially cerebral)
- CHF
- Uremia

Apneustic (prolonged inspiratory pause)

- Pontine lesion

© Bonnie Tang 2012

Figure 2. Respiration patterns in normal and disease states

Differential Diagnoses of Common Presentations

Table 1. Differential Diagnosis of Dyspnea

Acute dyspnea (minutes-hours)
Cardiac causes
Ischemic heart disease
CHF exacerbation
Cardiac tamponade
Pulmonary causes
Upper airway obstruction (anaphylaxis, foreign body)
Airway disease (asthma, COPD exacerbation, bronchitis)
Parenchymal lung disease (ARDS, pneumonia)
Pulmonary vascular disease (PE, vasculitis)
Pleural disease (pneumothorax, tension pneumothorax)
Respiratory control (metabolic acidosis, ASA toxicity)
Psychiatric
Anxiety/psychosomatic
Chronic dyspnea (weeks-months)
Cardiac causes
Valvular heart disease
Decreased CO
Respiratory causes
Parenchymal lung disease (interstitial disease)
Pulmonary vascular disease (pulmonary HTN, vasculitis)
Pleural disease (effusion)
Airway disease – asthma, COPD
Metabolic causes
Severe anemia
Hyperthyroidism
Neuromuscular and chest wall disorders
Deconditioning, obesity, pregnancy, neuromuscular disease

Table 2. Differential Diagnosis of Chest Pain
(see Cardiology and Cardiac Surgery C4 and Emergency Medicine ER21)

Nonpleuritic	Pleuritic
Pulmonary	Pulmonary
Pneumonia	Pneumonia
PE	PE
Neoplastic	Pneumothorax
Cardiac	Hemothorax
MI	Neoplasm
Myocarditis/pericarditis	TB
Esophageal	Empyema
GERD	Cardiac
Spasm	Pericarditis
Esophagitis	Dressler's syndrome
Ulceration	GI
Achalasia	Subphrenic abscess
Neoplasm	Pancreatitis
Esophageal rupture	MSK
Mediastinal	Costochondritis
Lymphoma	Fractured rib
Thymoma	Myositis
Subdiaphragmatic	Herpes zoster
PUD	
Gastritis	
Biliary colic	
Pancreatitis	
Vascular	
Dissecting aortic aneurysm	
MSK	
Costochondritis	
Skin	
Breast	
Ribs	

Table 3. Differential Diagnosis of Hemoptysis

Airway Disease
Acute or chronic bronchitis
Bronchiectasis
Bronchogenic CA
Bronchial carcinoid tumor
Parenchymal Disease
Pneumonia
TB
Lung abscess
Vascular Disease
PE
Elevated pulmonary venous pressure:
LVF
Mitral stenosis
Vascular malformation
Vasculitis
Goodpasture's syndrome
Idiopathic pulmonary hemosiderosis
Miscellaneous
Impaired coagulation
Pulmonary endometriosis

Table 4. Differential Diagnosis of Cough

Airway Irritants
Inhaled smoke, dusts, fumes
Postnasal drip (upper airway cough syndrome)
Aspiration
Gastric contents (GERD)
Oral secretions
Foreign body
Airway Disease
URTI including postnasal drip and sinusitis
Acute or chronic bronchitis
Bronchiectasis
Neoplasm
External compression by node or mass lesion
Asthma
COPD
Parenchymal Disease
Pneumonia
Lung abscess
Interstitial lung disease
CHF
Drug-induced (e.g. ACEI)

Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008. With permission from Elsevier

Most Common Causes of Chronic Cough in the Non-smoking Patient (cough > 3 mo with normal CXR)

- GERD
- Asthma
- Post-nasal drip
- ACEI

Hemoptysis

- Most common cause is bronchitis
- 90% of massive hemoptysis is from the bronchial arteries
- Considered "massive" if > 600 mL/24 h

Common Causes of Clubbing

- Pulmonary: Lung CA, bronchiectasis, pulmonary fibrosis, abscess, CF, empyema (NOT COPD)
- Cardiac: Cyanotic heart disease, endocarditis, A-V fistula
- GI: IBD, celiac, cirrhosis
- Endocrine: Graves'
- Other: Other malignancy, primary hypertrophic osteoarthropathy

Clubbing is not seen in COPD – if present, think malignancy

Figure 3. Signs of nail clubbing

Figure 4. Signs of respiratory distress

Figure 5A. Subcompartments of lung volumes

Figure 5B. Expiratory flow volume curves

Adapted with permission from Elsevier. Weinberger SE. Principles of pulmonary medicine, 5th ed. ©2008

Pulmonary Function Tests

- useful in differentiating the pattern of lung disease (obstructive vs. restrictive)
- assess lung volumes, flow rates, and diffusion capacity (see Figures 5A and 5B)
- **note:** normal values for FEV_1 are approximately $\pm 20\%$ of the predicted values (for age, sex, and height); ethnicity may affect predicted values

Table 5. Comparison of Lung Flow and Volume Parameters in Obstructive vs. Restrictive Lung Disease

	Obstructive	Restrictive
	<ul style="list-style-type: none"> • Decreased flow rates (most marked during expiration) • Air trapping (increased RV/TLC) • Hyperinflation (increased FRC, TLC) 	<ul style="list-style-type: none"> • Decreased lung compliance • Decreased lung volumes
DDx	Asthma, COPD, CF, bronchitis, bronchiectasis*	ILD, pleural disease, neuromuscular disease, chest wall disease
FEV_1/FVC	↓	↑ or N
TLC	↑ or N	↓
RV	↑ or N	↓
RV/TLC	↑ or N	N
DL_{CO}	↓ or N	↓ or N

*Bronchiectasis can be obstructive or mixed

Table 6. Common Respiriology Procedures

Technique	Purpose	Description
Plethysmography ("body box")	Measure FRC	<ul style="list-style-type: none"> • After a normal expiration the patient inhales against a closed mouthpiece • Resultant changes in the volume and pressure of the plethysmograph are used to calculate the volume of gas in the thorax • Useful for patients with air trapping
He Dilution	Measure FRC	<ul style="list-style-type: none"> • A known amount of helium is diluted into a patient's lungs following inspiration • Since the amount of helium remains constant, FRC is determined based on the final concentration of the helium in the closed system • Only includes airspaces that communicate with the bronchial tree
Bronchoscopy	Diagnosis and therapy	<ul style="list-style-type: none"> • A flexible or rigid bronchoscope is used for visualization of a patient's airways Allows for: <ul style="list-style-type: none"> • Tissue washings for culture and cytology • Endobronchial or transbronchial tissue biopsies • Removal of secretions/foreign bodies/blood • Laser resections • Airway stenting • Mediastinal lymph nodes can also be sampled using a special bronchoscope equipped with an U/S probe (EBUS)

Lung Volumes

ERV – Expiratory Reserve Volume
FEF – Forced Expiratory Flow Rate
 FEV_1 – Forced Expiratory Volume (in one second)
FRC – Functional Residual Capacity
IC – Inspiratory Capacity
RV – Residual Volume
TLC – Total Lung Capacity
VC – Vital Capacity
 V_T – Tidal Volume

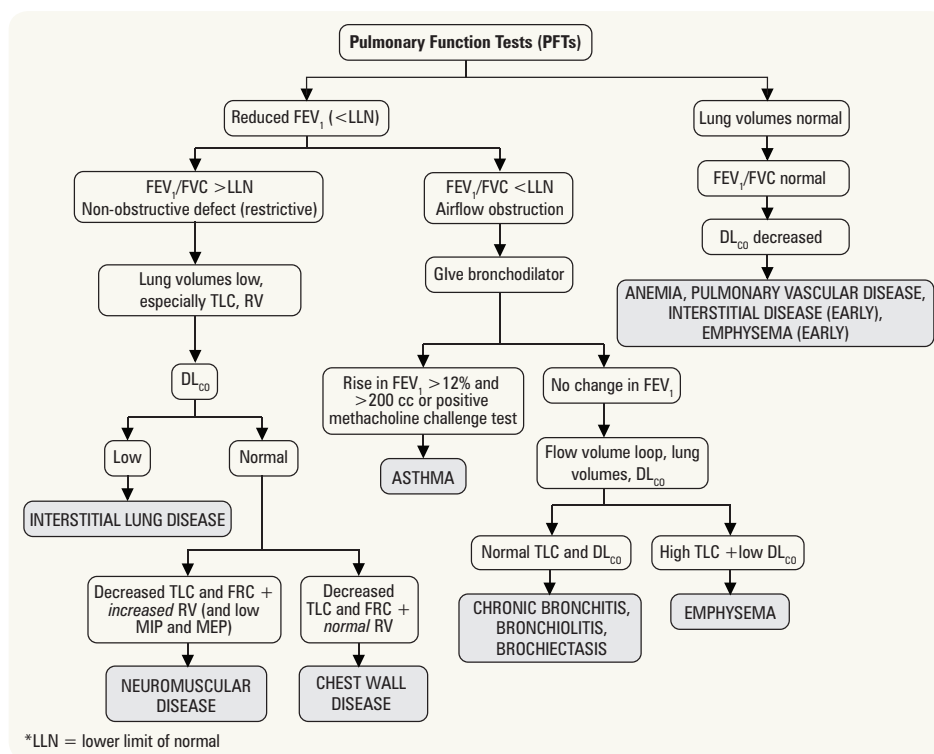

Figure 6. Interpreting PFTs

Chest X-Rays

- see [Medical Imaging](#), MI4

Table 7. CXR Patterns and Differential Diagnosis

Pattern	Signs	Common DDx
Consolidation ("Airspace disease")	Air bronchogram Silhouette sign Less visible blood vessels	<u>Acute</u> : water (pulmonary edema), pus (pneumonia), blood (hemorrhage) <u>Chronic</u> : neoplasm (lymphoma), inflammatory (eosinophilic pneumonia), chronic infection (TB, fungal)
Reticular ("Interstitial disease")	Increased pulmonary markings Honeycombing (IPF)	ILD (IPF, collagen vascular disease, asbestos, drugs)
Nodular	Cavitary vs. non-cavitary	<u>Cavitary</u> : neoplasm (primary vs. metastatic lung cancer), infectious (anaerobic or Gram negative, TB, fungal), inflammatory (RA, Granulomatosis with Polyangiitis [GPA]) <u>Non-cavitary</u> : above + sarcoid, Kaposi's sarcoma (in HIV), silicosis and other pneumoconiosis

Arterial Blood Gases

- provides information on acid-base and oxygenation status
- see [Nephrology](#), NP14

Approach to Acid-Base Status

1. Is the pH acidemic (pH < 7.35), alkalemic (pH > 7.45), or normal (pH 7.35-7.45)?
2. What is the primary disturbance?
 - metabolic: change in HCO_3^- and pH in same direction
 - respiratory: change in HCO_3^- and pH in opposite direction
3. Is there appropriate compensation? (see Table 8)
 - metabolic compensation occurs over 2-3 d reflecting altered renal HCO_3^- production and excretion
 - respiratory compensation through ventilatory control of P_aCO_2 occurs immediately
 - inadequate compensation may indicate a second acid-base disorder

Diffusion Capacity for Carbon Monoxide (DL_{CO})

DL_{CO} decreases with:

- Decreased surface area (e.g. emphysema)
- Decreased hemoglobin
- Interstitial lung disease
- Pulmonary vascular disease

DL_{CO} increases with:

- Asthma
- Pulmonary hemorrhage
- Polycythemia
- Increased pulmonary blood volume

OG = measured osmolality – calculated osmolality; for calculated osmolality think "2 salts and a sticky BUN" ($2\text{Na} + \text{glucose} + \text{urea}$)

Note: Mixed acid-base disturbances can still have a "normal" pH

Anion Gap Metabolic Acidosis

MUDPILES CAT

Methanol
Uremia
Diabetic ketoacidosis/starvation ketoacidosis
Phenformin/Paraldehyde
Isoniazid, Iron, Ibuprofen
Lactate
Ethylene glycol
Salicylates
Cyanide, Carbon dioxide
Alcoholic ketoacidosis
Toluene, Theophylline

Acidosis \leftrightarrow Hyperkalemia
Alkalosis \leftrightarrow Hypokalemia

Table 8. Expected Compensation for Specific Acid-Base Disorders

Disturbance	P _a CO ₂ (mmHg) (normal ~40)	HCO ₃ ⁻ (mmHg) (normal ~24)
Respiratory Acidosis		
Acute	↑ 10	↑ 1
Chronic	↑ 10	↑ 3
Respiratory Alkalosis		
Acute	↓ 10	↓ 2
Chronic	↓ 10	↓ 5
Metabolic Acidosis	↓ 1	↓ 1
Metabolic Alkalosis	↑ 5-7	↑ 10

4. If there is metabolic acidosis, what is the anion gap and osmolar gap?
- anion gap = $[\text{Na}^+] - ([\text{Cl}^-] + [\text{HCO}_3^-])$; normal ≤ 10 -15 mEq/L
 - osmolar gap = measured osmolarity – calculated osmolarity = measured – $(2[\text{Na}^+] + \text{glucose} + \text{urea})$; normal ≤ 10
5. If anion gap is increased, is the change in bicarbonate the same as the change in anion gap?
- if not, consider a mixed metabolic picture

Table 9. Differential Diagnosis of Respiratory Acidosis

Increased P_aCO₂ secondary to hypoventilation**Respiratory Center Depression (Decreased RR)**

Drugs (anesthesia, sedatives, narcotics)
Trauma
Increased ICP
Encephalitis
Stroke
Central apnea
Supplemental O₂ in chronic CO₂ retainers (e.g. COPD)

Neuromuscular Disorders (Decreased Vital Capacity)

Myasthenia gravis
Guillain-Barré syndrome
Poliomyelitis
Muscular dystrophies
ALS
Myopathies
Chest wall disease (obesity, kyphoscoliosis)

Airway Obstruction (Asthma, COPD)**Parenchymal Disease**

COPD
Pulmonary edema
Pneumothorax
Pneumonia
ILD (late stage)
ARDS

Mechanical Hypoventilation (Inadequate Mechanical Ventilation)

Table 10. Differential Diagnosis of Respiratory Alkalosis

Decreased P_aCO₂ secondary to hyperventilation**Hypoxemia**

Pulmonary disease (pneumonia, edema, PE, interstitial fibrosis)
Severe anemia
Heart failure
High altitude

Respiratory Center Stimulation

CNS disorders
Hepatic failure
Gram-negative sepsis
Drugs (ASA, progesterone, theophylline, catecholamines, psychotropics)
Pregnancy
Anxiety
Pain

Mechanical Hyperventilation (Excessive Mechanical Ventilation)**ABG Normal Values**

pH 7.35-7.45
HCO₃⁻ 22-26 mEq/L
P_aCO₂ 35-45 mm Hg
P_aO₂ 80-100 mm Hg

**A-aDO₂ Gradient Calculation**

= P_AO₂ (alveolar) – P_aO₂ (arterial)
= (F_iO₂ [Patm – PH₂O] – [P_aCO₂/RQ])
– P_aO₂

**At Sea Level on Room Air**

FiO₂ = 0.21
P_{atm} = 760 mmHg
PH₂O = 47 mmHg
RQ = 0.8
Thus, A-aDO₂ Gradient on Room Air
A-aDO₂ = (150 – 1.25 [P_aCO₂]) – P_aO₂

Figure 7. Oxygen-Hb dissociation curve

**Pulmonary Shunt**

Occurs when the capillary networks of the alveoli are perfused, yet there is a lack of adequate ventilation (and thus oxygenation) in that alveolus or group of alveoli. Thus this blood enters the pulmonary venous system without being oxygenated

- see [Nephrology](#), NP15 for differential diagnosis of metabolic acidosis and alkalosis

**Factors that Shift the Oxygen-Hb Dissociation Curve to the Right**

"CADET, face right!"

CO₂
Acid
2,3-DPG
Exercise
Temperature

Approach to Hypoxemia

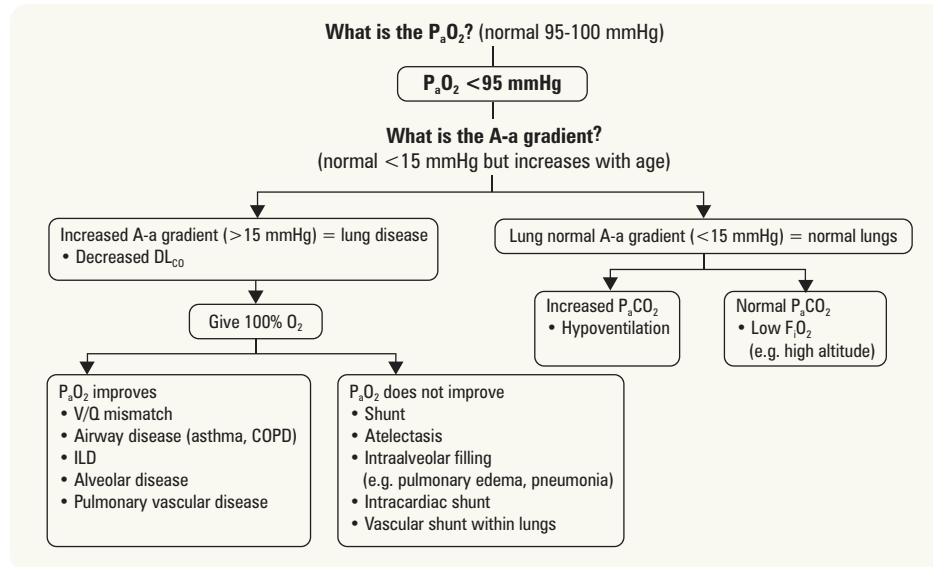

Figure 8. Approach to hypoxemia

Figure 9. Pathophysiology of shunt

Airway Obstruction (decreased FEV_1)

- Asthma
- COPD (chronic bronchitis, emphysema)
- Bronchiectasis
- Cystic fibrosis

Red Flags

Severe tachypnea/tachycardia, respiratory muscle fatigue, diminished expiratory effort, cyanosis, silent chest, decreased LOC

Central cyanosis is not detectable until SaO_2 is $< 85\%$. It is more easily detected in polycythemia and less readily detectable in anemia

Asthma Action Plan

Is a written plan developed by patients and their physicians which includes signs and symptoms for patients to recognize their current level of respiratory distress (denoted as 'green', 'yellow', or 'red/emergency' zones) and the personalized treatment options for each zone

Diseases of Airway Obstruction

Pneumonia

- see [Infectious Diseases](#), ID8

Asthma

- see [Family Medicine](#), FM15 and [Pediatrics](#), P91

Definition

- chronic inflammatory disorder of the airways resulting in episodes of reversible bronchospasm causing airflow obstruction
- associated with reversible airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli

Epidemiology

- common, 7-10% of adults, 10-15% of children
- most children with asthma significantly improve in adolescence
- often family history of atopy (asthma, allergic rhinitis, eczema)
- occupational asthma (organic allergies, isocyanates, animals, etc.)

Pathophysiology

- airway obstruction → V/Q mismatch → hypoxemia → ↑ ventilation → ↓ P_aCO₂ → ↑ pH and muscle fatigue → ↓ ventilation, ↑ P_aCO₂/↓ pH

Signs and Symptoms

- dyspnea, wheezing, chest tightness, cough (especially nocturnal), sputum
- symptoms can be paroxysmal or persistent
- signs of respiratory distress (see Figure 4)
- pulsus paradoxus

Table 11. Criteria for Determining if Asthma is Well Controlled

Daytime symptoms <4 d/wk	No asthma-related absence from work/school
Night-time symptoms <1 night/wk	β ₂ -agonist use <4 times/wk
Physical activity normal	FEV ₁ or PEF >90% of personal best
Exacerbations mild, infrequent	PEF diurnal variation <10-15%

Adapted from *Can Respir J* 2012; 19:127-164

Investigations

- O₂ saturation
- ABGs (consider in acute exacerbation, along with peak flows, in Emergency Department)
 - decreased P_aO₂ during attack (V/Q mismatch)
 - decreased P_aCO₂ in mild asthma (hyperventilation)
 - normal or increased P_aCO₂ is an ominous sign: patient is no longer able to hyperventilate (worsened airway obstruction or respiratory muscle fatigue)
- PFTs (do when stable)

Table 12. Pulmonary Function Criteria for Diagnosis of Asthma

Preferred Measurement	Alternative Measurements
Spirometry Showing Reversible Airway Obstruction (1) ↓ FEV ₁ /FVC below lower limit of normal (<0.75 to 0.8 in adults, <0.8-0.9 in children age 6+)	Peak Expiratory Flow Variability (1) ↑ in PEF after a bronchodilator or course of controller therapy <ul style="list-style-type: none"> Adults: PEF ↑ 60 L/min (min. 20%) OR Diurnal variation >8% for twice daily readings (20% for multiple daily readings) Children age 6+: PEF ↑ 20%
AND (2) ↑ FEV ₁ ≥12% (min. 200 mL in adults) after bronchodilator or controller therapy	Positive Challenge Test (1) Methacholine challenge: PC ₂₀ <4 mg/mL (4-16 mg/mL is borderline; >16 mg/mL is negative) OR (2) Post-exercise: ↓ FEV ₁ ≥10-15%

Adapted from *Can Respir J* 2012;19:127-164

Treatment

- environment: avoid triggers
- patient education: features of the disease, goals of treatment, self-monitoring
- pharmacological
 - symptomatic relief in acute episodes: short-acting β₂-agonist, anticholinergic bronchodilators, oral steroids, addition of a long acting β₂-agonist
 - long-term prevention: inhaled/oral corticosteroids, anti-allergic agents, long-acting β₂-agonists, methylxanthine, LTRA, anti-IgE antibodies (e.g. Xolair®)

Emergency Management of Asthma (see [Emergency Medicine, ER30](#))

- inhaled β₂-agonist first line (MDI route and spacer device recommended)
- systemic steroids (PO or IV, if severe)
- if severe, add anticholinergic therapy ± magnesium sulphate
- rapid sequence intubation in life-threatening cases (plus 100% O₂, monitors, IV access)
- SC/IV adrenaline if caused by anaphylaxis, IV salbutamol if unresponsive
- corticosteroid therapy at discharge

Asthma Triggers

- URTIs
- Allergens (pet dander, house dust, molds)
- Irritants (cigarette smoke, air pollution)
- Drugs (NSAIDs, β-blockers)
- Preservatives (sulphites, MSG)
- Other (emotion/anxiety, cold air, exercise, GERD)

Signs of Poor Asthma Control

DANGERS

Daytime Sx ≥4 times/wk
Activities reduced
Nighttime Sx ≥1 time/wk
GP visits
ER visits
Rescue puffer (SABA) use ≥4 times/wk
School and work absences

Consider LABA for night-time symptoms

LTRA in Addition to Usual Care for Acute Asthma in Adults and Children

Cochrane DB Syst Rev 2012;CD006100

Purpose: To determine if the addition of LTRA is beneficial to patients with acute asthma receiving inhaled bronchodilators and systemic corticosteroids.

Methods: RCTs in Cochrane Airway Group's Specialised Register of trials that compared LTRA and standard acute asthma vs. placebo and standard are in people with acute asthma of any age were included.

Results: 8 trials, 1,470 adults and 470 children. For oral treatment, no significant difference between LTRAs and control in hospital admission (RR 0.86; 95% CI 0.21-3.52) or requirement for additional care (RR 0.87; 95% CI 0.60-1.68). LTRAs improved FEV₁ in adults (mean difference 0.08; 95% CI 0.01-0.14) but not in children. No significant difference in adverse events between LTRAs and control (RR 0.81; 95% CI 0.22-2.99). Similar results were found for intravenous treatment.

Conclusions: Currently, there is no evidence to support routine use of LTRAs in acute asthma.

Natural Progression of COPD

- 40s** Chronic productive cough, wheezing occasionally
- 50s** 1st acute chest illness
- 60s** Dyspnea on exertion, increasing sputum, more frequent exacerbations
- Late Stage** Hypoxemia with cyanosis, polycythemia, hypercapnia (morning headache), cor pulmonale, weight loss

Remember, first line therapy for COPD is smoking cessation

Guidelines for Asthma Management

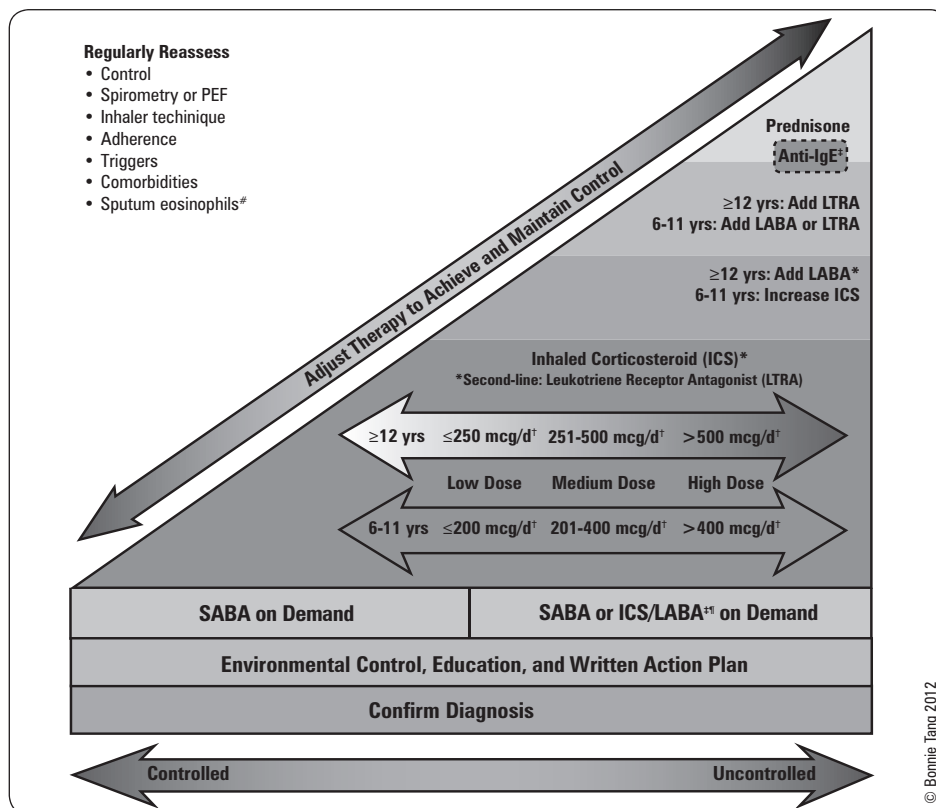

Figure 10. Guidelines for asthma management

†HFA Beclothemason or equivalent; *Second-line: LTRA; ‡Approved for 12 yr and over; †Using a formulation approved for use as a reliever; #In adults 18 yr and older with moderate to severe asthma
Adapted from *Can Respir J* 2012;19:127-164

α₁-Antitrypsin Deficiency

Inherited disorder of defective production of α₁-antitrypsin, a protein produced by hepatocytes. Acts in the alveolar tissue by inhibiting the action of proteases from destroying alveolar tissue. When deficient, proteases can destroy lung alveoli resulting in emphysema

CO₂ Retainers

On ABG, retainers have chronically elevated CO₂ levels with a normal pH. Maintain O₂ Sat between 88-92% to prevent Haldane effect and decreased respiratory drive

Pulmonary Embolism in Patients with Unexplained Exacerbation of COPD: Prevalence and Risk Factors

Ann Intern Med 2006;144:390-396

Study: Prospective cohort study of 211 patients with COPD (all current and former smokers) admitted to hospital for severe COPD exacerbation of unknown origin.

Measurements: All patients received spiral CT angiogram (CTA) and venous compression ultrasonography of both legs.

Results: 25% of patients met diagnostic criteria for PE (+ CTA or + U/S).

Conclusions: Prevalence of PE in patients hospitalized for COPD exacerbation of unknown origin is 25%. Therefore, all patients presenting to hospital with COPD exacerbation without obvious cause require PE workup (leg dopplers or CTA – decision of which to use depends on pre-test probability of the patient).

Non-Invasive Positive Pressure Ventilation for Treatment of Respiratory Failure due to Exacerbations of COPD

Cochrane DB Syst Rev 2004;CD004104

Study: Cochrane Systematic Review. 14 RCTs.

Population: 758 adult patients with COPD and acute respiratory failure due to COPD exacerbation.

Intervention: Usual medical care (UMC) and Non-invasive positive ventilation (NPPV) vs. UMC alone.

Primary Outcome: Treatment failure, mortality, and tracheal intubation.

Results: The risks for all primary outcomes were reduced with NPPV use: treatment failure (RR 0.48); mortality (RR 0.52); and intubation use (RR 0.61). Length of hospital stay was a significant mean 3.24 d shorter, but no difference between ICU length of stay. There is a small and significant improvement in pH (weight mean difference (WMD)=0.04), P_aCO₂ (WMD=-0.40 kPa), and respiratory rate (WMD=-3.08 bpm) within 1 h post-treatment with NPPV. Complications associated with treatment were reduced in the NPPV treatment arm (RR 0.38).

Conclusion: For patients in respiratory failure due to a COPD exacerbation, NPPV is effective in reducing treatment failure, mortality, and need for intubation when used as a first time treatment adjunct to UMC.

Chronic Obstructive Pulmonary Disease

- see [Family Medicine, FM15](#)

Definition

- progressive, and irreversible condition of the lung characterized by chronic obstruction to airflow with many patients having periodic exacerbations, gas trapping, lung hyperinflation, and weight loss
- 2 subtypes (chronic bronchitis or emphysema): usually coexist to variable degrees
- gradual decrease in FEV₁ over time with episodes of acute exacerbations

Table 13. Clinical and Pathologic Features of COPD*

Chronic Bronchitis	Emphysema
Defined Clinically Productive cough on most days for at least 3 consecutive months in 2 successive years Obstruction is due to narrowing of the airway lumen by mucosal thickening and excess mucus	Defined Pathologically Dilation and destruction of air spaces distal to the terminal bronchiole without obvious fibrosis Decreased elastic recoil of lung parenchyma causes decreased expiratory driving pressure, airway collapse, and air trapping
	2 Types 1) Centriacinar (respiratory bronchioles predominantly affected) • Typical form seen in smokers, primarily affects upper lung zones 2) Panacinar (respiratory bronchioles, alveolar ducts, and alveolar sacs affected) • Accounts for about 1% of emphysema cases • α ₁ -antitrypsin deficiency, primarily affects lower lobes

*Note that both chronic bronchitis and emphysema can exist without obstruction. Only if obstruction is also present is it termed COPD

Risk Factors

- smoking is #1 risk factor
- others
 - environmental: air pollution, occupational exposure, exposure to wood smoke or other biomass fuel for cooking
 - treatable factors: α₁-antitrypsin deficiency, bronchial hyperactivity
 - demographic factors: age, family history, male sex, history of childhood respiratory infections, low socioeconomic status

Signs and Symptoms

Table 14. Clinical Presentation and Investigations for Chronic Bronchitis and Emphysema

	Symptoms	Signs	Investigations
Bronchitis (Blue Bloater*)	Chronic productive cough Purulent sputum Hemoptysis Mild dyspnea initially	Cyanosis (2° to hypoxemia and hypercapnia) Peripheral edema from RVF (cor pulmonale) Crackles, wheezes Prolonged expiration if obstructive Frequently obese	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC N TLC, ↓ or N DL _{CO} CXR: AP diameter normal ↑ bronchovascular markings Enlarged heart with cor pulmonale
Emphysema (Pink Puffer*)	Dyspnea (± exertion) Minimal cough Tachypnea Decreased exercise tolerance	Pink skin Pursed-lip breathing Accessory muscle use Cachectic appearance due to anorexia and increased work of breathing Hyperinflation/barrel chest, hyperresonant percussion Decreased breath sounds Decreased diaphragmatic excursion	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC ↑ TLC (hyperinflation) ↑ RV (gas trapping) ↓ DL _{CO} CXR: ↑ AP diameter Flat hemidiaphragm (on lateral CXR) ↓ heart shadow ↑ retrosternal space Bullae ↓ peripheral vascular markings

*Note that the distinction between "blue bloaters" and "pink puffers" is more of historical than practical interest as most COPD patients have elements of both

Table 15. Treatment of Stable COPD

Treatment	Details
PROLONG SURVIVAL	
Smoking cessation	Nicotine replacement, bupropion, varenicline
Vaccination	Influenza, pneumococcal vaccine
Home oxygen	Prevents cor pulmonale and decreases mortality if used > 15h/d; indicated if (1) P _a O ₂ < 55 mmHg or (2) < 60 mmHg with cor pulmonale or polycythemia
SYMPTOMATIC RELIEF (no mortality benefit)	
Bronchodilators (mainstay of current drug therapy, used in combination)	<p>Short-acting anticholinergics (e.g. ipratropium bromide) and short-acting β₂-agonists (e.g. salbutamol, terbutaline)</p> <ul style="list-style-type: none"> SABAs: rapid onset but significant side effects at high doses (e.g. hypokalemia) Short-acting anticholinergics more effective than SABAs with fewer side effects but slower onset; take regularly rather than PRN <p>LABAs (e.g. salmeterol, formoterol, indacaterol) and long-acting anticholinergics (e.g. tiotropium bromide, glycopyrronium bromide)</p> <ul style="list-style-type: none"> More sustained effects for moderate to severe COPD <p>Inhaled corticosteroid (ICS) + LABA combination (e.g. Advair®: fluticasone + salmeterol, Symbicort®: budesonide + formoterol)</p> <ul style="list-style-type: none"> ICS/LABA increases effectiveness vs. LABA alone <p>Theophylline: weak bronchodilator; limited evidence to suggest combination with bronchodilator</p> <ul style="list-style-type: none"> Side effects: nervous tremor, nausea/vomiting/diarrhea, tachycardia, arrhythmias, sleep changes <p>PDE4 inhibitor: roflumilast (Daliresp®) anti-inflammatory medication useful in COPD with chronic bronchitis, severe airflow obstruction, frequent exacerbations</p>
Corticosteroids	ICS monotherapy is contraindicated and ICS should only be used with a LABA in combination in patients with a history of exacerbations COPD airways are usually inflamed but often not responsive to steroids, therefore avoid chronic systemic glucocorticoids (although oral steroids are very important when treating exacerbations)
Surgical	Lung volume reduction surgery (resection of emphysematous parts of lung, associated with higher mortality if FEV ₁ < 20%), lung transplant Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance
Other	Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance

Remember to step down therapy to lowest doses which control symptoms/signs of bronchoconstriction

**Complications of COPD**

- Polycythemia 2° to hypoxemia
- Chronic hypoxemia
- Pulmonary HTN from vasoconstriction
- Cor pulmonale
- Pneumothorax due to rupture of emphysematous bullae

**Influenza Vaccine for Patients with Chronic Obstructive Pulmonary Disease**

Cochrane DB Syst Rev 2006;1:CD002733

Study: Cochrane Systematic Review. 11 RCTs included, 6 specifically in COPD patients.

Population: Six of the studies were done on COPD patients in particular, while the others were on elderly and high-risk individuals. Asthma patients were excluded.

Intervention: Live or inactivated virus vaccines vs. placebo.

Outcome: Exacerbation rates, hospitalizations, mortality, lung function and adverse effects.

Results: In patients with COPD, inactive vaccine correlated with fewer exacerbations per vaccinated subject than placebo (weighted mean difference (WMD) -0.37, 95% CI -0.64 to -0.11). Inactivated vaccine resulted in fewer influenza-related infections than placebo (WMD 0.19, 95% CI 0.07-0.48). There was also an increased risk of local mild, transient adverse reactions with the vaccine.

Conclusions: There appears to be a reduction in influenza related infections, as well as exacerbations in patients with COPD receiving the vaccine.

**Systemic Corticosteroids for Acute Exacerbations of Chronic Obstructive Pulmonary Disease**

Cochrane DB Syst Rev 2009;1:CD001288

Study: Cochrane Systematic Review. 10 RCTs contributed data for analysis.

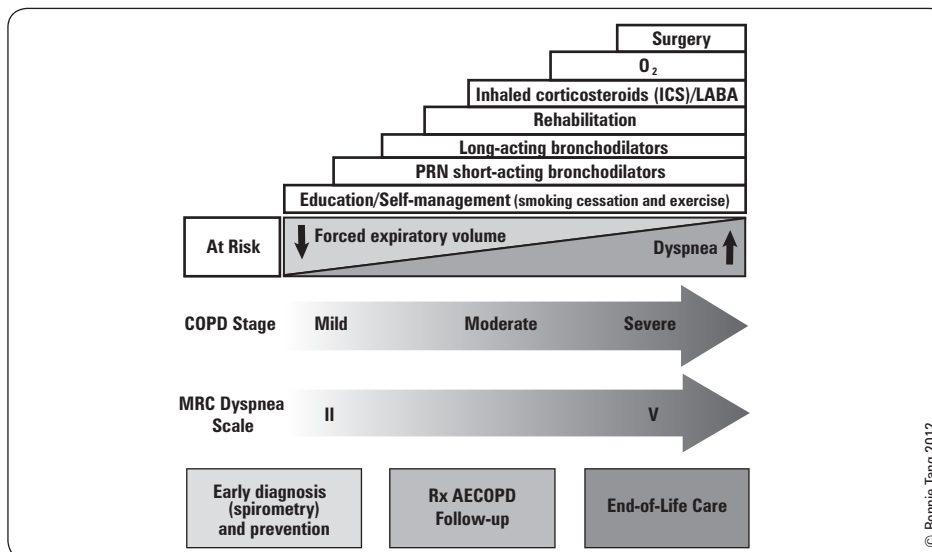

Population: 1,051 total patients with COPD experiencing acute exacerbations.

Intervention: Oral or parenteral corticosteroids vs. placebo.

Outcome: Rate of treatment failure, length of hospitalization, FEV₁.

Results: Patients receiving corticosteroids experienced fewer treatment failures than placebo (OR 0.50, 95% CI 0.36-0.69). The length of stay in hospital was shorter in patients receiving steroids (-1.22 d, 95% CI -2.26 to -0.18). There was also an improvement in FEV₁ at 72 h (140 mL, 95% CI 90-190) and at end of treatment (up to 15 d) (80 mL, 95% CI 10-160). The risk of hypoglycemia was increased (OR 4.95, 95% CI 2.47-9.91).

Conclusions: There appears to be a reduction in rate of treatment failure, reduced length of hospitalization and improved FEV₁ in patients receiving corticosteroid treatment for an acute exacerbation of COPD. However, there is also an increase in significant adverse effects. The ideal length of treatment remains controversial.

© Bonnie Tang 2012

Figure 11. Guidelines for COPD management

Adapted from Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease. Can Respir J 2008;(Suppl A):15

Acute Exacerbations of COPD**• definition**

- sustained (>24-48 h) worsening of dyspnea, cough, or sputum production leading to an increased use of medications

• etiology: viral URTI, bacteria, air pollution, CHF, PE, MI must be considered**• management**

- ABCs, consider assisted ventilation if decreasing LOC or poor ABGs
- O₂: target 88-92% SaO₂ for CO₂ retainers
- bronchodilators by MDI with spacer or nebulizer
 - ♦ SABA + anticholinergic, e.g. salbutamol and ipratropium bromide via nebulizers x 3 back-to-back q15min
- systemic corticosteroids: IV solumedrol or oral prednisone
- antibiotics if purulent sputum
 - ♦ simple exacerbation (no risk factors): amoxicillin, 2nd or 3rd generation cephalosporin, macrolide, or TMP/SMX
 - ♦ complicated exacerbation (one of: FEV₁ ≤50% predicted, ≥4 exacerbations per year, ischemic heart disease, home O₂ use, chronic oral steroid use): fluoroquinolone or β-lactam + β-lactamase inhibitor (amoxicillin/clavulanate)
- post exacerbation: rehabilitation with general conditioning to improve exercise tolerance
- ICU admission
 - for life threatening exacerbations
 - ventilatory support
 - ♦ non-invasive: NPPV, BiPAP
 - ♦ conventional mechanical ventilation

Prognosis in COPD

- prognostic factors
 - level of dyspnea is the single best predictor
 - development of complications, e.g. hypoxemia or cor pulmonale
- 5 yr survival
 - FEV₁ <1 L = 50%
 - FEV₁ <0.75 L = 33%
- BODE index for risk of death in COPD
 - greater score = higher probability the patient will die from COPD; score can also be used to predict hospitalization
 - 10 point index consisting of four factors
 - ♦ Body mass index (BMI): <21 (+1 point)
 - ♦ Obstruction (FEV₁): 50-64% (+1), 36-49% (+2), <35% (+3)
 - ♦ Dyspnea (MRC scale): walks slower than people of same age on level surface, stops occasionally (+1), stops at 100 yards or a few minutes on the level (+2), too breathless to leave house or breathless when dressing/undressing (+3)
 - ♦ Exercise capacity (6 minute walk distance): 250-349 m (+1), 150-249 m (+2), <149 m (+3)

Bronchiectasis

Definition

- irreversible dilatation of airways due to inflammatory destruction of airway walls resulting from persistently infected mucus
- usually affects medium sized airways
- P. aeruginosa* is the most common pathogen; *S. aureus*, *H. influenzae*, and nontuberculous mycobacteria also common

Table 16. Etiology and Pathophysiology of Bronchiectasis

Obstruction	Post-infection (results in dilatation of bronchial walls)	Impaired defenses (leads to interference of drainage, chronic infections and inflammation)
Tumor	Pneumonia	Hypogammaglobulinemia
Foreign body	TB	CF
Thick mucus	Measles	Defective leukocyte function
	Pertussis	Ciliary dysfunction (Kartagener's syndrome: bronchiectasis, sinusitis, situs invs.)
	Allergic bronchopulmonary aspergillosis	
	MAC	

Signs and Symptoms

- chronic cough, purulent sputum (but 10-20% have dry cough), hemoptysis (can be massive), recurrent pneumonia, local crackles (inspiratory and expiratory), wheezes
- clubbing
- may be difficult to differentiate from chronic bronchitis

Investigations

- PFTs: often demonstrate obstructive pattern but may be normal
- CXR
 - nonspecific: increased markings, linear atelectasis, loss of volume in affected areas
 - specific: "tram tracking" – parallel narrow lines radiating from hilum, cystic spaces, honeycomb like structures
- high-resolution thoracic CT (diagnostic, gold standard)
 - 87-97% sensitivity, 93-100% specificity
 - "signet ring": dilated bronchi with thickened walls where diameter bronchus > diameter of accompanying artery
- sputum cultures (routine + AFB)
- serum Ig levels
- sweat chloride if cystic fibrosis suspected (upper zone predominant)

Treatment

- vaccination: influenza and Pneumovax®
- antibiotics (oral, IV, inhaled): routinely used for mild exacerbations, driven by sputum sensitivity; macrolides may be used chronically for an anti-inflammatory effect
- inhaled corticosteroids: decrease inflammation and improve FEV₁
- oral corticosteroids for acute, major exacerbations
- chest physiotherapy, breathing exercises, physical exercise
- pulmonary resection: in selected cases with focal bronchiectasis

Cystic Fibrosis

- see [Pediatrics](#), P92

Pathophysiology

- chloride transport dysfunction: thick secretions from exocrine glands (lung, pancreas, skin, reproductive organs) and blockage of secretory ducts

Clinical Features

- results in severe lung disease, pancreatic insufficiency, diabetes, and azoospermia
- other manifestations: meconium ileus in infancy, distal ileal obstruction in adults, sinusitis, liver disease
- chronic lung infections
 - S. aureus*: early
 - P. aeruginosa*: most common
 - B. cepacia*: worse prognosis but less common
 - Aspergillus fumigatus*

Usually presents in childhood as recurrent lung infections that become persistent and chronic

Investigations

- sweat chloride test
 - increased concentrations of NaCl and K⁺ ([Cl⁻] >60 mEq/L is diagnostic in children)
 - heterozygotes have normal sweat tests (and no symptoms)
- PFTs
 - early: airflow limitation in small airways
 - late: severe airflow hyperinflation, gas trapping, decreased DL_{CO} (very late)

- ABGs
 - hypoxemia, hypercapnia later in disease with eventual respiratory failure and cor pulmonale
- CXR
 - hyperinflation, increased pulmonary markings (especially upper lobes)

Treatment

- chest physiotherapy and postural drainage
- bronchodilators (salbutamol ± ipratropium bromide)
- inhaled mucolytic (reduces mucus viscosity), hypertonic saline DNase
- inhaled tobramycin
- antibiotics (e.g. ciprofloxacin)
- lung transplant
- pancreatic enzyme replacements

Prognosis

- depends on: infections (cepacia colonization), FEV₁, acute pulmonary exacerbations, lung transplant vs. non-lung transplant

Interstitial Lung Disease

Definition

- a group of disorders which cause progressive scarring of lung tissue
- this scarring can eventually impair breathing and bloodstream oxygenation

Pathophysiology

- inflammatory and/or fibrosing process in the alveolar walls → distortion and destruction of normal alveoli and microvasculature
- typically associated with
 - lung restriction (decrease in TLC and VC)
 - decreased lung compliance (increased or normal FEV₁/FVC)
 - impaired diffusion (decreased DL_{CO})
 - hypoxemia due to V/Q mismatch (usually without hypercapnia until end stage)
 - pulmonary HTN and cor pulmonale occur with advanced disease secondary to hypoxemia and blood vessel destruction

Etiology

- >100 known disorders can cause ILD
- majority due to unknown agents or cause

Table 17. Interstitial Lung Diseases

UNKNOWN ETIOLOGY		
Idiopathic interstitial pneumonias	Sarcoidosis	
UIP (usual interstitial pneumonia e.g. IPF)	Langerhans-cell histiocytosis (eosinophilic granuloma)	
NSIP (non-specific interstitial pneumonia)	Lymphangioleiomyomatosis	
LIP (lymphocytic interstitial pneumonia)	Tuberous sclerosis	
COP (cryptogenic organizing pneumonia e.g. BOOP)		
KNOWN ETIOLOGY		
ILD Associated with Systemic Rheumatic Disorders	ILD Associated with Drugs or Treatments	Inherited Disorders
Scleroderma	Antibiotics (nitrofurantoin)	Familial IPF
Rheumatoid arthritis	Anti-inflammatory agents (methotrexate)	Telomerase mutations
SLE	Cardiovascular drugs (amiodarone)	Neurofibromatosis
Polymyositis/dermatomyositis	Antineoplastic agents (chemotherapy agents)	Tuberous sclerosis
Anti-synthetase syndromes	Illicit drugs	Gaucher's disease
Mixed connective tissue disease	Radiation	
Environment/Occupation Associated ILD	ILD Associated with Pulmonary Vasculitis	Alveolar Filling Disorders
Hypersensitivity pneumonitis (usually organic antigen)	Granulomatosis with Polyangiitis (GPA)	Chronic eosinophilic pneumonia
Farmer's lung	Goodpasture's syndrome	Pulmonary alveolar proteinosis
Air conditioner/humidifier lung	Idiopathic pulmonary hemosiderosis	
Bird breeder's lung		
Pneumoconioses (inorganic dust)		
Silicosis		
Asbestosis		
Coal worker's pneumoconiosis		
Chronic beryllium disease		
Pneumonitis from gases/fumes/vapour		

In ILD think
FASSTEN and **BAD RASH**

Upper Lung Disease (FASSTEN)

Farmer's lung (hypersensitivity pneumonitis)
Ankylosing spondylitis
Sarcoidosis
Silicosis
TB
Eosinophilic granuloma (Langerhans-cell histiocytosis)
Neurofibromatosis

Lower Lung Disease (BAD RASH)

Bronchiolitis obliterans with organizing pneumonia (BOOP)
Asbestosis
Drugs (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)
Rheumatologic disease
Aspiration
Scleroderma
Hamman Rich (acute interstitial pneumonia) and IPF

Signs and Symptoms

- SOB, especially on exertion
- nonproductive cough
- crackles (dry, fine, end-inspiratory)
- clubbing (especially in IPF and asbestosis)
- features of cor pulmonale
- note that signs and symptoms vary with underlying disease process
 - e.g. sarcoidosis is seldom associated with crackles and clubbing

Investigations

- CXR/high resolution CT (see [Medical Imaging, MI7](#))
 - usually decreased lung volumes
 - reticular, nodular, or reticulonodular pattern (nodular <3 mm)
 - hilar/mediastinal adenopathy (especially in sarcoidosis)
- PFTs
 - restrictive pattern: decreased lung volumes and compliance
 - normal or increased FEV₁/FVC (>70-80%), e.g. flow rates are often normal or high when corrected for absolute lung volume
 - DL_{CO} decreased due to V/Q mismatch less surface area for gas exchange ± pulmonary vascular disease
- ABGs
 - with progression of disease, hypoxemia and respiratory alkalosis may be present
- other
 - bronchoscopy, bronchoalveolar lavage, lung biopsy
 - ESR, ANA (lupus), RF (RA), serum-precipitating antibodies to inhaled organic antigens (hypersensitivity pneumonitis), c-ANCA (GPA)

The CXR can be normal in up to 15% of patients with interstitial lung disease

Unknown Etiologic Agents

**IDIOPATHIC PULMONARY FIBROSIS****Definition**

- also known as usual interstitial pneumonia or cryptogenic fibrosing alveolitis
- a progressive, irreversible condition characterized by fibrosis of lung parenchyma with no known cause
 - chest CT usually shows honeycomb lung, lung biopsy shows UIP (usual interstitial pneumonia) pattern
 - ♦ commonly presents over age 50, incidence rises with age; males > females
- DDx
 - other idiopathic interstitial pneumonia, especially NSIP, but also COP and:
 - ♦ desquamative interstitial pneumonitis (DIP)
 - ♦ lymphocytic interstitial pneumonitis (LIP): usually 2° to immune conditions such as HIV (mostly in children), Sjögren's

**IPF Prevalence**

- Age 35-44: 2-7 per 100,000
- Age >75: 175 per 100,000

Signs and Symptoms

- commonly presents over age 50, incidence rises with age; males > females
- dyspnea on exertion, nonproductive cough, constitutional symptoms, late inspiratory fine crackles at lung bases, clubbing

Investigations

- labs (nonspecific, autoimmune serology usually negative)
- CXR: reticular or reticulonodular pattern with lower lung predominance; may appreciate honeycombing in advanced disease
- high resolution CT: lower zone peripheral reticular markings, traction bronchiectasis, honeycombing, ground glass not prominent in IPF
- biopsy: rarely for UIP as honeycombing makes radiologic diagnosis possible

Treatment

- O₂
- N-acetylcysteine (anti-oxidant)
- lung transplantation for advanced disease
- mean survival of 3 to 5 yr after diagnosis

SARCOIDOSIS**Definition**

- idiopathic non-infectious granulomatous multi-system disease with lung involvement in 90%
- characterized pathologically by non-caseating granulomas
- numerous HLA antigens have been shown to play a role and familial sarcoidosis is now recognized

Epidemiology

- typically affects young and middle-aged patients
- higher incidence among African Americans and people at northern latitudes e.g. Scandinavia, Canada

Signs and Symptoms

- asymptomatic, cough, dyspnea, fever, arthralgia, malaise, erythema nodosum, chest pain
- chest exam often normal
- common extrapulmonary manifestations
 - cardiac (arrhythmias, sudden death)
 - eye involvement (anterior or posterior uveitis)
 - skin involvement (skin papules, erythema nodosum, lupus pernio)
 - peripheral lymphadenopathy
 - arthralgia
 - hepatomegaly ± splenomegaly
- less common extra-pulmonary manifestations involve bone, CNS, and kidney, cardiac (arrhythmias, sudden death)
- two acute sarcoid syndromes
 - Lofgren's syndrome: fever, erythema nodosum, bilateral hilar lymphadenopathy, arthralgias
 - Heerfordt-Waldenstrom syndrome: fever, parotid enlargement, anterior uveitis, facial nerve palsy

Investigations

- CBC (cytopenias from spleen or marrow involvement)
- serum electrolytes, creatinine, liver enzymes, calcium (hypercalcemia/hypercalciuria due to vitamin D activation by granulomas)
- hypergammaglobulinemia, occasionally RF positive
- elevated serum ACE (non-specific and non-sensitive)
- CXR: predominantly nodular opacities especially in upper lung zones ± hilar adenopathy
- PFTs: normal, obstructive pattern, restrictive pattern with normal flow rates and decreased DL_{CO} , or mixed obstructive/restrictive
- ECG: to rule out conduction abnormalities
- slit-lamp eye exam: to rule out uveitis

Diagnosis

- biopsy
 - transbronchial lung biopsy, transbronchial lymph node aspiration, endobronchial ultrasound guided surgical (EBUS) biopsy, or mediastinoscopic lymph node biopsy for granulomas
 - in ~75% of cases, transbronchial biopsy shows granulomas in the parenchyma even if the CXR is normal

Staging

- radiographic, based on CXR
 - Stage 0: normal radiograph
 - Stage I: bilateral hilar lymphadenopathy ± right paratracheal lymphadenopathy
 - Stage II: bilateral hilar lymphadenopathy and diffuse interstitial disease
 - Stage III: interstitial disease only (reticulonodular pattern or nodular pattern)
 - Stage IV: pulmonary fibrosis (honeycombing)

Treatment

- 85% of stage I resolve spontaneously
- 50% of stage II resolve spontaneously
- steroids for symptoms, declining lung function, hypercalcemia, or involvement of eye, CNS, kidney, or heart (not for abnormal CXR alone)
- methotrexate or other immunosuppressives occasionally used

Prognosis

- approximately 10% mortality secondary to progressive fibrosis of lung parenchyma

Most common presentation: asymptomatic CXR finding

Hilar adenopathy refers to enlargement of mediastinal lymph nodes which is most often seen by standard CXR as spherical/ellipsoidal and/or calcified nodes

If unilateral – think neoplasia, TB, or sarcoid

If bilateral – think sarcoid or lymphoma

**Corticosteroids for Pulmonary Sarcoidosis**

Cochrane DB Syst Rev 2005;CD001114

Study: Meta-analysis of 13 RCTs involving 1,066 participants examining the use of steroids (oral or inhaled) in sarcoidosis.

Results: Oral steroids demonstrated an improvement in CXR (RR 1.46, 95% CI 1.01-2.09). For inhaled corticosteroids, two studies showed no improvement in lung function and one study showed an improvement in diffusing capacity. No data on side-effects.

Conclusions: Oral steroids improve CXR findings and global scores of CXR, symptoms, and spirometry over 3-24 mo, but do not improve lung function or modify disease course. Oral steroids may be of benefit for patients with Stage 2 and 3 disease.

Known Etiologic Agents

HYPERSENSITIVITY PNEUMONITIS

- also known as extrinsic allergic alveolitis
- non-IgE mediated inflammation of lung parenchyma (acute, subacute, and chronic forms)
- caused by sensitization to inhaled agents, usually organic dust
- pathology: airway-centered, poorly formed granulomas and lymphocytic inflammation
- exposure usually related to occupation or hobby
 - Farmer's Lung (*Thermophilic actinomycetes*)
 - Bird Breeder's/Bird Fancier's Lung (immune response to bird IgA)
 - Humidifier Lung (*Aureobasidium pullulans*)
 - Sauna Taker's Lung (*Aureobasidium spp.*)

Signs and Symptoms

- acute presentation: (4-6 h after exposure)
 - dyspnea, cough, fever, chills, malaise (lasting 18-24 h)
 - CXR: diffuse infiltrates
 - type III (immune complex) reaction
- subacute presentation: more insidious onset than acute presentation
- chronic presentation
 - insidious onset
 - dyspnea, cough, malaise, anorexia, weight loss
 - PFTs: progressively restrictive
 - CXR: predominantly upper lobe reticulonodular pattern
 - type IV (cell mediated, delayed hypersensitivity) reaction (see [Rheumatology, R2](#))
- in both acute and chronic reactions, serum precipitins may be detectable (neither sensitive nor specific)

Calcified diaphragmatic plaques are highly suggestive of asbestosis, especially if bilateral

CXR Fibrotic Patterns

- Asbestosis: lower > upper lobes
- Silicosis: upper > lower lobes
- Coal: upper > lower lobes

Treatment

- early diagnosis: avoidance of further exposure is critical as chronic changes are irreversible
- systemic corticosteroids can relieve symptoms and speed resolution

Remember to involve occupational health at place of work for data collection and treatment plan. Also counsel re: worker's insurance as per jurisdiction (e.g. Workers Safety Insurance Board [WSIB] in Ontario)

PNEUMOCONIOSES

- reaction to inhaled inorganic dusts 0.5-5 µm in size
- no effective treatment, therefore key is exposure prevention through the use of protective equipment
- smoking cessation, annual influenza and pneumococcal vaccination, rehabilitation, lung transplant for endstage disease

Table 18. Pneumoconioses

Diagnosis	Etiology	Symptoms	Investigations	Complications
Asbestosis	Exposure risks: insulation, shipyard, construction, brake linings, pipe fitters, plumbers Slowly progressive diffuse interstitial fibrosis induced by inhaled asbestos fibers Usually > 10-20 yr of exposure; may develop with shorter but heavier exposure; typically prolonged interval (20-30 yr) between exposure and clinical disease	Insidious onset SOB Cough: paroxysmal, non-productive Fine end-respiratory crackles (increased at bases) Clubbing (much more likely in asbestosis than silicosis or CWP)	CXR Lower > upper lobe Reticulonodular pattern, may develop IPF-like honeycombing Asbestos exposure can also cause pleural and diaphragmatic plaques (± calcification), pleural effusion, round atelectasis Microscopic examination reveals ferruginous bodies: yellow-brown rod-shaped structures which represent asbestos fibers coated in macrophages	Asbestos exposure increases risk of bronchogenic CA and malignant mesothelioma Risk of lung cancer dramatically increased for smokers
Silicosis	At risk population: sandblasters, rock miners, stone cutters, quarry and highway workers Generally requires > 20 yr exposure; may develop with much shorter but heavier exposure	Dyspnea, cough, and wheezing	CXR Upper > lower lobe Early: nodular disease (simple pneumoconiosis), lung function usually normal Late: nodules coalesce into masses (progressive massive fibrosis) Possible hilar lymph node enlargement (frequently calcified), especially "egg shell" calcification	Mycobacterial infection (e.g. TB)
Coal Worker's Pneumoconiosis (CWP)	At risk population: coal workers, graphite workers Coal and silica, coal is less fibrogenic than silica	Pathologic hallmark is coal macule Simple CWP No signs or symptoms, usually normal lung function Complicated CWP (also known as progressive massive fibrosis) Dyspnea Course: few patients progress to complicated CWP	Simple CWP CXR: multiple nodular opacities, mostly upper lobe Complicated CWP CXR: opacities larger and coalesce	Caplan's syndrome: rheumatoid arthritis and CWP present as larger nodules

ILD ASSOCIATED WITH DRUGS OR TREATMENTS

Drug-Induced

- antineoplastic agents: bleomycin, mitomycin, busulfan, cyclophosphamide, methotrexate, chlorambucil, BCNU (carmustine)
- antibiotics: nitrofurantoin, penicillin, sulfonamide
- cardiovascular drugs: amiodarone, tocainide
- anti-inflammatory agents: methotrexate, penicillamine
- gold salts
- illicit drugs (heroin, methadone)
- rituximab, anti-TNF-α agents (infliximab, etanercept, adalimumab)

Radiation-Induced

- early pneumonitis: approximately 6 wk post-exposure
- late fibrosis: 6-12 mo post-exposure
- infiltrates conform to the shape of the radiation field

Pulmonary Vascular Disease

Pulmonary Hypertension

Definition

- mean pulmonary arterial pressure >25 mmHg at rest and >30 mmHg with exercise, or a systolic pulmonary artery pressure of >40 mmHg at rest
- in the past, pulmonary HTN was classified as primary or secondary pulmonary HTN, but this classification was modified to a more clinically useful, treatment based classification

Table 19. World Health Organization Classification of Pulmonary HTN

Classification	Some Causes	Treatment Options	Consider in All Patients with PH
I. Pulmonary Arterial HTN	Idiopathic Collagen vascular disease (scleroderma, SLE, RA) Congenital systemic-to-pulmonary shunts (Eisenmenger syndrome) Portopulmonary HTN HIV infection Drugs and toxins (e.g. anorexigens) Pulmonary veno-occlusive disease Schistosomiasis Pulmonary capillary hemangiomatosis Sickle cell disease	No effective treatment CCBs or advanced therapy often needed The latter includes: prostanoids, endothelin receptor antagonists, PDE5 inhibitors Lung transplantation	Oxygen therapy Exercise Consider anticoagulation
II. Pulmonary HTN due to Left Heart Disease	Left-sided atrial or ventricular heart disease (e.g. LV dysfunction) Left-sided valvular heart disease (e.g. aortic stenosis, mitral stenosis)	Treat underlying heart disease	
III. Pulmonary HTN due to Lung Disease and/or Hypoxia	Parenchymal lung disease (COPD, interstitial fibrosis, cystic fibrosis) Chronic alveolar hypoxia (chronic high altitude, alveolar hypoventilation disorders, sleep disordered breathing)	Treat underlying cause of hypoxia and correct with supplemental oxygen (proven mortality benefit)	
IV. Chronic Thromboembolic Pulmonary HTN (CTEPH)	Thromboembolic obstruction of proximal pulmonary arteries Obstruction of distal pulmonary arteries – PE (thrombus, foreign material, tumor, <i>in situ</i> thrombosis)	Anticoagulation, thromboendarterectomy	
V. Pulmonary HTN with Unclear Multifactorial Mechanisms	Hematologic disorders Systemic disorders (e.g. sarcoidosis) Metabolic disorders Extrinsic compression of central pulmonary veins (tumor, adenopathy, fibrosing mediastinitis)	Treat underlying cause	

Adapted from: Simonneau G, et al. J Am Coll Cardio 2009;54(1 Suppl):S43-S54

Mechanisms of Pulmonary HTN (Simplified)

- hypoxic vasoconstriction
 - chronic hypoxia causes pulmonary vasoconstriction by a variety of actions on the pulmonary artery endothelium and smooth muscle cells, such as: down regulation of endothelial nitric oxide synthase and alteration of voltage gated potassium channels leading to vasoconstriction
 - causes: COPD, chronic alveolar hypoxia
- decreased area of pulmonary vascular bed
 - leads to a rise in resting pulmonary arterial pressure
 - causes: collagen vascular disease, HIV infection, drugs and toxins, thrombotic or embolic disease, inflammatory, pulmonary capillary hemangiomatosis, interstitial fibrosis, CF
- volume and pressure overload
 - significant HTN only occurs with excessive volume overload, since pulmonary artery pressure will not rise in otherwise normal lung until pulmonary blood flow exceeds 2.5x the basal rate
 - causes: congenital systemic to pulmonary shunts (e.g. VSD, ASD, PDA), portopulmonary HTN, left-sided heart conditions, pulmonary veno-occlusive disease, extrinsic compression of central pulmonary veins

Pulmonary arterial pressures are measured by pulmonary artery catheters (i.e. Swan-Ganz catheter) which are inserted into a large vein (often internal jugular). A balloon at the end of the catheter tip is inflated causing the catheter to advance through the right side of the heart and into the pulmonary artery. This allows for the measurement of RA, RV, PA, and pulmonary capillary wedge pressures as well as sampling of mixed venous blood. A thermistor near the end of the catheter also allows for assessment of cardiac output by thermodilution

IDIOPATHIC PULMONARY ARTERIAL HTN (i.e. PRIMARY PULMONARY HTN)

Definition

- pulmonary HTN in the absence of a demonstrable cause
- exclude
 - left-sided cardiac valvular disease
 - myocardial disease
 - congenital heart disease
 - any clinically significant parenchymal lung disease
 - systemic connective-tissue disease
 - chronic thromboembolic disease

Epidemiology

- usually presents in young women (20-40 yr); mean age of diagnosis is 36 yr
- most cases are sporadic; familial predisposition in 10% of cases, some linked to mutations in BMPR2
- may be associated with the use of anorexic drugs (e.g. Aminorex®, Fenfluramine®), amphetamines and cocaine

Signs and Symptoms

Table 20. Signs and Symptoms of Pulmonary HTN

Symptoms	Signs
Dyspnea	Loud, palpable P ₂
Fatigue	RV heave
Substernal chest pain	Right-sided S ₄ (due to RVH)
Syncope	Systolic murmur (tricuspid regurgitation [TR])
Symptoms of underlying disease	If RV failure: right sided S ₃ , increased JVP, positive HJR, peripheral edema, TR Reynaud's phenomenon

Investigations

- CXR: enlarged central pulmonary arteries, cardiac changes due to RV enlargement (filling of retrosternal air space)
- ECG
 - RVH/right-sided strain (see [Cardiology and Cardiac Surgery, C7](#))
- 2-D echo doppler assessment of right ventricular systolic pressure
- cardiac catheterization: direct measurement of pulmonary artery pressures (necessary to confirm diagnosis)
- PFTs to asses for underlying lung disease: DL_{CO} usually reduced; volumes and flows normal
- CT angiogram to assess lung parenchyma and possible PE
- V/Q scan ± pulmonary angiogram to rule out thromboembolic disease
- serology: ANA positive in 30% of patients with primary pulmonary HTN; other serologic markers can be used in the appropriate clinical setting

Treatment

- see [Table 19](#)

Prognosis

- 2-3 yr mean survival from time of diagnosis
- survival decreases to approximately 1 yr if severe pulmonary HTN or right-heart failure

Pulmonary Embolism

Definition

- lodging of a blood clot in the pulmonary arterial tree with subsequent increase in pulmonary vascular resistance, impaired V/Q matching, and possibly reduced pulmonary blood flow

Etiology and Pathophysiology

- one of the most common causes of preventable death in the hospital
- proximal leg thrombi (popliteal, femoral, or iliac veins) are the source of most clinically recognized pulmonary emboli
- thrombi often start in calf, but must propagate into proximal veins to create a sufficiently large thrombus for a clinically significant PE
- fewer than 30% of patients have clinical evidence of DVT (e.g. leg swelling, pain, or tenderness)
- always suspect PE if patient develops fever, sudden dyspnea, chest pain, or collapse 1-2 wk after surgery

Guidelines for Vasodilator Response in Pulmonary Arterial HTN

- Patients with IPAH that respond to vasodilators acutely, have an improved survival with long-term use of CCBs
- Vasoreactivity testing: short-acting agent such as IV epoprostenol, IV adenosine, or inhaled NO
- Positive vasodilator response: mean PAP fall of at least 10 mmHg to ≤40 mmHg with an increased or unchanged cardiac output (European Society of Cardiology)
- Positive vasodilator response: should be considered as candidate for trial of oral CCB therapy

Medical Therapy for Pulmonary Arterial HTN. ACCP Evidence-Based Clinical Practice Guidelines. *Chest* 2004;(Suppl)06:126

Virchow's Triad

- Venous stasis
- Endothelial cell damage
- Hypercoagulable states

Multidetector Computed Tomography for Acute Pulmonary Embolism (PIOPED II Trial)

NEJM 2006;354:2317-2327

Study: Multicenter, prospective study investigating accuracy of computed tomography angiography (CTA) alone and combined with venous phase imaging (CTA-CTV) for the diagnosis of PE.

Patients: 824 patients of several thousand eligible for study received reference diagnosis to confirm absence or presence of PE (V/Q scan, venous compression U/S of lower extremities, and pulmonary digital-subtraction angiography [DSA] if necessary). To confirm absence, patients in whom PE was excluded were telephoned 3-6 mo after enrollment. Any deaths were reviewed by an outcome committee. All patients enrolled also underwent clinical assessment of PE (including a Wells score) prior to imaging.

Outcomes: Diagnosis of pulmonary embolism.

Results: 773 of 824 patients had adequate CTAs for interpretation. PE was diagnosed in 192 of the 824 patients. Sensitivity was 83% (150 of 181 patients, 95% CI 0.76-0.92) and specificity was 96% (567 of 592 patients, 95% CI 0.93-0.97). However, the predictive value of CTA-CTV varied when clinical pre-test probability was taken into account. PPV of CTA for high, intermediate and low clinical probability were 96% (95% CI 0.78-0.99), 92% (95% CI 0.84-0.96), and 58% (95% CI 0.40-0.73) respectively. NPV of CTA for high, intermediate and low clinical probability were 60% (95% CI 0.32-0.83), 89% (95% CI 0.82-0.93), and 96% (95% CI 0.92-0.98) respectively.

Conclusion: CTA is effective for diagnosing or excluding PE in accordance with assessment of clinical pretest probability. When clinical probability is inconsistent with imaging results, further investigations are required to rule out PE.

Risk Factors

- stasis
 - immobilization: paralysis, stroke, bed rest, prolonged sitting during travel, immobilization of an extremity after fracture
 - obesity, CHF
 - chronic venous insufficiency
- endothelial cell damage
 - post-operative injury, trauma
- hypercoagulable states
 - underlying malignancy (particularly adenocarcinoma)
 - cancer treatment (chemotherapy, hormonal)
 - exogenous estrogen administration (OCP, HRT)
 - pregnancy, post-partum
 - prior history of DVT/PE, family history
 - nephrotic syndrome
 - coagulopathies: Factor V Leiden, Prothrombin 20210A variant, inherited deficiencies of antithrombin/protein C/protein S, antiphospholipid antibody, hyperhomocysteinemia, increased Factor VIII levels, and myeloproliferative disease
- increasing age

Investigations (if highly suspicious, go straight to CT angiogram)

- see [Emergency Medicine, Figure 13, ER34](#)

Table 21. Common Investigations for Pulmonary Embolism

Investigation	Purpose/Utility
Pulmonary Angiogram (Gold Standard)	Filling defect indicative of embolus; negative angiogram excludes clinically relevant PE More invasive, and harder to perform than CT, therefore done infrequently
D-Dimer	Highly sensitive D-dimer result can exclude DVT/PE if pretest probability is already low Little value if pretest probability is high If D-dimer positive, will need further evaluation with compression U/S
CT Angiogram	Both sensitive and specific for PE Diagnosis and management uncertain for small filling defects CT may identify an alternative diagnosis if PE is not present CT scanning of the proximal leg and pelvic veins can be done at the same time and may be helpful
Venous Duplex U/S or Doppler	With leg symptoms Positive test rules in proximal DVT Negative test rules out proximal DVT Without leg symptoms Positive test rules in proximal DVT Negative test does not rule out a DVT: patient may have non-occlusive or calf DVT
ECG	Findings not sensitive or specific Sinus tachycardia most common; may see non-specific ST segment and T wave changes RV strain, RAD, RBBB, S1-Q3-T3 with massive embolization
CXR	Frequently normal; no specific features Atelectasis (subsegmental), elevation of a hemidiaphragm Pleural effusion: usually small Hampton's hump: cone-shaped area of peripheral opacification representing infarction Westermark's sign: dilated proximal pulmonary artery with distal oligemia/decreased vascular markings (difficult to assess without prior films) Dilatation of proximal PA: rare
V/Q Scan	Very sensitive but low specificity Order scan if CXR normal, no COPD Contraindication to CT (contrast allergy, renal dysfunction, pregnancy) Avoid V/Q scan if CXR abnormal or COPD Inpatient Suspect massive PE Results Normal: excludes the diagnosis of PE High probability: most likely means PE present, unless pre-test probability is low 60% of V/Q scans are nondiagnostic
Echocardiogram	Useful to assess massive or chronic PE Not routinely done
ABG	No diagnostic use in PE (insensitive and nonspecific) May show respiratory alkalosis (due to hyperventilation)

**Clinical Prediction Rule for Pulmonary Embolism**

J Thromb Hemost 2000;83:416-420

Wells' Criteria

Risk Factors	Points
Clinical signs of DVT	3.0
No more likely alternative diagnosis (using HGP, CXR, ECG)	3.0
Immobilization or surgery in the previous 4 wk	1.5
Previous PE/DVT	1.5
HR >100 beats/min	1.5
Hemoptysis	1.0
Malignancy	1.0

Clinical Probability

Low (0-2)	3%
Intermediate (3-6)	28%
High (>6)	78%

Modified Wells: >4 PE likely; ≤4 PE unlikely

JAMA 2006

**PE Rule Out Criteria (PERC)****Prospective Multicenter Evaluation of the Pulmonary Embolism Rule Out Criteria**

J Thromb Hemost 2008;6:772

- Age <50 yr
- Heart rate less than 100 bpm
- Oxyhemoglobin saturation ≥95 percent
- No hemoptysis
- No estrogen use
- No prior DVT or PE
- No unilateral leg swelling
- No surgery or trauma requiring hospitalization within the past 4 wk

Acute PE can probably be excluded without further diagnostic testing if the patient meets all PERC criteria AND there is a low clinical suspicion for PE, according to either the Wells' criteria or a low gestalt probability determined by the clinician prior to diagnostic testing for PE.

**Evaluation of a Suspected Pulmonary Embolism**

Low clinical probability of embolism

D-dimer (+ve) → CT scan (+ve) → ruled in
(-ve) ruled out (-ve) ruled out

Intermediate or high probability

CT scan (-ve) → ruled out
(+ve) ruled in

Notes

- Use D-dimers only if low clinical probability, otherwise, go straight to CT.
- If using V/Q scans (CT contrast allergy or renal failure):
 - Negative V/Q scan rules out the diagnosis
 - High probability V/Q scan only rules in the diagnosis if have high clinical suspicion
 - Inconclusive V/Q scan requires leg U/S to look for DVT or CT.

Classic ECG finding of PE is S₁-Q₃-T₃ (inverted T₃), but most commonly see only sinus tachycardia

D-dimer is elevated in patients with recent surgery, cancer, inflammation, infection, and severe renal dysfunction. It has good sensitivity and negative predictive value, but poor specificity and positive predictive value

Treatment

- admit for observation (patients with DVT only are often sent home on LMWH)
- oxygen: supplemental O₂ if hypoxemic or short of breath
- pain relief: analgesics if chest pain – narcotics or acetaminophen
- acute anticoagulation: therapeutic-dose SC LMWH or IV heparin – start ASAP
 - anticoagulation stops clot propagation, prevents new clots and allows endogenous fibrinolytic system to dissolve existing thromboemboli over months
 - get baseline CBC, INR, aPTT ± renal function ± liver function
 - for SC LMWH: dalteparin 200 U/kg once daily or enoxaparin 1 mg/kg bid – no lab monitoring – avoid or reduce dose in renal dysfunction
 - for IV heparin: bolus of 75 U/kg (usually 5,000 U) followed by infusion starting at 20 U/kg/h – aim for aPTT 2-3x control
- long-term anticoagulation
 - warfarin: start the same day as LMWH/heparin – overlap warfarin with LMWH/heparin for at least 5 d and until INR in target range of 2-3 for at least 2 d
 - LMWH instead of warfarin for pregnancy, active cancer, or high bleeding risk patients
 - dabigatran has been shown to have lower bleeding risk than warfarin
- IV thrombolytic therapy
 - if patient has massive PE (hypotension or clinical right heart failure) and no contraindications
 - hastens resolution of PE but may not improve survival or long-term outcome and doubles risk of major bleeding
- interventional thrombolytic therapy
 - massive PE is preferentially treated with catheter-directed thrombolysis by an interventional radiologist
 - works better than IV thrombolytic therapy and fewer contraindications
- IVC filter: only if recent proximal DVT + absolute contraindication to anticoagulation
- duration of long-term anticoagulation: individualized, however generally:
 - if reversible cause for PE (surgery, injury, pregnancy, etc.): 3-6 mo
 - if PE unprovoked: 6 mo to indefinite
 - if ongoing major risk factor (active cancer, antiphospholipid antibody, etc.): indefinite

Thromboprophylaxis

- mandatory for most hospital patients: reduces DVT, PE, all-cause mortality, cost-effective
- start ASAP
- continue at least until discharge or recommend extending for 35 d post-operatively, if major orthopedic surgery

Table 22. VTE Risk Categories and Prophylaxis (see [Hematology, H35](#))

Risk Group	Prophylaxis Options
Low Thrombosis Risk Medical patients: fully mobile Surgery: <30 min, fully mobile	No specific prophylaxis Frequent ambulation
Moderate Thrombosis Risk Most general, gynecologic, urologic surgery Sick medical patients	LMWH Low dose unfractionated heparin Fondaparinux
High Thrombosis Risk Arthroplasty, hip fracture surgery Major trauma, spinal cord injury	LMWH Fondaparinux Warfarin (INR 2-3) Dabigatran Apixaban Rivaroxaban Low dose unfractionated heparin
High Bleeding Risk Neurosurgery, intracranial bleed Active bleeding	TED stockings, pneumatic compression devices LMWH or low dose heparin when bleeding risk decreases

Workup for Idiopathic VTE

Thrombophilia Workup: recurrent or idiopathic DVT/PE, age <50, FHx, unusual location, massive

Malignancy Workup: 12% of patients with idiopathic VTE will have a malignancy

Extended Use of Dabigatran, Warfarin or Placebo in Venous Thromboembolism

NEJM 2013;368:709-718

Study: Two double blind, RCTs; one comparing against placebo, the other against active treatment. **Population:** 4,199 patients (2,856 in active-control study, 1,343 in placebo-control study) with VTE who had completed at least 3 mo of therapy.

Intervention: In the active-control study, patients randomized to either 150 mg dabigatran or warfarin (INR 2.0-3.0). Patients in the placebo-control study received either 150 mg dabigatran or placebo.

Outcome: Recurrence of VTE, risk of major or clinically relevant bleed.

Results: In the active-control study, there was a hazard ratio (HR) of 1.44 (95% CI 0.78-2.64 for non-inferiority) of recurrent VTE with dabigatran vs. warfarin. HR of major or clinically relevant bleed was 0.54 (95% CI 0.41-0.71). In the placebo-control study, the HR of VTE with dabigatran vs. placebo was 0.08 (95% CI 0.02-0.25). HR of major or clinically relevant bleed was 2.92 (95% CI 1.52-5.60).

Conclusions: Dabigatran appears to be non-inferior to warfarin in the prevention of VTE recurrence. Dabigatran is associated with a lower risk of major or clinically relevant bleed than warfarin, but greater than placebo.

Excluding Pulmonary Embolism at Bedside without Diagnostic Imaging

Ann Intern Med 2001;135:98-107

Study: Multicenter, prospective cohort study. **Patients:** 930 patients with suspected PE at emergency departments at 4 tertiary care hospitals in Canada.

Intervention: A Wells score was used to determine patient's pretest probability (PTP) of PE along with a D-dimer test was performed. Patients with low PTP and a negative D-dimer test had no further testing and the diagnosis of PE was excluded. All other patients had V/Q scanning, and if non-diagnostic, had bilateral deep venous ultrasonography. Further serial ultrasonography and angiography were done depending on the patients PTP and lung-scanning results.

Main Outcomes: Diagnosis of PE and the development of thromboembolic events at 3 mo follow-up.

Results: One of 759 patients in whom PE was initially ruled out developed a thromboembolic event during follow-up (0.1% [CI 0.0%-0.7%]). One of the 437 patients with negative D-dimers and low clinical PTP developed PE during follow-up (NPV 99.5%, CI 99.1-100%).

Conclusion: Managing patients with suspected pulmonary embolism on the basis of PTP and D-dimer results is safe and decreases the need for diagnostic imaging.

Pulmonary Vasculitis

Table 23. Pulmonary Vasculitis

Disease	Definition	Pulmonary Features	Extra-Pulmonary Features	Investigations	Treatment
Granulomatosis with Polyangiitis (Wegener's Granulomatosis) (see Nephrology , NP24)	Systemic vasculitis of medium and small arteries	Necrotizing granulomatous lesions of the upper and lower respiratory tract	Focal necrotizing lesions of arteries and veins; crescentic glomerulonephritis	CXR: nodules, cavities, and alveolar opacities c-ANCA Tissue confirmation	Corticosteroids and cyclophosphamide or rituximab
 Churg-Strauss Syndrome (Granulomatosis with Polyangiitis)	Multisystem disorder characterized by allergic rhinitis, asthma, and prominent peripheral eosinophilia	Asthma Infiltrates	Life-threatening systemic vasculitis involving the lungs, pericardium and heart, kidneys, skin, and PNS (mononeuritis multiplex)	Peripheral eosinophilia is the most common finding p-ANCA may be positive Biopsy involved tissue	Corticosteroids
 Goodpasture's Disease (see Nephrology , NP24)	A disorder characterized by diffuse alveolar hemorrhage and glomerulonephritis caused by anti-GBM antibodies, which cross-react with basement membranes of the kidney and lung	Hemoptysis May follow an influenza infection	Anemia	CXR: may see alveolar infiltrates if hemorrhage is profuse ELISA test with anti-GBM antibodies Renal biopsy/indirect immunofluorescence shows linear staining	Acutely: corticosteroids, plasmapheresis Immunosuppressive therapy Severe cases: bilateral nephrectomy
Systemic Lupus Erythematosus, Rheumatoid Arthritis, Scleroderma	See Rheumatology , RH8				

Pulmonary Edema

- see [Cardiology and Cardiac Surgery](#), C35

Scleroderma is the most common collagen vascular disease affecting the lung

Diseases of the Mediastinum and Pleura

Mediastinal Masses

Definition

- mediastinum: bound by the thoracic inlet, diaphragm, sternum, vertebral bodies, and the pleura
- can be broken down into 3 compartments: anterior, middle, and posterior

Etiology and Pathophysiology

- diagnosis is made by location and patient's age
- anterior compartment: more likely to be malignant
 - "Four Ts" (see sidebar), lymphoma, lipoma, pericardial cyst
- middle compartment
 - pericardial cyst, bronchogenic cyst/tumor, lymphoma, lymph node enlargement, aortic aneurysm
- posterior compartment
 - neurogenic tumors, meningocele, enteric cysts, lymphoma, diaphragmatic hernias, esophageal tumor, aortic aneurysm

Signs and Symptoms

- 50% asymptomatic (mainly benign); when symptomatic, 50% are malignant
- chest pain, cough, dyspnea, recurrent respiratory infections
- hoarseness, dysphagia, Horner's syndrome, facial/upper extremity edema (SVC compression)
- paraneoplastic syndromes (e.g. myasthenia gravis [thymomas])

Investigations

- CXR (compare to previous)
- CT with contrast (anatomic location, density, relation to mediastinal vascular structures)
- MRI: specifically indicated in the evaluation of neurogenic tumors
- U/S (best for assessment of structures in close proximity to the heart and pericardium)
- radionuclide scanning: ^{131}I (for thyroid), gallium (for lymphoma)
- biochemical studies: thyroid function, serum calcium, phosphate, PTH, AFP, $\beta\text{-hCG}$
- biopsy (mediastinoscopy, percutaneous needle aspiration)

Anterior Compartment

4 Ts

Thymoma
Thyroid enlargement (goitre)
Teratoma
Tumors
(lymphoma, parathyroid, esophageal, angiomatous)

Mediastinal Components

Anterior: sternum to posterior aspect of heart and great vessels. Includes: thymus, extrapericardial aorta and branches, great veins, lymphatic tissues
Middle: pericardium (anteriorly) posterior pericardial reflection, diaphragm, thoracic inlet. Includes: heart, intrapericardial great vessels, pericardium, trachea
Posterior: posterior pericardial reflection, posterior border of vertebral bodies, first rib to the diaphragm. Includes: esophagus, vagus nerve, thoracic duct, sympathetic chain, azygous venous system

Horner's Syndrome

Ptoxis, Miosis, Anhidrosis

Management

- excision if symptomatic enlarging benign masses or concerns of malignancy
- resect bronchogenic cysts and localized neurogenic tumors via minimally invasive video assisted procedures
- exploration via sternotomy or thoracotomy
- diagnostic biopsy rather than major operation if mass is likely to be a lymphoma, germ cell tumor, or unresectable invasive malignancy
- \pm post-operative radiotherapy/chemotherapy if malignant

Mediastinitis

- commonest causes: post-operative complications of cardiovascular or thoracic surgical procedures

Acute

- etiology
 - complication of endoscopy (e.g. esophageal perforation providing entry point for infection)
 - esophageal or cardiac surgery
 - tumor necrosis
- signs and symptoms
 - fever, substernal pain
 - pneumomediastinum, mediastinal compression
 - Hamman's sign (auscultatory "crunch" during cardiac systole)
- treatment
 - antibiotics, drainage, \pm surgical closure of perforation

Chronic

- usually granulomatous process or fibrosis related to previous infection (e.g. histoplasmosis, TB, sarcoidosis, syphilis)

Pleural Effusions**Definition**

- excess amount of fluid in the pleural space

Etiology

- disruption of normal equilibrium between pleural fluid formation/entry and pleural fluid absorption/exit
- pleural effusions are classified as transudative or exudative
 - distinguish clinically using Light's Criteria, which has a sensitivity of 98% and specificity of 83% for identifying exudative pleural effusions

Table 24. Laboratory Values in Transudative and Exudative Pleural Effusion

	Light's Criteria	Modified Light's Criteria
Protein – pleural/serum	>0.5	>0.5
LDH – pleural/serum	>0.6	>0.6
Pleural LDH	$>2/3$ upper limit of N serum LDH	>0.45 upper limit of N serum LDH
Exudate = at least one criterion met		

Ann Intern Med 1979;77:507-513 *Chest* 1997;111:970-980

Transudative Pleural Effusions

- pathophysiology: alteration of systemic factors that affect the formation and absorption of pleural fluid (e.g. increased capillary hydrostatic pressure, decreased plasma oncotic pressure)
- etiology
 - CHF: usually right-sided or bilateral cirrhosis
 - nephrotic syndrome, protein losing enteropathy, cirrhosis
 - pulmonary embolism (may cause transudative but more often causes exudative effusion)
 - peritoneal dialysis, hypothyroidism, CF, urinothorax

Exudative Pleural Effusions

- pathophysiology: increased permeability of pleural capillaries or lymphatic dysfunction
- etiology (see Table 25)

Transudative effusions are usually bilateral, not unilateral

Exudative effusions can be bilateral or unilateral

All criteria for transudate must be fulfilled to be considered a transudative effusion. If any one of the criteria for exudates is met – it is an exudate

Table 25. Exudative Pleural Effusion Etiologies

Etiology	Examples
Infectious	Parapneumonic effusion (associated with bacterial pneumonia, lung abscess) Empyema (bacterial, fungal, TB) TB pleuritis Viral infection
Malignancy	Lung carcinoma (35%) Lymphoma (10%) Metastases: breast (25%), ovary, kidney Mesothelioma
Inflammatory	Collagen vascular diseases: RA, SLE Pulmonary embolism Post-CABG Drug reaction
Intra-Abdominal	Subphrenic abscess Pancreatic disease (elevated pleural fluid amylase) Meigs' syndrome (ascites and hydrothorax associated with an ovarian fibroma or other pelvic tumor)
Intra-Thoracic	Esophageal perforation (elevated fluid amylase)
Trauma	Chylothorax: thoracic duct disrupted and chyle accumulates in the pleural space due to trauma, tumor Hemothorax: rupture of a blood vessel, commonly by trauma or tumors Pneumothorax (spontaneous, traumatic, tension)

Signs and Symptoms

- often asymptomatic
- dyspnea: varies with size of effusion and underlying lung function
- pleuritic chest pain
- inspection: trachea deviates away from effusion, ipsilateral decreased expansion
- percussion: decreased tactile fremitus, dullness
- auscultation: decreased breath sounds, bronchial breathing and egophony at upper level, pleural friction rub

Investigations

- CXR
 - must have >200 mL of pleural fluid for visualization on PA film
 - lateral: >50 mL leads to blunting of posterior costophrenic angle
 - PA: blunting of lateral costophrenic angle
 - dense opacification of lung fields with concave meniscus
 - decubitus: fluid will shift unless it is loculated
 - supine: fluid will appear as general haziness
- thoracentesis: indicated if pleural effusion is a new finding; be sure to send off blood work (LDH, glucose, protein) at the same time for comparison
 - risk of re-expansion pulmonary edema if >1.5 L of fluid is removed
 - inspect for color, character, and odor of fluid
 - analyze fluid
- pleural biopsy: indicated if suspect TB, mesothelioma, or other malignancy (and if cytology negative)
- \pm U/S: detects small effusions and can guide thoracentesis
- treatment depends on cause, \pm drainage if symptomatic
- CT can be helpful in differentiating parenchymal from pleural abnormalities

Table 26. Analysis of Pleural Effusion

Measure	Purpose
Protein, LDH	Transudate vs. exudate
Gram stain, Ziehl-Nielsen stain (TB), culture	Looking for specific organisms
Cell count differential	Neutrophils vs. lymphocytes (lymphocytic effusion in TB, cancer, lymphoma, serositis)
Cytology	Malignancy, infection
Glucose (low)	RA, TB, empyema, malignancy, esophageal rupture
Rheumatoid factor, ANA, complement	Collagen vascular disease
Amylase	Pancreatitis, esophageal perforation, malignancy
pH	Empyema <7.2, TB, and mesothelioma <7.3
Blood	Mostly traumatic, malignancy, PE with infarction, TB
Triglycerides	Chylothorax from thoracic duct leakage, mostly due to trauma, lung CA, or lymphoma

**Appearance of Pleural Fluid**

- Bloody: trauma, malignancy
- White: chylothorax, empyema
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odor: urinothorax
- Food particles: esophageal rupture

**Role of CT in Pleural Effusion**

- To assess for fluid loculation, pleural thickening and nodules, parenchymal abnormalities and adenopathy
- Helps to distinguish benign from malignant effusion and transudative from exudative effusion
- May not distinguish empyema from parapneumonic effusion

Features of Malignant Effusion

- Multiple pleural nodules
- Nodular pleural thickening

Features of Exudative Effusion

- Loculation
- Pleural thickening
- Pleural nodules
- Extrapleural fat of increased density

Treatment

- thoracentesis
- treat underlying cause
- consider indwelling pleural catheter or pleurodesis in refractory effusions

Complicated Parapneumonic Effusion

- persistent bacteria in the pleural space but fluid is non-purulent
- neutrophils, pleural fluid acidosis (pH <7.00), and high LDH
- often no bacteria grown since rapidly cleared from pleural space
- fibrin layer leading to loculation of pleural fluid
- treatment: antibiotics and drainage, treat as an empyema

Empyema**Definition**

- pus in pleural space or an effusion with organisms seen on a Gram stain or culture (e.g. pleural fluid is grossly purulent)
- positive culture is not required for diagnosis

Etiology

- contiguous spread from lung infection (most commonly anaerobes) or infection through chest wall (e.g. trauma, surgery)

Signs and Symptoms

- fever, pleuritic chest pain

Investigations

- CT chest
- thoracentesis
- PMNs (lymphocytes in TB) ± visible organisms on Gram stain

Treatment

- antibiotic therapy for at least 4-6 wk (rarely effective alone)
- complete pleural drainage with chest tube
- if loculated, more difficult to drain – may require surgical drainage with video-assisted thoroscopic surgery (VATS)

Atelectasis

- see [General Surgery](#), GS10

Pneumothorax**Definition**

- presence of air in the pleural space

Pathophysiology

- entry of air into pleural space raises intrapleural pressure causing partial lung deflation

Etiology

- traumatic: penetrating or non-penetrating chest injuries
- iatrogenic (central venous catheter, thoracentesis, mechanical ventilation with barotrauma)
- spontaneous (no history of trauma)
 - primary (no underlying lung disease)
 - ♦ spontaneous rupture of apical subpleural bleb of lung into pleural space
 - ♦ predominantly tall, healthy, young males
 - secondary (underlying lung disease)
 - ♦ rupture of subpleural bleb which migrates along bronchioalveolar sheath to the mediastinum then to the intrapleural space
 - ♦ necrosis of lung tissue adjacent to pleural surface (e.g. pneumonia, abscess, PCP, lung CA, emphysema)

Signs and Symptoms

- can be asymptomatic
- acute-onset pleuritic chest pain, dyspnea
- tachypnea, tachycardia

**Pleural Effusions****Simple Effusion**

pH > 7.2, LDH < 1/2 serum, glucose > 2.2

Complicated Effusion

pH < 7.2, LDH > 1/2 serum, glucose < 2.2, positive Gram stain
Needs drainage

When possible, organism-directed therapy, guided by culture sensitivities or local patterns of drug resistance, should be utilized

**Need to Rule Out Life-Threatening Tension Pneumothorax**

If pneumothorax with:

- Severe respiratory distress
- Tracheal deviation to contralateral side
- Distended neck veins (↑ JVP)
- Hypotension

Do not perform CXR

Needs immediate treatment

See [Emergency Medicine](#), ER11

- tracheal deviation (contralateral deviation in tension pneumothorax)
- ipsilateral diminished chest expansion
- decreased tactile/vocal fremitus
- hyperresonance
- ipsilateral diminished breath sounds

Investigations

- CXR
 - small: separation of visceral and parietal pleura seen as fine crescentic line parallel to chest wall at apex
 - large: increased density and decreased volume of lung on side of pneumothorax
 - see [Medical Imaging, M18](#)

Treatment

- small pneumothoraces (<20% with no signs of respiratory/circulatory collapse) resolve spontaneously; breathing 100% oxygen accelerates resorption of air
- small intercostal tube with Heimlich valve for most spontaneous pneumothoraces
- large pneumothoraces or those complicating underlying lung disease require placement of a chest tube connected to underwater seal \pm suction
- for repeated episodes: pleurodesis with sclerosing agent or apical bullectomy and abrasion
- treat underlying cause (e.g. antibiotic for PCP)

Asbestos-Related Pleural Disease and Mesothelioma

Etiology and Pathophysiology

- benign manifestations of asbestos exposure
 - “benign asbestos pleural effusion”
 - ♦ exudative effusion, typically ~10 yr after exposure, resolves
 - pleural plaques, usually calcified
 - ♦ marker of exposure; usually an asymptomatic radiologic finding
- mesothelioma
 - primary malignancy of the pleura
 - decades after asbestos exposure (even with limited exposure)
 - smoking not a risk factor, but asbestos and smoking synergistically increase risk of lung cancer

Signs and Symptoms

- persistent chest pain, dyspnea, cough, bloody pleural effusion, weight loss

Investigations

- biopsy (pleuroscopic or open)
- needle biopsy may seed needle tract with tumor

Treatment

- resection (extrapleural pneumonectomy) requires careful patient selection; rarely successful (average survival <1 yr)

Respiratory Failure

Definition

- failure of respiratory system to maintain normal blood gases
- hypoxemic ($P_aO_2 < 60$ mmHg)
- hypercapnic ($P_aCO_2 > 50$ mmHg)
- acute vs. chronic (compensatory mechanisms activated)

Signs and Symptoms

- signs of underlying disease
- hypoxemia: restlessness, confusion, cyanosis, coma, cor pulmonale
- hypercapnia: headache, dyspnea, drowsiness, asterixis, warm periphery, plethora, increased ICP (secondary to vasodilatation)

Investigations

- serial ABGs
- CXR and/or CT, bronchoscopy to characterize underlying cause if unclear

Hypoxemic Respiratory Failure

Definition

- P_aO_2 decreased, P_aCO_2 normal or decreased

Treatment

- reverse the underlying pathology
- oxygen therapy: maintain oxygenation (if shunt present, supplemental O_2 is less effective; see [Anesthesia, A9](#), for oxygen delivery systems)
- ventilation, BiPAP, and PEEP/CPAP (see [Anesthesia, A10](#)): positive pressure can recruit alveoli and redistribute lung fluid
- improve cardiac output: \pm hemodynamic support (fluids, vasopressors, inotropes), reduction of O_2 requirements

Table 27. Approach to Hypoxemia

Type of Hypoxemia	Settings	P_aCO_2	A-a DO_2	Oxygen Therapy	Ventilation, BiPAP and PEEP	Improved Cardiac Output
1. Low F_iO_2	Postop, high altitude	N or ↓	N	Improves	No change	No change
2. Hypoventilation	Drug overdose	↑	N	Improves	Improves with ventilation	No change
3a. Shunt	ARDS, pneumonia	N or ↓	↑	No change	Improves (except if one-sided)	Improves
3b. Shunt (Right to Left)	Pulmonary HTN	N or ↓	↑	No change	Worsens	Worsens
4. Low Mixed Venous O_2 Content	Shock	↓	↑	Improves or no change	Worsens	Improves
5. V/Q Mismatch	COPD	N or ↑	↑	Improves (small amounts)	Often improves	Improves
6. Diffusion Impairment	ILD, emphysema	N	↑	Improves	Improves with positive pressure	No change or worsens

Reprinted with permission from Dr. Ian Fraser

Hypercapnic Respiratory Failure

- P_aCO_2 increased, P_aO_2 decreased

Pathophysiology

- increased CO_2 production: fever, sepsis, seizure, acidosis, carbohydrate load
- alveolar hypoventilation: COPD, asthma, CF, chest wall disorder, dead space ventilation (rapid shallow breathing)
 - inefficient gas exchange results in inadequate CO_2 removal in spite of normal or increased minute volume
- hypoventilation
 - central: brainstem stroke, hypothyroidism, severe metabolic alkalosis, drugs (opiates, benzodiazepines)
 - neuromuscular: myasthenia gravis, Guillain-Barré, phrenic nerve injury, muscular dystrophy, polymyositis, kyphoscoliosis
 - muscle fatigue

Treatment

- reverse the underlying pathology
- if $P_aCO_2 > 50$ mmHg and pH is acidemic consider noninvasive or mechanical ventilation
- correct exacerbating factors
 - NTT/ETT suction: clearance of secretions
 - bronchodilators: reduction of airway resistance
 - antibiotics: treatment of infections
- maintain oxygenation (see above)
- diet: increased carbohydrate can increase P_aCO_2 in those with mechanical or limited alveolar ventilation; high lipids decrease P_aCO_2

Dead Space

- Ventilation without perfusion
- The opposite of shunt

Causes of Hypercapnia

- High Inspired CO_2
- Low Total Ventilation
- High Deadspace Ventilation
- High CO_2 Production

In chronic hypercapnia, supplemental O_2 may decrease the hypoxic drive to breathe, but do not deny oxygen if the patient is hypoxic

In COPD patients with chronic hypercapnia ("CO₂ retainers"), provide supplemental oxygen to achieve target SaO₂ from 88-92%

Acute Respiratory Distress Syndrome

- clinical syndrome characterized by severe respiratory distress, hypoxemia, and noncardiogenic pulmonary edema
- The Berlin Criteria (*JAMA* 2012; 307:2526-2533) for ARDS
 - acute onset
 - within 7 d of a defined event, such as sepsis, pneumonia, or patient noticing worsening of respiratory symptoms
 - usually occurs within 72 h of presumed trigger
 - bilateral opacities consistent with pulmonary edema on either CT or CXR
 - not *fully* explained by cardiac failure/fluid overload, but patient may have concurrent heart failure
 - an objective assessment (e.g. echocardiogram) should be performed if no clear risk factors

Etiology

- direct lung injury
 - airway: aspiration (**gastric contents**, drowning), **pneumonia**, inhalation injury (oxygen toxicity, nitrogen dioxide, smoke)
 - circulation: embolism (fat, amniotic fluid), reperfusion injury
- indirect lung injury
 - circulation: **sepsis**, **shock**, **trauma**, blood transfusion, pancreatitis
 - neurogenic: head trauma, intracranial hemorrhage, drug overdose (narcotics, sedatives, TCAs)

Pathophysiology

- disruption of alveolar capillary membranes → leaky capillaries → interstitial and alveolar pulmonary edema → reduced compliance, V/Q mismatch, shunt, hypoxemia, pulmonary HTN

Clinical Course

A. Exudative Phase

- first 7 d of illness after exposure to ARDS precipitant
- alveolar capillary endothelial cells and type I pneumocytes are injured, resulting in loss of normally tight alveolar barrier
- patients develop dyspnea, tachypnea, increased work of breathing
 - these result in respiratory fatigue and eventually respiratory failure (see *Hypoxemic Respiratory Failure*, R26)

B. Fibroproliferative Phase

- after day 7
- may still experience dyspnea, tachypnea, fatigue, and hypoxemia
- most patients clinically improve and are able to wean off mechanical ventilation
- some patients develop fibrotic lung changes that may require long-term support on supplemental oxygen or even mechanical ventilation
- if fibrosis present, associated with increased mortality

Treatment

- based on ARDS network (see *Landmark Respiriology Trials*, R36)
- treat underlying disorder (e.g. antibiotics if infection present)
- mechanical ventilation using low tidal volumes (<6 mL/kg) to prevent barotrauma
 - use optimal amount of PEEP (positive end-expiratory pressure) to keep airways open and allow the use of lower F_iO_2
 - may consider using prone ventilation, and/or inhaled nitric oxide, high frequency oscillator or ECMO (extracorporeal membrane oxygenation) if conventional treatment is failing
- fluids and inotropic therapy (e.g. dopamine, vasopressin) if cardiac output inadequate
- pulmonary-arterial catheter now seldom used for monitoring hemodynamics
- mortality: 30-40%, usually due to non-pulmonary complications
- sequelae of ARDS include residual pulmonary impairment, severe debilitation, polyneuropathy and psychologic difficulties, which gradually improve over time
- most survivors eventually regain near-normal lung function, often with mildly reduced diffusion capacity

ALI vs. ARDS: Definition is the same, except ALI is a $P_aO_2/F_iO_2 \leq 300$, while ARDS is a $P_aO_2/F_iO_2 \leq 200$

Categorization of ARDS as Mild, Moderate or Severe – The Berlin Criteria

ARDS Severity	P_aO_2/F_iO_2 (mmHg)*	Mortality (95% CI)†
Mild	200-300	27 (24-30)%
Moderate	100-200	32 (29-34)%
Severe	<100	45 (42-48)%

*on ≥ 5 cm H_2O PEEP, †P<0.001

JAMA 2012;307:2526-2533

Risk Factors for Aspiration Pneumonia

Categories	Examples
Decreased level of consciousness	Alcoholism
Upper GI tract disorders	Dysphagia, esophageal disorders
Mechanical instrumentation	Intubation, nasogastric tube, feeding tubes
Neurologic conditions	Dementia, Parkinson disease
Others	Protracted vomiting

Neoplasms

Lung Cancer

Classification

- lung tumors can be classified as primary or secondary, benign or malignant, endobronchial or parenchymal
- bronchogenic carcinoma (epithelial lung tumors) are the most common type of primary lung tumor (other types make up less than 1%)
 - small cell lung cancer (SCLC)
 - non-small-cell lung cancer (NSCLC)
 - squamous cell carcinoma: arise from the proximal respiratory epithelium
 - adenocarcinoma: incidence is increasing; most common subtype in nonsmokers
 - bronchoalveolar carcinoma: grows along the alveolar wall in the periphery; may arise at sites of previous lung scarring
 - large cell undifferentiated cancer: diagnosis of exclusion
- benign epithelial lung tumors can be classified as papillomas or adenomas

Table 28. Characteristics of Bronchogenic Cancer

Cell Type	Incidence	Correlation with Smoking	Location	Histology	Metastasis	5 Year Survival Rates
Adenocarcinoma	M: 35% F: 40%	Weak	Peripheral	Glandular, mucin producing	Early, distant	12% (60% for bronchoalveolar carcinoma, a subtype, with a resectable solitary lesion)
Squamous Cell Carcinoma (SCC)	30%	Strong	Central	Keratin, intercellular bridges	Local invasion and distant spread, may cavitate	25%
SCLC	25%	Strong	Central	Oat cell, neuroendocrine	Disseminated at presentation Origin in endobronchial cells	1% (poorest prognosis)
Large Cell Carcinoma	10-15%	Strong	Peripheral	Anaplastic, undifferentiated	Early, distant	13%

Risk Factors

- cigarette smoking: the relative risk of developing lung cancer is 10-30 times higher for smokers than for nonsmokers
- other risk factors include cigar smoking, pipe smoking, second-hand smoke, asbestos without smoking (relative risk is 5), asbestos with smoking (relative risk is 92), metals (e.g. chromium, arsenic, nickel), radon gas, ionizing radiation, genetics

Signs and Symptoms

- may be due to primary lesion, metastasis, or paraneoplastic syndrome
- primary lesion
 - cough (75%): beware of chronic cough that changes in character
 - dyspnea (60%)
 - chest pain (45%)
 - hemoptysis (35%)
 - other pain (25%)
 - clubbing (21%)
 - constitutional symptoms: anorexia, weight loss, fever, anemia
- metastasis
 - lung, hilum, mediastinum, pleura: pleural effusion, atelectasis, wheezing
 - pericardium: pericarditis, pericardial tamponade
 - esophageal compression: dysphagia
 - phrenic nerve: paralyzed diaphragm
 - recurrent laryngeal nerve: hoarseness
 - superior vena cava syndrome
 - obstruction of SVC causing neck and facial swelling, as well as dyspnea and cough
 - other symptoms: hoarseness, tongue swelling, epistaxis, and hemoptysis
 - physical findings: dilated neck veins, increased number of collateral veins covering the anterior chest wall, cyanosis, edema of the face, arms, and chest, Pemberton's sign (facial flushing, cyanosis, and distension of neck veins upon raising both arms above head)
 - milder symptoms if obstruction is above the azygos vein
 - lung apex (Pancoast tumor): Horner's syndrome, brachial plexus palsy (most commonly C8 and T1 nerve roots)
 - rib and vertebrae: erosion
 - distant metastasis to brain, bone, liver, adrenals
- paraneoplastic syndromes
 - a group of disorders associated with malignant disease, not related to the physical effects of the tumor itself
 - most often associated with SCLC

Summary of Recommendations on Screening for Lung Cancer

American College of Chest Physicians (2013)

Screening with CXR

Not recommended

Screening with low-dose CT

Recommended for high-risk patients (current or former smokers quit within last 15 yr, aged 55-74, ≥ 30 pack yr smoking Hx)

American Lung Association (2013)

Screening with CXR

Not recommended

Screening with Low-Dose CT

Recommended for high-risk patients (current or former smokers aged 55-74, ≥ 30 pack yr smoking Hx, no Hx of lung cancer)

Reduced Lung Cancer Mortality with Low-Dose CT Screening

NEJM 2011;365:395-409

Study: Multicenter, RCT.

Methods: 53,454 participants at high risk for lung cancer (55-74 yr, >30 yr smoking, and smoking cessation for <5 yr) were assigned to undergo three annual screenings with either low dose CT or single-view PA CXR.

Results: A relative reduction in mortality from lung cancer with low-dose CT screening of 20.0% (95% CI 6.8-26.7; $p=0.004$). Rate of death from any cause was reduced in the low-dose CT group as compared to the CXR group by 6.7% (95% CI 1.2-13.6; $p=0.02$).

	Low-dose CT	CXR
Rate of positive screening test	24.2%	6.9%
False positives	96.4%	94.5%
Incidence of lung cancer	645/100 K person yr	572/100 K person yr
Deaths from lung cancer	247/100 K person yr	309/100 K person yr

Conclusions: Screening with low-dose CT reduces mortality from lung cancer

Malignant lung tumors are the most common cause of cancer mortality throughout the world in both men and women

Endobronchial Ultrasound (EBUS)

- Allows visualization of peri-bronchial structures and distal peripheral lung lesions
- Provides detailed assessment of the airway wall layers
- Allows for guided biopsies of lymph nodes and tumors
- Used for diagnosis and staging

Table 29. Paraneoplastic Syndromes

System	Clinical Presentation	Associated Malignancy
Skeletal	Clubbing, hypertrophic pulmonary osteoarthropathy (HPOA)	NSCLC
Dermatologic	Acanthosis nigricans Dermatomyositis	Bronchogenic cancer Bronchogenic cancer
Endocrine	Hypercalcemia (osteolysis or PTHrP) Hypophosphatemia Hypoglycemia Cushing's syndrome (ACTH) Somatostatinoma syndrome SIADH	Squamous cell cancer Squamous cell cancer Sarcoma SCLC Bronchial carcinoid SCLC
Neuromyopathic	Lambert-Eaton syndrome Polymyositis Subacute cerebellar degeneration Spinocerebellar degeneration Peripheral neuropathy	SCLC
Vascular/ Hematologic	Nonbacterial endocarditis Trousseau's syndrome (migratory thrombophlebitis) DIC	Bronchogenic cancer NSCLC
Renal	Nephrotic syndrome	

Investigations

- initial diagnosis
 - imaging: CXR, CT chest + upper abdomen, PET scan, bone scan
 - cytology: sputum
 - biopsy: bronchoscopy, EBUS, CT-guided percutaneous needle biopsy, mediastinoscopy
- staging workup
 - TMN staging system: T – primary tumor (size); N – regional lymph nodes; M – distant metastasis
 - blood work: electrolytes, LFTs, calcium, ALP
 - imaging: CXR, CT thorax and upper abdomen, bone scan, neuroimaging
 - invasive: bronchoscopy (EBUS), mediastinoscopy, mediastinotomy, thoracotomy
 - screen adenocarcinoma for EGFR mutations

Table 30. SCLC vs. NSCLC

	Stage	Definition	Treatment	Median Survival
SCLC	Limited stage	Confined to single radiation port (one hemithorax and regional lymph nodes)	Radiation ± chemotherapy ± prophylactic to brain	1-2 yr (12 wk without treatment)
	Extensive stage	Extension beyond a single radiation port	Chemotherapy	6 mo (5 wk without treatment)
	Stage	TNM	Treatment	5 Yr Survival (%)*
NSCLC	IA	T1a-1bN0M0	1st line is complete surgical resection with possible post-operative adjuvant chemotherapy with stage IB and stage II; radiotherapy for non-surgical candidates	50-73
	IB	T2aN0M0		43-58
	IIA	T1a-T2a,N1M0 or T2bN0M0		36-46
	IIB	T2bN1M0 or T3N0M0	Combined modality approach (concurrent chemotherapy followed by surgery)	25-36
	IIIA	T1a-T2bN2M0 or T3N1-2M0 or T4N0-1M0		19-24
	IIIB	T4N2M0 or T1-4N3M0		7-9
	IV	T1-4N0-3M1a-1b	Systemic therapy or molecularly targeted therapy or symptom-based palliative management (radiation); isolated metastasis may be resected	2-13

* Depends on clinical vs. pathologic stage

Refer to *AJCC Cancer Staging Manual*, 7th ed. (2010) for complete TNM classification

Treatment

- options include surgery, radiotherapy, chemotherapy, and palliative care for end-stage disease
- surgery not usually performed for SCLC since it is generally non-curable
- contraindications for surgery
 - spread to contralateral lymph nodes or distant sites
 - patients with potentially resectable disease must undergo mediastinal node sampling since CT thorax is not accurate in 20-40% of cases
 - poor pulmonary status (e.g. unable to tolerate resection of lung)

Horner has a MAP of the Coast

A **Pancoast** tumor compresses the cervical sympathetic plexus causing a **Horner's** syndrome:

Miosis
Anhydrosis
Ptosis

2/3 of primary lung cancer is found in the upper lung; 2/3 of metastases occur in the lower lung (hematogenous spread secondary to increased blood flow to the base of the lung)

Combination treatment may be superior, giving better response rates

Prevention

Smoking cessation
Avoidance of exposures
Early detection

- chemotherapy (used in combination with other treatments)
 - common agents: etoposide, platinum agents (e.g. cisplatin), ifosfamide, vincristine, anthracyclines, paclitaxel, irinotecan, gefitinib (an endothelial growth factor receptor inhibitor)
 - complications
 - acute: tumor lysis syndrome, infection, bleeding, myelosuppression, hemorrhagic cystitis (cyclophosphamide), cardiotoxicity (doxorubicin), renal toxicity (cisplatin), peripheral neuropathy (vincristine)
 - chronic: neurologic damage, leukemia, additional primary neoplasms

Approach to the Solitary Pulmonary Nodule

- see [Medical Imaging](#), MI7

Definition

- a round or oval, sharply circumscribed radiographic lesion up to 3-4 cm, which may or may not be calcified, and is surrounded by normal lung
- can be benign or malignant

Table 31. Differential Diagnosis for Benign vs. Malignant Solitary Nodule

Benign (70%)	Malignant (30%)
Infectious granuloma (histoplasmosis, coccidiomycosis, TB, atypical mycobacteria)	Bronchogenic carcinoma
Other infections (bacterial abscess, PCP, aspergilloma)	Adenocarcinoma
Benign neoplasms (hamartoma, lipoma, fibroma)	Squamous cell carcinoma
Vascular (AV malformation, pulmonary varix)	Large cell carcinoma
Developmental (bronchogenic cyst)	Small cell carcinoma
Inflammatory (granulomatosis with polyangiitis, rheumatoid nodule, sarcoidosis)	Metastatic lesions
Other (hamartoma, infarct, pseudotumor, rounded atelectasis, lymph nodes, amyloidoma)	Breast
	Head and neck
	Melanoma
	Colon
	Kidney
	Sarcoma
	Germ cell tumors
	Pulmonary carcinoid

Investigations)

- CXR: always compare with previous CXR
- CT densitometry and contrast enhanced CT of thorax
- sputum cytology: usually poor yield
- biopsy (bronchoscopic or percutaneous) or excision (thoracoscopy or thoracotomy): if clinical and radiographic features do not help distinguish between benign or malignant lesion
 - if at risk for lung cancer, biopsy may be performed regardless of radiographic features
 - if a biopsy is non-diagnostic, whether to observe, re-biopsy, or resect will depend on the level of suspicion
- watchful waiting: repeat CXR and/or CT scan at 3, 6, 12 mo
- PET scan can help distinguish benign from malignant nodules

Table 32. CXR Characteristics of Benign vs. Malignant Solitary Nodule

Parameters	Benign	Malignant
Size	<3 cm, round, regular	>3 cm, irregular, spiculated
Margins	Smooth margin	Ill-defined or notched margin
Features	Calcified pattern: central, "popcorn" pattern if hamartoma, usually no cavitation; if cavitating, wall is smooth and thin, no other lung pathology	Usually not calcified; if calcified, pattern is eccentric, no satellite lesions, cavitation with thick wall, may have pleural effusions, lymphadenopathy
Doubling Time	Doubles in <1 mo or >2 yr	Doubles in >1 mo or <2 yr

Carcinoids

- Early onset (40-60 yr)
- Most are central and can produce symptoms and signs of bronchial obstruction
- Hemoptysis is present in ~50% of cases

Hamartomas

- 10% of benign lung lesions
- Composed of tissues normally present in lung (fat, epithelium, fibrous tissue, and cartilage), but they exhibit disorganized growth
- Peak incidence is age 60, more common in men
- Usually peripheral and clinically silent
- CXR shows clustered "popcorn" pattern of calcification (pathognomonic for hamartoma)

Pulmonary neoplasms may present as a solitary pulmonary nodule identified incidentally on a radiographic study (~10% of cases) or as symptomatic disease (most cases)

Adenocarcinoma present in a non-smoker may be due to endothelial growth factor receptor mutation

Corona Radiata Sign on Chest CT

- Fine striations that extend linearly from a nodule in a spiculated fashion
- Highly associated with malignancy

Terminology

- "nodule" <3 cm
- "mass" >3 cm

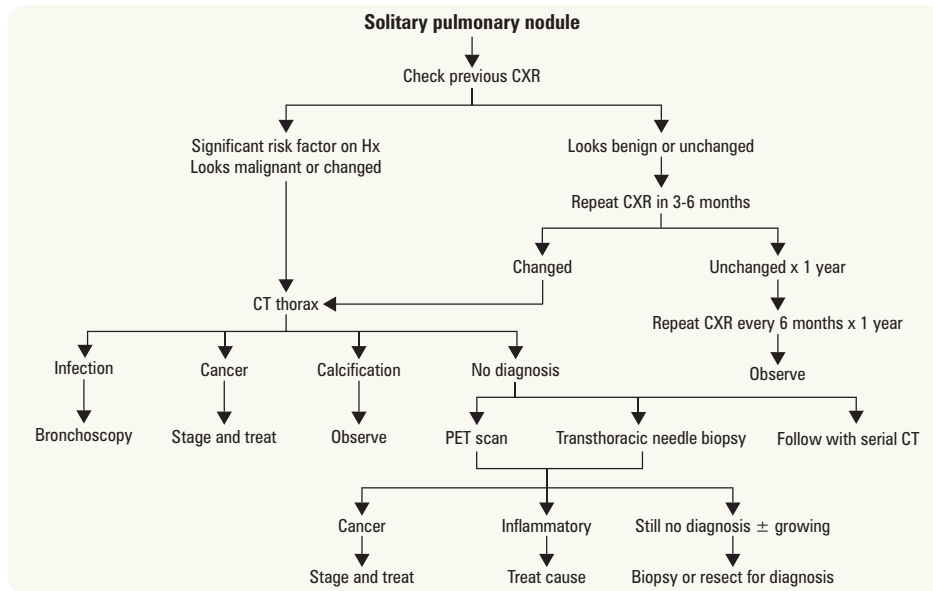

Figure 12. Evaluation of a solitary pulmonary nodule

Sleep-Related Breathing Disorders

Hypoventilation Syndromes

- primary alveolar hypoventilation: idiopathic
- obesity-hypoventilation syndrome (Pickwickian syndrome)
- respiratory neuromuscular disorders

Sleep Apnea

Definition

- episodic decreases in airflow during sleep
- quantitatively measured by the Apnea/Hypopnea Index (AHI) = # of apneic and hypopneic events per hour of sleep
- sleep apnea generally accepted to be present if AHI > 15

Classification

- obstructive (OSA)
 - caused by transient, episodic obstruction of the upper airway
 - absent or reduced airflow despite persistent respiratory effort
- central (CSA) (see [Neurology, N46](#))
 - caused by transient, episodic decreases in CNS drive to breathe
 - no airflow because no respiratory effort
 - Cheyne-Stokes Respiration: a form of CSA in which central apneas alternate with hyperpneas to produce a crescendo-decrescendo pattern of tidal volume; seen in severe LV dysfunction, brain injury, and other settings (see [Figure 2](#))
- mixed (MSA)
 - features of both OSA and CSA
 - loss of hypoxic and hypercapnic drives to breathe secondary to “resuscitative breathing”: overcompensatory hyperventilation upon awakening from OSA induced hypoxia

Risk Factors

- for OSA: obesity, upper airway abnormality, neuromuscular disease, hypothyroidism, alcohol/sedative use, nasal congestion, sleep deprivation
- for CSA: LV failure, brainstem lesions, encephalitis, encephalopathy, myxedema, high altitude

Signs and Symptoms

- obtain history from spouse/partner
- secondary to repeated arousals and fragmentation of sleep: daytime somnolence, personality and cognitive changes, snoring
- secondary to hypoxemia and hypercapnia: morning headache, polycythemia, pulmonary/systemic HTN, cor pulmonale/CHF, nocturnal angina, arrhythmias

Normal Respiratory Changes during Sleep

- Tidal volume decreases
- Arterial CO₂ increases (due to decreased minute ventilation)
- Pharyngeal dilator muscles relax causing increased upper airway resistance

Apnea: absence of breathing for ≥10 s

Hypopnea: excessive decrease in rate or depth of breathing (>50% reduction in ventilation)

Hyperpnea: excessive increase in rate or depth of breathing

- the typical presentation for OSA is a middle-aged obese male who snores
- CSA can be due to neurological disease

Investigations

- sleep study (polysomnography)
 - evaluates sleep stages, airflow, ribcage movement, ECG, SaO₂, limb movements
 - indications
 - ♦ excessive daytime sleepiness
 - ♦ unexplained pulmonary HTN or polycythemia
 - ♦ daytime hypercapnia
 - ♦ titration of optimal nasal CPAP
 - ♦ assessment of objective response to other interventions

Treatment

- modifiable factors: weight loss, decreased alcohol/sedatives, nasal decongestion, treatment of underlying medical conditions
- OSA or MSA: nasal CPAP, postural therapy (e.g. no supine sleeping), dental appliance, uvulopalatopharyngoplasty, tonsillectomy
- CSA or hypoventilation syndromes: nasal BiPAP/CPAP, respiratory stimulants (e.g. progesterone) in select cases
- tracheostomy rarely required and should be used as last resort for OSA

Complications

- depression, weight gain, decreased quality of life, workplace and vehicular accidents, cardiac complications (e.g. HTN), reduced work/social function

Continuous Positive Airways Pressure for Obstructive Sleep Apnea

Cochrane DB Syst Rev 2006;CD001106

Study: Pooled analysis of 36 RCTs (n=1,718) comparing nocturnal CPAP with an inactive control or oral appliances in adults with OSA.

Conclusions: The use of CPAP showed significant improvements in objective and subjective measures including cognitive function, sleepiness, measures of quality of life, and a lower average systolic and diastolic blood pressure. People who responded equally well to CPAP and oral appliances expressed a strong preference for oral appliances; however, participants on oral appliances were more likely to withdraw from therapy.

CPAP has been shown to reduce cardiovascular risk and cardiovascular related deaths in patients with obstructive sleep apnea

ICU Psychosis

A form of delirium or acute brain failure that occurs in ICU patients. Signs and symptoms may include anxiety, agitation, paranoia, hallucinations, and disorientation in time and place. Treatment varies with cause

Introduction to Intensive Care

- goal is to provide stabilization for critically ill patients: hemodynamic, respiratory or cardiac instability, or need for close monitoring

Intensive Care Unit Basics

Lines and Catheters

- arterial lines
 - monitor beat-to-beat blood pressure variations, obtain blood for routine ABGs
 - common sites are the radial and femoral arteries
- central venous catheter (central line)
 - administer IV fluids, monitor CVP, insert pulmonary artery catheters
 - administer TPN and agents too irritating for peripheral line
 - common sites: internal jugular vein, subclavian vein, femoral vein
- pulmonary arterial catheter
 - balloon guides the catheter from a major vein to the right heart
 - measures pulmonary capillary wedge pressure (PCWP) via a catheter wedged in distal pulmonary artery
 - PCWP reflects the LA and LV diastolic pressure (barring pulmonary venous or mitral valve disease)
 - indications (now used infrequently due to associated complications)
 - ♦ diagnosis of shock states, primary pulmonary HTN, valvular disease, intracardiac shunts, cardiac tamponade, PE
 - ♦ assessment of hemodynamic response to therapies
 - ♦ differentiation of high- vs. low-pressure pulmonary edema
 - ♦ management of complicated MI, multiorgan system failure and/or severe burns, or hemodynamic instability after cardiac surgery
 - absolute contraindications
 - ♦ tricuspid or pulmonary valve mechanical prosthesis
 - ♦ right heart mass (thrombus or tumor)
 - ♦ tricuspid or pulmonary valve endocarditis

Table 33. Useful Equations and Cardiopulmonary Parameters

$BSA = [Ht (cm) + Wt (kg) - 60]/100$	$PCWP = LVEDP$
$SV = CO / HR$	$SVI = CI / HR$
$CI = CO / BSA$	$RV \text{ Ejection Fraction} = SV / RVEDV$
$SVRI = [(MAP - RAP) 80]/CI$	$PP = sBP - dBP$
$P:F \text{ ratio} = P_aO_2 / F_iO_2$	$MAP = 1/3 sBP + 2/3 dBP = dBP + 1/3 PP$

BSA = body surface area; CI = cardiac index; CO = cardiac output; dBP = diastolic blood pressure; HR = heart rate; LVEDP = left ventricular end diastolic pressure; MAP = mean arterial pressure; PCWP = pulmonary capillary wedge pressure; PP = pulse pressure; RAP = right atrial pressure; RVEDV = right ventricular end diastolic volume; sBP = systolic blood pressure; SV = stroke volume; SVI = stroke volume index; SVRI = systemic vascular resistance index

Organ Failure

Table 34. Types of Organ Failure

Type of Failure	Clinical Presentation	Treatment
Respiratory Failure (see <i>Respiratory Failure</i> , R25) 	Hypoxemia Hypercapnea	Treat underlying cause (e.g. lung disease, shunt, V/Q mismatch, drug-related, cardiac) Manage mechanical ventilation settings Supplemental oxygen
Cardiac Failure (see <i>Cardiology and Cardiac Surgery</i> , C33) 	Hypotension Decreased urine output Altered mental status Arrhythmia Hypoxia	Treat underlying cause (e.g. bradycardia, tachycardia, blood loss, adrenal insufficiency) Volume resuscitation Vasopressors Inotropes Intra-aortic balloon pump
Coagulopathy (see <i>Hematology</i> , H32) 	Increased INR or PTT Low platelet count Bleeding, bruising	Treat underlying cause (e.g. thrombocytopenia, drug-related, immune-related, DIC) Transfusion of blood product, clotting factors
Liver Failure (see <i>Gastroenterology</i> , G36) 	Elevated transaminases, bilirubin Coagulopathy Jaundice Mental alteration (encephalopathy) Hypoglycemia	Treat underlying cause (e.g. viral hepatitis, drug related, metabolic) Liver transplant Lactulose
Renal Failure (see <i>Nephrology</i> , NP35) 	Elevated creatinine Reduced urine output Signs of volume overload (e.g. CHF, effusions)	Treat underlying cause (e.g. shock, drug-related, obstruction) Correct volume and electrolyte status, eliminate toxins Diuretics Dialysis

Intensive Insulin Therapy in Critically Ill Patients

NEJM 2001;345:1359-1367

Study: Prospective, randomized controlled clinical outcome study.

Patients: 1,548 patients admitted to the ICU.

Intervention: At admission, patients were randomly assigned to either intensive insulin therapy or conventional therapy. Those in the intensive group had an infusion started if BG exceeded 6.1 mEq/L, and maintained to keep BG between 4.4-6.1 mEq/L. Those in the conventional group were started on insulin only if BG exceeded 11.9, and the infusion was adjusted for a target between 10.0-11.1 mEq/L.

Primary Outcome: Death from any cause during ICU stay.

Results: 35 patients (4.6%) died in the intensive group in the ICU, vs. 63 patients (8.0%) in the conventional group. This represents a 32% mortality reduction ($p=0.04$). Intensive insulin therapy also reduced overall in-hospital mortality, lowered deaths due to sepsis, multi-organ failure. Most of the mortality benefit was seen in long stay patients (>5 d).

Conclusion: Intensive insulin therapy in the ICU reduces mortality by 32%, and improves in-hospital mortality and morbidity.

Shock

- see [Emergency Medicine](#), ER3
- inadequate tissue perfusion potentially resulting in end organ injury
 - categories of shock
 - ♦ hypovolemic: hemorrhage, dehydration, vomiting, diarrhea, interstitial fluid redistribution
 - ♦ cardiogenic: myopathic (myocardial ischemia \pm infarction), mechanical, arrhythmic, pharmacologic
 - ♦ obstructive: massive PE (saddle embolus), pericardial tamponade, constrictive pericarditis, increased intrathoracic pressure (e.g. tension pneumothorax)
 - ♦ distributive: sepsis, anaphylactic reaction, neurogenic, endocrinologic, toxic

Table 35. Changes Seen in Different Classes of Shock

	Hypovolemic	Cardiogenic	Obstructive	Distributive
HR	↑	↑, N, or ↓	↑	↑
BP	↓	↓	↓	↓
JVP	↓	↑	↑	↓
Extremities	Cold	Cold	N or Cold	Warm
Other	Look for visible hemorrhage or signs of dehydration	Bilateral crackles on chest exam	Depending on cause, may see pulsus paradoxus, Kussmaul's sign, or tracheal deviation	Look for obvious signs of infection or anaphylaxis

- treat underlying cause
- treatment goal is to return critical organ perfusion to normal (e.g. normalize BP)
- common treatment modalities include
 - fluid resuscitation
 - inotropes (e.g. dobutamine), vasopressors (e.g. norepinephrine), vasopressin
 - revascularization or thrombolytics for ischemic events

Sepsis

- the leading cause of death in noncoronary ICU settings is multi-organ failure due to sepsis
- the predominant theory is that sepsis is attributable to uncontrollable immune system activation

Definitions

- sepsis: the presence of both infection and SIRS (see [Table 36](#))
- severe sepsis: sepsis associated with organ dysfunction, hypoperfusion or hypotension
- septic shock: sepsis with arterial hypotension despite adequate fluid resuscitation

Shock: Clinical Correlation

Hypovolemic: patients have cool extremities due to peripheral vasoconstriction

Cardiogenic: patients usually have signs of left-sided heart failure

Obstructive: varied presentation

Distributive: patients have warm extremities due to peripheral vasodilation

Causes of SHOCK

Spinal (neurogenic), Septic

Hemorrhagic

Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)

Cardiogenic (e.g. arrhythmia, MI)

Anaphylactic

Systemic Inflammatory Response Syndrome (SIRS):

generalized inflammatory reaction caused by infectious and noninfectious entities, manifested by two or more of:

- Body temperature $>38^{\circ}\text{C}$ or $<36^{\circ}\text{C}$
- Heart rate $>90/\text{min}$
- Respiratory rate $>20/\text{min}$ or $\text{P}_a\text{CO}_2 <32$ mmHg
- WBC $>12,000$ cells/mL or $<4,000$ cells/mL or $>10\%$ bands

- multiorgan dysfunction syndrome: sepsis in the presence of altered organ function such that homeostasis cannot be maintained without intervention

Signs and Symptoms

Table 36. Clinical Manifestations of Sepsis

General Variables	Organ Dysfunction Variables
Fever ($>38^{\circ}\text{C}$) or hypothermia ($<36^{\circ}\text{C}$)	Arterial hypoxemia ($\text{P}_a\text{O}_2/\text{F}_i\text{O}_2 < 300$)
Heart rate $> 90/\text{min}$	Acute oliguria (urine output $< 0.5 \text{ mL/kg/h}$)
sBP $< 90 \text{ mmHg}$, MAP < 70 , or a sBP decrease $> 40 \text{ mmHg}$	Creatinine increase $> 40 \mu\text{mol/L}$
Tachypnea	Coagulation abnormalities (INR > 1.5 or aPTT $> 60 \text{ s}$)
Altered mental status	Ileus (absent bowel sounds)
Positive fluid balance ($> 20 \text{ mL/kg}$ over 24 h)	Thrombocytopenia (platelet count $< 100,000/\text{L}$)
Hyperglycemia (BG $> 140 \text{ mg/dL}$) in the absence of diabetes	Hyperbilirubinemia (plasma total bilirubin $> 4 \text{ mg/dL}$)
Leukopenia (WBC $< 4,000/\text{L}$)	Leukocytosis (WBC $> 12,000/\mu\text{L}$)
Normal WBC count with $> 10\%$ immature forms	Tissue Perfusion Variables
Plasma C-reactive protein $> 2 \text{ SD}$ above the normal value	Hyperlactatemia ($> 20 \text{ mg/dL}$)
	Decreased capillary refill or mottling

Table adapted with permission from Levy MM, Fink MP, Marshall JC, et al. 2001 SCCM/ESICM/ACCP/ATS/SIS International Sepsis Definitions Conference. *Critical Care Medicine* 2003;31:1250-1256

Treatment

- identify the cause and source of infection: blood, sputum, urine Gram stain and C&S
- initiate empiric antibiotic therapy
- monitor, restore and maintain hemodynamic function

Early Goal Directed Therapy

- adjustments of cardiac preload, afterload, and contractility to balance oxygen delivery with demand
- should be started immediately and completed within 6 h of recognition of severe sepsis or septic shock
- patient should meet SIRS criteria and sBP $< 90 \text{ mmHg}$ or lactate $> 35 \text{ mg/dL}$
 1. supplemental oxygen \pm intubation and mechanical ventilation
 2. central venous and arterial catheterization
 3. maintain CVP 8-12 mmHg with IV crystalloids/colloids
 4. MAP maintained 65-90 mmHg with the use of vasoactive agents
 5. $\text{S}_{\text{cv}}\text{O}_2 < 70\%$ then
 - ♦ transfusion of red cells until Hct $> 30\%$
 - ♦ if $\text{S}_{\text{cv}}\text{O}_2 < 70\%$ after transfusion then use inotropic agents
- supportive oxygenation and ventilation using lung-protective regimen
- early nutritional support: enteral route is used to preserve function of intestinal mucosal barrier
- control hyperglycemia with insulin to decrease infectious complications
- physiologic dose corticosteroid replacement therapy in patients with relative adrenal insufficiency (nonresponders to corticotropin stimulation test)
 - consider in mechanically ventilated septic shock patients with organ dysfunction requiring vasopressors, despite early goal-directed therapy and appropriate antibiotic therapy
- recombinant activated protein C may be considered in patients with severe sepsis or septic shock with an APACHE II score > 25 despite early goal-directed therapy and appropriate antibiotic therapy
- DVT/PE prophylaxis
- advanced care planning, including the communication of likely outcomes and realistic goals of treatment with patients and families

Corticosteroids for Treating Severe Sepsis and Septic Shock

Cochrane DB Syst Rev 2010;CD002243

Study: Meta-analysis of 25 RCTs and quasi-RCTs examining the efficacy of corticosteroids on death at one month in patients with severe sepsis and septic shock.

Results: Overall, there was no difference in 28 d all-cause mortality but there was significant heterogeneity in dosing strategy between the studies. Treatment with long course of low dose corticosteroids significantly reduced 28-d mortality, increased the proportion of shock reversal by day 7 and day 28, reduced the sepsis-related organ failure assessment score by day 7, and survivors' length of stay in the ICU, without inducing gastroduodenal bleeding, superinfection, or neuromuscular weakness. Corticosteroids increased the risk of hyperglycemia and hyponatremia.

Conclusions: Corticosteroids did not change mortality in severe sepsis and septic shock. A long course of low dose corticosteroids reduced 28 d mortality without major complications.

Early Goal-Directed Therapy for Severe Sepsis and Septic Shock

NEJM 2001;345:1368-1377

Purpose: To evaluate the efficacy of early goal-directed therapy before ICU admission.

Methods: Randomized assignment of patients who presented to emergency with severe sepsis or septic shock to either 6 h of early goal-directed therapy or standard therapy (hemodynamic support protocol). Clinicians who assumed care subsequently were blinded to treatment assignment. Primary outcomes were mortality and APACHE II scores.

Results: The mortality rate in the early therapy group ($n=130$) and control group ($n=133$) was 30.5% and 46.5% respectively ($p=0.009$). Within the 72 h, early therapy resulted in a significantly higher mean central venous oxygen saturation (70.4% vs. 65.3%), a lower lactate concentration (3.0 vs. 3.9 mEq/L), and a higher pH (7.40 vs. 7.36) compared to standard therapy ($p \leq 0.02$ for all comparisons). APACHE II scores were significantly lower in the early therapy group (13.0 vs. 15.9; $p < 0.001$).

Conclusion: Severe sepsis and septic shock significantly benefit from early goal-directed therapy compared to standard therapy protocols.

Common Medications

Table 37. Common Medications for Respiratory Diseases

	Drug	Typical Adult Dose	Indications	Side Effects
β₂-AGONISTS				
Short-Acting	salbutamol/albuterol (Ventolin®) (light blue/navy), terbutaline (Bricanyl®)	1-2 puffs q4-6h prn	Bronchodilator in acute reversible airway obstruction	CV (angina, flushing, palpitations, tachycardia, can precipitate atrial fibrillation), CNS (dizziness, H/A, insomnia, anxiety), GI (diarrhea, N/V), rash, hypokalemia, paroxysmal bronchospasm
Long-Acting	salmeterol (Serevent®), formoterol (Foradil®) indacaterol (Arcapta Neohaler®)	1-2 puffs bid 1 puff daily	Maintenance treatment (prevention of bronchospasm) in COPD, asthma	
Combination Long-Acting β₂-Agonist and Inhaled Corticosteroid	fluticasone and salmeterol (Advair®) (purple MDI or diskus) Budesonide and formoterol (Symbicort®) (red turbuhaler) Mometasone and formoterol (Zenhale®) (blue MDI)	1 puff bid 2 puffs bid	COPD and asthma	Common: CNS, H/A, dizziness Resp: URTI, GI (N/V, diarrhea, pain/discomfort, oral candidiasis)
ANTICHOLINERGICS				
	ipratropium bromide (Atrovent®) (clear/green), tiotropium bromide (Spiriva®) glycopyrronium bromide	2-3 puffs qid 1 puff qam 1 puff daily	Bronchodilator used in COPD, bronchitis and emphysema	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
CORTICOSTEROIDS				
Inhaled	fluticasone (Flovent®) (orange/peach) budesonide (Pulmicort®) ciclesonide (Alvesco®) beclomethasone (QVAR®, Vanceril®) Mometasone (Asmanex®)	2-4 puffs bid 2 puffs bid 1-4 puffs OD 1-4 puffs bid (40 µg), 1-2 puffs bid (80 µg) 1 puff daily or bid	Maintenance treatment of asthma	H/A, fever, N/V, MSK pain, URTI, throat irritation, growth velocity reduction in children/adolescents, HPA axis suppression, increased pneumonia risk in COPD
Systemic	prednisone (Apo-prednisone®, Deltasone®) methylprednisolone (Depo-Medrol®, Solu-Medrol®)	Typically 40-60 mg per day PO 125 mg q8h IV (sodium succinate) loading dose 2 mg/kg then 0.5-1 mg/kg q6h for 5 d	Acute exacerbation of COPD; severe, persistent asthma, PCP Status asthmaticus	Endocrine (hirsutism, DM/glucose intolerance, Cushing's syndrome, HPA axis suppression), GI (increased appetite, indigestion), ocular (cataracts, glaucoma), edema, AVN, osteoporosis, headache, psychiatric (anxiety, insomnia), easy bruising
ADJUNCT AGENTS				
	theophylline (Uniphyll®)	400-600 mg OD	Treatment of symptoms of reversible airway obstruction due to COPD	GI upset, diarrhea, N/V, anxiety, H/A, insomnia, muscle cramp, tremor, tachycardia, PVCs, arrhythmias Toxicity: persistent, repetitive vomiting, seizures
LEUKOTRIENE ANTAGONISTS				
	montelukast (Singulair®) zafirlukast (Accolate®)	10 mg PO qhs, now only available as once daily slow release 20 mg bid	Prophylaxis and chronic treatment of asthma	H/A, dizziness, fatigue, fever, rash, dyspepsia, cough, flu-like symptoms
MONOCLONAL ANTIBODIES				
	omalizumab (Xolair®)	150-375 mg SC q2-4wk	Moderate-severe persistent asthma	H/A, sinusitis, pharyngitis, URTI, viral infection, thrombocytopenia, anaphylaxis
PDE5 INHIBITORS				
	roflumilast (Daliresp®)	500 µg PO OD	Severe emphysema, with frequent exacerbations	Weight loss, suicidal ideation
ANTIBIOTICS – COMMUNITY ACQUIRED PNEUMONIA				
Macrolide	erythromycin azithromycin clarithromycin	250-500 mg PO tid x 7-10 d 500 mg PO x 1 dose, then 250 mg OD x 4 500 mg PO bid x 7-10 d	Alternate to doxycycline or fluoroquinolone	GI (abdominal pain, diarrhea, N/V), H/A, prolonged QT, ventricular arrhythmias, hepatic impairment GI (diarrhea, N/V, abdominal pain), renal failure, deafness Headache, rash, GI (diarrhea, N/V, abnormal taste, heartburn, abdominal pain), increased urea
Doxycycline		100 mg PO bid x 7-10 d	Alternate to macrolide or fluoroquinolone	Photosensitivity, rash, urticaria, anaphylaxis, diarrhea, enterocolitis, tooth discoloration in children
Fluoroquinolone	levofloxacin (Levaquin®) moxifloxacin (Avelox®)	500 mg PO OD x 7-10 d 400 mg PO OD x 7 d	Alternate to macrolide or doxycycline	CNS (dizziness, fever, H/A), GI (N/V, diarrhea, constipation), prolonged QT

Table 37. Common Medications for Respiratory Diseases (continued)

Drug	Typical Adult Dose	Indications	Side Effects	
ANTIBIOTICS – HOSPITAL ACQUIRED PNEUMONIA				
3rd gen Cephalosporin	ceftriaxone (Rocephin®)	1-2 g IV OD x 7-10 d	Combine with fluoroquinolone or macrolide	Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases
Fluoroquinolone	levofloxacin moxifloxacin	750 mg PO OD x 5 d 400 mg PO OD x 7 d (5 d for AECOPD)	Combine with 3rd gen cephalosporin	See above
Piperacillin/ Tazobactam (Tazocin®)		4.5 g IV q6-8h x 7-10 d	Suspect Pseudomonas	CNS (confusion, convulsions, drowsiness), rash, Hematologic (abnormal platelet aggregation, prolonged PT, positive Coombs)
Vancomycin (Vancocin®)		1 g IV bid x 7-10 d	Suspect MRSA	CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity
Macrolide	azithromycin	500 mg IV OD x 2 d, then 500 mg PO OD x 5 d	Suspect Legionella	See above
	clarithromycin	500 mg PO bid x 7-10 d		See above
ICU MEDICATIONS				
Pressors/Inotropes	norepinephrine (Levophed®) phenylephrine dobutamine	0.5-30 µg/min IV 0.5 µg/kg/min IV 2-20 µg/kg/min IV	Acute hypotension Severe hypotension Inotropic support	Angina, bradycardia, dyspnea, hyper/hypotension, arrhythmias See above See above
Sedatives/Analgesia	fentanyl (opioid class)	50-100 µg then 50-unlimited µg/h IV	Sedation and/or analgesia	Bradycardia, respiratory depression, drowsiness, hypotension
	propofol (anesthetic)	1-3 mg/kg then 0.3-5 mg/kg/h IV	Sedation and/or analgesia	Apnea, bradycardia, hypotension (good for ventilator sedation)

See [Infectious Diseases](#), ID27 – for the management of pulmonary tuberculosis

Landmark Respiriology Trials

Trial	Reference	Results
ARDS Network	<i>NEJM</i> 2000; 342:1301-8	Mortality decreased in ARDS patients ventilated with a low tidal volume strategy
Berlin Criteria	<i>JAMA</i> 2012; 307:2526-33	The new definition of ARDS, better predicts mortality
CPAP and Apnea	<i>NEJM</i> 2005; 353:2025-33	CPAP ameliorates symptoms of sleep apnea but does not affect mortality in CHF
EINSTEIN-PE	<i>NEJM</i> 2012; 366:1287-97	Fixed dose of rivoxabarin was non-inferior to standard therapy (Vit K antagonist) initial and long-term treatment of PE
Emphysema Treatment Trial	<i>NEJM</i> 2003; 348:2059-73	Lung volume reduction surgery benefits patients with upper lobe disease and low exercise capacity
IELCAP	<i>NEJM</i> 2006; 355:1763-71	High survival rate in patients with early stage lung cancer detected by low dose CT screening
Lung Health	<i>JAMA</i> 1994; 272:1497-505	Aggressive smoking intervention significantly decreases the age-related decline in FEV ₁ in middle-aged smokers with mild airways obstruction
Pneumonia	<i>NEJM</i> 1978; 298:801-9	Interstitial lung disease subsets have different prognoses and response to treatment (e.g. desquamative but not usual interstitial pneumonia respond well to corticosteroids)
POET-COPD	<i>NEJM</i> 2011; 364:1093-103	Tiotropium decreases the number of moderate-to-severe exacerbations in comparison to salmeterol
ROFLUMILAST	<i>Lancet</i> 2009; 374:695-703	Leukotriene inhibitors improve FEV ₁ when used as add-on therapy in COPD patients on tiotropium or salmeterol
TORCH	<i>NEJM</i> 2007; 356:775-89	Combination of inhaled steroids and long-acting β ₂ -agonists improves COPD symptoms, reduces exacerbations, and shows a trend to lowers mortality
UPLIFT	<i>NEJM</i> 2008; 359:1543-54	Tiotropium improves symptoms of COPD with fewer exacerbations, but does not affect FEV ₁ decline

CMC	carpometacarpal joint	MCP	metacarpal phalangeal joint	SLE	systemic lupus erythematosus
CNS	central nervous system	MCTD	mixed connective tissue disease	SS	Sjögren's syndrome
CPPD	calcium pyrophosphate dihydrate	MHC	major histocompatibility complex	TNF	tumour necrosis factor
CRP	C-reactive protein	MPO	myeloperoxidase	U/A	urinalysis
DIP	distal interphalangeal joint	MTP	metatarsal phalangeal joint	ULN	upper limit of normal
DM	diabetes mellitus	MTX	methotrexate	VDRL	venereal disease research laboratory
DMARD	disease-modifying anti-rheumatic drug	OA	osteoarthritis	WBC	white blood cell
DMM	dermatomyositis	PAN	polyarteritis nodosa		

Anatomy of Joint Pathology

Figure 1. Structure of normal, degenerative, and inflammatory joint

Terminology in Rheumatology

Arthritis

- Joint swelling: effusion/synovial thickening
- Decreased ROM
- Stress pain (pain at the end of ROM)
- Increased warmth

Arthralgia: perception of joint pain without obvious clinical findings

Active joint: swollen joint, joint line tenderness, or stress pain

Basics of Immunology

Immune Mechanisms of Disease

Table 1. Mechanisms of Immunologically Mediated Disorders

Type	Pathophysiology	Examples
Anaphylactic (type I)	Formation of IgE → release of immunologic mediators from basophils/mast cells → diffuse inflammation	Asthma Allergic rhinitis
Cytotoxic (type II)	Formation of Ab → deposit and bind to Ag on cell surface → phagocytosis or lysis of target cell	Autoimmune hemolytic anemia, Goodpasture's syndrome, Graves' disease, pernicious anemia
Immune complex (type III)	Formation of Ag-Ab complexes → activate complement → attract inflammatory cells and release cytokines	SLE, PAN, post-streptococcal glomerulonephritis, serum sickness
Cell-mediated/delayed hypersensitivity (type IV)	Release of cytokines by sensitized T-cells and T-cell mediated cytotoxicity	Contact dermatitis

Immunogenetics and Disease

- cell surface molecules called HLAs play a role in mediating immune reactions
- MHCs are genes on the short arm of chromosome 6 that encode HLA molecules
- there are three classes of MHCs
- discrete domains of hypervariability within MHC molecules thought to represent "susceptibility determinants"
- certain HLA haplotypes are associated with increased susceptibility to autoimmune diseases

Table 2. Classes of MHCs

MHC Class	Types	Location	Function
I	HLA-A, B, C	All cells	Recognized by CD8+ (cytotoxic) T-lymphocytes
II	HLA-DP, DQ, DR	Ag presenting cells (mononuclear phagocytes, B cells, etc.)	Recognized by CD4+ (helper) T-lymphocytes
III	Some components of the complement cascade	In plasma	Chemotaxis, opsonization, lysis of bacteria and cells

Table 3. HLA-Associated Rheumatic Disease

HLA Type	Associated Conditions	Comments
B27	AS	In AS, relative risk = 70-90x
	ReA	In ReA, relative risk = 40x
	EA	
DR4, DR1	RA	In RA, relative risk = 2-10x; found in 93% of patients
DR3	SS	DR3 associated with many non-rheumatic conditions (celiac disease, type 1 DM, Graves' disease, chronic active hepatitis)
	SLE	

Differential Diagnoses of Common Presentations

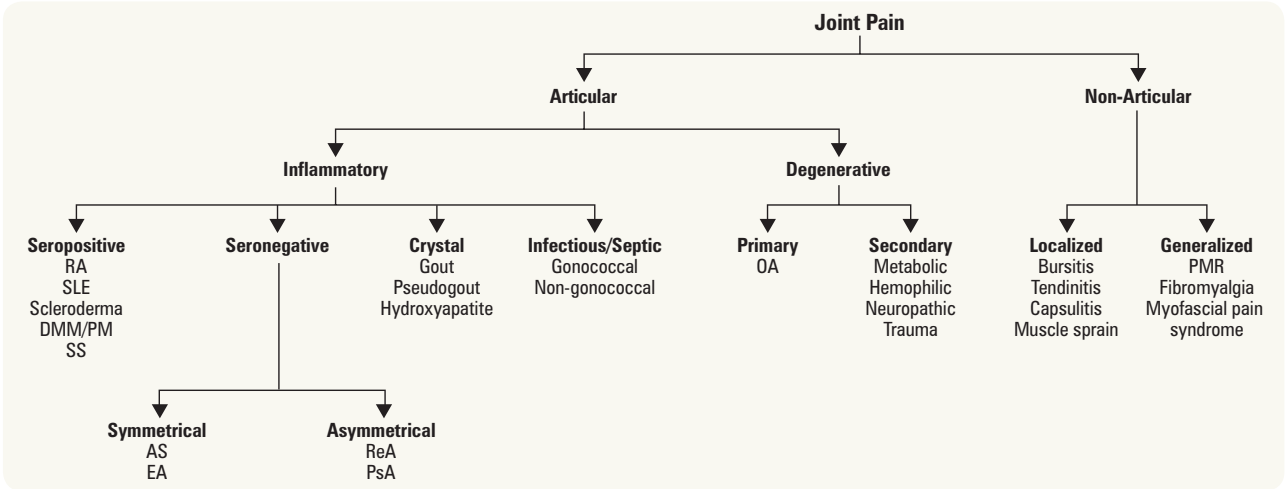

Figure 2. Clinical approach to joint pain

Table 4. Differential Diagnosis of Monoarthritis

Infection	Crystal	Degenerative	Trauma	Neoplastic	Other
Septic arthritis (Staph, GC, fungi, TB)	Gout Pseudogout Hydroxyapatite	OA	Hemarthrosis Osteonecrosis	Tumor	Systemic inflammatory disease Polyarthritis presenting with monoarticular symptoms first

Table 5. Differential Diagnosis of Oligoarthritis/Polyarthritis

Acute (<6 weeks)	Chronic (>6 weeks)		
First presentation of inflammatory arthritis Post-viral (parvovirus B19) Acute rheumatic fever Infectious (GC, non-GC)	Seropositive inflammatory arthritis RA SLE Scleroderma DMM/PM	Seronegative inflammatory arthritis AS EA PsA ReA Crystal (polyarticular gout)	Degenerative OA

Table 6. Symptoms of Inflammatory Arthritis vs. Degenerative Arthritis

Inflammatory	Degenerative
Pain at rest, relieved by motion Morning stiffness >1 h Warmth, swelling, erythema Malalignment/deformity Extra-articular manifestations	Pain with motion, relieved by rest Morning stiffness <½ h Joint instability, buckling, locking Bony enlargement, malalignment/deformity

Causes of Joint Pain

SOFTER TISSUE

Sepsis
OA
Fracture
Tendon/muscle
Epiphyseal
Referred
Tumor
Ischemia
Seropositive arthritides
Seronegative arthritides
Urate (gout)/other crystal
Extra-articular rheumatism (PMR/ fibromyalgia)

Patterns of Joint Involvement

- Symmetrical vs. asymmetrical
- Small vs. large
- Mono vs. oligo (2-4 joints) vs. polyarticular (≥5 joints)
- Axial vs. peripheral

Table 7. Seropositive vs. Seronegative Rheumatic Diseases

	Seropositive	Seronegative
Demographics	F > M	M > F
Peripheral Arthritis	Symmetrical Small (PIP, MCP) and medium joints (wrist, knee, ankle, elbow) common DIP less involved	Usually asymmetrical Usually larger joints, lower extremities (PsA may be the exception) DIP in PsA Dactylitis ("sausage digit") Enthesitis
Pelvic/Axial Disease	No (except for C-spine)	Yes
Enthesitis	No	Yes
Extra-Articular	Nodules Vasculitis Sicca Raynaud's phenomenon	Iritis (anterior uveitis) Oral ulcers Gastrointestinal Dermatologic features

The presence of synovitis often indicates articular as opposed to non-articular joint pain; synovitis presents with: soft tissue swelling, effusion, warmth, and pain with movement

Common Investigations in Rheumatology

- general: CBC, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen, platelets
- complement (C3, C4)
- U/A to detect disease complications (proteinuria, active sediment)
- serology: autoimmune Abs (ANA, anti-dsDNA, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RF, and anti-CCP)
- synovial fluid analysis
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

Synovial Fluid Analysis

- synovial fluid is an ultrafiltrate of plasma plus hyaluronic acid; it lubricates joint surfaces and nourishes articular cartilage

Indications

- diagnostic: mandatory if septic arthritis suspected; advised if crystal arthritis or hemarthrosis suspected; advised if unexplained effusion in accessible joint
- therapeutic: drainage of blood, purulent or tense effusions; corticosteroid injection

Contraindications

- absolute: open lesion or suspected infection of overlying skin or soft tissue
- relative: bleeding diathesis, thrombocytopenia, prosthetic joint

Most Important Tests of Synovial Fluid (3 Cs)

- ensure synovial fluid is described in terms of color, clarity, viscosity, and quantity
- 1. Cell count and differential
- 2. Culture and Gram stain (bacteria, mycobacteria, fungi)
- 3. Crystal examination (microscopy with polarized light)
 - gout (monosodium urate) → needle-shaped, negatively birefringent (bright yellow)
 - pseudogout (calcium pyrophosphate dihydrate) → rhomboid-shaped, positively birefringent (pale blue)

Protein, LDH, glucose less helpful

Table 8. Synovial Fluid Analysis

Parameter	Normal	Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
Color	Pale yellow	Pale yellow	Pale yellow	Yellow to white	Red/brown
Clarity	Clear	Clear	Opaque	Opaque	Sanguinous
Viscosity	High (due to hyaluronic acid)	High	Low	Low or paradoxically high if purulent	Variable
WBC/mm³	<200	<2000	>2000	Higher cell counts (particularly >50,000) suggestive	Variable
% PMN	<25%	<25%	>25%	>75%	Variable
Culture/ Gram Stain	–	–	–	Usually positive	–
Examples		Trauma OA Neuropathy Hypertrophic – arthropathy	Seropositives Seronegatives Crystal arthropathies	<i>S. aureus</i> Gram negative GC → difficult to culture	Trauma Hemophilia

Septic Arthritis

- for any acute monoarticular arthritis, one must rule out septic etiology; consider empiric antibiotic treatment until septic arthritis is excluded by history, physical exam, and synovial fluid analysis
- poor prognostic factors: older age, immunocompromised, delay in treatment, previously damaged joint, joint prosthesis
- see [Infectious Diseases](#) for *Gonococcal Arthritis*, ID15/[Orthopedics](#), OR10

Septic arthritis is a medical emergency; it leads to rapid joint destruction, and there is a 10-15% risk of mortality

Degenerative Arthritis: Osteoarthritis

Definition

- progressive deterioration of cartilage and bone due to failed repair of joint damage caused by stresses on the joint

Classification (Based on Etiology)

- primary (idiopathic)
 - most common, unknown etiology
- secondary
 - post-traumatic or mechanical
 - post-inflammatory (e.g. RA) or post-infectious
 - heritable skeletal disorders (e.g. scoliosis)
 - endocrine disorders (e.g. acromegaly, hyperparathyroidism, hypothyroidism)
 - metabolic disorders (e.g. gout, pseudogout, hemochromatosis, Wilson's disease, ochronosis)
 - neuropathic (e.g. Charcot joints)
 - ♦ atypical joint trauma due to peripheral neuropathy (e.g. DM, syphilis)
 - AVN
 - other (e.g. congenital malformation)

Pathophysiology

- deterioration of articular cartilage due to local biomechanical factors, which leads to joint trauma and release of proteolytic and collagenolytic enzymes
 - OA develops when cartilage catabolism > synthesis
 - loss of proteoglycans and water exposes underlying bone
- abnormal local bone metabolism further damages joint
- altered joint function and damage
- synovitis is secondary to cartilage damage; therefore, may see small effusions in OA

Epidemiology

- most common arthropathy
- increased prevalence with increasing age (35% of 30 yr olds, 85% of 80 yr olds)

Risk Factors

- genetic predisposition, advanced age, obesity (for knee OA), female, trauma

Signs and Symptoms

- localized to affected joints (not a systemic disease)
- pain is often insidious, gradually progressive, with intermittent flares and remissions

Table 9. Signs and Symptoms of OA

Signs	Symptoms
Joint line tenderness; stress pain ± joint effusion	Joint pain with motion; relieved with rest
Bony enlargement at affected joints	Short duration of stiffness (< 1/2 h) after immobility
Malalignment/deformity (angulation)	Joint instability/buckling
Limited ROM	Joint locking due to "joint mouse" (bone or cartilage fragment)
Crepitus on passive ROM	Loss of function or other internal derangements (e.g. meniscal tear)
Inflammation (mild if present)	
Periarticular muscle atrophy	

Joint Involvement

- asymmetric
- hand
 - DIP (Heberden's nodes = osteophytes → enlargement of joints)
 - PIP (Bouchard's nodes)
 - CMC (usually thumb squaring)
 - 1st MCP (other MCPs are usually spared)

Obesity is linked to OA in the knee as well as CMC, which suggests a systemic inflammatory component to OA

- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colati

Figure 3. Common sites of joint involvement in OA

1. Thumb squaring
2. Heberden's nodes
3. Bouchard's nodes

© Tabby Lulham 2011

Figure 4. Hand findings in OA

OA of MCP joints can be seen in hemochromatosis or chondrocalcinosis

- hip
 - usually presents as groin pain \pm dull or sharp pain in the trochanteric area, internal rotation and abduction are lost first
 - pain can radiate to the anterior thigh, but generally does not go below the knee
- knee
 - initial narrowing of one compartment, medial > lateral; seen on standing x-rays, often patellar-femoral joint involved
- foot
 - common in first MTP and midfoot
- lumbar spine
 - very common, especially L4-L5, L5-S1
 - degeneration of intervertebral discs and facet joints
 - reactive bone growth can contribute to neurological impingement (e.g. sciatica, neurogenic claudication) or spondylolisthesis (forward or backward movement of one vertebra over another)
- cervical spine
 - commonly presents with neck pain that radiates to scapula, especially in mid-lower cervical area (C5 and C6)

Investigations

- blood work
 - normal CBC and ESR, CRP
 - negative RF and ANA
- radiology: 4 hallmark findings
- synovial fluid: non-inflammatory (see Table 8)

Treatment

- presently no treatment alters the natural history of OA
- **non-pharmacological therapy**
 - weight loss (minimum 5-10 lb loss) if overweight
 - physiotherapy: heat/cold, low impact exercise programs
 - occupational therapy: aids, splints, cane, walker, bracing
- **pharmacological therapy** (see Table 32)
 - oral: acetaminophen/NSAIDs, glucosamine \pm chondroitin (nutraceuticals not proven)
 - joint injections: corticosteroid, hyaluronic acid (questionable benefit)
 - topical: capsaicin, NSAIDs
- **surgical treatment**
 - joint debridement, osteotomy, total and/or partial joint replacement, fusion (see [Orthopedics](#), OR28)

Hint: Bouchard's is closer to the Body

The Radiographic Hallmarks of OA

- Joint space narrowing
- Subchondral sclerosis
- Subchondral cysts
- Osteophytes

Meta-Analysis: Chondroitin for Osteoarthritis of the Knee and Hip

Ann Intern Med 2007;146:580-590

Study: Meta-analysis of 20 RCTs and quasi-RCTs (n=3,846) examining the efficacy of chondroitin in OA.

Results: The analysis of this review was hampered by significant trial heterogeneity. Trials with poor methodology (small numbers, inadequate randomization concealment, intention to treat analysis) showed larger effect sizes in favor of chondroitin. When the authors restricted analysis to 3 trials with large sample sizes and an ITT analysis, 40% of patients were included and an effect size of -0.03 (95% CI -0.13-0.07) was generated.

Conclusion: There is high quality evidence to suggest there is no difference between chondroitin and placebo. Chondroitin should be discouraged from routine use in clinical practice.

Intra-articular Corticosteroid for Treatment of Osteoarthritis of the Knee

Cochrane DB Syst Rev 2009;CD005328

Population: Patients with osteoarthritis (OA) of the knee.

Intervention: Intraarticular (IA) corticosteroid injection.

Results: 28 RCTs and quasi-RCTs (n=1,973). IA corticosteroids were more effective than placebo for pain reduction and global assessment at 1 wk post-injection. There was significant pain reduction at 2 and 3 wk, but no benefit for pain and function beyond 4 wk post-injection. There was no benefit for global function beyond 1 wk post-injection. There were higher rates of pain reduction at 4 wk post-injection for triamcinolone hexacetonide vs. betamethasone. There was no difference between IA corticosteroids and joint lavage in outcomes or safety. Hyaluronic acid injections showed better response than IA corticosteroids between 5 and 13 wk post-injection.

Conclusion: IA corticosteroid injection is effective for the short-term treatment of OA of the knee with few side effects. Hyaluronic acid therapy can provide more durable results.

Glucosamine Therapy for Treating Osteoarthritis

Cochrane DB Syst Rev 2009;CD002946

Study: Meta-analysis of 25 RCTs (n=4,963) examining the efficacy of glucosamine on OA.

Results: Collectively the 25 RCTs favored glucosamine over placebo for total reduction in pain with 22% improvement as well as improvement in function using the Lequesne index. However, results were not uniformly positive. Only the glucosamine containing Rotta preparation was found to be significant. Rotta preparation also showed that glucosamine was able to slow radiological evidence of OA over a 3 yr period. Glucosamine had an excellent safety profile.

Conclusion: Rotta preparation of glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from OA.

SEROPOSITIVE RHEUMATIC DISEASE

- diagnosis vs. classification in rheumatology
 - diagnostic criteria are often dependent on disease progression and evolution over time, as early objective measures are often unavailable
 - classification criteria are derived from studying patients with long-term diseases and clear diagnoses in order to determine which criteria have good specificity in the early prediction of certain diagnoses
- seropositive arthropathies are characterized by the presence of a serologic marker such as positive RF or ANA
- a small subset of the vasculitides, the small vessel ANCA-associated vasculitides, have a measureable serological component, but even these are often considered a separate entity from seropositive disease by experts

Blood Work

- general: CBC, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, complement (C3 and C4), fibrinogen,
- note: C3, C4 often decrease in active SLE
- autoantibodies

Urinalysis

- proteinuria, active sediment

Synovial Fluid Analysis

- see Table 8

Radiology

- plain film, CT, MRI, U/S, bone densitometry, angiography, and bone scan

Table 10. Autoantibodies and their Prevalence in Rheumatic Diseases

Autoantibody	Disease	Healthy Controls	Comments
RF	RA 80%	<5%	Autoantibodies (IgM>IgG>IgA) directed against Fc domain of IgG Present in most seropositive diseases Levels correlate with disease severity in RA Non-specific Present in IE, TB, hepatitis C, silicosis, sarcoidosis
	SS 50%	10-20%	
	SLE 20%	>65	
Anti-CCP	RA 80%		In RA: anti-CCP more specific than RF May be useful in early disease and to predict aggressive disease
ANA	SLE 98%	<5% (seen in other CTDs)	Ab against nuclear components (DNA, RNA, histones, centromere) Sensitive but not specific for SLE
	MCTD 95%		
	SS 70-90%		
	CREST 80%		
Anti-dsDNA	SLE 50-70%	0%	Specific for SLE Levels correlate with disease activity
Anti-Sm	SLE <30%	0%	Specific but not sensitive for SLE
Anti-Ro (SSA)	SS 40-95%	0.5%	Subacute cutaneous SLE and mothers of babies with neonatal SLE 25%
Anti-La (SSB)	SS 40% SLE 10%	0%	Usually occurs with anti-Ro
Antiphospholipid Ab (LAC, ACLA)	APLA 100% SLE 31-40%	<5%	By definition present in APLA Only small subset of SLE patients develop clinical syndrome of APLA If positive, will often get a false positive VDRL test
Anti-Histone	Drug-induced SLE >90%	0%	Present in MCTD; present in many other CTD
	Idiopathic SLE >50%	0%	
Anti-RNP	MCTD		Present in MCTD; present in many other CTD
Anti-Centromere	CREST >80%	0%	Specific for CREST variant of systemic sclerosis
Anti-Topoisomerase I (formerly Scl-70)	Diffuse systemic sclerosis 26-76%	0%	
c-ANCA	Active GPA (Wegener's) >90%	0%	Specific and sensitive
p-ANCA	GPA (Wegener's) 10% Other vasculitis	0%	Nonspecific and poor sensitivity (found in ulcerative colitis, PAN, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis)
Anti-Mi-2	DMM 15-20%		Specific but not sensitive (not available in all centers)
Ab Against RBCs, WBCs, or Platelets	SLE		Perform direct Coomb's test Test Hb, reticulocyte, leukocyte and platelet count, antiplatelet Abs

- note: some individuals in the normal population test positive for RF and/or ANA, but do not have the conditions listed in Table 10

**Differential Diagnosis of Elevated ESR**

- RA, PMR, GCA
- Hypoalbuminemia, anemia, multiple myeloma
- Bacterial infections
- Malignancy

ESR (and CRP) is insensitive for polymyositis/dermatomyositis, AS, scleroderma, SLE, viral infections

**OARSI Guidelines for the Non-Surgical Management of Knee Osteoarthritis**

Osteoarthr Cartilage 2014;22:363-388

Objective: To develop concise, updated consensus guidelines for the management of knee OA.

Methods: The OA Guidelines Development Group consisted of 13 physicians from relevant medical specialties and a patient representative. Based on previous OA guidelines and a systematic review of the OA literature, 29 treatment modalities were investigated. Treatments were recommended as Appropriate, Uncertain, or Not Appropriate, for each of four clinical sub-phenotypes and accompanied by 1-10 risk and benefit scores.

Results: Appropriate treatment modalities for all individuals with knee OA included biomechanical interventions, IA corticosteroids, exercise, self-management and education, strength training, and weight management. Treatments appropriate for specific clinical sub-phenotypes included acetaminophen, balneotherapy, capsaicin, canes, duloxetine, oral and topical NSAIDs. Treatments of uncertain appropriateness for specific clinical sub-phenotypes included acupuncture, avocado soybean unsaponifiables, chondroitin, crutches, diacerein, glucosamine, IA hyaluronic acid, opioids, rosehip, transcutaneous electrical nerve stimulation, and U/S. Treatments voted not appropriate included risperidone and neuromuscular electrical stimulation.

Conclusion: Several mainstream treatments are effective for all patients with knee OA, whereas others are only appropriate for certain subtypes. Treatments of uncertain appropriateness can still be considered as treatment and should be based on risk-benefit profile and individual characteristics, as well as comorbidities and preferences of the patient.

Connective Tissue Disorders

Table 11. Features of Seropositive Arthropathies

	RA	SLE	Scleroderma	Dermatomyositis
CLINICAL FEATURES				
History	Symmetrical polyarthritis (small joint involvement) morning stiffness (>1 h)	Multisystemic disease: rash, photosensitivity, Raynaud's, alopecia, cardiac and pulmonary serositis, CNS symptoms, glomerulonephritis	Skin tightness, stiffness of fingers, Raynaud's, heartburn, dysphagia, pulmonary HTN, renal crisis with new onset HTN or hypertensive urgency/emergency, dyspnea on exertion	Heliotrope rash (periorbital), Gottron's papules (violaceous papules over knuckles and IP joints) ± poikiloderma Shawl sign: macular erythema over chest and shoulder Proximal muscle weakness ± pain Dyspnea on exertion
Physical Examination	Effused joints Tenosynovitis Joint deformities Bone-on-bone crepitus in advanced disease	Confirm historical findings (rash, serositis, renal, CVS, etc.) ± effused (typically small) joints (can be minimal, look for soft tissue swelling)	Skin tightness on dorsum of hand, facial skin tightening, telangiectasia, calcinosis, non-effused joint, inspiratory crackles	Rash, proximal muscle weakness, inspiratory crackles
LABORATORY				
Non-Specific	↑ ESR in 50-60% ↑ platelets ↓ Hb ↓ WBC (Felty's)	↑ ESR ↓ platelets (autoimmune) ↓ Hb (autoimmune) ↓ WBC (leukopenia, lymphopenia)	↑ ESR ↓ Hb Normal WBC	Possible increased ESR ↓ Hb Normal WBC
Specific	RF +ve in ~80% Anti-CCP +ve in ~80%	ANA +ve in 98% Anti-dsDNA +ve in 50-70% Anti-SM +ve in 30% ↓ C3, C4, total hemolytic complement False positive VDRL (in SLE subtypes) ↑ PTT (in SLE subtypes, e.g. APLA)	ANA +ve in >90% Anti-topoisomerase 1 (diffuse) Anti-centromere (usually in CREST, see RH13)	CK elevated in 80% ANA +ve in 33% anti-Jo-1, anti-Mi-2 Muscle biopsy EMG MRI
Synovial Fluid	Inflammation Leukocytosis (>10,000)	Mild inflammation with +ve ANA	Not specific	Not specific
Radiographs	Periarticular osteopenia Joint space narrowing Erosions Absence of bone repair Symmetric/concentric	Non-erosive ± osteopenia ± soft tissue swelling	± pulmonary fibrosis ± esophageal dysmotility ± calcinosis ± interstitial lung disease	± esophageal dysmotility ± interstitial lung disease ± calcifications

Rheumatoid Arthritis

Definition

- chronic, symmetric, erosive synovitis of peripheral joints (e.g. wrists, MCPs, MTPs)
- characterized by a number of extra-articular features

Table 12. Classification Criteria for RA

Criteria	Score	Comments
1. Joint involvement (swollen or tender)		
1 large joint (shoulders, elbows, hips, knees, and ankles)	0	
2-10 large joints	1	
1-3 small joints (MCPs, PIPs, wrists, 2nd-5th MTPs)	2	
4-10 small joints	3	
>10 joints (at least 1 small joint)	5	
2. Serology		
Negative RF and negative Anti-CCP	0	Total score of ≥6: definite RA Must have ≥1 joint with definite clinical swelling, not better explained by other disease
Low-positive RF or low-positive Anti-CCP (<3x ULN)	2	
High-positive RF or high-positive Anti-CCP (>3x ULN)	3	
3. Acute phase reactants		
Normal CRP and normal ESR	0	
Abnormal CRP and abnormal ESR	1	
4. Duration of symptoms		
<6 wk	0	
≥6 wk	1	

Arthritis Rheum 2010;62:2569-2581

RA is an independent risk factor for atherosclerosis and CV disease; RA is associated with increased overall mortality/morbidity from all causes: CV disease, neoplasm (especially lymphoma), infection

Common Presentation

- Morning stiffness >1 h, improves with use
- Symmetric joint involvement
- Initially involves small joints of hands and feet
- Constitutional symptoms

1987 American Rheumatism Association RA Criteria

- At least 4 of:
- Morning stiffness >1 h for >6 wk
 - Arthritis ≥3 joints for >6 wk
 - Arthritis of hand joints for >6 wk
 - Symmetric arthritis for >6 wk
 - Rheumatoid nodules
 - Serum RF positive
 - Radiographic changes (erosions or periarticular osteopenia)

Criteria are 91-94% sensitive and 89% specific for RA

Pathophysiology

- autoimmune disorder, unknown etiology
- hallmark of RA is hypertrophy of the synovial membrane
 - activated rheumatoid synovium (pannus) grows into and over the articular surface; inflammatory mediators lead to release of metalloproteinases and collagenases resulting in destruction of articular cartilage and subchondral bone
- two theories attempt to explain chronic remissions and exacerbations seen in RA
 - **sequestered Ag**
 - ♦ during inflammation, immune complexes (ICs) are deposited at avascular cartilage-bone junction → immune complexes are released as further cartilage breaks down → triggers inflammatory cascade
 - **molecular mimicry**
 - ♦ cartilage damage → altered cartilage resembles undefined offending agent → triggers inflammatory cascade

Epidemiology

- prevalence 1% of adult population
- F:M = 3:1
- age of onset 20-40 yr
- genetic predisposition: HLA-DR4/DR1 association (93% of patients have either HLA type)

Signs and Symptoms

- variable course of exacerbations and remissions
- morning stiffness >1 h, improves with use, increases with rest
- may have joint pain with activity
- symmetric joint involvement
- joint swelling, tender joints
- constitutional symptoms: profound fatigue; rarely myalgia or weight loss
- extra-articular features (EAF)
- limitation of function and decrease in global functional status
- complications of chronic synovitis
 - signs of mechanical joint damage: loss of motion, instability, deformity, crepitus, joint deformities
 - ♦ swan neck deformity, boutonnière deformity
 - ♦ ulnar deviation of MCP, radial deviation of wrist joint
 - ♦ hammer toe, mallet toe, claw toe
 - ♦ flexion contractures
 - atlanto-axial and subaxial subluxation
 - ♦ C-spine instability
 - ♦ neurological impingement (long tract signs)
 - ♦ difficult/dangerous intubation: risk of worsening subluxation and damage to spinal cord
 - limited shoulder mobility, spontaneous tears of the rotator cuff leading to chronic spasm
 - tenosynovitis → may cause rupture of tendons
 - carpal tunnel syndrome
 - ruptured Baker's cyst (outpouching of synovium behind the knee); presentation similar to acute DVT

Table 13. Extra-Articular Features of RA Classified by Underlying Pathophysiology

System	Vasculitic	Lymphocytic Infiltrate
Skin	Periungual infarction, cutaneous ulcers, palpable purpura	Rheumatoid nodules (may have vasculitic component)
Ocular	Episcleritis, scleritis	Keratoconjunctivitis sicca
Head and Neck		Xerostomia, Hashimoto's thyroiditis (see Endocrinology, E27)
Cardiac		Peri-/myocarditis, valvular disease, conduction defects
Pulmonary		Pulmonary fibrosis, pleural effusion, pleuritis, pulmonary nodules
Neurologic	Peripheral neuropathy: sensory stocking-glove, mononeuritis multiplex	
Hematologic		Splenomegaly, neutropenia (Felty's syndrome)
Renal		Amyloidosis – caused by accumulation of abnormal proteins

Classification of Global Functional Status in RA

- **Class I:** able to perform usual ADLs (self-care, vocational, avocational)
- **Class II:** able to perform self-care and vocational activities, restriction of avocational activities
- **Class III:** able to perform self-care, restriction of vocational and avocational activities
- **Class IV:** limited ability to perform self-care, vocational, and avocational activities

Figure 5. Common sites of joint involvement in RA

Figure 6. Joint deformities

Syndromes in RA

- **SS (common):** keratoconjunctivitis sicca and xerostomia (dry eyes and mouth)
- **Caplan's syndrome (rare):** multiple pulmonary nodules and pneumoconiosis
- **Felty's syndrome (rare):** arthritis, splenomegaly, neutropenia

Investigations

- blood work
 - RF sensitivity ~80% but non-specific; may not be present at onset of symptoms
 - anti-CCP: sensitivity ~80% but more specific; may precede onset of symptoms
 - increased disease activity is associated with decreased Hb (anemia of chronic disease), increased platelets, ESR, CRP, and RF
- imaging
 - x-rays may be entirely normal at onset
 - first change is periarticular osteopenia, followed by erosions
 - U/S, MRI may be used to image hands to detect early synovitis and erosions

Treatment

- goals of therapy: remission or lowest possible disease activity
 - control disease activity
 - relieve pain and stiffness
 - maintain function and lifestyle
 - prevent or control joint damage
 - key is early diagnosis and early intervention with DMARDs
 - “window of opportunity” = early treatment within first 3 mo of disease may allow better control/remission

Education

- The Arthritis Society (Canada), Arthritis Foundation (U.S.), The Rheumatoid Patient Foundation for educational resources

Behavioral

- exercise program (isometrics and active, gentle ROM exercise during flares, aquatic/aerobic/strengthening exercise between flares), assistive devices as needed
- job modification may be necessary

Pharmacologic

1. DMARDs and Biologics (see Table 33)

- **DMARDs:** standard of care and should be started as soon as possible
- treatments guided by disease severity and prognostic features
- MTX is the gold standard and is first-line unless contraindicated
- delayed onset of action (may take 8-12 wk)
- potential toxicities: GI, hematologic, hepatic (liver enzymes), pulmonary, teratogenic
- if inadequate response (3-6 mo) → combine or switch
- add-ons include: hydroxychloroquine, sulfasalazine, leflunomide
- **biologics:** indicated if inadequate response to DMARDs
 - ♦ can be combined with DMARD therapy
 - ♦ agents include infliximab, etanercept, adalimumab, abatacept, rituximab, tocilizumab
 - ♦ reassess every 3-6 mo and monitor disease severity

2. Reducing Inflammation and Pain

- NSAIDs
 - ♦ individualize according to efficacy and tolerability
 - ♦ contraindicated or cautioned in some patients (e.g. PUD, ischemic cardiac disease, pregnancy); add acetaminophen ± opioid prn for synergistic pain control
- corticosteroids
 - ♦ local
 - IA injections to control symptoms in a specific joint
 - ♦ systemic (prednisone)
 - low dose (5-10 mg/d) useful for short-term to improve symptoms if NSAIDs ineffective, to bridge gap until DMARD takes effect
 - for severe RA, low dose prednisone can be added to DMARDs
 - do baseline DEXA bone density scan and consider bone supportive pharmacologic therapy if using corticosteroids >3 mo at >7.5 mg/d
 - cautions/contraindications: active infection, TB, osteoporosis, HTN, gastric ulcer, DM

Follow-Up Management of Established RA

- follow-up every 3-6 mo, then 6-12 mo after inflammation has been suppressed
- examine joints for active inflammation – if active, consider adjusting medications, referral to specialist, PT/OT
- if assessment reveals joint damage – consider analgesia, referral to PT/OT, surgical options

Surgical Therapy

- indicated for structural joint damage
- surgical options include: synovectomy, joint replacement, joint fusion, reconstruction/tendon repair

Poor prognostic features of RA include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

Side Effects of Steroids

- Weight gain
- Osteoporosis
- AVN
- Cataracts, glaucoma
- PUD
- Susceptibility to infection
- Easy bruising
- Acne
- HTN
- Hyperlipidemia
- Hypokalemia, hyperglycemia
- Mood swings

Only DMARDs (not analgesics or NSAIDs) alter the course of RA

Comparison of Treatment Strategies in Early Rheumatoid Arthritis

Ann Intern Med 2007;146:406-415

Study: RCT of 508 patients comparing 4 different treatment strategies for early RA (known as the BEST trial).

Intervention:

- Group 1: Sequential Monotherapy with traditional DMARDs
- Group 2: Step-Up Combination Therapy
- Group 3: Initial Combination Therapy with prednisone (high dose)
- Group 4: Initial Combination Therapy with infliximab

Results: Patients in groups 3 and 4 responded faster and had significantly greater overall change in physical function scores after the first year of treatment. By end of the second year, groups 1 and 2 had achieved a similar response to groups 3 and 4. Groups 3 and 4 also showed significantly less radiologic progression of their disease over 2 yr than groups 1 and 2. There were no significant differences in toxicity levels between the 4 groups.

Conclusions: Initial combination therapy with prednisone or infliximab results in faster response rates. Whether faster initial response rates leads to better long-term disease outcomes has not yet been studied.

Diagnostic Criteria of SLE

MD SOAP BRAIN

Malar rash	Blood
Discoid rash	Renal
Serositis	Arthritis
Oral ulcers	Immune
ANA	Neurologic
Photosensitivity	

Systemic Lupus Erythematosus

- see [Nephrology](#), NP24 and [Dermatology](#), D38 for additional details

Definition

- chronic inflammatory multi-system disease of unknown etiology
- characterized by production of autoantibodies and diverse clinical manifestations

Table 14. Diagnostic Criteria of SLE*

Criteria	Description
CLINICAL	
Malar rash	Classic "butterfly rash", sparing of nasolabial folds, no scarring
Discoid rash	May cause scarring due to invasion of basement membrane
Photosensitivity	Skin rash in reaction to sunlight
Oral/nasal ulcers	Usually painless
Arthritis	Symmetric, involving ≥ 2 small or large peripheral joints, non-erosive
Serositis	Pleuritis or pericarditis
Neurologic disorder	Seizures or psychosis
LABORATORY	
Renal disorder	Proteinuria (>0.5 g/d or 3+) <ul style="list-style-type: none"> Cellular casts (RBC, Hb, granular, tubular, mixed)
Hematologic disorder	Hemolytic anemia, leukopenia, lymphopenia, thrombocytopenia
Immunologic disorder	Anti-dsDNA or anti-Sm or antiphospholipid Ab (anticardiolipin Ab, SLE anticoagulant) or false positive VDRL with 6 mo confirmatory negative
ANA	Most sensitive test (98%), not specific

*Note: "4, 7, 11" rule \rightarrow 4 (or more) out of 11 criteria (4 lab, 7 clinical) must be present, serially or simultaneously, for diagnosis American College of Rheumatology, 1997 update

Etiology and Pathophysiology

- production of autoantibodies causing multi-organ inflammation
- multi-factorial etiology
- **genetics**
 - common association with HLA-B8/DR3; ~10% have positive family history
- **estrogen**
 - pre-pubertal and post-menopausal women have similar incidence to men
 - men with SLE have higher concentration of estrogenic metabolites
- **infection**
 - viral (non-specific stimulant of immune response)
- **drug-induced**
 - anti-hypertensives (hydralazine), anti-convulsants (phenytoin), anti-arrhythmics (procainamide), isoniazid, biologics, oral contraceptive pills
 - anti-histone Ab are commonly seen in drug-induced SLE
 - symptoms resolve with discontinuation of offending drug

Epidemiology

- prevalence: 0.05% overall
- F:M = 10:1
- age of onset in reproductive yr (13-40)
- more common and severe in African Americans and Asians
- bimodal mortality pattern
 - early (within 2 yr)
 - ♦ active SLE, active nephritis, infection secondary to steroid use
 - late (>10 yr)
 - ♦ inactive SLE, inactive nephritis, atherosclerosis likely due to chronic inflammation

Signs and Symptoms

- characterized by periods of exacerbation and remission

The Safety of Infliximab, Combined with Background Treatments, among Patients with Rheumatoid Arthritis and Various Comorbidities (START)

Arthritis Rheum 2006;54:1075-1086

Study: Multicenter RCT.

Patients: 1,084 patients (mean age 52 yr, 80% female) with active moderate to severe RA despite treatment with MTX.

Intervention: Patients were randomized to receive infusions of placebo, infliximab dosed at 3 mg/kg, or infliximab dosed at 10 mg/kg at 0, 2, 6, and 14 wk, in addition to MTX.

Primary Outcome: Incidence of serious infection within 22 wk.

Results: Compared with the placebo group, the relative risk of developing serious infection at 3 mg/kg and 10 mg/kg of infliximab was 1.0 (95% CI 0.3-3.1, $p=0.995$) and 3.1 (95% CI 1.2-7.9, $p=0.013$) respectively. In addition, 31% of patients receiving infliximab at 3 mg/kg and 32% of patients receiving infliximab at 10 mg/kg were able to achieve remission at 22 wk compared with only 14% of those receiving placebo ($p<0.001$, NNT=6).

Conclusions: Therapy with infliximab 3 mg/kg does not significantly increase the risk of serious infection in patients with active moderate to severe RA already receiving MTX. However, therapy with infliximab 10 mg/kg does significantly increase the risk of serious infection in this population.

ACR 2012 Update for the Use of DMARDs in the Treatment of RA

Arthritis Care & Research 2012;64(5):625-639

Indications for initiating and switching DMARDs and biologic agents:

- In patients with early RA (<6 mo), DMARD monotherapy is recommended in the absence of poor prognostic features, DMARD combination therapy is recommended for moderate/high disease activity and poor prognostic factors, anti-TNF biologic \pm MTX is recommended for high disease activity and poor prognostic factors.
- In patients with established RA (>6 mo):
 - If disease activity progresses in 3 mo, move from monotherapy to DMARD polytherapy.
 - If disease activity remains high after 2 mo of MTX monotherapy or DMARD combination therapy, add or switch to anti-TNF biologic, abatacept, or rituximab.
 - If disease activity persists for 3 mo on anti-TNF biologic, switch to another anti-TNF biologic or non-TNF biologic.
- In patients with hepatitis C, etanercept could be potentially used; biologic agents are not recommended for untreated chronic hepatitis B patients.
- Biologic agents may be used in patients treated for solid malignancies or nonmelanoma skin cancer >5 yr ago.
- Anti-TNF agents should not be used in CHF patients with NYHA III or IV.
- Patients considered for biologic agents should be screened for latent TB infection.
- Vaccinations (pneumococcal, influenza, hepatitis B, HPV, and live attenuated VZV) should be administered prior to starting therapy with DMARDs or biologic agents.

Table 15. Symptoms of SLE

System	Symptoms
Systemic	Fatigue, malaise, weight loss, fever, lymphadenopathy
Renal	HTN, peripheral edema, glomerulonephritis, renal failure
Dermatological	Photosensitivity, malar rash, discoid rash, oral ulcers, alopecia (hair loss), purpura, panniculitis (inflammation of subcutaneous fat and muscle tissue), urticaria
Musculoskeletal	Polyarthralgias, polyarthritis, myalgias, AVN; reducible deformities of hand = Jaccoud's arthritis
Ophthalmic	Keratoconjunctivitis sicca, episcleritis, scleritis, cytooid bodies (cotton wool exudates on fundoscopy = infarction of nerve cell layer of retina)
Cardiac	Pericarditis, CAD, non-bacterial endocarditis (Libman-Sachs) Note: SLE is an independent risk factor for atherosclerosis and CAD
Vascular	Raynaud's phenomenon, livedo reticularis (mottled discoloration of skin due to narrowing of blood vessels, characteristic lacy or net-like appearance), thrombosis, vasculitis
Respiratory	Pleuritis, interstitial lung disease, pulmonary HTN, PE, alveolar hemorrhage
Gastrointestinal	Pancreatitis, SLE enteropathy, hepatitis, hepatomegaly
Neurologic	H/A, depression, psychosis, seizures, cerebritis, transverse myelitis, peripheral neuropathy, stroke

Investigations

- blood work: ANA (sensitivity 98%, but poor specificity → used as a screening test, ANA titres are not useful to follow disease course)
- anti-dsDNA and anti-Sm are specific (95-99%)
- anti-dsDNA titer and serum complement (C3, C4) are useful to monitor treatment response in patients who are clinically and serologically concordant
 - anti-dsDNA increases and C3 and C4 decrease with disease activity
- antiphospholipid Ab (anti-cardiolipin Ab and SLE anticoagulant), may cause increased risk of clotting and increased aPTT

Treatment

- **goals of therapy**
 - treat early and avoid long-term steroid use, if unavoidable see [Endocrinology, E42](#) for osteoporosis management
 - if high doses of steroids necessary for long-term control, add steroid-sparing agents and taper when possible
 - treatment is tailored to organ system involved and severity of disease
 - all medications used to treat SLE require periodic monitoring for potential toxicity
- **dermatologic**
 - sunscreen, avoid UV light and estrogens
 - topical steroids, hydroxychloroquine
- **musculoskeletal**
 - NSAIDs ± gastroprotective agent for arthritis (also beneficial for pleuritis and pericarditis)
 - hydroxychloroquine improves long-term control and prevents flares
 - bisphosphonates, calcium, vitamin D to combat osteoporosis
- **organ-threatening disease**
 - high-dose oral prednisone or IV methylprednisolone in severe disease
 - steroid-sparing agents: azathioprine, MTX, mycophenolate
 - IV cyclophosphamide for serious organ involvement (e.g. cerebritis or SLE nephritis)

Radiographically, the arthritis of SLE is non-erosive (unlike RA)

Consider SLE in a patient who has involvement of 2 or more organ systems

Figure 7. Multi-factorial etiology of SLE

Drug-Induced SLE

Often presents atypically with systemic features and serositis; usually associated with anti-histone Ab

Raynaud's Phenomenon

Vasospastic disorder characteristically causing discoloration of fingers and toes (white → blue → red)
Classic triggers: cold and emotional stress

Manifestations of APLA

- Thromboembolic events
- Spontaneous abortions
- Thrombocytopenia
- Associated with livedo reticularis, migraine headaches

Arterial and venous thrombosis are usually mutually exclusive

Antiphospholipid Antibody Syndrome

Definition

- multi-system vasculopathy manifested by recurrent thromboembolic events, spontaneous abortions, and thrombocytopenia
- often presents with migraine-type headaches
- circulating antiphospholipid autoantibodies interfere with coagulation cascade
- **primary APLA**: occurs in the absence of other disease
- **secondary APLA**: occurs in the setting of a connective tissue disease (including SLE), malignancy, drugs (hydralazine, procainamide, phenytoin, interferon, quinidine), and infections (HIV, TB, hepatitis C, infectious mononucleosis)
- **catastrophic APLA**: development within 1 wk of small vessel thrombotic occlusion in ≥3 organ systems with positive antiphospholipid Ab (high mortality)

Table 16. Classification Criteria of APLA*

Criteria	Description
CLINICAL	
Vascular thrombosis	Arterial: stroke/TIA, multi-infarct dementia, MI, valvular incompetence, limb ischemia Venous: DVT, PE, renal and retinal vein thrombosis Must be confirmed by imaging or histopathology
Pregnancy morbidity	Fetal death (>10 wk GA), recurrent spontaneous abortions (<10 wk GA) or premature birth (<34 wk GA)
LABORATORY	
Labs must be positive on 2 occasions, at least 12 wk apart	
SLE anticoagulant	
Anti-cardiolipin Ab	IgG and/or IgM
Anti- β_2 glycoprotein-I Ab	IgG and/or IgM

*1 clinical and 1 laboratory criteria must be present for diagnosis
J Thromb Haemost 2006;4:295-306

Signs and Symptoms

- see clinical criteria in Table 16
- hematologic
 - thrombocytopenia, hemolytic anemia, neutropenia
- dermatologic
 - livedo reticularis, Raynaud's phenomenon, purpura, leg ulcers, and gangrene

Treatment

- thrombosis
 - lifelong anti-coagulation with warfarin
 - target INR 2.0-3.0 for first venous event, >3.0 for recurrent and/or arterial event
- recurrent fetal loss
 - heparin/low molecular weight heparin \pm Aspirin® during pregnancy
- catastrophic APLA
 - high-dose steroids, anti-coagulation, cyclophosphamide, plasmapheresis

A Systematic Review of Secondary Thromboprophylaxis in Patients with Antiphospholipid Ab

Arthritis Rheum 2007;57:1487-11495

Study: Review of RCTs, prospective and retrospective cohort studies, and subgroup analysis ($n > 15$) that focused on the secondary thromboprophylaxis in patients with antiphospholipid Ab (aPL) were selected.

Results: Sixteen studies were selected. Patients with venous events and a single test for aPL showed a low recurrence rate while receiving oral anti-coagulation at a target INR of 2.0-3.0. Patients with stroke and a single positive aPL test had no increased risk compared with those without aPL. Recurrence rates in patients with definite APLA and previous venous thromboembolism were lower than in patients with arterial and/or recurrent events, both with and without therapy. Only 3.8% of recurrent events occurred at an actual INR >3.0. Mortality due to recurrent thrombosis was higher than mortality due to bleeding (18 patients vs. 1 patient reported).

Conclusion: For patients with definite APLA, the authors recommend prolonged warfarin therapy at a target INR of 2.0-3.0 in APLA patients with first venous events and >3.0 for those with recurrent and/or arterial events. For patients with venous thromboembolism or stroke and a single positive aPL test, the authors recommend further testing to determine if they have a persisting Ab. If they do not, the same therapy as for the general population should be used (warfarin at a target INR of 2.0-3.0 and low-dose Aspirin®, respectively).

Scleroderma

Definition

- a non-inflammatory autoimmune disorder characterized by widespread small vessel vasculopathy and fibrosis

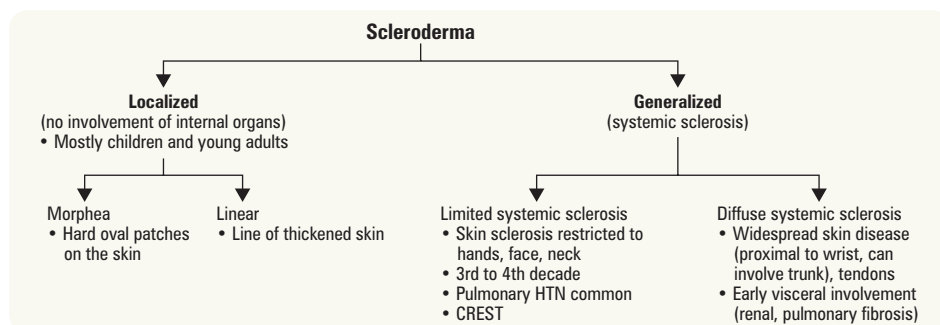

Figure 8. Forms of scleroderma

Table 17. Classification Criteria of Systemic Sclerosis*

Criteria	Description
Major	
Scleroderma proximal to MCPs	Skin tightness, thickening, non-pitting induration
Minor	
Sclerodactyly	Skin changes limited to digits
Digital pitting scars or loss of substance from finger pad	
Bibasilar pulmonary fibrosis	

*Diagnosed if 1 major or 2 minor criteria must be present
 American Rheumatism Association, 1980

Etiology and Pathophysiology

- idiopathic vasculopathy (not vasculitis) leading to atrophy and fibrosis of tissues
 - intimal proliferation and media mucinous degeneration \rightarrow progressive obliteration of vessel lumen \rightarrow fibrotic tissue
 - resembles malignant HTN

CREST Syndrome

Calcinosis: calcium deposits on skin
Raynaud's phenomenon

Esophageal dysfunction: acid reflux

Sclerodactyly: tightening of skin on digits

Telangiectasia: superficial dilated blood vessels

Epidemiology

- F:M = 3-4:1, peaking in 5th and 6th decades
- associated with HLA-DR1
- associated with environmental exposure (silica, epoxy resins, toxic oil, aromatic hydrocarbons, polyvinyl chloride)
- limited systemic sclerosis has a higher survival prognosis (>70% at 10 yr) than diffuse systemic sclerosis (40-60% at 10 yr)

Signs and Symptoms

Table 18. Clinical Manifestations of Scleroderma

System	Features
Dermatologic	Painless non-pitting edema → skin tightening Ulcerations, calcinosis, periungual erythema, hypo/hyperpigmentation, pruritus, telangiectasias Characteristic face: mask-like facies with tight lips, beak nose, radial perioral furrows
Vascular	Raynaud's phenomenon → digital pits, gangrene
Gastrointestinal (~90%)	Distal esophageal hypomotility → dysphagia Loss of lower esophageal sphincter function → GERD, ulcerations, strictures Small bowel hypomotility → bacterial overgrowth, diarrhea, bloating, cramps, malabsorption, weight loss Large bowel hypomotility → wide mouth diverticuli are pathognomonic radiographic finding on barium study
Renal	Mild proteinuria, Cr elevation, HTN "Scleroderma renal crisis" (10-15%) may lead to malignant arterial HTN, oliguria, and microangiopathic hemolytic anemia
Pulmonary	Interstitial fibrosis, pulmonary HTN, pleurisy, pleural effusions
Cardiac	Left ventricular dysfunction, pericarditis, pericardial effusion, arrhythmias
Musculoskeletal	Polyarthralgias "Resorption of distal tufts" (radiological finding) Proximal weakness 2° to disuse, atrophy, low grade myopathy
Endocrine	Hypothyroidism

Investigations

- blood work
 - CBC, Cr, ANA
 - anti-topoisomerase 1/anti-Scl-70: specific but not sensitive for diffuse systemic sclerosis
 - anti-centromere: favors diagnosis of CREST (limited systemic sclerosis)
- PFT
 - assess for pulmonary HTN or interstitial lung disease
- imaging
 - CXR for fibrosis, echo for pulmonary HTN

Treatment

- dermatologic
 - good skin hygiene
 - low-dose prednisone (>20 mg may provoke renal crisis if susceptible), MTX (limited evidence)
- vascular
 - patient education on cold avoidance
 - vasodilators (CCBs, local nitroglycerine cream, systemic PGE₂ inhibitors, PDE5 inhibitors)
- gastrointestinal
 - GERD: PPIs are first line, then H₂-receptor agonists
 - small bowel bacterial overgrowth: broad spectrum antibiotics (tetracycline, metronidazole)
- renal disease
 - ACE inhibitors for hypertensive crisis
- pulmonary
 - early interstitial disease: cyclophosphamide
 - pulmonary HTN: vasodilators e.g. bosentan (Tracleer®), epoprostenol (Flolan®), PDE5 inhibitors
- cardiac
 - pericarditis: systemic steroids
- musculoskeletal
 - arthritis: NSAIDs
 - myositis: systemic steroids

Raynaud's Phenomenon DDx

COLD HAND

Cryoglobulins/Cryofibrinogens
Obstruction/Occupational
SLE erythematosus, other connective tissue disease
Diabetes mellitus/Drugs
Hematologic problems (polycythemia, leukemia, etc.)
Arterial problems (atherosclerosis)/
Anorexia nervosa
Neurologic problems (vascular tone)
Disease of unknown origin (idiopathic)

Scleroderma is the most common cause of secondary Raynaud's phenomenon

Lung disease is the most common cause of morbidity and mortality

Features of Pathologic Raynaud's Syndrome

- New onset
- Asymmetric
- Precipitated by stimuli other than cold or emotion
- Associated with distal pulp pitting or tissue reabsorption
- Digit ischemia
- Capillary dilatation by capillaroscopy

Idiopathic Inflammatory Myopathy

Definition

- autoimmune diseases characterized by proximal muscle weakness \pm pain
- muscle becomes damaged by a non-suppurative lymphocytic inflammatory process
- classification
 - PM/DMM
 - adult and juvenile form
 - associated with malignancy
 - ♦ increased risk of malignancy: age >50, DMM>PM, normal CK, refractory disease
 - ♦ 2.4-6.5 fold increased risk of underlying malignancy usually in internal organs
 - associated with other connective tissue disease, Raynaud's phenomenon, autoimmune disorders
 - inclusion body myositis
 - ♦ age >50, M>F, slowly progressive, vacuoles in cells on biopsy
 - ♦ suspect when patient unresponsive to treatment
 - ♦ distal as well as proximal muscle weakness
 - ♦ muscle biopsy positive for inclusion bodies

POLYMYOSITIS/DERMATOMYOSITIS

Table 19. Classification Criteria for PM/DMM

Criteria	Description
1. Symmetric proximal muscle weakness	Typical involvement of shoulder girdle and hip girdle
2. Elevated muscle enzymes	\uparrow CK, aldolase, LDH, AST, ALT
3. EMG changes	Short polyphasic motor units, high frequency repetitive discharge, insertional irritability
4. Muscle biopsy	Segmental fiber necrosis, basophilic regeneration, perivascular inflammation (DMM), endomysial inflammation (PM) and atrophy
5. Typical rash of dermatomyositis	Required for diagnosis of DMM (see below)

NEJM 1975;292:403-407

Etiology and Pathophysiology

- PM is CD8 cell-mediated muscle necrosis, found in adults
- DMM is B-cell and CD4 immune complex-mediated peri-fascicular vascular abnormalities

Signs and Symptoms

- progressive symmetrical proximal muscle weakness (shoulder and hip) developing over weeks to months
 - difficulty lifting head off pillow, arising from chair, climbing stairs
- dermatological
 - DMM has characteristic dermatological features (F>M, children and adults)
 - ♦ Gottron's papules
 - pink-violaceous, flat-topped papules overlying the dorsal surface of the interphalangeal joints
 - ♦ Gottron's sign
 - erythematous, smooth or scaly patches over the dorsal IPs, MCPs, elbows, knees, or medial malleoli
 - ♦ heliotrope rash: violaceous rash over the eyelids; usually with edema
 - ♦ shawl sign: erythematous rash over neck, upper chest, and shoulders
 - ♦ mechanic's hands: dark, dry, thick scale on palmar and lateral surface of digits
 - ♦ periungual erythema
- cardiac
 - dysrhythmias, CHF, conduction defect, ventricular hypertrophy, pericarditis
- gastrointestinal
 - oropharyngeal and lower esophageal dysphagia, reflux
- pulmonary
 - weakness of respiratory muscles, interstitial lung disease, aspiration pneumonia

Signs of DMM

Gottron's papules and Gottron's sign are pathognomonic of DMM (occur in 70% of patients)

Investigations

- blood work: CK, ANA, anti-Jo-1 (DMM), anti-Mi-2, anti-SRP
- imaging: MRI may be used to localize biopsy site
- EMG, muscle biopsy

Treatment

- non-pharmacological: physical therapy and occupational therapy
- pharmacological treatment
 - high-dose corticosteroid (1-2 mg/kg/d) and slow taper
 - add immunosuppressive agents (azathioprine, MTX, cyclosporine)
 - intravenous immunoglobulin if severe or refractory
 - hydroxychloroquine for DMM rash

- malignancy surveillance
 - detailed history and physical (breast, pelvic, and rectal exam)
 - CXR, abdominal and pelvic U/S, fecal occult blood, Pap test, mammogram ± CT scan (thoracic, abdominal, pelvic)

Malignancies Associated with DMM

- Breast
- Lung
- Colon
- Ovarian

Sjögren's Syndrome

Definition

- autoimmune condition characterized by dry eyes (keratoconjunctivitis sicca/xerophthalmia) and dry mouth (xerostomia), caused by lymphocytic infiltration of salivary and lacrimal glands
- may evolve into systemic disorder with diminished exocrine gland activity in respiratory tract and skin
- primary and secondary form (associated with RA, SLE, DMM, and HIV)
- incidence estimated at 4/100,000 people
- 90% of cases are among females
- mean age of diagnosis is 40-60 yr

Table 20. Classification Criteria for SS*

Criteria	Comments
1. Dry eye symptoms	Dry >3 mo, foreign body sensation, or requiring tear substitutes
2. Dry mouth symptoms	Dry >3 mo, swollen salivary glands, or requiring liquids to swallow food
3. Dry eye signs	Schirmer test (to assess tear flow) or slit lamp exam with Rose Bengal stain
4. Dry mouth signs	Low salivary flow, sialography
5. Salivary gland biopsy	Focal lymphocytic sialoadenitis
6. Autoantibodies	anti-Ro and/or anti-La, ANA, RF

*Diagnosed if 4 of the above criteria present, one of which includes salivary gland biopsy or autoantibodies
Ann Rheum Dis 2002;61:554-558

Signs and Symptoms

- "sicca complex": dry eyes (keratoconjunctivitis sicca/xerophthalmia), dry mouth (xerostomia)
- staphylococcus blepharitis
- dental caries, oral candidiasis, angular cheilitis (inflammation and fissuring at the labial commissures of the mouth)
- systemic complications
 - sinusitis, autoimmune thyroid dysfunction
 - arthralgias, arthritis
 - subclinical diffuse interstitial lung disease, xerotrachea leading to chronic dry cough
 - renal disease, glomerulonephritis
 - palpable purpura, vasculitis
 - peripheral neuropathy
 - lymphoma risk greatly increased

Treatment

- ocular
 - artificial tears or surgical punctal occlusion for dry eyes
- oral
 - good dental hygiene, hydration
 - agents that stimulate salivary flow (e.g. pilocarpine)
 - topical nystatin or clotrimazole x 4-6 wk for oral candidiasis
- systemic
 - e.g. hydroxychloroquine, corticosteroids

Classic Triad (identifies 93% of Sjögren's patients)

- Dry eyes
- Dry mouth (xerostomia) → dysphagia
- Arthritis (small joint, asymmetrical, non-erosive) but may be associated with RA, in which case, the arthritis is erosive

Patients with Sjögren's syndrome are at higher risk of non-Hodgkin's lymphoma

Mixed Connective Tissue Disease

- syndrome with features of 3 different connective tissue diseases (e.g. SLE, scleroderma, PM)
- common symptoms: Raynaud's phenomenon, swollen fingers
- blood work: anti-RNP (see Table 10)
- treatment is generally guided by the severity of symptoms and organ system involvement
- prognosis
 - 50-60% will evolve into SLE
 - 40% will evolve into scleroderma
 - only 10% will remain as MCTD for the rest of their lives
 - cardiac involvement (dysrhythmia) common, renal or lung involvement rare

Overlap Syndrome

- syndrome with sufficient diagnostic features of 2+ different connective tissue diseases

Vasculitides

- inflammation and subsequent necrosis of blood vessels leading to tissue ischemia or infarction
- any organ system can be involved
- keys to diagnosis
 - clinical suspicion: suspect in cases of unexplained multiple organ ischemia or systemic illness with no evidence of malignancy or infection
 - labs non-specific: anemia, increased WBC and ESR, abnormal U/A
 - biopsy if tissue accessible
 - angiography if tissue inaccessible
- treatment generally involves corticosteroids and/or immunosuppressive agents

Table 21. Classification of Vasculitis and Characteristic Features

Classification	Characteristic Features
SMALL VESSEL	
<ul style="list-style-type: none"> Non-ANCA-Associated <ul style="list-style-type: none"> Predominantly cutaneous vasculitis Henoch-Schönlein purpura (see Pediatrics, P96) Essential cryoglobulinemic vasculitis ANCA-Associated <ul style="list-style-type: none"> Granulomatosis with polyangiitis (GPA, formerly Wegener's) pR3 (c-ANCA) > MPO (p-ANCA) Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) (50% ANCA positive) Microangiopathic polyangiitis (70% ANCA positive, usually MPO) 	<p>Immune complex-mediated (most common mechanism)</p> <p>Also known as hypersensitivity/leukocytoclastic vasculitis</p> <p>Vascular deposition of IgA causing systemic vasculitis (skin, GI, renal), usually self-limiting; most common in childhood</p> <p>Systemic vasculitis caused by circulating cryoproteins forming immune complexes; may be associated with underlying infection (e.g. hepatitis C) or connective tissue disease</p> <p>Granulomatous inflammation of vessels of respiratory tract and kidneys, initially have URTI symptoms; most common in middle age</p> <p>Granulomatous inflammation of vessels with hypereosinophilia and eosinophilic tissue infiltration, frequent lung involvement (asthma, allergic rhinitis), can be associated with MPO or pR3, other manifestations include coronary arteritis, myocarditis and neuropathy, average age 40s</p> <p>Pauci-immune necrotizing vasculitis, affecting kidneys (necrotizing glomerulonephritis), lungs (capillaritis and alveolar hemorrhage), skin, most common in middle age</p>
MEDIUM VESSEL	
<ul style="list-style-type: none"> Polyarteritis nodosa Kawasaki disease (see Pediatrics, P96) 	<p>Segmental, non-granulomatous necrotizing inflammation</p> <p>Unknown etiology in most cases, any age (average 40-50s), M>F</p> <p>Arteritis and mucocutaneous lymph node syndrome</p>
LARGE VESSEL	
<ul style="list-style-type: none"> GCA/Temporal arteritis Takayasu's arteritis 	<p>Inflammation predominantly of the aorta and arteries originating from it > 50 yr of age, F>M</p> <p>"Pulseless disease", unequal peripheral pulses, chronic inflammation, most often the aorta and its branches</p> <p>Usually young adults of Asian descent, F>M; risk of aortic aneurysm</p>
OTHER VASCULITIDES	
<ul style="list-style-type: none"> Buerger's disease ("Thromboangiitis Obliterans") Behçet's disease Vasculitis mimicry 	<p>Inflammation secondary to pathological clotting, affects small and medium-sized vessels of distal extremities, may lead to distal claudication and gangrene, most important etiologic factor is cigarette smoking</p> <p>Most common in young Asian males</p> <p>Leukocytoclastic vasculitis, multi-system disorder presenting with ocular involvement (uveitis), recurrent oral and genital ulceration, venous thrombosis, skin and joint involvement, more common in Mediterranean and Asia, average age 30s, M>F</p> <p>Cholesterol emboli, atrial myxoma</p>

c-ANCA: circulating anti-neutrophil cytoplasmic Ab associated with anti-pR3

p-ANCA: perinuclear anti-neutrophil cytoplasmic Ab associated with multiple antigens, e.g. lactoferrin (IBD), myeloperoxidase (microscopic polyangiitis)

Features of Small Vessel Vasculitis

- Palpable purpura
- Vesicles
- Chronic urticaria
- Superficial ulcers

Churg-Strauss Triad

- Allergic rhinitis and asthma (often quiescent at time of vasculitis)
- Eosinophilic infiltrative disease resembling pneumonia
- Systemic vasculitis often mononeuritis multiplex/peripheral neuropathy and peripheral eosinophilia

Features of Medium Vessel Vasculitis

- Livedo reticularis
- Erythema nodosum
- Raynaud's phenomenon
- Nodules
- Digital infarcts
- Ulcers

Figure 9. Classification of vasculitides by vessel size

Small Vessel Non-ANCA Associated Vasculitis

PREDOMINANTLY CUTANEOUS VASCULITIS

- subdivided into
 - drug-induced vasculitis
 - serum sickness reaction
 - vasculitis associated with other underlying primary diseases

Etiology and Pathophysiology

- cutaneous vasculitis following
 - drug exposure (allopurinol, gold, sulfonamides, penicillin, phenytoin)
 - viral or bacterial infection
 - idiopathic causes
- small vessels involved (post-capillary vessels most frequently)
- usually causes a leukocytoclastic vasculitis: debris from neutrophils around vessels
- sometimes due to cryoglobulins which precipitate in cold temperatures

Signs and Symptoms

- palpable purpura ± vesicles and ulceration, urticaria, macules, papules, bullae, subcutaneous nodules
 - renal or joint involvement may occur, especially in children

Investigations

- vascular involvement (both arteriole and venule) established by skin biopsy

Treatment

- stop possible offending drug
- corticosteroids ± immunosuppressive agents
- usually self-limiting

Small Vessel ANCA-Associated Vasculitis

GRANULOMATOSIS WITH POLYANGIITIS (GPA, formerly known as Wegener's Granulomatosis)

Definition

- granulomatous inflammation of vessels that may affect the upper airways (rhinitis, sinusitis), lungs (pulmonary nodules, infiltrates), and kidneys (glomerulonephritis, renal failure)
- highly associated with c-ANCA
- incidence 5 per 100,000; more common in Northern latitudes

Table 22. Classification Criteria for GPA*

Criteria	Description
1. Nasal or oral involvement	Inflammation, ulcers, epistaxis
2. Abnormal findings on CXR	Nodules, cavitations, etc.
3. Urinary sediment	Microscopic hematuria ± RBC casts
4. Biopsy of involved tissue	Lungs show granulomas, kidneys show necrotizing segmental glomerulonephritis

*Diagnosed if 2 or more of the above 4 criteria present
American College of Rheumatology, 1990

Etiology

- pathogenesis depends on genetic susceptibility and environmental triggers (e.g. infection)
 - dysregulated immune response due to loss of B and T-cell tolerance
 - acute vascular injury mediated by neutrophils and monocytes

Signs and Symptoms

- systemic
 - malaise, fever, weakness, weight loss
- HEENT
 - sinusitis or rhinitis, nasal crusting and bloody nasal discharge, nasoseptal perforation, saddle nose deformity
 - proptosis due to: inflammation/vasculitis involving extra-ocular muscles, granulomatous retrobulbar space occupying lesions or direct extension of masses from the upper respiratory tract
 - hearing loss due to involvement of CN VIII
- pulmonary
 - cough, hemoptysis, granulomatous upper respiratory tract masses
- renal
 - hematuria
- other
 - joint, skin, eye complaints, vasculitic neuropathy

Investigations

- blood work: anemia (normal MCV), increased WBC, increased Cr, increased ESR, elevated platelet count, ANCA (PR3 > MPO)
- U/A: proteinuria, hematuria, RBC casts
- CXR: pneumonitis, lung nodules, infiltrations, cavitary lesions
- biopsy: renal (segmental necrotizing glomerulonephritis), lung (granulomas, tracheobronchial erosion)
- possible decline in c-ANCA and ESR used to monitor response to treatment in some patients

Treatment

- prednisone 1 mg/kg/d PO for 3-6 mo ± cyclophosphamide 2 mg/kg/d PO for 3-6 mo followed by high dose MTX (20-25 mg PO/SC weekly) or azathioprine (2 mg/kg/d PO OD)
- consider biologic agents (rituximab, IVIg) and plasmapheresis (PEXIVAS trial)
- RAVE trial (*NEJM* 2010;363:221-232): rituximab equivalent or superior to cyclophosphamide in severe or relapsing disease

Classic Features

- Necrotizing granulomatous vasculitis of lower and upper respiratory tract
- Focal segmental glomerulonephritis

Medium Vessel Vasculitis

POLYARTERITIS NODOSA

Definition

- systemic, necrotizing vasculitis of medium sized vessels
- ANCA negative
- often associated with hepatitis B positivity
- incidence 0.7 per 100,000; affects individuals between 40-60 yr; M:F = 2:1

Table 23. Classification Criteria for PAN*

Criteria	Description
1. Weight loss	>4 kg, not due to dieting or other factors
2. Myalgias, weakness, or leg tenderness	Diffuse myalgias or weakness
3. Livedo reticularis	Mottled, reticular pattern over skin
4. Neuropathy	Mononeuropathy, mononeuropathy multiplex, or polyneuropathy
5. Testicular pain or tenderness	Not due to infection, trauma, or other causes
6. dBP >90 mmHg	Development of HTN with dBP >90 mmHg
7. Elevated Cr or BUN	Cr >130 µmol/L (1.5 mg/dL), BUN >14.3 mmol/L (40 mg/dL)
8. Hepatitis B positive	Presence of hepatitis B surface antigen or Ab
9. Arteriographic abnormality	Commonly aneurysms
10. Biopsy of artery	Presence of granulocytes and/or mononuclear leukocytes in the artery wall

*Diagnosed if 3 or more of the above 10 criteria present
American College of Rheumatology, 1990

There is an association between hepatitis B surface antigen (HBsAg) positivity and PAN

Consider PAN in a non-diabetic patient with mononeuritis multiplex

Etiology and Pathophysiology

- focal panmural necrotizing inflammatory lesions in small and medium-sized arteries
- thrombosis, aneurysm, or dilatation at lesion site may occur
- healed lesions show proliferation of fibrous tissue and endothelial cells that may lead to luminal occlusion

Investigations

- blood work: CBC, ESR, Cr, BUN, p-ANCA, hepatitis B serology
- imaging: angiography
- arterial biopsy

Treatment

- prednisone 1 mg/kg/d PO and cyclophosphamide 2 mg/kg/d PO
- ± anti-viral therapy to enhance clearance of hepatitis B virus

Large Vessel Vasculitis

- see [Neurology, N44](#) and [Ophthalmology, OP38](#) for more details

GCA/TEMPORAL ARTERITIS

Table 24. Classification Criteria for GCA*

Criteria	Description
1. Age at onset ≥50	
2. New headache	Often temporal
3. Temporal artery abnormality	Temporal artery tenderness or decreased pulsations, not due to arteriosclerosis
4. Elevated ESR	ESR ≥50 mm/h
5. Abnormal artery biopsy	Mononuclear cell infiltration or granulomatous inflammation, usually with multinucleated giant cells

*Diagnosed if 3 or more of the above 5 criteria present
American College of Rheumatology, 1990

Epidemiology

- most frequent vasculitis in North America
- patients >50 yr
- F:M = 2:1
- North-South gradient (predominance in Northern Europe/US)
- affects extracranial arteries

Signs and Symptoms

- new onset temporal headache ± scalp tenderness due to inflammation of involved portion of the temporal or occipital arteries
- sudden, painless loss of vision and/or diplopia due to narrowing of the ophthalmic or posterior ciliary arteries (PCA more common); can affect both eyes
- tongue and jaw claudication (pain in muscles of mastication on prolonged chewing)
- PMR (proximal myalgia, constitutional symptoms, elevated ESR) occurs in 30% of patients
- aortic arch syndrome (involvement of subclavian and brachial branches of aorta result in pulseless disease), aortic aneurysm ± rupture are late complications

Investigations

- diagnosis made by clinical suspicion, increased ESR, increased CRP, temporal artery biopsy within 14 d of starting steroids, possible U/S

Treatment

- if suspect GCA, immediately start high dose prednisone 1 mg/kg in divided doses for approximately 4 wk, and then tapering prednisone as symptoms resolve; highly effective in treatment and in prevention of blindness and other vascular complications
- consider low dose ASA

Prognosis

- increased risk of thoracic aortic aneurysm and aortic dissection
- yearly CXR ± abdominal U/S as screening

GCA Criteria
Presence of 3 or more criteria yields sensitivity of 94%, specificity of 91%

Medical Emergency
Untreated, GCA can lead to permanent blindness in 20-25% of patients; treat on clinical suspicion

SERONEGATIVE RHEUMATIC DISEASE

Spondyloarthropathies

Table 25. A Comparison of the Spondyloarthropathies (inflammatory joint disease of the vertebral column)

Feature	AS	PsA	ReA	EA
M:F	3:1	1:1	8:1	1:1
Age of Onset	20s	35-45	20s	Any
Peripheral Arthritis	25%	96%	90%	Common
Distribution	Axial, LE	Any	LE	LE
Sacroiliitis	100%	40%	80%	20%
Dactylitis	Uncommon	Common	Occasional	Uncommon
Enthesitis	Common	Common	Common	Less Common
Skin Lesions	Rare	100% Psoriasis eventually 70% at onset of arthritis	Common Keratoderma	Occasional Pyoderma, erythema nodosum
Uveitis	Common	Occasional	20%	Rare
Urethritis	Rare	Uncommon	Common	Rare
HLA-B27	90%	40%	80%	30%

LE = lower extremities

Figure 10. Spondyloarthropathy subsets (U-SpA = undifferentiated spondyloarthropathy)

Ankylosing Spondylitis

Definition

- chronic inflammatory arthritis involving the sacroiliac joints and vertebrae
- AS in women: more peripheral arthritis and upper spine spondylitis
- prototype of the spondyloarthropathies

Table 26. ASAS Classification Criteria for Axial Spondyloarthritis*

Sacroiliitis on imaging plus ≥1 AS feature or HLA-B27 positive plus ≥2 AS features	
AS features: <ul style="list-style-type: none">• Inflammatory back pain• Arthritis• Enthesitis (heel)• Uveitis• Dactylitis• Psoriasis• Crohn's disease/colitis• Good response to NSAIDs• Family history of AS• HLA-B27 positive• Elevated CRP	Sacroiliitis on imaging: <ul style="list-style-type: none">• Active (acute) inflammation on MRI highly suggestive of sacroiliitis associated with AS• Definite radiographic sacroiliitis ≥ grade 2 bilaterally or grade 3-4 unilaterally

*For patients with ≥3 mo back pain and age at onset <45 yr

Etiology and Pathophysiology

- enthesitis (inflammation of tendon or ligament at site of attachment to bone)
- inflammation → osteopenia → erosion → ossification → osteoproliferation (syndesmophytes)

Epidemiology

- M:F = 5:1; females have milder disease which may be under-recognized
- 95% of patients have HLA-B27 (9% HLA-B27 positive in general population)

Figure 11. Common sites of involvement of AS

Rule of 2s
AS occurs in
0.2% of the general population
2% of HLA-B27 positive individuals
20% of HLA-B27 positive individuals with affected family member

Table 27. Types of Back Pain

Parameter	Mechanical	Inflammatory
Past History	±	++
Family History	–	+
Onset	Acute	Insidious
Age	15-90 yr	<40 yr
Sleep Disturbance	±	++ (worse during 2nd half of night)
Morning Stiffness	<30 min	>1 h
Involvement of Other Systems	–	+
Exercise	Worse	Better
Rest	Better	Worse
Radiation of Pain	Anatomic (L5-S1)	Diffuse (thoracic, buttock)
Sensory Symptoms	+	–
Motor Symptoms	+	–

Signs and Symptoms

- **axial**
 - mid and lower back stiffness, prolonged morning stiffness, night pain, persistent buttock pain, painful sacroiliac joint (+ Faber test)
 - spinal restriction (decreased ROM): lumbar (decreased Schöber), thoracic (decreased chest wall expansion, normal >5 cm at T4), cervical (global decrease, often extension first)
 - postural changes: decreased lumbar lordosis + increased thoracic kyphosis + increased cervical flexion = increased occiput to wall distance (>5 cm)
- **peripheral**
 - asymmetrical large joint arthritis, most often involving lower limb
 - enthesitis: tenderness over tibial tuberosity, or Achilles tendon and plantar fascia insertions into the calcaneus
- **extra-articular manifestations**
 - ophthalmic: acute anterior uveitis is common (25-30% patients)
 - renal: amyloidosis (late and rare) and IgA nephropathy
 - gastrointestinal: IBD
 - cardiac: aortitis, aortic regurgitation, pericarditis, conduction disturbances, heart failure (rare)
 - respiratory: apical fibrosis (rare)
 - neurologic: cauda equina syndrome (rare)
 - skin: psoriasis

Investigations

- x-ray of SI joint: “pseudowidening” of joint due to erosion with joint sclerosis → bony fusion (late), symmetric sacroiliitis
- x-ray of spine: “squaring of edges” from erosion and sclerosis on corners of vertebral bodies (shiny corner sign) leading to ossification of outer fibers of annulus fibrosis (bridging syndesmophytes) → “bamboo spine” radiographically
- MRI of spine: assess activity in early disease; detection of cartilage changes, bone marrow edema, bone erosions, and subchondral bone changes. Best seen on T2 STIR images (suppress fat and see bone edema)

Treatment

- **conservative/non-pharmacologic**
 - prevent fusion from poor posture and disability through: exercise (e.g. swimming), postural and deep breathing exercises, outpatient PT, smoking cessation
- **medical**
 - NSAIDs (first line of treatment)
 - glucocorticoids (topical eye drops, local injections)
 - DMARDs for peripheral arthritis (sulfasalazine, MTX)
 - biologics for axial and peripheral involvement
 - manage extra-articular manifestations
- **surgical**
 - hip replacement, vertebral osteotomy for marked deformity

Prognosis

- spontaneous remissions and relapses are common and can occur at any age
- function may be excellent despite spinal deformity
- favorable prognosis if female and age of onset >40 yr
- early onset with hip disease may lead to severe disability; may require arthroplasty

Extra-Articular Manifestations of AS

6 As

Atlanto-axial subluxation
Anterior uveitis
Apical lung fibrosis
Aortic incompetence
Amyloidosis (kidneys)
Autoimmune bowel disease (UC)

Consider AS in the differential for causes of aortic regurgitation

The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) is a self-reported scoring system that focuses on fatigue, axial pain, peripheral pain, enthesitis, and morning stiffness

Enteropathic Arthritis

- see [Gastroenterology](#), *Inflammatory Bowel Disease*, G19
- MSK manifestations in the setting of either ulcerative colitis or Crohn's disease include peripheral arthritis (large joint, asymmetrical), spondylitis, and hypertrophic osteoarthropathy
- non-arthritic MSK manifestations can occur 2° to steroid treatment of bowel inflammation (arthralgia, myalgia, osteoporosis, AVN)
- NSAIDs should be used cautiously as they may exacerbate bowel disease

Table 28. Comparing Features of Spondylitis vs. Peripheral Arthritis in EA

Parameter	Spondylitis	Peripheral Arthritis
HLA-B27 Association	Yes	No
Gender	M>F	M=F
Onset Before IBD	Yes	No
Parallels IBD Course	No	Yes
Type of IBD	UC=CD	CD

Both AS and EA feature symmetric sacroiliitis

Psoriatic Arthritis

Etiology and Pathophysiology

- unclear but many genetic, immunologic, and some environmental factors involved (e.g. psoriatic plaque flora, particularly Group A *Streptococcus*, and trauma)

Epidemiology

- psoriasis affects 1% of population
- arthropathy in 10% of patients with psoriasis
- 15-20% of patients will develop joint disease before skin lesions appear

Signs and Symptoms

- **dermatologic**
 - well-demarcated erythematous plaques with silvery scale
 - nail involvement: pitting, transverse or longitudinal ridging, discoloration, subungual hyperkeratosis, onycholysis, and oil drops
- **musculoskeletal**
 - 5 general patterns
 - ♦ asymmetric oligoarthritis (most common – 70%)
 - ♦ arthritis of DIP joints with nail changes
 - ♦ destructive (mutilans) arthritis (5%)
 - ♦ symmetric polyarthritis (similar to RA)
 - ♦ sacroiliitis and spondylitis (usually older, male patients)
 - other findings: dactylitis, enthesopathy
- **ophthalmic**
 - conjunctivitis, iritis (anterior uveitis)
- **cardiac and respiratory** (late findings)
 - aortic insufficiency
 - apical lung fibrosis
- **neurologic**
 - cauda equina syndrome
- **radiologic**
 - floating syndesmophytes
 - pencil-in-cup appearance at IP joints
 - osteolysis, periostitis

Treatment

- treat skin lesions (e.g. steroid cream, salicylic and/or retinoic acid, tar, UV light)
- NSAIDs or IA steroids
- DMARDs, biologic therapies to minimize erosive disease (use early if peripheral joint involvement)

Table 29. CASPAR Criteria for Psoriatic Arthritis*

Criterion	Description
1. Evidence of psoriasis	Current, past, or family history
2. Psoriatic nail dystrophy	Onycholysis, pitting, hyperkeratosis
3. Negative results for RF	
4. Dactylitis	Current or past history
5. Radiological evidence	Juxta articular bone formation on hand or foot x-rays

*To meet the CASPAR (CIASsification criteria for Psoriatic ARthritis) criteria, a patient must have inflammatory articular disease (joint, spine, or entheses) with ≥3 points from the above 5 categories

Arthritis Rheum 2006;54(8):2665-2673. Classification criteria for psoriatic arthritis: development

Check "hidden" areas for psoriatic lesions (ears, hair line, umbilicus, gluteal cleft, nails)

Risks and Benefits of Tumor Necrosis Factor-Alpha (TNF-α) Inhibitors in the Management of Psoriatic Arthritis (PsA): Systematic Review and Meta-Analysis of Randomized Controlled Trials
J Rheumatol 2008;35:883-890

Study: Review of RCTs of adalimumab, etanercept, and infliximab used in patients with PsA.

Results: Six RCTs were included (n=982). All 3 TNF-α inhibitors were significantly more effective than placebo on the basis of Psoriatic Arthritis Response Criteria (PsARC) and American College of Rheumatology response criteria ACR20, ACR50, and ACR70 ratings. There were no significant differences between TNF-α inhibitors and placebo in the proportions of patients who withdrew for any reason (RR 0.48, 95% CI 0.20-1.18), or withdrawal due to adverse events (RR 2.14, 95% CI 0.73-6.27), serious adverse events (RR 0.98, 95% CI 0.55-1.77), or upper respiratory tract infections (RR 0.91, 95% CI 0.65-1.28). Pooled rates for injection site reactions were significantly higher for adalimumab and etanercept than for placebo (RR 2.48, 95% CI 1.16-5.29), but there was no significant difference in the proportion of patients experiencing infusion reactions with infliximab (RR 1.03, 95% CI 0.48-2.20) compared to placebo. Indirect analysis did not demonstrate any significant differences between the TNF-α inhibitors.

Conclusions: TNF-α inhibitors are effective treatments for PsA with no important added risks associated with their short-term use. There is still a need for long-term risk-benefit assessment of use of these drugs for the management of PsA.

Reactive Arthritis

Definition

- two meanings
 1. ReA: a sterile arthritis following an infection (e.g. rheumatic fever, post-viral arthritis, etc.), not used frequently by rheumatologists
 2. ReA: one of the seronegative spondyloarthropathies in which patients have a peripheral arthritis (≥ 1 mo duration) accompanied by one or more extra-articular manifestations that appears shortly after certain infections of the GI or GU tracts

Etiology

- onset following an infectious episode either involving the GI or GU tract
 - GI: *Shigella*, *Salmonella*, *Campylobacter*, *Yersinia* species
 - GU: *Chlamydia* (isolated in 16-44% of ReA cases), *Mycoplasma* species
- acute clinical course
 - 1-4 wk post-infection
 - lasts weeks to years
 - often recurring
 - spinal involvement persists

Epidemiology

- in HLA-B27 patients, axial > peripheral involvement
- M>F

Signs and Symptoms

- **musculoskeletal**
 - peripheral arthritis, asymmetric pattern, spondylitis, Achilles tendinitis, plantar fasciitis, dactylitis
- **ophthalmic**
 - iritis (anterior uveitis), conjunctivitis
- **dermatologic**
 - keratoderma blennorrhagicum (hyperkeratotic skin lesions on palms and soles) and balanitis circinata (small, shallow, painless ulcers of glans penis and urethral meatus) are diagnostic
- **gastrointestinal**
 - oral ulcers, diarrhea
- **urethritis and cervicitis**
 - sterile cultures; presence not related to site of initiating infection

Investigations

- diagnosis is clinical plus laboratory
- blood work: normocytic, normochromic anemia, and leukocytosis
- sterile cultures
- serology: HLA-B27 positive

Treatment

- antibiotics for non-articular infections
- NSAIDs, physical therapy, exercise
- local therapy
 - joint protection
 - IA steroid injection
 - topical steroid for ocular involvement
- systemic therapy
 - corticosteroids, sulfasalazine, MTX (for peripheral joint involvement only)
 - TNF- α inhibitors for spinal inflammation

Prognosis

- self-limited, typically 3-5 mo, varies based on pathogen and patient's genetic background
- chronic in 15-20% of cases

Clinical Triad of Reactive Arthritis

- Arthritis
- Conjunctivitis/uveitis
- Urethritis/cervicitis

"Can't see, can't pee, can't climb a tree":

Triad of conjunctivitis, urethritis, and arthritis is 99% specific (but 51% sensitive) for ReA

Crystal-Induced Arthropathies

Table 30. Gout vs. Pseudogout

Parameter	Gout	Pseudogout
Gender	M>F	M=F
Age	Middle-aged males Post-menopausal females	Age > 60 yr
Onset of Disease	Acute	Acute/insidious
Crystal Type	Monosodium urate (MSU) Negative birefringence (yellow when parallel to compensator filter), needle-shaped	Calcium pyrophosphate dihydrate (CPPD) Positive birefringence (blue when parallel), rhomboid-shaped

Table 30. Gout vs. Pseudogout (continued)

Parameter	Gout	Pseudogout
Distribution	First MTP classically; also midfoot, ankle, knee, or polyarticular	Knee, wrist; monoarticular or polyarticular if chronic
Radiology (note findings are non-specific)	Erosions	Chondrocalcinosis OA (knee, wrist, 2nd and 3rd MCP)
Treatment	NSAIDs, corticosteroids, colchicine Allopurinol, febuxistat (chronic)	NSAIDs, corticosteroids

Gout

Definition

- derangement in purine metabolism resulting in hyperuricemia; monosodium urate crystal deposits in tissues (tophi) and synovium (microtophi)

Etiology and Pathogenesis

- sources of uric acid: diet and endogenous
- synthesis
 - hypoxanthine → xanthine → uric acid
 - both steps catalyzed by xanthine oxidase

Hyperuricemia

- primary or genetic**
 - mostly due to idiopathic renal underexcretion (90%)
 - also idiopathic overproduction or abnormal enzyme production/function
- secondary**
 - dietary excess (particularly high consumption of beer, seafood, and meat)
 - underexcretion (>90%): renal failure, drugs, systemic conditions
 - overproduction (<10%): increased nucleic acid turnover states (e.g. malignancy, post-chemotherapy)
- sudden changes (increasing or decreasing) in uric acid concentration are more important than absolute values
 - acute gout can occur with normal serum uric acid
 - changes in pH, temperature, or initiation of antihyperuricemics may precipitate an acute gouty attack
- common precipitants: alcohol, dietary excess, dehydration, drugs (e.g. thiazide and loop diuretics), trauma, illness, surgery, starting xanthine oxidase inhibitor therapy
- other associated conditions: HTN, obesity, DM, starvation

Epidemiology

- most common in males >45 yr old
- extremely rare in premenopausal females

Signs and Symptoms

- single episode progressing to recurrent episodes of acute inflammatory arthritis
- acute gouty arthritis**
 - severe pain, redness, joint swelling, usually involving lower extremities
 - joint mobility may be limited
 - attack will subside spontaneously within several days to weeks; may recur
- tophi**
 - urate deposits on cartilage, tendons, bursae, soft tissues, and synovial membranes
 - common sites: first MTP, ear helix, olecranon bursae, tendon insertions (common in Achilles tendon)
- kidney**
 - gouty nephropathy
 - uric acid calculi

Investigations

- joint aspirate: >90% of joint aspirates show crystals of monosodium urate (see Table 30) (negatively birefringent, needle-shaped)
- x-rays may show tophi as soft tissue swelling, punched-out lesions – erosion with “overhanging” edge

Treatment

- acute gout**
 - NSAIDs: high dose, then taper as symptoms improve
 - corticosteroids: IA, oral, or intra-muscular (if renal, cardiovascular, or GI disease and/or if NSAIDs contraindicated or failed)
 - colchicine within first 12 h but effectiveness limited by narrow therapeutic range
 - allopurinol can worsen an acute attack (do not start during acute flare)
- chronic gout**
 - conservative
 - avoid foods with high purine content (e.g. visceral meats, sardines, shellfish, beans, peas)
 - avoid drugs with hyperuricemic effects (e.g. pyrazinamide, ethambutol, thiazide, alcohol)

Figure 12. Common sites of involvement in gout
(asymmetric joint involvement)

- An acute gout attack may mimic cellulitis; however, joint mobility is preserved in cellulitis
- Gout often affects more than one joint (i.e. ankle, midfoot, and MTPs)

Precipitants of Gout

Drugs are FACT

Furosemide
Aspirin®/Alcohol
Cytotoxic drugs
Thiazide diuretics

Foods are SALT

Seafood
Alcohol (beer and spirits)
Liver and kidney
Turkey (meat)

- The majority of people with hyperuricemia do not have gout
- Normal or low uric acid levels do not rule out gout

10 Multinational Expert Based Recommendations on the Diagnosis and Management of Gout

Ann of Rheum Dis 2013;73(2):328-335

- Identification of monosodium urate crystals should be performed for a definitive diagnosis of gout.
- Gout/hyperuricemia should prompt investigations of renal function and CV risk factors.
- Acute gout should be treated with colchicine, NSAIDs, and/or glucocorticoids.
- Patients should be counseled about lifestyle.
- Allopurinol is first line for urate lowering therapy, with uricosurics as second line.
- Patients should be informed about the risk of acute gout flare with initiation of urate lowering therapy; colchicine prophylaxis should be considered.
- Allopurinol can be used in patients with mild/moderate renal impairment with slow titration and monitoring.
- Treatment goal is urate <0.36 mM and absence of attacks and resolution of tophi.
- Tophi should be treated medically by lowering serum urate to <0.3 mM. Surgery is only for select cases.
- Prophylactic pharmacological management of asymptomatic hyperuricemia is not recommended.

- medical
 - ♦ antihyperuricemic drugs (allopurinol and febuxostat): decrease uric acid production by inhibiting xanthine oxidase
 - ♦ uricosuric drugs (probenecid, sulfapyrazone): use if failure on or intolerant to allopurinol; do not use in renal failure
 - prophylaxis prior to starting antihyperuricemic drugs (colchicine/low-dose NSAID)
 - in renal disease secondary to hyperuricemia, use low-dose allopurinol and monitor Cr
- indications for treatment with antihyperuricemic medications include:
 - recurrent attacks, tophi, bone erosions, urate kidney stones
 - perhaps in renal dysfunction with very high urate load (controversial)

Pseudogout (Calcium Pyrophosphate Dihydrate Disease)

Etiology and Pathophysiology

- acute inflammatory arthritis due to phagocytosis of IgG-coated CPPD crystals by neutrophils and subsequent release of inflammatory mediators within joint space
- more frequently polyarticular
- slower in onset in comparison to gout, lasts up to 3 wk but is self-limited

Risk Factors

- old age, advanced OA, neuropathic joints
- other associated conditions: hyperparathyroidism, hypothyroidism, hypomagnesemia, hypophosphatasia (low ALP), DM, hemochromatosis

Signs and Symptoms

- affects knees, wrists, MCPs, hips, shoulders, elbows, ankles, big toe
- multiple manifestations
 - asymptomatic crystal deposition (seen on radiograph only)
 - acute crystal arthritis (self-limited flares of acute inflammatory arthritis resembling gout)
 - pseudo-OA (progressive joint degeneration, sometimes with episodes of acute inflammatory arthritis)
 - pseudo-RA (symmetrical polyarticular pattern with morning stiffness and constitutional symptoms)
- acute may be triggered by dehydration, acute illness, surgery, trauma

Investigations

- must aspirate joint to rule out septic arthritis, gout
- CPPD crystals: present in 60% of patients, often only a few crystals
- x-rays show chondrocalcinosis in 75%: radiodensities in fibrocartilaginous structures (e.g. knee menisci) or linear radiodensities in hyaline articular cartilage

Treatment

- joint aspiration, rest, and protection
- NSAIDs: also used for maintenance therapy
- prophylactic colchicine PO (controversial)
- IA or oral steroids to relieve inflammation

Figure 13. Common sites of involvement in CPPD

Pediatric Rheumatology

- see [Pediatrics](#), P93

Non-Articular Rheumatism

Definition

- disorders that primarily affect soft tissues or periarticular structures
- includes bursitis, tendinitis, tenosynovitis, fibromyalgia, and PMR

Polymyalgia Rheumatica

Definition

- characterized by pain and stiffness of the proximal extremities (girdle area)
- closely related to GCA (15% of patients with PMR develop GCA)
- no muscle weakness

Table 31. PMR Classification Criteria Scoring Algorithm*

	Points without U/S (0-6)	Points with Abnormal U/S** (0-8)
Morning stiffness duration >45 min	2	2
Hip pain or limited ROM	1	1
Absence of RF or ACPA	2	2
Absence of other joint involvement	1	1
At least one shoulder with subdeltoid and/or biceps tenosynovitis and/or glenohumeral synovitis (either posterior or axillary) and at least one hip with synovitis and/or trochanteric bursitis on U/S	N/A	1
Both shoulders with subdeltoid bursitis, biceps tenosynovitis, or glenohumeral synovitis on U/S	N/A	1

*Required criteria: age ≥ 50 yr, bilateral shoulder aching, and abnormal ESR/CRP

**A score of 4 or more is categorized as PMR in the algorithm without U/S and a score of 5 or more is categorized as PMR in the algorithm with U/S

**Optional U/S criteria

Ann Rheum Dis 2012;71:484-492

Epidemiology

- incidence 50 per 100,000 per year in those >50 yr
- age of onset typically >50, F:M = 2:1

Signs and Symptoms

- constitutional symptoms prominent (fever, weight loss, malaise)
- pain and stiffness of symmetrical proximal muscles (neck, shoulder and hip girdles, thighs)
- gel phenomenon (stiffness after prolonged inactivity)
- physical exam reveals tender muscles, but no weakness or atrophy

Investigations

- blood work: often shows anemia, elevated platelets, elevated ESR and CRP, and normal CK; up to 5% of PMR reported with normal inflammatory markers

Treatment

- goal of therapy: symptom relief
- start with prednisone dose of 15-20 mg PO OD
- taper slowly over 2 yr period monitoring ESR and symptoms closely
- relapses should be diagnosed and treated on clinical basis; do not treat a rise in ESR as a relapse
- treat relapses aggressively (50% relapse rate)
- monitor for steroid side effects, glucocorticoid-induced osteoporosis prevention, and follow for symptoms of GCA

Most patients are treated for up to 2 yr

Prednisone Plus MTX for PMR

Ann Intern Med 2004;141:493-500

Study: Multicenter RCT.

Patients: Patients with newly diagnosed PMR.

Intervention: Prednisone dosage (25 mg/d) was tapered to 0 mg/d within 24 wk and was adjusted if flare-ups occurred. Oral MTX (10 mg) or placebo with folic acid supplementation (7.5 mg) was given weekly for 48 wk.

Primary Outcome: The proportion of patients no longer taking prednisone, the number of flare-ups, and the cumulative prednisone dose after 76 wk.

Results: 28 of 32 patients in the MTX group and 16 of 30 patients in the placebo group were no longer taking prednisone at 76 wk ($p = 0.003$). Similar results were obtained after adjustment for C-reactive protein level and duration of symptoms in a multivariate model. 15 of 32 patients in the MTX group and 22 of 30 patients in the placebo group had at least 1 flare-up by the end of follow-up ($p = 0.04$). The median prednisone dose was 2.1 g in the MTX group and 2.97 g in the placebo group ($p = 0.03$). The rate and severity of adverse events were similar.

Limitations: Follow-up was short, and a high dose of folic acid and a relatively high starting dosage of prednisone were used. 10 of 72 patients (14%) discontinued treatment or were lost to follow-up.

Conclusions: Prednisone plus MTX is associated with shorter prednisone treatment and steroid sparing. It may be useful in patients at high risk for steroid-related toxicity.

Fibromyalgia

Definition

- chronic (>3 mo), widespread (axial, left- and right-sided, upper and lower segment), non-articular pain with characteristic tender points

Diagnosis

2010 Diagnostic Criteria for Fibromyalgia

- widespread pain index ≥ 7 and symptom severity score ≥ 5 or WPI 3-6 and SS ≥ 9
- symptoms have been present at a similar level for ≥ 3 mo
- the patient does not have a disorder that would otherwise explain the pain
 - widespread pain index = number of areas in which the patient had pain over the last week (L and R: shoulder girdle, upper arm, lower arm, hip, upper leg, lower leg, jaw, chest, abdomen, upper and lower back, neck = max score 19)
 - symptom severity score = sum of a) severity of fatigue, b) waking unrefreshed, and c) cognitive symptoms over the past week, plus d) extent of somatic symptoms (IBS, H/A, abdominal pain/cramps, dry mouth, fever, hives, ringing in ears, vomiting, heartburn, dry eyes, SOB, loss of appetite, rash, hair loss, easy bruising, etc.); all (a-d) rated on 0-3 scale:
0 = no problem, 1 = mild, 2 = moderate, 3 = severe
- this clinical definition identified 88.1% of American College of Rheumatology classified fibromyalgia and can allow longitudinal assessment of symptom severity

Epidemiology

- F:M = 3:1
- primarily ages 25-45 yr, some adolescents
- prevalence of 2-5% in general population
- overlaps with chronic fatigue syndrome and myofascial pain syndrome
- strong association with psychiatric illness

Signs and Symptoms

- widespread aching, stiffness
- easy fatigability
- sleep disturbance: non-restorative sleep, difficulty falling asleep, and frequent waking
- symptoms aggravated by physical activity, poor sleep, emotional stress
- patient feels that joints are diffusely swollen although joint examination is normal
- neurologic symptoms of hyperalgesia, paresthesias
- associated with irritable bowel or bladder syndrome, migraines, tension headaches, restless legs syndrome, obesity, depression, and anxiety
- physical exam should reveal only tenderness with palpation of soft tissues, with no specificity for trigger/tender points

Investigations

- blood work: includes TSH and ESR; all typically normal unless unrelated, underlying illness present
- serology: do not order ANA or RF unless there is clinical suspicion for a connective tissue disease
- laboratory sleep assessment

Differential Diagnosis

- diagnosis of exclusion
- rule out other disorders by history and physical exam

Treatment

- **conservative**
 - education
 - exercise program (walking, aquatic exercises), physical therapy (good posture, stretching, muscle strengthening, massage)
 - stress reduction, CBT
 - no evidence for alternative medicine such as biofeedback, meditation, acupuncture
- **medical**
 - low dose tricyclic antidepressant (e.g. amitriptyline)
 - ♦ for sleep restoration
 - ♦ select those with lower anticholinergic side effects
 - SNRI: duloxetine, milnacipran
 - anticonvulsant: pregabalin, gabapentin
 - analgesics may be beneficial for pain that interferes with sleep (NSAIDs, not narcotics)

Prognosis

- variable; usually chronic, unless diagnosed and treated early

Adult Onset Still's Disease

Definition

- systemic inflammatory condition (ANA and RF negative) with fevers and characteristic rash, numerous systemic symptoms, and may have severe arthritis

Etiology and Pathophysiology

- idiopathic; infectious triggers likely – various viruses and bacteria have been implicated
- stress increases risk

Epidemiology

- F>M; age of onset typically 16-40, approximately 1 per 100,000

Signs and Symptoms

- classic triad of symptoms
 - high-spiking fevers (95.7% of patients, typically T = 102.2°F/39°C, <4 h duration, quotidian pattern)
 - characteristic "salmon rash" (~72% of patients, on proximal limbs + trunk)
 - arthralgia/arthritis (64-100%)
- sore throat, myalgias and serositis may also occur
- arthritis is symmetric, typically affects large joints, i.e. wrists, knees and ankles, may involve PIP and DIPs, elbow, MTPs
- liver abnormalities ± hepatomegaly (50-75% patients)
- splenomegaly (44%)

A 14 Week, RCT of Pregabalin in Patients with Fibromyalgia

J Pain 2008;9:792-880

Study: Multicenter RCT. 750 patients with fibromyalgia with pain score of <40 mm on the visual analog scale (VAS) were assigned to placebo or pregabalin (300 mg, 450 mg, or 600 mg) daily for 12 wk.

Primary Outcome: Change in the mean pain score derived from the subject's daily pain diary as measured at the patient's baseline to the end point of the study.

Results: Patients treated with 450 and 600 mg/d pregabalin showed a statistically significant improvement in the end point mean pain score compared with placebo-treated subjects by -0.50 and -0.45 respectively.

The 30% responder rate was 30%, 42%, 50%, and 48% in the placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. The 50% responder rate was 15%, 24%, 27%, and 30% for placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. Discontinuations due to adverse events were 12%, 16%, 22%, and 26% in placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. The 450 and 600 mg/d groups were significantly different from placebo (p=0.0001).

Conclusions: Pregabalin at 300 mg/d, 450 mg/d, and 600 mg/d showed statistically significant response rates as compared to placebo although discontinuation rates for the 450 mg/d and 600 mg/d regimens were significantly higher as compared to placebo.

Exercise for Treating Fibromyalgia Syndrome

Cochrane DB Syst Rev 2008;CD003786

Study: Systematic review of exercise training including cardiorespiratory endurance, muscle strengthening, and flexibility for global well-being and physical function in patients with fibromyalgia.

Result: 34 studies were included (n=2,276). Aerobic-only exercises improve global well-being, physical function, and possibly pain and tender points. There was insufficient data to evaluate the effect of strength and flexibility on the primary outcomes.

Conclusions: Moderate aerobic cardiorespiratory exercise improves function and well-being in patients with FM. Benefits from muscle strengthening and flexibility require additional research to delineate benefits.

Triad of Still's Disease

FAR

Fever

Arthralgias/Arthritis

Rash

Classification

- numerous classification systems proposed
- Yamaguchi's criteria (*J Rheumatol* 1992;19:424-30): need 5 criteria to diagnose Still's, at least 2 major
 - major criteria
 - ♦ $T > 39^{\circ}\text{C}$, intermittent, >1 wk
 - ♦ typical rash
 - ♦ $\text{WBC} > 10,000$ ($>80\%$ granulocytes)
 - minor criteria
 - ♦ sore throat
 - ♦ lymphadenopathy \pm splenomegaly
 - ♦ abnormal transaminases
 - ♦ negative ANA and RF
 - exclusion criteria: infection, malignancy, rheumatic disease

Investigations

- ANA and RF negative
- markedly elevated ESR, CRP, ferritin (typically >1000 ng/mL, >2200 pmol/L)
 - total ferritin $>5 \times \text{ULN} = 80\%$ sensitive, 41% specific
- anemia, thrombocytosis, leukocytosis may occur
- transaminases, LDH may be elevated

Treatment

- refer to rheumatologist for treatment with biologics (anti-IL1 and anti-IL6 agents)
- begin management with low-dose glucocorticoids \pm MTX

Common Medications

Table 32. Common Medications for OA

Class	Generic Drug Name	Trade Name	Dosing (PO)	Indications	Contraindications	Adverse Effects
Analgesic	acetaminophen	Tylenol®	500 mg tid q4h (4 g daily max)	1st line		Hepatotoxicity Overdose Potentiates warfarin
NSAIDs	ECASA	Entrophen®	325-975 mg qid	2nd line	GI bleed	Nausea, tinnitus, vertigo, rash, dyspepsia, GI bleed, PUD, hepatitis, renal failure, HTN, nephrotic syndrome
	ibuprofen	Advil,® Motrin®	200-600 mg tid		Renal impairment	
	diclofenac	Voltaren®	25-50 mg tid		Allergy to ASA, NSAIDs	
	diclofenac/misoprostol	Arthrotec®	50-75/200 mg tid		Pregnancy (T3)	
	naproxen	Naprosyn®, Aleve®	125-500 mg bid			
	meloxicam	Mobicox®	7.5-15 mg OD			
COX-2 INHIBITORS						
	celecoxib	Celebrex®	200 mg OD	High risk for GI bleed: age >65 Hx of GI bleed, PUD	Renal impairment Sulfa allergy (celecoxib) Cardiovascular disease	Delayed ulcer healing Renal/hepatic impairment Rash
Other Treatments		Comments				
Combination analgesics (acetaminophen + codeine, acetaminophen + NSAIDs)		Enhanced short-term effect compared to acetaminophen alone More adverse effects: sedation, constipation, nausea, GI upset				
IA corticosteroid injection		Short-term (weeks-months) decrease in pain and improvement in function Used for management of an intraarticular inflammatory process when infection has been ruled out				
IA hyaluronic acid q6mo		Used for mild-moderate OA of the knees, however little supporting evidence, and not considered to be effective Precaution with chicken/egg allergy				
Topical NSAIDs		1.5% wt/wt topical diclofenac (Pennsaid®) May use for patients who fail acetaminophen treatment and who wish to avoid systemic therapy				
Capsaicin cream		Mild decrease in pain				
Glucosamine sulfate ± chondroitin		Limited clinical studies				

Table 33. Disease Modifying Anti-Rheumatic Drugs (DMARDs)

Generic Drug Name	Trade Name	Dosing	Contraindications	Adverse Effects
COMMONLY USED				
hydroxychloroquine \$	Plaquenil®	400 mg PO OD initially 200-400 mg PO OD maintenance (6.5 mg/kg ideal body weight per day)	Retinal disease, G6PD deficiency	GI symptoms, skin rash, macular damage, neuromyopathy Requires regular ophthalmological screening to monitor for retinopathy
sulfasalazine \$	Salazopyrim® Azulfidine® (US)	1000 mg PO bid-tid	Sulfa/ASA allergy, kidney disease, G6PD deficiency	GI symptoms, rash, headache, leukopenia
methotrexate \$	Rheumatrex® Folex/Mexate®	7.5-25 mg PO/IM/SC qweekly	Bone marrow suppression, liver disease, significant lung disease, immunodeficiency, pregnancy, EtOH abuse	Oral ulcers, GI symptoms, cirrhosis, myelosuppression, pneumonitis, tubular necrosis
leflunomide \$\$	Arava®	10-20 mg PO OD	Liver disease	Alopecia, GI symptoms, liver dysfunction, pulmonary infiltrates
NOT COMMONLY USED				
cyclosporine \$\$	Neoral®	2.5-3 mg/kg/d divided and given in 2 doses PO	Kidney/liver disease, infection, HTN	HTN, decreased renal function, hair growth, tremors, bleeding
gold (injectable) \$	Solganal® Myocrysine®	50 mg IM q1wk after gradual introduction	IBD, kidney/liver disease	Rash, mouth soreness/ulcers, proteinuria, marrow suppression
azathioprine \$	Imuran®	2/5 mg/kg/d PO once daily	Kidney/liver disease TPMT deficiency	Rash, pancytopenia (especially ↓ WBC, ↑ AST, ALT), biliary stasis, vomiting, diarrhea
cyclophosphamide \$	Cytosan®	1 g/m ² /mo IV as per protocol	Kidney/liver disease	Cardiotoxicity, GI symptoms, hemorrhagic cystitis, nephrotoxicity, bone marrow suppression, sterility
Generic Drug Name	Trade Name	Dosing	Mechanism of Action	
NEWER DMARDs (Biologics)				
etanercept \$\$\$	Enbrel®	25 mg biweekly or 50 mg weekly SC	Fusion protein of TNF receptor and Fc portion of IgG	
infliximab \$\$\$	Remicade®	3-5 mg/kg IV q8wk	Chimeric mouse/human monoclonal anti-TNF-α	
adalimumab \$\$\$	Humira®	40 mg SC q2wk	Monoclonal anti-TNF-α	
abatacept \$\$\$	Orencia®	IV infusion	Costimulation modulator of T-cell activation	
rituximab \$\$\$	Rituxan®	2 IV infusions, 2 wk apart	Causes B-cell depletion, binds to CD20	
certolizumab \$\$\$	Cimzia®	400 mg SC q2wk x3 then 200 mg SC q4wk	PEGylated monoclonal anti-TNF-α	
golimumab \$\$\$	Simponi®	50 mg SC q month	Monoclonal anti-TNF-α	
tocilizumab \$\$\$	Actemra®	4-8 mg/kg IV q4wk	Interleukin-6 receptor antagonist	

**Risks of Biologics**

- Reactivation of TB or hepatitis B; patients require negative TB skin test, chest x-ray, and negative hepatitis B virus serology prior to starting any of these medications
- Increased risk of serious infections
- Worsening heart failure

Landmark Rheumatology Trials

Trial	Reference	Results
RHEUMATOID ARTHRITIS		
ATTEST	<i>Ann Rheum Dis</i> 2008; 67:1096-103	Abatacept and infliximab have similar efficacy in RA patients who have failed MTX
ATTRACT	<i>Lancet</i> 1999; 354:1932-9	Infliximab and MTX combined are more effective than MTX alone for patients with active RA
CIMESTRA	<i>Arthritis Rheum</i> 2006; 54:1401-9	Combination of MTX and sulfasalazine is superior to either alone
COMET	<i>Lancet</i> 2008; 372:375-82	Etanercept add-on therapy increases rates of remission in early RA
ERA	<i>NEJM</i> 2000; 343:1586-93	Etanercept more rapidly decreases symptoms in early RA compared to MTX
European Leflunomide Study Group	<i>Lancet</i> 1999; 353:259-66	Leflunomide is equal in efficacy to sulphasalazine
FIN-RACo	<i>Lancet</i> 1999; 353:1568-73	Combination therapy with DMARDs improves remission rates in early RA
Infliximab and MTX	<i>NEJM</i> 2000; 343:1594-602	Infliximab combined with MTX reduces joint damage in RA
Leflunomide RA Investigators Group	<i>Arch Intern Med</i> 1999; 159:2542-50	Leflunomide is equivalent to MTX therapy and superior to placebo
PREMIER	<i>Arthritis Rheum</i> 2006; 54:26-37	Combination therapy with adalimumab and MTX is superior to either alone in patients with early RA
Swefot	<i>Lancet</i> 2009; 374:459-66	Anti-TNF agents are more effective second-line therapy than DMARDs in patients who fail MTX
OSTEOARTHRITIS		
GAIT	<i>NEJM</i> 2006; 354:795-808	Glucosamine, chondroitin, and the combination of both are no more effective than placebo in treatment of knee OA
Hyaluronan	<i>Ann Rheum Dis</i> 2010; 69:1097-102	Hyaluronan injections do not improve disease activity in patients with moderate-severe knee OA
LUPUS		
Belimumab	<i>Lancet</i> 2011; 377:721-31	Treatment with belimumab reduces the incidence of BILAG A and B flares in patients with SLE compared to placebo
BILAG open-RCT	<i>Rheumatology</i> 2010; 49:723-32	Low dose cyclosporine and azathioprine are equivalent in efficacy as maintenance therapy for SLE
Mycophenylate mofetil or intravenous cyclophosphamide	<i>NEJM</i> 2005; 353:2219-28	Mycophenylate mofetil is more efficacious than cyclophosphamide in inducing remission of SLE nephritis
CONNECTIVE TISSUE DISEASES		
Azathioprine or MTX maintenance for ANCA-associated vasculitis	<i>NEJM</i> 2008; 359:2790-803	MTX and azathioprine are equally safe and effective as maintenance agents in ANCA vasculitis
Cyclophosphamide in scleroderma lung disease	<i>NEJM</i> 2006; 354:2655-66	Cyclophosphamide therapy leads to transient improvements in lung function, skin scores, and overall health in patients with scleroderma
Etanercept plus standard therapy for granulomatosis with polyangiitis	<i>NEJM</i> 2005; 352:351-61	Etanercept is not effective in inducing remission in patients with ANCA vasculitis
Mycophenylate mofetil vs. azathioprine for maintenance in ANCA-associated vasculitis	<i>JAMA</i> 2010; 304:2381-8	Mycophenylate mofetil is less effective than azathioprine for maintaining disease in ANCA-associated vasculitis
Rituximab vs. cyclophosphamide for ANCA-associated vasculitis	<i>NEJM</i> 2010; 363:221-32	Rituximab is not inferior to cyclophosphamide for induction of remission in ANCA vasculitis
GOUT		
Febuxostat vs. allopurinol	<i>NEJM</i> 2005; 353:2450-61	Febuxostat is more effective than allopurinol at lowering serum urate, and has similar effectiveness on flare reduction

Trial	Reference	Results
ANKYLOSING SPONDYLITIS		
Adalimumab	<i>Arthritis Rheum</i> 2006; 54:2136-46	Adalimumab induced partial remission in 22% of AS patients
ASSERT (rituximab)	<i>Arthritis Rheum</i> 2005; 52:582-91	Sixty percent of patients treated with rituximab had a clinical response to the medication
ATLAS (adalimumab)	<i>J Rheumatol</i> 2008; 35:1346-53	Compared to placebo, adalimumab significantly reduces pain and fatigue in AS patients
Infliximab in AS	<i>Lancet</i> 2002; 359:1187-93	Infliximab induces regression of symptoms in 50% of patients and is superior to placebo
SPINE (etanercept)	<i>Ann Rheum Dis</i> 2011; 70:799-804	Etanercept has short-term efficacy for patients with advanced AS and reduces disease severity
Sulfasalazine	<i>Arthritis Rheum</i> 1995; 38:618-27	Sulfasalazine is superior to placebo in treatment of patients with seronegative spondyloarthropathy

DSD	detrusor sphincter dyssynergia			TMP/SMX	trimethoprim/sulfamethoxazole		
EBRT	external beam radiation therapy						

Basic Anatomy Review

- recall that the anatomical position of the penis is erect; therefore, the anatomical ventral side of the penis appears to be the dorsal side of the flaccid penis

Figure 1. Midline cross-section of abdominal wall

Figure 2. Anatomy of scrotum

Figure 3. Essential genitourinary tract male anatomy

Figure 4. Cross section of the penis

Figure 5. Median sagittal section of the male pelvis and perineum

Urologic History

- follow the OPQRSTUVW approach
 - note that pain may not be limited to the genital region (e.g. lower abdomen, CVA)
- inquire about risk factors: past urologic disease (e.g. UTI, stones, STD, cancers, anatomic abnormalities, family Hx, medications, lifestyle factors, trauma, previous surgical procedures)
- urinary habits
 - frequency of voiding, quality of urine, volume of voids, incontinence, nocturia
 - specific urinary symptoms include
 - ♦ storage symptoms: frequency, nocturia, urgency
 - ♦ voiding symptoms: straining, hesitancy, dysuria, intermittency, post-void dribbling, reduced stream, feeling of incomplete voiding
 - ♦ hematuria: part of stream during which bleeding occurs, blood clots
 - ♦ incontinence: rushing to washroom (urge); leakage with coughing, sneezing, laughing (stress); constant dribbling (overflow)
- sexual function
 - scrotal mass: see *Scrotal Mass*, U28
 - ED: see *Erectile Dysfunction*, U30
 - infertility: see *Infertility*, U33
- risk factors
 - past urologic disease (e.g. UTI, stones, cancers, STD), anatomic abnormalities, trauma, previous surgical procedures, medications, family Hx, lifestyle factors
- associated symptoms
 - N/V
 - bowel dysfunction
- constitutional symptoms
 - fever, chills, unintentional weight loss, night sweats, fatigue, malaise

Always ask about sexual function on history. Change in erectile function can be one of the first symptoms that there is concomitant vascular disease. If there is new onset ED, consider screening for diabetes and CAD risk factors

Hematuria (Blood in the Urine)

Macroscopic (Gross) Hematuria

Definition

- blood in the urine that can be seen with the naked eye

Classification

- see [Nephrology](#), NP21

Etiology

Table 1. Etiology by Age Group

Age (Years)	Etiology	
0-20	UTI, glomerulonephritis, congenital abnormalities	
20-40	UTI, stones, bladder tumor	
40-60	Male: bladder tumor, stones, UTI	Female: UTI, stones, bladder tumor
>60	Male: BPH, bladder tumor, UTI, RCC	Female: bladder tumor, UTI, RCC

Table 2. Etiology by Type

Pseudo-hematuria	Infectious/ Inflammatory	Malignancy	Benign	Structural	Hematologic
Vaginal bleeding Dyes (beets, rhodamine B in candy and juices) Hemoglobin (hemolytic anemia) Myoglobin (rhabdomyolysis) Drugs (rifampin, phenazopyridine, phenytoin) Porphyria Laxatives (phenolphthalein)	Pyelonephritis Cystitis Urethritis Glomerulonephritis Interstitial nephritis Tuberculosis	RCC (mainly in adult population) UCC Wilms' tumor (mainly in pediatric population) Leukemia	BPH Polyps Exercise-induced	Stones Trauma Foreign body Urethral stricture Polycystic kidneys Arteriovenous malformation Infarct	Anticoagulants Coagulation defects Sickle cell disease Thromboembolism

History

- inquire about timing of hematuria in urinary stream
 - initial: anterior urethra
 - terminal: bladder neck and prostatic urethra
 - total: bladder and/or above

Investigations

- CBC (r/o anemia, leukocytosis), electrolytes, Cr, BUN, INR, PTT
- urine studies
 - U/A, C&S, cytology
- imaging
 - CT (with contrast) has largely replaced IVP to investigate upper tracts
 - consider contraindications to contrast; allergy, renal insufficiency
 - U/S alone is not sufficient
 - cystoscopy to investigate lower tract (possible retrograde pyelogram)

Acute Management of Severe Bladder Hemorrhage

- manual irrigation via catheter with normal saline to remove clots
- CBI using large (22-26 Fr) 3-way Foley to help prevent clot formation
- cystoscopy if active bleeding
 - identify resectable tumors
 - coagulate obvious sites of bleeding
- refractory bleeding
 - intravesical agents
 - continuous intravesical irrigation with 1% aluminum potassium sulfate solution as needed
 - intravesical instillation of 1% silver nitrate solution
 - intravesical instillation of 1-4% formalin (requires GA and pre-procedure cystogram to rule out reflux)
 - embolization or ligation of iliac arteries
 - cystectomy and diversion (rarely performed)

Gross, painless hematuria in adults is bladder cancer until proven otherwise

Common Urologic Causes of Hematuria Can Be Classified as:

TICS

Trauma/Tumor/Toxins
Infection/Inflammatory
Calculi/Cysts
Surgery/Sickle cell and other hematological causes

Upper Tract Imaging Options

Intravenous Pyelogram (IVP)

Traditional option but rarely used (replaced by CTU). Reasonable sensitivity for UCC, but poor sensitivity for RCC

U/S: Superior to IVP for evaluation of renal parenchyma and renal cysts. Limited sensitivity for UCC and small renal masses. U/S alone is not sufficient for upper tract imaging

CT Urography (CTU): Optimal test for renal parenchyma, calculi, and infections. Involves exposure to radiation and IV contrast. Assess kidney function, allergies prior to use of contrast

Microscopic Hematuria

Definition

- blood in the urine that is not visible to the naked eye
- >3 RBCs/HPF on urinalysis of at least two separate samples

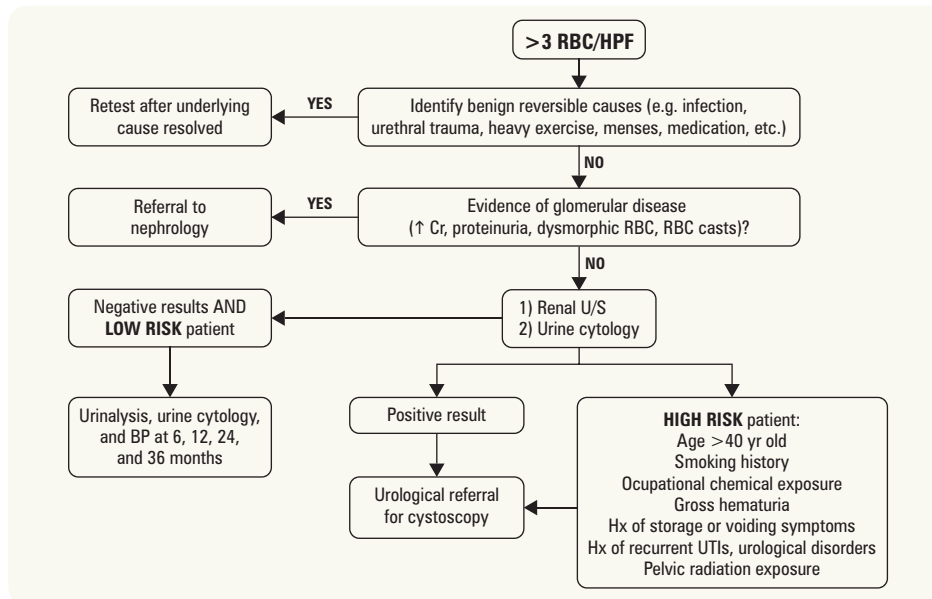

Figure 6. Workup of asymptomatic microscopic hematuria

Based on CUA Guidelines. Alternatively, the AUA recommends cystoscopy and CT urogram for all patients with confirmed microscopic hematuria; follow-up for negative workup is urinalysis yearly for two years, with repeat anatomic evaluation if microscopic hematuria persists

Voiding Dysfunction

- see [Gynecology](#), GY34 for relevant female topics

Voiding

- two phases of lower urinary tract function
 1. storage phase (bladder filling and urine storage)
 - ♦ accommodation and compliance
 - ♦ no involuntary contraction
 2. voiding phase (bladder emptying)
 - ♦ coordinated detrusor contraction
 - ♦ synchronous relaxation of outlet sphincters
 - ♦ no anatomic obstruction
- voiding dysfunction can therefore be classified as
 - failure to store: due to bladder or outlet
 - failure to void: due to bladder or outlet
- three types of symptoms
 - storage (formerly known as irritative)
 - voiding (formerly known as obstructive)
 - post-voiding

Urinary Incontinence

Definition

- involuntary leakage of urine

Etiology

- urgency incontinence
 - detrusor overactivity
 - ♦ CNS lesion, inflammation/infection (cystitis, stone, tumor), bladder neck obstruction (tumor, stone), BPH, idiopathic

Lower Urinary Tract Symptoms (LUTS)

Storage (FUND)

Frequency
Urgency
Nocturia
Dysuria

Voiding (SHED)

Stream changes
Hesitancy
Incomplete Emptying
Dribbling

- decreased compliance of bladder wall (inability to store urine)
 - CNS lesion, fibrosis
 - sphincter/urethral problem
- stress urinary incontinence (SUI)
 - common in women; seen in men after prostate cancer treatment or pelvic operations
 - urethral hypermobility
 - weakened pelvic floor and musculofascial urethral and vaginal supporting mechanisms allows bladder neck and urethra to descend with increased intra-abdominal pressure
 - urethra is pulled open by greater motion of posterior wall of outlet relative to anterior wall
 - associated with childbirth, pelvic surgery, aging, levator muscle weakness, obesity
 - intrinsic sphincter deficiency (ISD): weakness of the urethra and associated smooth and striated muscle elements
 - pelvic surgery, neurologic problem, aging and hypoestrogen state
 - ISD and urethral hypermobility can co-exist
- mixed incontinence
 - combination of stress and urgency incontinence
- overflow incontinence
 - is a term sometimes used to describe urinary incontinence as a complication of urinary retention; for causes of urinary retention see Table 4
 - use of the term is used it should be accompanied by the associated pathophysiology (e.g. BPH with overflow incontinence)

Epidemiology

- variable prevalence in women: 25-45%
- F:M = 2:1
- more frequent in the elderly, affecting 5-15% of those living in the community and 50% of nursing home residents

Table 3. Urinary Incontinence: Types and Treatments

Type	Urgency	Stress	Mixed
Definition	Involuntary leakage of urine preceded by a strong, sudden urge to void	Involuntary leakage of urine with sudden increases in intra-abdominal pressure	Urinary leakage associated with urgency and increased intra-abdominal pressure
Etiology	Bladder (detrusor overactivity)	Urethra/sphincter weakness, post-partum pelvic musculature weakness	Combination of bladder and sphincter issues
Diagnosis	Hx Urodynamics	Hx Urodynamics Stress test (have patient bear down/cough)	Hx Urodynamics Stress test
Therapy	Lifestyle changes (fluid alterations, diet, etc.) Bladder habit training Anticholinergics β3 agonist Neuromodulation Botulinum toxin A	Weight loss Kegel exercises Bulking agents Surgery (slings, tension-free vaginal tape, transobturator tape, artificial sphincters)	Combination of management of urge and stress incontinence

Causes of Reversible Urinary Incontinence

DIAPERS

Delirium
Inflammation/Infection
Atrophic vaginitis/urethritis
Pharmaceuticals/Psychological
Excess U/O
Restricted mobility/Retention
Stool impaction

Urgency is the symptom of a strong need to void; it is not necessarily associated with incontinence

Urinary Retention

Table 4. Etiology of Urinary Retention

Outflow Obstruction	Bladder Innervation	Pharmacologic	Infection
<ul style="list-style-type: none"> Bladder neck or urethra: calculus, clot, foreign body, neoplasm, neurological (DSD) Prostate: BPH, prostate cancer Urethra: stricture, phimosis, traumatic disruption Miscellaneous: constipation, pelvic mass 	<ul style="list-style-type: none"> Intracranial: CVA, tumor, Parkinson's, cerebral palsy Spinal cord: injury, disc herniation, MS DM Post-abdominal or pelvic surgery 	<ul style="list-style-type: none"> Anticholinergics Narcotics Antihypertensives (ganglionic blockers, methyldopa) OTC cold medications containing ephedrine or pseudoephedrine Antihistamines Psychoactive substances (e.g. ecstasy) 	<ul style="list-style-type: none"> GU: UTI, prostatitis, abscess, genital herpes Infected foreign body Varicella zoster

Clinical Features

- suprapubic pain
- palpable and/or percussible bladder (suprapubic)
- possible purulent/bloody meatal D/C
- increased size of prostate or reduced anal sphincter tone on DRE
- neurological: presence of abnormal or absent deep tendon reflexes, reduced "anal wink," saddle anesthesia

Acute vs. Chronic Retention

Acute retention is a medical emergency characterized by suprapubic pain and anuria with normal bladder volume and architecture

Chronic retention can be painless with greatly increased bladder volume and detrusor hypertrophy followed by atony (late)

If a trauma patient is unable to void, has blood at urethral meatus, a scrotal hematoma, or a high riding prostate, there is urethral injury until proven otherwise so catheterization is CONTRAINDICATED unless performed by urology staff or resident

Investigations

- CBC, electrolytes, Cr, BUN, U/A and urine C&S, U/S, cystoscopy, urodynamic studies, PVR

Treatment

- treat underlying cause
- catheterization
 - acute retention
 - ♦ immediate catheterization to relieve retention; leave Foley in to drain bladder; follow-up to determine cause; closely monitor fluid status and electrolytes (risk of POD)
 - chronic retention
 - ♦ intermittent catheterization by patient may be used; definitive treatment depends on etiology
- suprapubic tube placement
- for post-operative patients with retention:
 - encourage ambulation
 - α -blockers to relax bladder neck outlet
 - may need catheterization
 - definitive treatment will depend on etiology

Patients with ascites may have a falsely elevated PVR measured by bladder scan

Benign Prostatic Hyperplasia

Definition

- periurethral hyperplasia of stroma and epithelium in prostatic transition zone
- prostatic smooth muscle cells play a role in addition to hyperplasia

Etiology

- etiology unknown
 - DHT required (converted from testosterone by 5- α reductase)
 - possible role of impaired apoptosis, estrogens, other growth factors
 - genetic: increased risk in 1st degree relatives and twin studies

Epidemiology

- age-related, extremely common (50% of 50 yr olds, 80% of 80 yr olds)
- 25% of men will require treatment

Clinical Features

- result from outlet obstruction and compensatory changes in detrusor function
- voiding and storage symptoms
- DRE
 - prostate is smooth, rubbery, and symmetrically enlarged
- complications
 - retention
 - overflow incontinence
 - hydronephrosis
 - renal insufficiency
 - infection
 - gross hematuria
 - bladder stones

Investigations

- Hx, assessing LUTS and impact on QOL
 - may include self-administered questionnaires (IPSS or AUA symptom index for severity, progression, and treatment response)
- P/E, including DRE
- U/A to exclude UTI
- Cr to assess renal function
- uroflowmetry to measure flow rate (optional)
- PVR (optional)
- consider cystoscopy or transrectal ultrasound prior to potential surgical management to evaluate outlet and prostate volume
- biopsy if suspicious for malignancy, i.e. elevated PSA or abnormal DRE

Figure 7. Cross-section of prostate

Prostate size does not correlate well with symptoms in BPH

Approximate Prostate Sizes

- 20 cc – chestnut
- 25 cc – plum
- 50 cc – lemon
- 75 cc – orange
- 100 cc – grapefruit

AUA BPH Symptom Score

FUNWISE

Frequency
Urgency
Nocturia
Weak stream
Intermittency
Straining
Emptying, incomplete feeling of

Each symptom graded out of 5
0-7: Mildly symptomatic
8-19: Moderately symptomatic
20-35: Severely symptomatic

Note: dysuria not included in score but is commonly associated with BPH

Treatment

Table 5. Treatment of BPH

	Conservative	Medical	Surgical	Minimally Invasive Surgical Therapies
When to Use	Asymptomatic patients	Moderate to severe symptoms that are distressing for patient	Significant symptom burden, acute urinary retention, refractory hematuria, recurrent infections	Patients who wish to avoid or may not tolerate surgery
Options	<ul style="list-style-type: none"> • Watchful waiting: 50% of patients improve spontaneously • Lifestyle modifications (e.g. evening fluid restriction, planned voiding) 	<ul style="list-style-type: none"> • α-adrenergic antagonists: reduce stromal smooth muscle tone • 5-α reductase inhibitor: block conversion of testosterone to DHT; act to reduce prostate size • Combination is synergistic • Anti-cholinergic agents (for storage LUTS, without elevated PVR) 	<ul style="list-style-type: none"> • TURP (see U41) • Laser ablation • TUIP (prostate <30 g) • Open prostatectomy 	<ul style="list-style-type: none"> • Microwave therapy • TUNA • Prostatic stent (not commonly used)

Men with planned cataract surgery should avoid starting α -adrenergic antagonists until after their surgery due to the risk of intraoperative floppy iris syndrome

BPH Surgery Absolute Indication

- Renal failure with obstructive uropathy
- Refractory urinary retention

Relative Indications

- Recurrent UTIs
- Recurrent hematuria refractory to medical treatment
- Renal insufficiency (r/o other causes)
- Bladder stones

Finasteride for Benign Prostatic Hyperplasia

Cochrane DB Syst Rev 2010;10:CD006015

Purpose: To examine the effectiveness and safety of finasteride vs. placebo or other active controls for the treatment of urinary tract symptoms.

Summary of Findings:

1. Finasteride improved urinary symptoms more than placebo in trials >1 yr duration and significantly lowered the risk of BPH progression.
2. Compared with alpha blockers, finasteride was less effective than either doxazosin or terazosin, but equally as effective as tamsulosin.
3. Symptom improvement with finasteride + doxazosin is equal to doxazosin alone.
4. Finasteride treatment resulted in an increased risk of ejaculation disorder, impotence and lowered libido compared with placebo.
5. Compared with doxazosin and terazosin, finasteride had a lower risk of asthenia, dizziness, and postural hypotension.

Microwave Thermotherapy for Benign Prostatic Hyperplasia

Cochrane DB Syst Rev 2012;9:CD004135

Purpose: To evaluate the efficacy and safety of microwave thermotherapy for the treatment of benign prostatic obstruction.

Selection Criteria: RCTs evaluating transurethral microwave therapy (TUMT) for men with symptomatic BPH with multiple comparison groups.
Results/Conclusions: 15 studies, 1,585 patients, mean age 66.8 yr, 3-60 mo duration. Mean urinary symptom scores decreased by 65% with TUMT and 77% with TURP. The pooled mean peak urinary flow increased by 70% with TUMT and 119% with TURP. Compared with TURP TUMT was associated with decreased risks for retrograde ejaculation, treatment for strictures, hematuria, blood transfusions and transurethral resection syndrome, but increased risk for dysuria, urinary retention and retreatment for BPH symptoms. Overall, microwave thermotherapy techniques are effective alternatives to TURP and alpha blockers for treating symptomatic BPH, although less effective than TURP in improving symptom score and urinary flow.

Urethral Stricture

Definition

- decrease in urethral calibre due to scar formation in urethra (may also involve corpus spongiosum)
- M>F

Etiology

- congenital
 - failure of normal canalization (i.e. posterior urethral valves)
- trauma
 - instrumentation/catheterization (most common)
 - external trauma (e.g. burns, straddle injury)
 - foreign body
- infection
 - long-term indwelling catheter
 - STD (gonococcal or chlamydial disease)
- inflammation
 - balanitis xerotica obliterans (BXO); lichen sclerosis or chronic progressive sclerosing dermatosis of the male genitalia) causing meatal and urethral stenosis

Clinical Features

- voiding symptoms
- urinary retention
- hydronephrosis
- related infections: recurrent UTI, secondary prostatitis/epididymitis

Investigations

- laboratory findings
 - flow rates <10 mL/s (normal ~20 mL/s) on uroflowmetry
 - urine culture usually negative, but U/A may show pyuria
- radiologic findings
 - RUG and VCUG will demonstrate location
- cystoscopy

Treatment

- urethral dilatation
 - temporarily increases lumen size by breaking up scar tissue
 - healing will often reform scar tissue, recurrence of stricture
- visual internal urethrotomy (VIU)
 - endoscopically incise stricture
 - equal success rates to dilation with mid bulbar strictures <2 cm
 - high rate of recurrence (30-80%), avoid in younger patients
- open surgical reconstruction
 - complete stricture excision with anastomosis, \pm urethroplasty depending on location and size of stricture

Neurogenic Bladder

Definition

- malfunctioning urinary bladder due to deficiency in some aspect of its innervation

Neurophysiology

Table 6. Efferent Sympathetic, Parasympathetic, and Somatic Nerve Supply

Nerve Fibers	Nerve Roots	Neurotransmitter/Receptor	Target
Sympathetic	T10-L2	NA/Adrenergic	Trigone, internal sphincter, proximal urethra (α) Bladder body (β)
Somatic (pudendal)	S2-4	ACh/Nicotinic	External sphincter
Parasympathetic	S2-4	ACh/Muscarinic (M2, M3)	Detrusor

- stretch receptors in the bladder wall relay information to PMC and activate micturition reflex (normally inhibited by cortical input)
 - micturition
 - stimulation of parasympathetic neurons (bladder contraction)
 - inhibition of sympathetic and somatic neurons (internal and external sphincter relaxation, respectively)
 - urine storage
 - opposite of micturition
- voluntary action of external sphincter (pudendal nerve roots S2-S4) can inhibit urge to urinate
- cerebellum, basal ganglia, thalamus, and hypothalamus all have input at PMC in the brainstem

Classification of Neurologic Voiding Dysfunction

- neuropathic detrusor overactivity (formerly termed detrusor hyperreflexia)
 - lesion above PMC (e.g. stroke, tumor, MS, Parkinson's disease)
 - loss of voluntary inhibition of voiding
 - intact pathway inferior to PMC maintains coordination of bladder and sphincter
- detrusor sphincter dyssynergia (DSD)
 - suprasacral lesion of spinal cord (e.g. trauma, MS, arteriovenous malformation, transverse myelitis)
 - loss of coordination between detrusor and sphincter (detrusor contracts on closed sphincter and vice versa)
 - component of detrusor overactivity as well
- detrusor atony/areflexia
 - lesion of sacral cord or peripheral efferents (e.g. trauma, DM, disc herniation, MS, congenital spinal cord abnormality, post abdominoperineal resection)
 - flaccid bladder which fails to contract
 - may progress to poorly compliant bladder with high pressures
- peripheral autonomic neuropathy
 - deficient bladder sensation \rightarrow increasing residual urine \rightarrow decompensation (e.g. DM, neurosyphilis, herpes zoster)
- muscular lesion
 - can involve detrusor, smooth/striated sphincter

Neuro-Urologic Evaluation

- hx and P/E (urologic and general neurologic)
- U/A, renal profile
- imaging
 - U/S to r/o hydronephrosis and stones
- cystoscopy
- urodynamic studies
 - uroflowmetry to assess flow rate, pattern
 - filling CMG to assess capacity, compliance, detrusor overactivity
 - voiding CMG (pressure-flow study) to assess bladder contractility and extent of bladder outflow obstruction
 - video study to visualize bladder/bladder neck/urethra during CMG using x-ray contrast
 - EMG ascertains presence of coordinated or uncoordinated voiding, allows accurate diagnosis of DSD

Treatment

- goals of treatment
 - prevent renal failure
 - prevent infections
 - achieve social continence

4Cs of Bladder

Capacity: 350-500 cc;

Compliance: Δ Pressure/ Δ Volume

Contractility: voluntary and sustained

Cooperation: of bladder and sphincter

Nerve roots in micturition

"S2-3-4 keeps the urine off the floor"

"Spinal shock", initially manifests as atonic bladder

- clean intermittent catheterization (CIC)
- treatment options depend on status of bladder and urethra
 - bladder hyperactivity → anticholinergic medications to relax bladder (see *Urinary Incontinence, U5*)
 - ♦ if refractory
 - botulinum toxin injections into bladder wall
 - occasionally augmentation cystoplasty (enlarging bladder volume and improving compliance by grafting section of detubularized bowel onto the bladder)
 - occasionally urinary diversion (ileal conduit or continent diversion) in severe cases if bladder management unsuccessful
 - flaccid bladder → CIC

Dysuria

Definition

- painful urination

Etiology

Table 7. Differential Diagnosis of Dysuria

Infectious	Cystitis, urethritis, prostatitis, epididymitis/orchitis (if associated with lower tract inflammation), cervicitis, vulvovaginitis, perineal inflammation/infection, TB, vestibulitis
Neoplasm	Kidney, bladder, prostate, penis, vagina/vulva, BPH
Calculi	Bladder stone, urethral stone, ureteral stone
Inflammatory	Seronegative arthropathies (reactive arthritis: arthritis, uveitis, urethritis), drug side effects, autoimmune disorders, chronic pelvic pain syndrome (CPPS), interstitial cystitis
Hormonal	Endometriosis, hypoestrogenism
Trauma	Catheter insertion, post-coital cystitis (honeymoon cystitis)
Psychogenic	Somatization disorder, depression, stress/anxiety disorder
Other	Contact sensitivity, foreign body, radiation/chemical cystitis, diverticulum

Investigations

- focused Hx and P/E to determine cause (fever, d/c, conjunctivitis, CVA tenderness, back/joint pain)
 - any d/c (urethral, vaginal, cervical) should be sent for gonococcus/chlamydia testing; wet mount if vaginal d/c
 - U/A and urine C&S
 - if suspect infection, may start empiric Antibiotic treatment
 - ± imaging of urinary tract (tumor, stones)

Hydronephrosis

Definition

- dilation of the renal pelvis and calyces caused by the impairment in antegrade urine flow

Etiology

- mechanical
 - congenital: see *Congenital Abnormalities, U35*
 - acquired
 - ♦ intrinsic: trauma, inflammation and bleeding, calculi, urologic neoplasms, BPH, urethral stricture, phimosis, previous urological surgery
 - ♦ extrinsic: trauma, neoplasms (uterine fibroid; colorectal, uterine, and cervical malignancies; lymphoma), aortic aneurysm, pregnancy (gravid uterus)
- functional
 - neuropathic: neurogenic bladder, diabetic neuropathy, spinal cord disease
 - pharmacologic: anticholinergics, α-adrenergic agonists
 - hormonal: pregnancy (progesterone decreases ureteral tone)

Investigations

- focused Hx, inquiring about pain (flank, lower abdomen, testes, labia), U/O, medication use, pregnancy, trauma, fever, Hx of UTIs, calculi, and PID and urological surgery

- CBC, electrolytes, Cr, BUN, U/A, C&S
- imaging studies (U/S is >90% sensitive and specific)
 - MAG3 diuretic renogram: evaluates differential renal function and demonstrates if functional obstruction exists

Treatment

- hydronephrosis can be physiologic
- treatment should be guided at improving symptoms, treating infections, or improving renal function
- urgent treatment may require percutaneous nephrostomy tube or ureteral stenting to relieve pressure

Post-Obstructive Diuresis

Definition

- polyuria resulting from relief of severe chronic obstruction
- >3 L/24 h or >200 cc/h over each of two consecutive hours

Pathophysiology

- **physiologic POD** secondary to excretion of retained urea, Na⁺, and H₂O (high osmotic load) after relief of obstruction
 - self-limiting; usually resolves in 48 h with PO fluids but may persist to pathologic POD
- **pathologic POD** is a Na⁺-wasting nephropathy secondary to impaired concentrating ability of the renal tubules due to
 - decreased reabsorption of NaCl in the thick ascending limb and urea in the collecting tubule
 - increased medullary blood flow (solute washout)
 - increased flow and solute concentration in the distal nephrons

Management

- admit patient and closely monitor hemodynamic status and electrolytes (Na⁺ and K⁺ q6-12h and replace prn; follow Cr and BUN to baseline)
- monitor U/O q2h and ensure total fluid intake <U/O by replacing every 1 cc U/O with 0.5 cc 1/2 NS IV (PO fluids if physiologic POD)
- avoid glucose-containing fluid replacement (iatrogenic diuresis)

Infectious and Inflammatory Diseases

Table 8. Antibiotic Treatment of Urological Infections

Condition	Drug	Duration
Urethritis	Non-Gonococcal:	
	azithromycin (1 g PO)	x 1
	OR	
	doxycycline (100 mg PO bid)	7 d
Gonococcal:		
	ceftriaxone (250 mg IM) AND treat for <i>Chlamydia trachomatis</i>	x 1
Simple, Uncomplicated UTI	TMP-SMX (160 mg/800 mg PO bid)	3 d
	OR	
	nitrofurantoin (100 mg PO bid)	5 d
Complicated UTI (see <i>Classification</i> , U12 for features)	ciprofloxacin (1 g PO daily OR 400 mg IV q12h)	up to 2-3 wk
	OR	
	ampicillin (1 g IV q6h) + gentamicin (1 mg/kg IV q8h)	up to 2-3 wk
	OR	
	ceftriaxone (1-2 g IV q24h)	up to 2-3 wk
Recurrent/Chronic Cystitis	*prophylactic treatment	
	continuous: TMP-SMX (40 mg/200 mg PO qd OR 3x/wk)	6-12 mo
	OR	
	nitrofurantoin (50-100 mg PO qd)	6-12 mo
	post-coital: TMP-SMX (40 mg/200 mg-80 mg/400 mg)	within 2 h of coitus
	OR	
	nitrofurantoin (50-100 mg PO qd)	within 2 h of coitus

Table 8. Antibiotic Treatment of Urological Infections (continued)

Condition	Drug	Duration
Acute Prostatitis	ciprofloxacin (500-750 mg PO bid)	2-4 wk
	OR	
	TMP-SMX (160 mg/800 mg PO bid)	4 wk
	OR	
	IV therapy with gentamicin and ampicillin, penicillin with β -lactamase inhibitor, 3rd gen cephalosporin, OR a fluoroquinolone	4 wk total (IV and oral step-down)
Chronic Prostatitis	ciprofloxacin (500 mg PO bid)	4-6 wk
Epididymitis/Orchitis	<35 yr:	
	ceftriaxone (200 mg IM)	x 1
	AND	
	doxycycline (100 mg PO bid)	10 d
	≥ 35 yr:	
	ofloxacin (300 mg PO bid)	10 d
Acute Uncomplicated Pyelonephritis	ciprofloxacin (500 mg PO bid)	7 d
	\pm ceftriaxone (1 g IV) OR ciprofloxacin (400 mg IV)	x 1
	OR	
	IV therapy with a fluoroquinolone, gentamicin and ampicillin, extended spectrum cephalosporin, extended spectrum penicillin, OR a carbapenem	14 d total (IV and oral step-down)

Antibiotic therapy should always be based on local resistance patterns and adjusted according to culture and sensitivity results

IV antibiotics should be stepped down to oral when the patient is afebrile and clinically stable

Acute uncomplicated pyelonephritis: suspected or confirmed enterococcus infection requires treatment with ampicillin

Urinary Tract Infection

- for UTIs during pregnancy, see [Obstetrics](#), OB19

Definition

- symptoms suggestive of UTI + evidence of pyuria and bacteriuria on U/A or urine C&S
 - if asymptomatic + 100,000 CFU/mL = asymptomatic bacteriuria; only requires treatment in certain patients (e.g. pregnancy)

Classification

- uncomplicated: lower UTI in a setting of functionally and structurally normal urinary tract
- complicated: structural and/or functional abnormality, male patients, immunocompromised, diabetic, iatrogenic complication, pregnancy, pyelonephritis, catheter-associated
- recurrent: see [Recurrent/Chronic Cystitis](#), U13

Risk Factors

- stasis and obstruction
 - residual urine due to impaired urine flow e.g. PUVs, reflux, medication, BPH, urethral stricture, cystocele, neurogenic bladder
- foreign body
 - introduce pathogen or act as nidus of infection e.g. catheter, instrumentation
- decreased resistance to organisms
 - DM, malignancy, immunosuppression, spermicide use, estrogen depletion, antimicrobial use
- other factors
 - trauma, anatomic abnormalities, female, sexual activity, fecal incontinence

Clinical Features

- storage symptoms: frequency, urgency, dysuria
- voiding symptoms: hesitancy, post-void dribbling
- other: suprapubic pain, hematuria, foul-smelling urine
- pyelonephritis – if present: typically presents with more severe symptoms (e.g. fever/chills, CVA tenderness, flank pain)

Organisms

- typical organisms
- atypical organisms
 - tuberculosis (TB)
 - Chlamydia trachomatis*
 - Mycoplasma (*Ureaplasma urealyticum*)
 - fungi (*Candida*)

Indications for Investigations

- pyelonephritis
- persistence of pyuria/symptoms following adequate antibiotic therapy
- severe infection with an increase in Cr
- recurrent/persistent infections
- atypical pathogens (urea splitting organisms)
- hx of structural abnormalities/decreased flow

Cystitis: Common Pathogens

KEEPS

Klebsiella sp.
E. coli (90%), other Gram-negatives
Enterococci
Proteus mirabilis, *Pseudomonas*
S. saprophyticus

Investigations

- U/A, urine C&S
 - UA: leukocytes \pm nitrites \pm hematuria
 - C&S: midstream, catheterized, or suprapubic aspirate
- if hematuria present, retest post-treatment, if persistent need hematuria workup (see *Microscopic Hematuria*, U5)
- U/S, CT scan if indicated

Treatment

- see Table 8 for approach to ABx therapy
- if febrile, consider admission with IV therapy and r/o obstruction

Recurrent/Chronic Cystitis

Definition

- ≥ 3 UTIs/yr

Etiology

- bacterial reinfection (80%) vs. bacterial persistence (relapse)
 - **bacterial reinfection**
 - ♦ recurrence of infection with either 1) a different organism, 2) the same organism if cultured >2 wk following therapy, or 3) with any organism with an intermittent sterile culture
 - **bacterial persistence**
 - ♦ same organism cultured within 2 wk of sensitivity-based therapy

Investigations

- assess predisposing factors as described above
- investigations may include cystoscopy, U/S, CT

Treatment

- lifestyle changes (limit caffeine intake, increase fluid/H₂O intake)
- ABx: continuous vs. post-coital
- post-menopausal women: consider topical or systemic estrogen therapy
- no treatment for asymptomatic bacteriuria except in pregnant women or patients undergoing urinary tract instrumentation

**Prevention of UTIs**

- Maintain good hydration (try cranberry juice)
- Wipe from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

Interstitial Cystitis (Painful Bladder or Bladder Pain Syndrome)

Definition

- bladder pain, chronic urgency and frequency without other reasonable causation

Classification

- non-ulcerative (more common)
- ulcerative

Etiology

- unknown
 - theories: increased epithelial permeability, autoimmune, neurogenic, defective GAG layer overlying mucosa
 - associations: severe allergies, IBS, fibromyalgia

Epidemiology

- prevalence: 20/100,000
- 90% of cases are in females
- mean age at onset is 40 yr (non-ulcerative tends to affect a younger to middle-aged population, while ulcerative tends to be seen in middle-aged to older)

Clinical Features

- pain associated with the bladder
- glomerulations (submucosal petechiae) or Hunner's lesions (ulcers) on cystoscopic examination
- urinary urgency
- negative U/A, urine C&S, and urine cytology

Differential Diagnosis

- UTI, vaginitis, bladder tumor
- radiation/chemical cystitis
- eosinophilic/TB cystitis
- bladder calculi

Cystoscopic evaluation is not necessary to make a diagnosis

Treatment

- first-line: patient empowerment (diet, lifestyle, stress management), pain management
- second-line
 - oral: pentosan polysulfate sodium, amitriptyline, cimetidine, hydroxyzine
 - intravesical: dimethylsulfoxide (DMSO), heparin, lidocaine
- third-line: cystoscopy with bladder hydrodistention (traditionally diagnostic) under GA, treat Hunner's lesions if present
- fourth-line: neuromodulation, pain management
- fifth-line: cyclosporine A, intradetrusor BTX
- sixth-line: diversion w/ or w/out cystectomy, substitution cystoplasty
- surgery (last resort): augmentation cystoplasty, or urinary diversion ± cystectomy

Four Symptom Scores Exist to Evaluate and Monitor Patients with Interstitial Cystitis

- Interstitial Cystitis Symptom Index (ICSI)
- Interstitial Cystitis Problem Index (ICPI)
- Wisconsin Interstitial Cystitis (UW-IC) Scale
- Pain, Urgency and Frequency (PUF) Score

Acute Pyelonephritis

Definition

- infection of the renal parenchyma with local and systemic manifestations
- clinical diagnosis of flank pain, fever and elevated WBC

Etiology

- ascending (usually GN bacilli) or hematogenous route (usually GP cocci)
- causative microorganisms
 - gram positives: *Enterococcus faecalis*, *S. aureus*, *S. saprophyticus*
 - gram negatives: *E. coli* (most common), *Klebsiella*, *Proteus*, *Pseudomonas*, *Enterobacter*
- common underlying causes of pyelonephritis
 - stones, strictures, prostatic obstruction, vesicoureteric reflux, neurogenic bladder, catheters, DM, sickle-cell disease, PCKD, immunosuppression, post-renal transplant, instrumentation, pregnancy

Clinical Features

- rapid onset (<24 h)
- LUTS including frequency, urgency, hematuria; NOT dysuria unless concurrent cystitis
- fever, chills, nausea, vomiting, myalgia, malaise
- CVA tenderness or exquisite flank pain

Investigations

- U/A, urine C&S
- CBC and differential: leukocytosis, left shift
- imaging indicated if suspicious of complicated pyelonephritis or symptoms do not improve with 48-72 h of treatment
 - abdominal/pelvic U/S
 - CT
- nuclear medicine: DMSA scan can be used to help secure the diagnosis
 - a photopenic defect indicates active infection or scar; if normal alternative diagnoses should be considered

Treatment

- hemodynamically stable
 - outpatient oral ABx treatment ± single initial IV dose (see Table 8)
- severe or non-resolving
 - admit, hydrate, and treat with IV ABx (see Table 8)
- emphysematous pyelonephritis
 - percutaneous nephrostomy tube and antibiotics first line
 - consider early nephrectomy after IV ABx started and patient stabilized
- renal obstruction
 - admit for emergent stenting or percutaneous nephrostomy tube

Nitrofurantoin has poor tissue penetration and therefore is not used to treat pyelonephritis (requires post-renal uroconcentration)

4-Glass Test: Prostatic source is suggested when colony counts in EPS and VB3 exceed those of VB1 and VB2 by 10x

Prostatic massage may cause extreme tenderness and increased risk of inducing sepsis, abscess, or epididymo-orchitis

It is not recommended to do a serum PSA during acute bacterial prostatitis

Prostatitis/Prostatodynia

Epidemiology

- most common urologic diagnosis in men <50 yr
- prevalence 2-12%

Classification

Table 9. Comparison of the Three Types of Prostatitis

	Category I: Acute Bacterial Prostatitis	Category II: Chronic Bacterial Prostatitis	Category III: Chronic Pelvic Pain Syndrome (CPPS) (Abacterial)
Etiology	Ascending urethral infection with KEEPS (see U12 sidebar): 80% <i>E. coli</i> Often associated with outlet obstruction, recent cystoscopy, prostatic biopsy Most infections occur in the peripheral zone (see Figure 7, U7)	Recurrent exacerbations of acute prostatitis-like signs and symptoms Recurrent UTI with same organism	Divided into inflammatory (IIIA) and non-inflammatory (IIIB) Intraprostatic reflux of urine \pm urethral hypertonia Multifactorial (immunological, neuropathic, neuroendocrine, psychosocial)
Clinical Features	Acute onset fever, chills, malaise Rectal, lower back, and perineal pain LUTS	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain
Investigations	P/E: abdomen, external genitalia, perineum, prostate U/A Blood CBC, C&S Transrectal U/S if non-resolving/suspect prostatic abscess	P/E: as per Category I + pelvic floor Urine C&S: 4-glass test VB1 (voided bladder): initial (urethra) VB2: midstream (bladder) EPS (expressed prostatic secretions): not usually performed VB3: post-massage/DRE	Same as per Category II NIH-CPSI score* Consider psychological assessment
Treatment	Supportive measures PO or IV ABx depending how sick (see Table 8) May consider catheterization in patients with severe obstructive LUTS or retention I&D of abscess if present	ABx (see Table 8) Consider addition of an α -blocker	Supportive measures Trial of ABx therapy if newly diagnosed Multimodal treatment strategy may include: α -blocker Anti-inflammatories Phytotherapy (quercetin, cernilton)

*NIH-CPSI: National Institute of Health Chronic Prostatitis Symptom Index

Epididymitis and Orchitis

Etiology

- common infectious causes
 - <35 yr: *N. gonorrhoeae* or *Chlamydia trachomatis*
 - ≥ 35 yr or penetrative anal intercourse: GI organisms (especially *E. coli*)
- other causes
 - mumps infection may involve orchitis, post-parotitis
 - TB
 - syphilis
 - granulomatous (autoimmune) in elderly men
 - amiodarone (involves only head of epididymis)
 - chemical: reflux of urine into ejaculatory ducts

Risk Factors

- UTI
- unprotected sexual contact
- instrumentation/catheterization
- increased pressure in prostatic urethra (straining, voiding, heavy lifting) may cause reflux of urine along vas deferens \rightarrow sterile epididymitis
- immunocompromise

Clinical Features

- sudden onset scrotal pain and swelling \pm radiation along cord to flank
- scrotal erythema and tenderness
- fever
- storage symptoms, purulent d/c
- reactive hydrocele

Investigations

- U/A, urine C&S
- \pm urethral d/c: Gram stain/culture
- if diagnosis uncertain, must do
 - color-flow Doppler U/S to r/o testicular torsion

Treatment

- r/o torsion (see *Investigations* and Table 23, U28)
- see Table 8 for ABx therapy
- scrotal support, bed rest, ice, analgesia

Complications

- if severe \rightarrow testicular atrophy
- 30% have persistent infertility problems

Prehn's Sign: pain may be relieved with elevation of testicles in epididymitis but not in testicular torsion. Poor sensitivity, especially in children

If unsure between diagnoses of epididymitis and torsion, always go to OR
Remember: torsion > 6 h has poor prognosis

Inadequately treated acute epididymitis may lead to chronic epididymitis or epididymo-orchitis

Urethritis

Etiology

- infectious or inflammatory (e.g. reactive arthritis)

Table 10. Infectious Urethritis: Gonococcal vs. Non-Gonococcal

	Gonococcal	Non-gonococcal
Causative Organism	<i>Neisseria gonorrhoeae</i>	Usually <i>Chlamydia trachomatis</i>
Diagnosis	Hx of sexual contact, thick, profuse, yellow-gray purulent d/c, LUTS Gram stain (GN diplococci), urine PCR and/or culture from urethral specimen	Hx of sexual contact, mucoid whitish purulent d/c, \pm storage LUTS Gram stain demonstrates >4 PMN/oil immersion field, no evidence of <i>N. gonorrhoeae</i> , urine PCR and/or culture from urethral specimen
Treatment	see Table 8	see Table 8

If culture negative or unresponsive to treatment consider: *Ureaplasma urealyticum*, *Mycoplasma genitalium*, *Trichomonas vaginalis*, HSV, or adenovirus

Reactive Arthritis (formerly known as Reiter's syndrome)
Urethritis, uveitis (or conjunctivitis), and arthritis
(can't pee, can't see, can't climb a tree)

Stone Disease

Epidemiology

- prevalance of 2-3%
- M:F = 3:1
- peak incidence 30-50 yr of age
- recurrence rate: 10% at one yr, 50% at 5 yr, 60-80% lifetime

Risk Factors

- hereditary: RTA, Glucose-6-phosphate dehydrogenase deficiency, cystinuria, xanthinuria, oxaluria, etc.
- lifestyle: minimal fluid intake; excess vitamin C, oxalate, purines, calcium
- medications: loop diuretics (furosemide, bumetanide), acetazolamide, topiramate, and zonisamide
- medical conditions: UTI (with urea-splitting organisms: *Proteus*, *Pseudomonas*, *Providencia*, *Klebsiella*, *Mycoplasma*, *Serratia*, *S. aureus*), myeloproliferative disorders, IBD, gout, DM, hypercalcemia disorders (hyperparathyroidism, tumor lysis syndrome, sarcoidosis, histoplasmosis), obesity (BMI >30)

Clinical Features

- urinary obstruction \rightarrow upstream distention \rightarrow pain
 - flank pain from renal capsular distention (non-colicky)
 - severe waxing and waning pain radiating from flank to groin, testis, or tip of penis due to stretching of collecting system or ureter (ureteral colic)
- writhing, never comfortable, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- bladder stones result in: storage and voiding LUTS, terminal hematuria, suprapubic pain
- if fever, r/o concurrent pyelonephritis and/or obstruction

Table 11. Differential Diagnosis of Renal Colic

GU	Abdominal	Neurological
<ul style="list-style-type: none"> Pyelonephritis Ureteral obstruction from other cause: UPJ obstruction, clot colic secondary to gross hematuria, sloughed papillae Gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, PID 	<ul style="list-style-type: none"> AAA Bowel ischemia Pancreatitis Other acute abdominal crisis 	<ul style="list-style-type: none"> Radiculitis (L1): herpes zoster, nerve root compression

Location of Stones

- calyx: may cause flank discomfort, persistent infection, persistent hematuria, or remain asymptomatic
- pelvis: tend to cause obstruction at UPJ, may cause persistent infection
- ureter: <5 mm diameter will pass spontaneously in 75% of patients

Stone Pathogenesis

- supersaturation of stone constituents (at appropriate temperature and pH)
- stasis, low flow, and low volume of urine (dehydration)
- crystal formation and stone nidus
- loss of inhibitory factors
 - citrate (forms soluble complex with calcium)
 - magnesium (forms soluble complex with oxalate)
 - pyrophosphate
 - Tamm-Horsfall glycoprotein

Key Points in Stone Hx

- Diet (especially FLUID INTAKE)
- Predisposing medical conditions
- Predisposing medications
- Previous episodes/investigations/treatments
- Family Hx (1st degree relative)

The four narrowest passage points for upper tract stones are:

- UPJ
- Pelvic brim
- Under vas deferens/broad ligament
- UVJ

	Radiopaque	Radiolucent
KUB	Calcium Struvite Cystine	Uric acid Indinavir Atazanavir
CT	Calcium Struvite Cystine Uric acid	Indinavir Atazanavir

Approach to Renal Stone

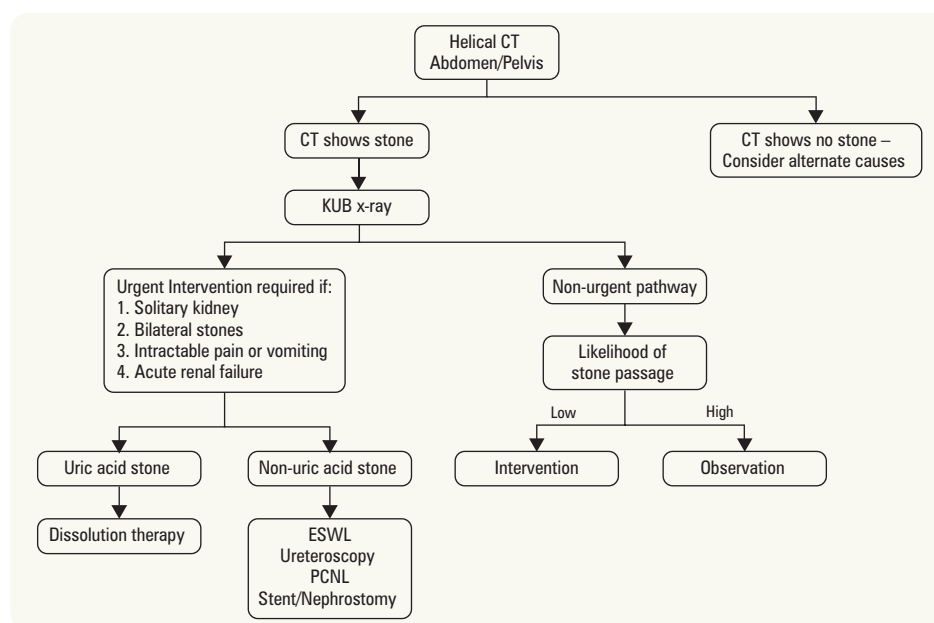

Figure 8. Approach to renal stone

Investigations

Table 12. Investigations for Renal Stones

	CBC, uric acid, U/A, urine C&S	KUB x-ray	CT scan	Abdominal ultrasound	Cystoscopy	PTH, 24 h urine x 2 for volume, Cr, Ca ²⁺ , Na ⁺ , PO ₄ ³⁻ , Mg ²⁺ , oxalate, citrate, ± cystine
Who gets it?	Everyone	Most	First episode renal colic	Pediatric cases or those concerning for obstruction	± Those concerning for bladder stone	Recurrent Ca ²⁺ stone formers ± pediatric cases
Why is it done?	May show signs of infection, ± sensitivities	90% of stones are radiopaque Good for follow-up	Distinguish radiolucent stone from soft tissue filling defect X-ray comparison	Identify and follow-up stone without radiation exposure Visualize hydronephrosis	Visualize bladder	Need to rule out metabolic cause for stones
Cautions	–	Do not mistake phleboliths for stones!	Radiation (especially if female of child bearing age) Must be a non-contrast scan	Not good at visualizing stones in ureter	–	–

Treatment – Acute

- medical
 - analgesic ± antiemetic
 - NSAIDs help lower intra-ureteral pressure
 - medical expulsion therapy (MET)
 - ♦ α-blockers: increase rate of spontaneous passage in distal ureteral stones
 - ♦ calcium channel blockers
 - ± Abx for bacteriuria
 - IV fluids if vomiting (note: IV fluids do NOT promote stone passage)
- interventional
 - required if obstruction endangers patient, e.g. sepsis, renal failure
 - first line: ureteric stent (via cystoscopy)
 - second line: image-guided percutaneous nephrostomy
- admit if necessary
 - see sidebar: *Indications for Admission to Hospital*

Treatment – Elective

- medical
 - likely conservative if ureteral stone <10 mm or kidney stone <5 mm and no complications/symptoms well controlled
 - ♦ stones <5 mm especially likely to pass spontaneously
 - PO fluids to increase urine volume to >2 L/d (3–4 L if cystine) and MET
 - specific to stone type (see Table 13)
 - periodic imaging to monitor stone position and assess for hydronephrosis
 - progress to interventional stone removal methods if symptoms worsen or fail to improve (indicating stone passage)

Detailed metabolic studies are NOT recommended unless complex patient (recurrent stone formers, pregnancy, pediatrics, strong family hx, underlying kidney or systemic disease, etc.)

24 h urine collections must be done AFTER discontinuing stone preventing/promoting medications

Indications for Admission to Hospital

- Intractable pain
- Intractable vomiting
- Fever (suggests infection)
- Compromised renal function (including single kidney, bilateral obstructing stone)
- Pregnancy

Stones and Infection

If septic, urgent decompression via ureteric stent or percutaneous nephrostomy is indicated. Definitive treatment of the stone should be delayed until the sepsis has cleared

Alpha-Blockers as Medical Expulsive Therapy for Ureteral Stones

Cochrane DB Syst Rev 2014;4:CD008509

Purpose: To determine whether or not alpha blockers compared with other pharmacological treatments or placebo improve stone clearance rates and other clinically relevant outcomes in patients presenting with symptoms of stones less than 10 mm confirmed by imaging.

Results/Conclusions: 32 RCTs, 5,864 participants. Although patients using α-blockers were more likely to experience adverse effects compared to standard therapy, stone-free rates were significantly higher in the α-blocker group (RR 1.48, 95% CI 1.33–1.64), expulsion time was 2.91 d shorter, and there was a reduction in the number of pain episodes (MD -0.48, 95% CI -0.94 to -0.01), the need for analgesic medication (MD -38.17, 95% CI -74.93 to -1.41), and hospitalization (RR 0.35, 95% CI 0.13–0.97). α-blockers should therefore be offered as a primary treatment modality for ureteral stones.

- interventional
 - kidney
 - ♦ may stent prior to ESWL if stone is 1.5-2.5 cm
 - ♦ ESWL if stone <2 cm
 - ♦ PCNL if stone >2 cm
 - ureteral stones >10 mm
 - ♦ ESWL and URS are both first line treatment modalities for all locations
 - URS has significantly greater stone-free rates for stones at all locations in ureter, but also has higher complication rates (ureter perforation, stricture formation, etc.)
 - ♦ PCNL is second line treatment
 - ♦ laparoscopic or open stone removal (very rare)
 - bladder
 - ♦ transurethral stone removal or cystolitholapaxy
 - ♦ remove outflow obstruction (TURP or stricture dilatation)

Prevention

- dietary modification
 - increase fluid (>2 L/d), K⁺ intake
 - reduce animal protein, oxalate, Na⁺, sucrose, and fructose intake
 - avoid high-dose vitamin C supplements
- medications
 - thiazide diuretics for hypercalciuria
 - allopurinol for hyperuricosuria
 - potassium citrate for hypocitraturia, hyperuricosuria

Indications for PCNL

- Size >2 cm
- Staghorn
- UPJ obstruction
- Calyceal diverticulum
- Cystine stones (poorly fragmented with ESWL)
- Anatomical abnormalities
- Failure of less invasive modalities

Although hypercalciuria is a risk factor for stone formation, decreasing dietary calcium is NOT recommended to prevent stone formation. Low dietary calcium leads to increased GI oxalate absorption and higher urine levels of calcium oxalate

Consideration must be given to monitoring stone formers with periodic imaging (i.e. at 1 yr and then q2-4yr based on likelihood of recurrence)

Table 13. Stone Classification

Type of Stone	Calcium (75-85%)	Uric Acid (5-10%)	Struvite (5-10%)	Cystine (1%)
Etiology	Hypercalciuria Hyperuricosuria (25% of patients with Ca ²⁺ stones) Hyperoxaluria (<5% of patients) Hypocitraturia (12% of patients) Other causes <ul style="list-style-type: none"> • Hypomagnesemia – associated with hyperoxaluria and hypocitraturia • High dietary Na⁺ • Decreased urinary proteins • High urinary pH, low urine volume (e.g. GI water loss) • Hyperparathyroidism, obesity, gout, DM 	Uric acid precipitates in low volume, acidic urine with a high uric acid concentration <ul style="list-style-type: none"> • Hyperuricosuria alone • Low urinary pH, low urine volume (e.g. GI water loss) • Drugs (ASA, thiazides) • Diet (purine rich red meats) • Hyperuricosuria with hyperuricemia • Gout • High rate of cell turnover or cell death (leukemia, cytotoxic drugs) 	Infection with urea-splitting organisms (<i>Proteus</i> , <i>Pseudomonas</i> , <i>Providencia</i> , <i>Klebsiella</i> , <i>Mycoplasma</i> , <i>Serratia</i> , <i>S. aureus</i>) results in alkaline urinary pH and precipitation of struvite (magnesium ammonium phosphate)	Autosomal recessive defect in small bowel mucosal absorption and renal tubular absorption of dibasic amino acids results in “COLA” in urine (cystine, ornithine, lysine, arginine)
Key Features	Radiopaque on KUB Reducing dietary Ca ²⁺ is NOT an effective method of prevention/treatment	Radiolucent on KUB Radiopaque on CT Acidic urine, pH <5.5 (NOT necessarily elevated urinary uric acid)	Perpetuates UTI because stone itself harbours organism Stone and all foreign bodies must be cleared to avoid recurrence Associated with staghorn calculi Positive urine dip and cultures Note: <i>E. coli</i> infection does not cause struvite stones M:F = 3:1, UTI more common in female	Aggressive stone disease seen in children and young adults Recurrent stone formation, family Hx Often staghorn calculi Faintly radiopaque on KUB Positive urine sodium nitroprusside test, urine chromatography for cystine
Treatment Medical if stone <5 mm and no complications Procedural/Surgical treatment if stone >5 mm or presence of complications (see U17 for treatment)	Fluids to increase urine volume to >2 L/d For calcium stones: cellulose phosphate, orthophosphate for absorptive causes Calcium oxalate: thiazides, ± potassium citrate, ± allopurinol Calcium struvite: ABx (stone must be removed to treat infection)	Increased fluid intake Alkalinization of urine to pH 6.5 to 7 (bicarbonate, potassium citrate) ± allopurinol	Complete stone clearance ABx for 6 wk Regular follow-up urine cultures	Increased fluid intake (3-4 L of urine/d) Alkalinize urine (bicarbonate, potassium citrate), Penicillamine/α-MPG or Captopril (form complex with cystine) ESWL not effective

Urological Neoplasms

Approach to Renal Mass

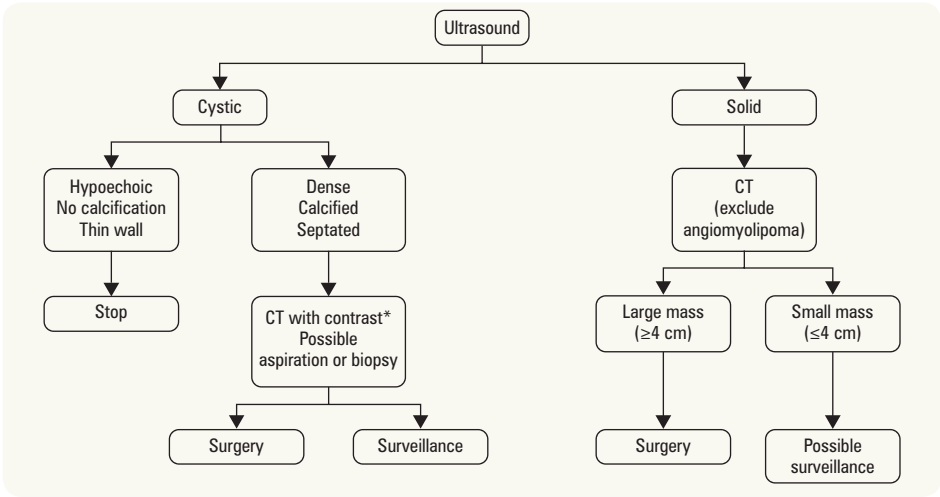

Figure 9. Workup of a renal mass
*Imaging modality may be different in cases of contrast allergy or elevated creatinine

 There is controversy over optimal management of small renal masses

Benign Renal Neoplasms

CYSTIC KIDNEY DISEASE

- **simple cysts:** usually solitary or unilateral
 - very common: up to 50% at age 50
 - usually incidental finding on abdominal imaging
 - **Bosniak Classification** is used to stratify for risk of malignancy based on cyst features from contrast CT
- **polycystic kidney disease**
 - autosomal recessive: multiple bilateral cysts, often leading to early renal failure in infants
 - autosomal dominant: progressive bilateral disease leading to HTN and renal failure, adult-onset
- **medullary sponge kidney:** cystic dilatation of the collecting ducts
 - usually benign course, but patients are predisposed to stone disease
- **von Hippel-Lindau syndrome:** multiple bilateral cysts or clear cell carcinomas (50% incidence of RCC)
 - renal cysts, cerebellar, spinal and retinal hemangioblastomas, pancreatic and epididymal cysts, pheochromocytomas

 **Tuberous Sclerosis**
Syndrome characterized by mental retardation, epilepsy, and adenoma sebaceum. 45-80% of patients also present with angiomyolipomas which are often multiple and bilateral

 Percutaneous needle biopsies of cystic renal masses may lead to peritoneal seeding

Table 14. Bosniak Classification of Renal Cysts

Class	Description	Features	Risk of Malignancy	Management Plan
I	Simple cyst	Round, no septations, no calcifications, no solid component	Near zero	Follow-up usually not required
II	Simple cyst	A few thin septa, no true enhancement, well-marginated, uniform high attenuation, <3 cm	Minimal	Follow-up usually not required
IIF	Minimally complex cyst with extra features that require follow-up	Still well-marginated and non-enhancing, but now multiple thin septa or some thickening/ calcification of septa/wall, >3 cm	5-20%	Requires follow-up with imaging q6-12 mo If the lesion evolves, may require surgical resection
III	Complex cyst	Thicker or more irregular walls with measurable enhancement	>50%	Requires surgical resection
IV	Clearly malignant	Class III + enhancing soft-tissue components	>90%	Requires surgical resection

Table 15. Benign Renal Masses

	Angiomyolipoma (Renal Hamartoma)	Renal Oncocytoma	Renal Adenoma
Epidemiology	<1% of adult renal tumors F>M 20% associated with tuberous sclerosis (especially if multiple, recurrent)	3-7% of renal tumors M>F Oncocytomas also found in adrenal, thyroid and parathyroid glands	Most common benign renal neoplasm M:F = 3:1 Incidence increases with age Found in 7-23% of all autopsies
Characteristics	Clonal neoplasm consisting of blood vessels (angio-), smooth muscle (-myo-), and fat (-lipoma) May extend into regional lymphatics and other organs and become symptomatic	Spherical, capsulated with possible central scar Histologically organized aggregates of eosinophilic cells originating from intercalated cells of collecting duct	Small cortical lesions <1 cm Majority are solitary but can be multifocal
Diagnosis	Incidental finding on CT Negative attenuation (-20 HU) on CT is pathognomonic Rare presentation of hematuria, flank pain, and palpable mass (same as RCC)	Incidental finding on CT Difficult to distinguish from RCC on imaging – treated as RCC until proven otherwise Biopsy may be performed to r/o malignancy	Incidental finding on CT Rarely symptomatic Controversy as to whether this represents benign or pre-malignant neoplasm
Management	May consider surgical excision or embolization if symptomatic (pain, bleeding) or higher risk of bleeding (e.g. pregnancy) Potential role for mTOR inhibitors in unresectable/metastatic disease Follow with serial U/S	Partial/radical nephrectomy for large masses HIFU or RFA for smaller masses	If mass >3 cm, likely not a benign adenoma; will require partial/radical nephrectomy due to increased likelihood of malignancy

Malignant Renal Neoplasms

RENAL CELL CARCINOMA

Etiology

- cause unknown
- originates from proximal convoluted tubule epithelial cells in clear cell subtype (most common)
- hereditary forms seen with von Hippel-Lindau syndrome and hereditary papillary renal carcinoma

Epidemiology

- 8th most common malignancy (accounts for 3% of all newly diagnosed cancers)
- 85% of primary malignant tumors in kidney
- M:F = 3:2
- peak incidence at 50-60 yr of age

Pathology

- histological subtypes: clear cell (75-85%), papillary (10-15%), chromophobic (5-10%), collecting duct
- sarcomatoid elements in any subtype is a poor prognostic factor

Risk Factors

- top 3 risk factors: smoking, HTN, obesity
- miscellaneous: horseshoe kidney, acquired renal cystic disease
- role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

Clinical Features

- usually asymptomatic: frequently diagnosed incidentally by U/S or CT
- poor prognostic indicators: weight loss, weakness, anemia, bone pain
- classic “too late triad” found in 10-15%
 - gross hematuria 50%
 - flank pain <50%
 - palpable mass <30%
- was called the “internist’s tumor” because of paraneoplastic symptomatology – now called the “radiologist’s tumor” because of incidental diagnosis via imaging
- metastases: seen in 1/3rd of new cases; additional 20-40% will go on to develop metastases
 - bone, brain, lung and liver most common site
 - may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumor, and pulmonary emboli

Investigations

- routine labs for paraneoplastic syndromes (CBC, ESR, LFTs, extended electrolytes)
- U/A (60-75% have hematuria)
- renal U/S: solid vs. cystic lesion

Figure 10. RCC staging

Role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

RCC Systemic Effects: paraneoplastic syndromes (10-40% of patients)

- Hematopoietic disturbances: anemia, polycythemia, raised ESR
- Endocrinopathies: hypercalcemia (increased vitamin D hydroxylation), erythrocytosis (increased erythropoietin), HTN (increased renin), production of other hormones (prolactin, gonadotropins, TSH, insulin, and cortisol)
- Hepatic cell dysfunction or Stauffer syndrome: abnormal LFTs, decreased WBC count, fever, areas of hepatic necrosis; no evidence of metastases; reversible following removal of primary tumor
- Hemodynamic alterations: systolic HTN (due to AV shunting), peripheral edema (due to caval obstruction)

- contrast-enhanced CT: higher sensitivity than U/S for detection of renal masses and for staging purposes
- MRI: useful for evaluation of vascular extension
- renal biopsy: to confirm diagnosis if considering observation or other non-surgical therapy

Staging

- involves CT, CXR, liver enzymes and LFTs, bone/head imaging (if symptoms dictate)

Table 16. 2010 TNM Classification of Renal Cell Carcinoma

T	N	M
T1: tumor <7 cm, confined to renal parenchyma T1a: <4 cm T1b: 4-7 cm T2: tumor >7 cm, confined to renal parenchyma T2a: tumor >7 cm but ≤10 cm in greatest dimension, limited to the kidney T2b: tumor >10 cm, limited to the kidney T3: tumor extends into major veins or perinephric tissues, but NOT into ipsilateral adrenal or beyond Gerota's fascia T3a: into renal vein or sinus fat T3b: into infradiaphragmatic IVC T3c: into supradiaphragmatic IVC T4: tumor extends beyond Gerota's fascia including extension into ipsilateral adrenal	N0: no regional nodes N1: metastasis to a single node, <2 cm N2: metastasis to a single node between 2 and 5 cm or multiple nodes <2 cm N3: node >5 cm	M0: no evidence of metastasis M1: presence of distant metastasis

Treatment

- surgical
 - radical nephrectomy: en bloc removal of kidney, tumor, ipsilateral adrenal gland (in upper pole tumors) and intact Gerota's capsule and paraaortic lymphadenectomy
 - partial nephrectomy (parenchyma-sparing): small tumor (roughly <4 cm) or solitary kidney/bilateral tumors
 - surgical removal of solitary metastasis may be considered
- ablative techniques (cryoablation, RFA)
- palliative radiation to painful bony lesions
- therapy for advanced stage
 - tyrosine kinase inhibitors for metastatic disease (e.g. sunitinib, sorafenib)
 - anti-angiogenesis/anti-VEGF (e.g. bevacizumab)
 - mTOR inhibitors (e.g. temsirolimus, everolimus)
 - high-dose IL-2 (high toxicity but able to induce long-term cure in 5-7% of patients)
 - IFN α: monotherapy has been largely replaced by molecularly targeted agents listed above

Tumor may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumor, and pulmonary emboli

Prognosis

- stage at diagnosis most important prognostic factor
 - T1: 90-100% 5 yr survival
 - T2-T3: 60% 5 yr survival
 - metastatic disease: <5% 10 yr survival

Carcinoma of the Renal Pelvis and Ureter

Etiology

- risk factors include
 - smoking
 - chemicals/dietary exposures (industrial dyes and solvents; aristolochic acid)
 - analgesic abuse (acetaminophen, ASA, and phenacetin)
 - Balkan nephropathy

Epidemiology

- rare: accounts for 5% of all urothelial cancers
- frequently multifocal, 2-5% are bilateral
- M:F = 3:1
- relative incidence: bladder:renal:ureter = 100:10:1

Pathology

- 85% are papillary UCC; others include SCC and adenocarcinoma
- UCC of ureter and renal pelvis are histologically similar to bladder UCC

Clinical Features

- gross/microscopic hematuria
- flank pain
- storage or voiding symptoms (dysuria only if lower urinary tract involved)
- flank mass ± hydronephrosis (10-20%)

Axitinib vs. Sorafenib as Second-Line Treatment for Advanced Renal Cell Carcinoma: Overall Survival Analysis and Updated Results from a Randomized Phase 3 Trial

Lancet Oncol 2013;14:552-562

Study: Phase 3 trial of patients with clear cell metastatic renal cell carcinoma randomized to receive axitinib 5 mg twice daily (n=361) or sorafenib 400 mg twice daily (n=362).

Results: Median overall survival was 20.1 mo with axitinib (16.7-23.4) and 19.2 mo with sorafenib (17.5-22.3) (HR 0.969, 95% CI 0.800-1.174). Median progression-free survival was 8.3 mo with axitinib (6.7-9.2) and 5.7 mo with sorafenib (4.7-6.5) (HR 0.656, 95% CI 0.552-0.779).

Conclusions: Axitinib should be a second-line treatment option for patients with metastatic renal cell carcinoma.

Investigations

- IVP/CT urogram
- cystoscopy and retrograde pyelogram

Treatment

- radical nephroureterectomy with cuff of bladder
- distal ureterectomy for distal ureteral tumors
- emerging role for endoscopic laser ablation in patients with low grade disease, poor baseline renal health

Bladder Carcinoma**Etiology**

- unknown, but environmental risk factors include
 - smoking (main factor – implicated in 60% of new cases)
 - aromatic amines: naphthylamines, benzidine, tryptophan, phenacetin metabolites
 - cyclophosphamide
 - prior Hx of radiation treatment to the pelvis
 - *Schistosoma hematobium* infection (associated with SCC)
 - chronic irritation: cystitis, chronic catheterization, bladder stones (associated with SCC)
 - aristolochic acid: associated with Balkan Nephropathy (renal failure, upper tract urothelial cancer) and Chinese Herbal Nephropathy

Epidemiology

- 2nd most common urological malignancy
- M:F = 3:1, more common among whites than blacks
- mean age at diagnosis is 65 yr

Pathology

- classification
 - UCC >90%
 - SCC 5-7%
 - adenocarcinoma 1%
 - others <1%
- stages and prognoses of urothelial carcinoma at diagnosis
 - non-muscle invasive (75%) → >80% overall survival
 - ♦ 15% of these will progress to invasive UCC
 - ♦ the majority of these patients will have recurrence
 - invasive (25%) → 50-60% 5 yr survival
 - ♦ 85% have no prior hx of superficial UCC (i.e. *de novo*)
 - ♦ 50% have occult metastases at diagnosis, and most of these will develop overt clinical evidence of metastases within 1 yr – lymph nodes, lung, peritoneum, liver
- carcinoma *in situ* → flat, non-papillary erythematous lesion characterized by dysplasia confined to urothelium
 - more aggressive, worse prognosis
 - usually multifocal
 - may progress to invasive UCC

Clinical Features

- asymptomatic (20%)
- hematuria (key symptom: 85-90% at the time of diagnosis)
- pain (50%) → location determined by size/extent of tumor (i.e. flank, suprapubic, perineal, abdominal, etc.)
- clot retention (17%)
- storage urinary symptoms → consider carcinoma *in situ*
- palpable mass on bimanual exam → likely muscle invasion
- obstruction of ureters → hydronephrosis and uremia (nausea, vomiting, and diarrhea)

Investigations

- U/A, urine C&S, urine cytology
- U/S
- CT scan with contrast → look for filling defect
- cystoscopy with biopsy (gold standard)
- biopsy to establish diagnosis and to determine depth of penetration
- specific bladder tumor markers (e.g. NMP-22, BTA, Immunocyt, FDP)

Grading

- low grade: <=10% invasive, 60% recur
- high grade: 50-80% are invasive or should progress to invasive over time

Staging

- for invasive disease: CT or MRI, CXR, LFTs, extended electrolytes (Ca^{2+} , Mg^{1+} , PO_4^{-3}) (metastatic workup)

**Differential Diagnosis of Filling Defect**

- Urothelial carcinoma (differentiate via cytology and CT scan)
- Uric acid stone (differentiate via cytology and CT scan)
- Blood clot
- Pyelitis cystica
- Papillary necrosis
- Fungus ball
- Gas bubble from gas producing organisms

The “field defect” theory helps to explain why UCC has multiple lesions and has a high recurrence rate. The entire urothelium (pelvis to bladder) is bathed in carcinogens

**Radiotherapy with or without Chemotherapy in Muscle-Invasive Bladder Cancer**

NEJM 2012;366:1477-1488

Study: Phase 3 trial with random assignment of 360 patients with muscle-invasive bladder cancer to radiotherapy with or without chemotherapy.

Results: At 2 yr, rates of locoregional disease-free survival were 67% in the chemoradiotherapy group and 54% in the radiotherapy group (HR 0.68, 95% CI 0.48-0.96). Five year overall survival rates were 48% in the chemoradiotherapy group and 35% in the radiotherapy group (HR 0.82, 95% CI 0.63-1.09).

Conclusions: Chemotherapy with fluorouracil and mitomycin C in combination with radiotherapy improves locoregional control of bladder cancer compared to radiotherapy alone, with no significant increase in adverse events.

The ENTIRE urinary tract must be evaluated in patients with hematuria unless there is clear evidence of glomerular bleeding (e.g. red cell casts, dysmorphic RBCs, etc.)

Unexplained hematuria in any individual >40 yr old must be investigated to r/o a malignancy

Cystoscopy is the initial procedure of choice for the diagnosis and staging of urothelial malignancy

Tumor grade is the single most important prognostic factor for progression

Table 17. 2010 TNM Classification of Bladder Carcinoma

T	N	M
TX: Primary tumor cannot be assessed	NX: Lymph nodes cannot be assessed	M0: No distant metastasis
T0: No evidence of primary tumor		
Ta: Noninvasive papillary carcinoma Tis: Carcinoma <i>in situ</i> : "flat tumor"	N0: No lymph node metastasis	M1: Distant metastasis
T1: Tumor invades subepithelial connective tissue	N1: Single regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node)	
T2: Tumor invades muscularis propria pT2a: Tumor invades superficial muscularis propria (inner half) pT2b: Tumor invades deep muscularis propria (outer half)	N2: Multiple regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node metastasis)	
T3: Tumor invades perivesical tissue: pT3a: Microscopically pT3b: Macroscopically (extravesical mass)	N3: Lymph node metastasis to the common iliac lymph nodes	
T4: Tumor invades any of the following: prostatic stroma, seminal vesicles, uterus, vagina, pelvic wall, abdominal wall T4a: Tumor invades prostatic stroma, uterus, vagina T4b: Tumor invades pelvic wall, abdominal wall		

**Figure 11. Urothelial carcinoma of bladder****Treatment**

- superficial (non-muscle invasive) disease: Tis, Ta, T1
 - low-grade disease
 - ♦ single dose mitomycin c within 24 h of resection reduces recurrence rates
 - high-grade
 - ♦ TURBT ± intravesical chemo/immuno-therapy (e.g. BCG, mitomycin C) to decrease recurrence rate
 - ♦ maintenance with intravesical chemotherapy with BCG for 3 cycles every 3 mo, may be continued for 2-3 yr
- invasive disease: T2a, T2b, T3
 - radical cystectomy + pelvic lymphadenectomy with urinary diversion (e.g. ileal conduit, Indiana pouch, ileal neobladder) or TURBT + chemo-radiation (bladder sparing) for small tumors with non-obstructed ureters
 - neo-adjuvant chemotherapy prior to cystectomy may also be done
 - use of adjuvant chemotherapy after definitive local treatment is controversial
- advanced/metastatic disease: T4a, T4b, N⁺, M⁺
 - initial combination of systemic chemotherapy ± irradiation ± surgery

Prognosis

- depends on stage, grade, size, number of lesions, recurrence and presence of CIS
 - T1: 90% 5 yr survival
 - T2: 55% 5 yr survival
 - T3: 20% 5 yr survival
 - T4/N⁺/M⁺: <5% 5 yr survival

Prostate Cancer**Etiology**

- not known
- risk factors
 - increased incidence in persons of African descent
 - high dietary fat = 2x risk

**Neoadjuvant Chemotherapy plus Cystectomy Compared with Cystectomy Alone for Locally Advanced Bladder Cancer**

NEJM 2003;349:859-866

Study: Randomized clinical trial.**Patients:** 317 patients with transitional-cell carcinoma of the bladder (T2N0M0 to T4aN0M0).**Intervention:** Randomized to undergo radical cystectomy or to receive three cycles of combined chemotherapy (methotrexate, vinblastine, doxorubicin, and cisplatin) followed by radical cystectomy.**Main Outcome:** Survival. Secondary objective was to quantify down-staging of tumor following chemotherapy.**Results:** At 5 yr after treatment initiation, 57% of the combination-therapy group vs. 43% of the cystectomy group were alive (p=0.06). In the combination-therapy group, 38% of the patients were pathologically free of cancer at the time of cystectomy vs. 15% of the cystectomy-only group at the time of surgery (p<0.001).**Conclusions:** For locally advanced bladder carcinoma, neoadjuvant chemotherapy significantly reduces tumor volume and also improves survival.**Figure 12. Ileal conduit, Indiana pouch, ileal neobladder**

- family Hx
 - ♦ 1st degree relative = 2x risk
 - ♦ 1st and 2nd degree relatives = 9x risk

Epidemiology

- most prevalent cancer in males
- 3rd leading cause of male cancer deaths (following lung and colon)
- up to 50% risk of CaP at age 50
- lifetime risk of death from CaP is 3%
- 75% diagnosed between 60-85 yr; mean age at diagnosis is 72

Pathology

- adenocarcinoma
 - >95%, often multifocal
- urothelial carcinoma of the prostate (4.5%)
 - associated with UCC of bladder; does NOT follow TNM staging below; not hormone-responsive
- endometrial (rare)
 - carcinoma of the utricule

Anatomy (see Figure 7, U7)

- 60-70% of nodules arise in the peripheral zone
- 10-20% arise in the transition zone
- 5-10% arise in the central zone

Clinical Features

- usually asymptomatic
- most commonly detected by DRE, elevated PSA, or as an incidental finding on TURP
 - DRE: hard irregular nodule or diffuse dense induration involving one or both lobes
 - PSA: see *Prostate Cancer Screening, U25*
- locally advanced disease
 - storage and voiding symptoms, ED (all uncommon without spread)
- metastatic disease
 - bony mets to axial skeleton common
 - visceral mets are less common (liver, lung, and adrenal gland most common sites)
 - leg pain and edema with nodal mets obstructing lymphatic and venous drainage

Methods of Spread

- local invasion
- lymphatic spread to regional nodes
 - obturator > iliac > presacral/para-aortic
- hematogenous dissemination occurs early

Investigations

- DRE
- PSA elevated in the majority of patients with CaP
- TRUS-guided needle biopsy
- bone scan may be omitted in untreated CaP with PSA <10 ng/mL
- CT scanning to assess metastases
- MRI: being investigated for possible role in detection, staging, MRI-guided biopsying and active surveillance

Table 18. 2010 TNM Classification of Prostate Carcinoma

T	N	M
T1: clinically undetectable tumor, normal DRE and TRUS T1a: tumor incidental histologic finding in <5% of tissue resected T1b: tumor incidental histologic finding in >5% of tissue resected T1c: tumor identified by needle biopsy (due to elevated PSA level)	NX: regional lymph nodes were not assessed N0: no regional lymph node metastasis N1: spread to regional lymph nodes	M0: no distant metastasis M: distant metastasis M1a: nonregional lymph nodes M1b: bone(s) M1c: other site(s) with or without bone disease
T2: palpable, confined to prostate T2a: tumor involving ≤ one half of one lobe T2b: tumor involving > one half of one lobe, but not both lobes T2c: tumor involving both lobes		
T3: tumor extends through prostate capsule T3a: extracapsular extension (unilateral or bilateral) T3b: tumor invading seminal vesicle(s)		
T4: tumor invades adjacent structures (besides seminal vesicles)		

Table 19. Prostate Cancer Mortality Risk

	Low Risk	Intermediate Risk (if any of following)	High Risk (if any of following)
PSA	<10	10-20	>20
Gleason Score	<7	7	8-10
Stage	pT1-2a	pT2b-T2c	pT3/4

Treatment

- T1/T2 (localized, low-risk)
 - if adequate life expectancy or no other significant comorbidities, consider active surveillance vs. definitive local treatment (RP, brachytherapy, or EBRT)
 - no difference in cure rate between definitive treatment modalities
 - in older population: watchful waiting + palliative treatment for symptomatic progression
- T1/T2 (intermediate or high-risk)
 - definitive therapy over active surveillance
- T3, T4
 - EBRT + androgen deprivation therapy or RP + adjuvant EBRT
- N >0 or M >0
 - requires hormonal therapy/palliative radiotherapy for metastases; may consider combined androgen blockade
 - bilateral orchiectomy – removes 90% of testosterone
 - GnRH agonists (e.g. leuprolide, goserelin)
 - GnRH antagonist (e.g. degarelix)
 - estrogens (e.g. diethylstilbestrol [DES])
 - antiandrogens (bicalutamide)
 - local irradiation of painful secondaries or half-body irradiation
- hormone-refractory prostate cancer
 - chemotherapy: docetaxel, cabazitaxel, sipuleucel-T

Table 20. Treatment Options for Localized Prostate Cancer

Modality	Population Considered	Limitations
Watchful Waiting	Short life expectancy (<5-10 yr); will likely only receive non-curative hormonal therapy if disease progresses	Disease progression
Active Surveillance (Serial PSA, DRE, and Biopsies)	Low grade disease, good follow-up; is still considering more curative treatment if disease progresses	Disease progression; decrease in QOL associated with serial testing; risks associated with biopsies; no optimal monitoring schedule has been defined to date
Brachytherapy	Low volume, low PSA (<10), low grade	ED (50%), long-term effectiveness not well-established
EBRT	Locally advanced disease, older patients	Radiation proctitis (5%), ED (50%), risk of rectal cancer
RP	Young patients (<75 yr), high-risk disease	Incontinence (10%), ED (30-50%)

*Other options include cryosurgery, HIFU, hormonal ablation

Prognosis

- T1-T2: comparable to normal life expectancy
- T3-T4: 40-70% 10 yr survival
- N+ and/or M+: 40% 5 yr survival
- prognostic factors: tumor stage, tumor grade, PSA value, PSA doubling time

Prostate Cancer Screening

Digital Rectal Exam

- should be included as part of initial screening
- suspicious findings: abnormal feeling, nodularity, focal lesion, discrete change in texture/fullness/symmetry

Prostate Specific Antigen

- glycoprotein produced by epithelial cells of prostate gland
- leaks into circulation in setting of disrupted glandular architecture
- value of <4 ng/mL traditionally considered as cut-off to differentiate normal from pathologic value, but no single justifiable cutpoint
- measured serum PSA is a combination of free (15%) and bound PSA (85%)
- PSA velocity, PSA density, and free:total PSA: all intended to increase sensitivity and specificity of serum PSA values
 - association of increased CaP rates with decreased free:total PSA, elevated PSA velocity and density

Screening Recommendations

- conflicting evidence regarding mortality reduction with PSA-based screening and debate regarding overdiagnosis/overtreatment

Radical Prostatectomy vs. Watchful Waiting in Early Prostate Cancer (Scandinavian Prostate Cancer Group Study)

NEJM 2011;364:1708-1717

Study: Randomized clinical trial comparing watchful waiting with radical prostatectomy for localized prostate cancer.

Methods: 695 men from 14 centers in Finland, Sweden, and Iceland with newly diagnosed, localized prostate cancer were included in this study.

Main Outcomes: Mortality, distant metastases, local progression.

Results: For men with low-risk prostate cancer (PSA <10, Gleason score <7), at 15 yr after treatment initiation, the relative risk of death due to prostate cancer in the radical prostatectomy group vs. watchful waiting was 0.62 (p=0.01). The cumulative incidence of death from prostate cancer after radical prostatectomy was high as compared with other studies.

Conclusions: Radical prostatectomy was associated with reduced rate of death due to prostate cancer.

Radical Prostatectomy vs. Observation for Localized Prostate Cancer. (Prostate Cancer Intervention vs. Observation Trial (PIVOT) Study Group)

NEJM 2012;367:203-213

Study: Randomized clinical trial comparing observation with radical prostatectomy for localized prostate cancer.

Methods: 731 men at 52 United States centers with localized prostate cancer participated.

Main Outcomes: Mortality, bone metastases, surgical morbidity.

Results: Radical prostatectomy did not reduce all-cause or prostate cancer mortality relative to observation (relative risk 0.60, p=0.09), through at least 12 yr of follow-up.

Conclusions: Observation is recommended for localized prostate cancer, especially in men with low PSA and low-risk disease.

PSA is specific to the PROSTATE, but NOT to prostate cancer

Causes of Increased PSA

BPH, prostatitis, prostatic ischemia/infarction, prostate biopsy/surgery, prostatic massage, acute urinary retention, urethral catheterization, cystoscopy, TRUS, strenuous exercise, perineal trauma, ejaculation, acute renal failure, coronary bypass graft, radiation therapy

- Ontario Ministry of Health and Long-Term Care and United States Preventative Services Task Force both recommend against PSA testing as a population-wide screening tool
- however, serum PSA screening recommended in any man with >10 yr life-expectancy and any of the following:
 - suspicious finding on DRE
 - moderate-severe LUTS
 - high risk individuals
 - investigating secondary carcinoma of unknown origin to r/o CaP as primary

American Urological Association Guidelines (2013) re: Prostate Cancer Screening

- men under age 40 yr should not have PSA screening (Grade C)
- men aged 40-54 yr should not be screened, unless they have high risk factors (e.g. positive family history or African American race), screening decisions should be individualized (Grade C)
- men aged 55-69 yr should proceed with screening only after shared decision-making on the basis of their values and preferences (Grade B)
- routine screening interval of two years or more may be preferred over annual screening in those men who have participated in shared decision-making and decided on screening (Grade C)
- men aged 70+ years or any man with less than a 10-15 yr life expectancy should not have PSA screening

Screening for Prostate Cancer

Cochrane DB Syst Rev 2013;1:CD004720

Background: Screening for prostate cancer has an unclear benefit for reducing prostate cancer-specific mortality and morbidity.

Study: Systematic review of randomized clinical trials of screening vs. no screening. A total of 31 trials were retrieved for this review.

Results: A meta-analysis of 5 RCTs with 341,342 participants was done. Collectively, there was no significant reduction in prostate cancer-specific mortality within 10 yr of follow-up. Screening procedures and biopsies were commonly associated with bleeding, bruising, and short-term anxiety; subsequent over-diagnosis and overtreatment resulted in additional harms, some severe.

Conclusions: Men who have a life expectancy less than 10-15 yr should be informed that screening for prostate cancer is unlikely to be beneficial. Significant harms are associated with screening, over-diagnosis, and overtreatment.

Testicular Tumors

Etiology/Risk Factors

- cryptorchidism, atrophy, sex hormones, HIV infection, infertility, family hx, past hx of testicular cancer

Epidemiology

- rare, but most common solid malignancy in young males 15-34 yr
- any solid testicular mass or acute hydrocoele in young patient – must r/o malignancy
- slightly more common in right testis (corresponds with slightly higher incidence of right-sided cryptorchidism)
- 2-3% bilateral (simultaneously or successively)

Pathology

- primary
 - 1% of all malignancies in males
 - cryptorchidism has increased risk (10-40x) of malignancy
 - 95% are germ cell tumors (all are malignant)
 - ♦ seminoma (35%) → classic, anaplastic, spermatocytic
 - ♦ NSGCT → embryonal cell carcinoma (20%), teratoma (5%), choriocarcinoma (<1%), yolk sac (<<1%), mixed cell type (40%)
 - 5% are non-germ cell tumors (usually benign) → Leydig (testosterone, precocious puberty), Sertoli (gynecomastia, decreased libido)
- secondary
 - male >50 yr
 - usually lymphoma or metastases (e.g. lung, prostate, GI)

Clinical Features

- **painless** testicular enlargement (painful if intratesticular hemorrhage or infarction)
- dull, heavy ache in lower abdomen, anal area or scrotum
- associated hydrocele (10%)
- coincidental trauma (10%)
- infertility (rarely presenting complaint)
- gynecomastia due to secretory tumor effects
- supraclavicular and inguinal lymphadenopathy
- abdominal mass (retroperitoneal lymph node mets)

Methods of Spread

- local spread follows lymphatics
 - right → medial, paracaval, anterior and lateral nodes
 - left → left lateral and anterior paraaortic nodes
 - “cross-over” metastases from right to left are fairly common, but no reports from left to right
- hematogenous most commonly to lung, liver, bones, and kidney

Investigations

- diagnosis is established by pathological evaluation of specimen obtained by radical inguinal orchiectomy
- tumor markers (β-hCG, LDH, AFP)
 - β-hCG and AFP are positive in 85% of non-seminomatous tumors
 - elevated marker levels return to normal post-operatively if no metastasis
 - β-hCG positive in 7% of pure seminomas, AFP never elevated with seminoma
- testicular U/S (hypoechoic area within tunica albuginea = high suspicion of testicular cancer)
- evidence of testicular microlithiasis is not a risk factor for testicular cancer
- needle aspiration contraindicated

Staging

- Clinical: CXR (lung mets), markers for staging (β -hCG, AFP, LDH), CT abdomen/pelvis (retroperitoneal lymphadenopathy)
 - Stage I: disease limited to testis, epididymis, or spermatic cord
 - Stage II: disease limited to the retroperitoneal nodes
 - Stage III: disease metastatic to supradiaphragmatic nodal or visceral sites

Table 21. 2010 TNM Classification of Testicular Carcinoma

T	N	M
Tis: intratubular germ cell neoplasia T1: limited to testis and epididymis without vascular/lymphatic invasion T2: limited to testis and epididymis with vascular/lymphatic invasion T3: invasion of the spermatic cord \pm vascular/lymphatics T4: invasion of the scrotum \pm vascular/lymphatics	N status: same as RCC	M0: no distant mets M1: distant mets M1a: nonregional lymph node(s) or pulmonary mets M1b: distant mets other than to regional lymph nodes and lung

Management

- orchiectomy through inguinal ligament for all stages
- consider sperm banking, testicular prosthesis
- adjuvant therapies

Prognosis

- 99% cured with stage I and II disease
- 70-80% complete remission with advanced disease

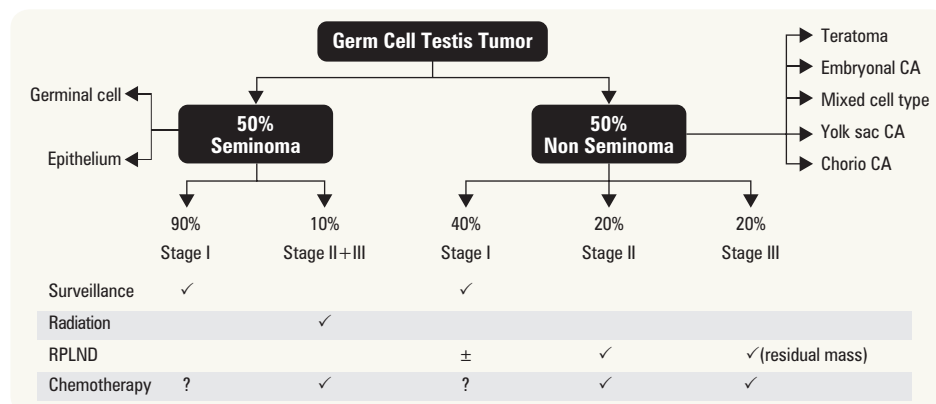

Figure 13. Adjuvant management of testicular cancer post-orchiectomy

Adapted from Dr. MAS Jewett

Orchiopexy

Surgical descent (orchiopexy) of undescended testis does not eliminate the risk of malignancy, but allows for earlier detection by self-examination and reduces the risk of infertility

Testes and scrotum have different lymphatic drainage, therefore trans-scrotal approach for biopsy or orchiectomy should be avoided

Penile Tumors

Epidemiology

- rare (<1% of cancer in males in U.S.)
- most common in 6th decade

Benign

- cyst, hemangioma, nevus, papilloma

Pre-Malignant

- balanitis xerotica obliterans, leukoplakia, Buschke-Lowenstein tumor (large condyloma)

Pre-Invasive Cancer

- carcinoma *in situ* (CIS)
 - Bowen's disease \rightarrow crusted, red plaques on the shaft
 - erythroplasia of Queyrat \rightarrow velvet red, ulcerated plaques on the glans
 - treatment options: local excision, laser, radiation, topical 5-fluorouracil

Malignant

- risk factors
 - chronic inflammatory disease
 - STD
 - phimosis
 - uncircumcised penis
- 2% of all urogenital cancers
- SCC (>95%), basal cell, melanoma, Paget's disease of the penis (extremely rare)
- definitive diagnosis requires full thickness biopsy of lesion
- lymphatic spread (superficial/deep inguinal nodes \rightarrow iliac nodes) >> hematogenous

Treatment

- wide surgical excision with tumor-free margins (dependent on extent and area of penile involvement) ± lymphadenectomy
- consider less aggressive treatment modalities in CIS (cryotherapy, laser therapy, etc.) if available

**Differential of a Benign Scrotal Mass****HIS BITS**

Hydrocele
Infection (epididymitis/orchitis)
Sperm (spermatocele)
Blood (hematocele)
Intestines (hernia)
Torsion
Some veins (varicocele)

Acute scrotal swelling/pain in young boys is torsion until proven otherwise

Transillumination refers to if light is able to transmit through tissue (i.e. due to excess fluid)

**Varicocele Grading**

- Grade 1: Palpable only with Valsalva manoeuvre
- Grade 2: Palpable without Valsalva
- Grade 3: Visible through scrotal skin

Scrotal Mass

Table 22. Differentiating between Scrotal Masses

Condition	Pain	Palpation	Additional Findings
Torsion	+	Diffuse tenderness Horizontal lie of testicle	Absent cremaster reflex, negative Prehn's sign
Epididymitis (U15)	+	Epididymal tenderness	Present cremaster reflex, positive Prehn's sign
Orchitis (U15)	+	Diffuse tenderness	Present cremaster reflex, positive Prehn's sign
Hematocele	+	Diffuse tenderness	No transillumination
Hydrocele	–	Testis not separable from hydrocele, cord palpable	Transillumination, Hx of trauma
Spermatocele	–	Testis separable from spermatocele, cord palpable	Transillumination
Varicocele	–	Bag of worms	No transillumination, increases in size with Valsalva, decrease in size if supine
Indirect Inguinal	– (+ if strangulated)	Testis separable from hernia, cord not palpable, cough impulse may transmit, may be reducible	No transillumination
Tumor	– (+ if hemorrhagic)	Hard lump/nodule	
Generalized/Dependant Edema	–	Diffuse swelling	Often post-operative or immobilized, check for liver dysfunction
Idiopathic	–		

Table 23. Benign Scrotal Masses

Type	Varicocele	Spermatocele	Hydrocele	Testicular Torsion	Inguinal Hernia
Definition	Dilatation and tortuosity of pampiniform plexus	A benign, sperm filled epididymal retention cyst	Collection of serous fluid that results from a defect or irritation in the tunica vaginalis	Twisting of the testicle causing venous occlusion and engorgement as well as arterial ischemia and infarction	Protrusion of abdominal contents through the inguinal canal into the scrotum
Etiology	15% of men Due to incompetent valves in the testicular veins 90% left sided	Multiple theories, including: Distal obstruction Aneurysmal dilations of the epididymis Agglutinated germ cells	Usually idiopathic Found in 5-10% testicular tumors Associated with trauma/infection Communicating: patent processus vaginalis, changes size during day (peds) Non-communicating: non-patent processus vaginalis (adult)	Trauma Cryptorchidism "Bell clapper deformity" Many occur in sleep (50%) Necrosis of glands in 5-6 h	Indirect (through internal ring, often into scrotum): congenital Direct (through external ring, rarely into scrotum): abdominal muscle weakness
Hx/P/E	"Bag of worms" Often painless Pulsates with Valsalva	Non-tender, cystic mass Transilluminates	Non-tender, intrascrotal mass Cystic Transilluminates	Acute onset severe scrotal pain, swelling GI upsets cases Retracted and transverse testicle (horizontal lie) Negative Phren's sign Absent cremasteric reflex	A small bulge in the groin that may increase in size with Valsalva and disappear when lying down Can present as a swollen or enlarged scrotum Discomfort or sharp pain – especially when straining, lifting, or exercising
Investigations	P/E Valsava	P/E U/S to r/o tumor	U/S to r/o tumor	U/S with color flow Doppler probe over testicular artery Decrease uptake on ^{99m} Tc-pertechnetate scintillation scan (doughnut sign)	Hx and P/E Invagination of the scrotum Valsalva
Treatment	Conservative Surgical ligation of testicular veins Percutaneous vein occlusion (balloon, sclerosing agents) Repair may improve sperm count/motility 50-75%	Conservative Avoid needle aspiration as it can lead to infection, reaccumulation and spilling of irritating sperm within scrotum Excise if symptomatic	Conservative Needle drainage Surgical	Emergency surgical exploration and bilateral orchiopexy Orchiectomy if poor prognosis	Surgical repair

TORSION OF TESTICULAR APPENDIX

- twisting of testicular/epididymal vestigial appendix

Signs and Symptoms

- clinically similar to testicular torsion, but vertical lie and cremaster reflex preserved
- “blue dot sign”
 - blue infarcted appendage seen through scrotal skin (can usually be palpated as small, tender lump)

Treatment

- analgesia – most will subside over 5-7 d
- surgical exploration and excision if refractory pain

HEMATOCELE

- trauma with bleed into tunica vaginalis
- U/S helpful to exclude fracture of testis which requires surgical repair

Treatment

- ice packs, analgesics, surgical repair

Suspect a Retroperitoneal Mass/Process in a Patient with a Varicocele if:

- Acute onset
- Right sided (isolated)
- Palpable abdominal mass
- Does not reduce while supine

Indications for Treatment of Varicocele

- Impaired sperm quality or quantity
- Pain or dull ache affecting QOL
- Affected testis fails to grow in adolescents
- Cosmetic indications (especially in adolescents)

Penile Complaints

Table 24. Penile Complaints

Type	Peyronie's Disease	Priapism	Paraphimosis	Phimosis	Premature Ejaculation
Definition	Benign curvature of penile shaft secondary to fibrous thickening of tunica albuginea	Prolonged erection lasting >4 h in the absence of sexual excitement/desire	Foreskin caught behind glans leading to edema → inability to reduce foreskin	Inability to retract foreskin over glans penis	Ejaculation prior to when one or both partners desire it, either before or soon after penetration
Etiology	Etiology unknown Trauma/repeated inflammation Familial predisposition Associated with DM, vascular disease, autoimmunity, Dupuytren's contracture, erectile dysfunction	50% idiopathic Ischemic (common) • Thromboembolic (sickle cell) Non-Ischemic • Trauma • Medications • Neurogenic	Iatrogenic (post cleaning/instrumentation) Trauma Infectious (balanitis, balanoposthitis)	Congenital (90% natural separation by age 3) Balanitis Poor Hygiene	Psychological factors Primary: no period of acceptable control Secondary: symptoms after a period of control, not associated with general medical condition
Hx/P/E	Penile curvature/shortening Pain with erection Poor erection distal to plaque	Painful erection ± signs of necrosis	Painful, swollen glans penis, foreskin Constricting band proximal to corona Dysuria, decreased urinary stream in children	Limitation and pain when attempting to retract foreskin Balanoposthitis (infection of prepuce)	Ejaculatory latency ≥1 min Inability to control or delay ejaculation Psychological distress
Investigations	Hx and P/E	Hx and P/E Cavernosal blood gas analysis	Hx and P/E	Hx and P/E	Hx and P/E Testosterone levels if in conjunction with impotence
Treatment	Watchful waiting (spontaneous resolution in up to 50%) Intralesional or topical verapamil Incision/excision of plaque Shortening of less affected side ± penile prosthesis	Treat reversible causes High-flow • Self-limited • Consider arterial embolization Low-flow • Needle aspirated decompression • Phenylephrine intracorporeal injection q3-5min • Surgical shunt no response within 1 h	Manual pressure (with analgesia) Dorsal slit Circumcision (urgent or electively to prevent recurrence)	Proper hygiene Topical corticosteroids Dorsal slit Circumcision	r/o medical condition Address psychiatric concerns, counseling Medication • SSRI or clomipramine • Topical lidocaine, prilocaine

Erectile Dysfunction

Definition

- consistent (>3 mo duration) or recurrent inability to obtain or maintain an adequate erection for satisfactory sexual performance

Physiology

- erection involves the coordination of psychologic, neurologic, hemodynamic, mechanical, and endocrine components
- nerves: sympathetic (T11-L2), parasympathetic (S2-4), somatic (dorsal penile/pudendal nerves [S2-4])
- erection ("POINT")
 - parasympathetics → release of nitric oxide (NO) → increased cGMP levels within corpora cavernosa leading to:
 - arteriolar dilatation
 - sinusoidal smooth muscle relaxation → increased arterial inflow and compression of penile venous drainage (decreased venous outflow)
- emission ("SHOOT")
 - sensory afferents from glans
 - secretions from prostate, seminal vesicles, and ejaculatory ducts enter prostatic urethra (sympathetics)
- ejaculation ("SHOOT")
 - bladder neck closure (sympathetic)
 - spasmodic contraction of bulbo-cavernosus and pelvic floor musculature (somatic)
- detumescence
 - sympathetic nerves, norepinephrine, endothelin-1 → arteriolar and sinusoidal constriction → penile flaccidity

Classification

Table 25. Classification of Erectile Dysfunction

	Psychogenic	Organic
Proportion	10%	90%
Onset	Sudden	Gradual
Frequency	Sporadic	All circumstances
Variation	With partner and circumstance	No
Age	Younger	Older
Organic Risk Factors (HTN, DM, Dyslipidemia)	No organic risk factors	Risk factors present
Nocturnal/AM Erection	Present	Absent

Etiology ("IMPOTENCE")

- Iatrogenic: pelvic surgery, pelvic radiation
- Mechanical: Peyronie's, post-priapism
- Psychological: depression, stress, anxiety, PTSD, widower syndrome
- Occlusive vascular: arterial HTN, DM, smoking, hyperlipidemia, PVD, venous (impaired veno-occlusion)
- Trauma: penile/pelvic, bicycling
- Extra factors: renal failure, cirrhosis, COPD, sleep apnea, malnutrition
- Neurogenic: CNS (e.g. Parkinson's, MS, spinal cord injury, Guillain-Barré, spina bifida, stroke), PNS (e.g. DM, peripheral neuropathy)
- Chemical: antihypertensives, sedatives, antidepressants, antipsychotics, anxiolytics, anticholinergics, antihistamines, anti-androgens (including 5- α reductase inhibitors), statins, GnRH agonists, illicit drugs
- Endocrine: DM, hypogonadism, hyperprolactinemia, hypo/hyperthyroid

Diagnosis

- complete Hx (include sexual, medical, and psychosocial aspects)
- self-administered questionnaires (e.g. International Index of Erectile Function, Sexual Health Inventory for Men Questionnaire, ED Intensity Scale, ED Impact Scale)
- focused P/E, including vascular and neurologic examinations, secondary sexual characteristics
- lab investigations, dependent on clinical picture
 - risk factor evaluation: fasting blood glucose or HbA1c, cholesterol profile
 - optional: TSH, CBC, U/A, testosterone (free and total), prolactin, LH
- specialized testing including nocturnal penile tumescence monitoring usually unnecessary
- evaluation of penile vasculature only relevant with past history of trauma (i.e. pelvic fracture)

Erections POINT AND SHOOT
parasympathetics = **point**; and
sympathetics/somatics = **shoot**

Figure 14. Peyronie's disease

Penile vascular abnormalities may be a marker of risk for CV disease. Young men with vascular ED have 50x higher risk of having a CV event

Testosterone deficiency is an uncommon cause of ED

Treatment

- can often be managed by family doctor, see sidebar for when to refer
- must fully inform patient/partner of options, benefits and complications
- non-invasive
 - lifestyle changes (alcohol, smoking), psychological (sexual counseling and education)
 - change precipitating medications
 - treat underlying causes (diabetes, CVD, HTN, endocrinopathies)
- minimally invasive
 - oral medication (see *Common Medications*, U42)
 - ♦ sildenafil, tadalafil, vardenafil, avanafil: inhibits PDE-5 to increase intracavernosal cyclic GMP levels
 - all four have similar effectiveness, but tadalafil has certain advantages: earlier onset, longer half-life, no cyanopsia, can be taken on empty or full stomach (others better on empty stomach)
 - vacuum devices: draw blood into penis via negative pressure, then put ring at base of penis once erect
 - MUSE: male urethral suppository for erection – vasoactive substance (PGE1) capsule inserted into urethra
- invasive
 - intracavernous vasodilator injection/self-injection
 - ♦ triple therapy (papaverine, phentolamine, PGE1) or PGE1 alone
 - ♦ complications: priapism (overdose), thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) and hematoma
- surgical
 - penile implant (last resort): malleable or inflatable
 - penile artery reconstruction (in young men with isolated vascular lesion – investigational)

**When to Consider Referral****FAT PEN**

Failed medical therapy
 penile **A**natomic abnormality
 pelvic/perineal **T**rauma
Psychogenic cause
 Endocrinopathy
 vascular/**N**eurologic assessment

PDE-5 inhibitors are contraindicated in patients on nitrates/nitroglycerin due to severe hypotension

Initial trial of MUSE® or intracavernosal injection should be done under medical supervision

Trauma

- see *Emergency Medicine*, ER14

Renal Trauma

Classification According to Severity

- minor
 - contusions and superficial lacerations/hematomas: 90% of all blunt traumas, surgical exploration seldom necessary
- major
 - laceration that extends into medulla and collecting system, major renal vascular injury, shattered kidney

Etiology

- 80% blunt (MVC, assaults, falls) vs. 20% penetrating (stab wounds and gunshots)

Clinical Features

- mechanism of injury raises suspicion
- can be hemodynamically unstable secondary to renal vascular injury and/or other sustained injuries: ABCs
- upper abdominal tenderness, flank tenderness, flank contusions, lower rib/vertebral transverse process fracture

Investigations

- U/A
 - hematuria: requires workup but degree does not correlate with the severity of injury
- imaging
 - CT (contrast, triphasic) if patient stable: look for renal laceration, extravasation of contrast, retroperitoneal hematoma, and associated intra-abdominal organ injury

Staging (Does Not Necessarily Correlate Well with Clinical Status)

- I: contusion/hematoma
- II: <1 cm laceration without urinary extravasation
- III: >1 cm laceration without urinary extravasation
- IV: urinary extravasation
- V: shattered kidney or avulsion of pedicle

Treatment

- microscopic hematuria + isolated well-staged minor injuries → no hospitalization
- gross hematuria + contusion/minor lacerations → hospitalize, bedrest, repeat CT if bleeding persists
- surgical intervention/minimally invasive angiography and embolization:
 - absolute indications
 - ♦ hemorrhage and hemodynamic instability
 - relative indications
 - ♦ non-viable tissue and major laceration
 - ♦ urinary extravasation
 - ♦ vascular injury
 - ♦ expanding or pulsating peri-renal mass
 - ♦ laparotomy for associated injury
- follow-up with U/S or CT before d/c, and at 6 wk

Complications

- HTN in 5% of renal trauma

Bladder Trauma

Classification

- contusions: no urinary extravasation, damage to mucosa or muscularis
- intraperitoneal ruptures: often involve the bladder dome
- extraperitoneal ruptures: involve anterior or lateral bladder wall in full bladder

Etiology

- blunt (MVC, falls, and crush injury) vs. penetrating trauma to lower abdomen, pelvis, or perineum
- blunt trauma is associated with pelvic fracture in 97% of cases

Clinical Features

- abdominal tenderness, distention, peritonitis, and inability to void
- can be hemodynamically unstable secondary to pelvic fracture, other sustained injuries: ABCs
- suprapubic pain

Investigations

- U/A: gross hematuria in 90%
- imaging (including CT cystogram and post-drainage films for extravasation)

Treatment

- penetrating trauma → surgical exploration
- contusion → urethral catheter until hematuria completely resolves
- extraperitoneal bladder perforations → typically non-operative with foley insertion, and follow with cystograms
 - surgery if: infected urine, rectal/vaginal perforation, bony spike into bladder, laparotomy for concurrent injury, bladder neck involvement, persistent urine leak and failed conservative management
- intraperitoneal rupture usually requires surgical repair and suprapubic catheterization

Complications

- complications of bladder injury itself are rare
- mortality is around 20%, and is usually due to associated injuries rather than bladder rupture

Urethral Injuries

Etiology

- posterior urethra
 - common site of injury is junction of membranous and prostatic urethra due to blunt trauma, MVCs, pelvic fracture
 - shearing force on fixed membranous and mobile prostatic urethra
- anterior urethra
 - straddle injury can crush bulbar urethra against pubic rami
- other causes
 - iatrogenic (instrumentation, prosthesis insertion), penile fracture, masturbation with urethral manipulation
- always look for associated bladder rupture

All patients with suspected urethral injury should undergo RUG

Clinical Features

- blood at urethral meatus
- high-riding prostate on DRE
- swelling and butterfly perineal hematoma
- penile and/or scrotal hematoma
- sensation of voiding without U/O
- distended bladder

Investigations

- must perform RUG or cystoscopy prior to catheterization

Treatment

- simple contusions
 - no treatment
- partial urethral disruption
 - very gentle attempt at catheterization by urologist
 - with no resistance to catheterization → Foley x 2-3 wk
 - with resistance to catheterization → suprapubic cystostomy or urethral catheter alignment in OR
- periodic flow rates/urethrograms to evaluate for stricture formation
- complete disruption
 - immediate repair if patient stable, delayed repair if unstable (suprapubic tube in interim)

Complications

- stricture

Infertility

Definition

- failure to conceive after one year of unprotected, properly timed intercourse
- incidence
 - 15% of all couples
 - ~ 35-40% female, 20% male, 25-30% combined problem

Female Factors

- see [Gynecology, GY20](#)

Male Factors

Male Reproduction

- hypothalamic-pituitary-testicular axis (HPTA)
 - pulsatile GnRH from hypothalamus acts on anterior pituitary stimulating release of LH and FSH
 - LH acts on Leydig (interstitial) cells → testosterone synthesis and secretion
 - FSH acts on Sertoli cells → structural and metabolic support to developing spermatogenic cells
 - FSH and testosterone support germ cells (responsible for spermatogenesis)
 - sperm route: epididymis → vas deferens → ejaculatory ducts → prostatic urethra

Etiology

- idiopathic (40-50% infertile males)
- testicular
 - varicocele (35-40% infertile males)
 - tumor
 - congenital (Klinefelter's triad: small, firm testes, gynecomastia, and azoospermia)
 - post-infectious (epididymo-orchitis, STDs, mumps)
 - uncorrected torsion
 - cryptorchidism (<5% of cases)
- obstructive
 - iatrogenic (surgery: see below)
 - infectious (gonorrhea, chlamydia)
 - trauma
 - congenital (absence of vas deferens, CF)

**Male Infertility Factors****SPERM COUNT**

Systemic factor/Smoking

Psychological illness

Endocrinopathy

Retrograde ejaculation

Medications

Chronic disease

Obstructive

Unexplained

Narcotics

Testicular

- bilateral ejaculatory duct obstruction, epididymal obstructions
- Kartagener's syndrome (autosomal recessive disorder causing defect in action of cilia)
- endocrine (see [Endocrinology, E47](#))
- HPTA (2-3%) e.g. Kallmann's syndrome (congenital hypothalamic hypogonadism), excess prolactin, excess androgens, excess estrogens
- other
 - retrograde ejaculation secondary to surgery
 - medications
 - drugs: marijuana, cocaine, tobacco, alcohol
 - increased testicular temperature (sauna, hot baths, tight pants or underwear)
 - chronic disease: e.g. liver, renal
 - unexplained infertility

History

- age of both partners
- medical: past illness, DM, trauma, CF, genetic syndromes, STDs, cryptorchidism
- surgical: vasectomy, herniorrhaphy, orchidopexy, prostate surgery
- fertility: pubertal onset, previous pregnancies, duration of infertility, treatments
- sexual: libido, erection/ejaculation, timing, frequency
- family Hx
- medications: cytotoxic agents, GnRH agonists, anabolic steroids, nitrofurantoin, cimetidine, sulfasalazine, spironolactone, α -blockers
- social hx: alcohol, tobacco, cocaine, marijuana
- occupational exposures: radiation, heavy metals

Physical Exam

- general appearance: sexual development, gynecomastia, obesity
- scrotal exam: size, consistency, and nodularity of testicles; palpation of cord for presence of vas deferens; DRE; Valsalva for varicocele

Investigations

- semen analysis (SA) at least 2 specimens, collected 1-2 wk apart
 - delivery to lab within 1 h, 2-7 d of abstinence prior to collection
- hormonal evaluation
 - indicated with abnormal SA (rare to be abnormal with normal SA)
 - testosterone and FSH
 - serum LH and prolactin are measured if testosterone or FSH are abnormal
- genetic evaluation
 - chromosomal studies (Klinefelter's syndrome – XXY)
 - genetic studies (Y-chromosome microdeletion, CF gene mutation)
- immunologic studies (antisperm antibodies in ejaculate and blood)
- testicular biopsy
- scrotal U/S (varicocele, testicular size)
- vasography (assess patency of vas deferens)

Treatment

- assessment of partner
- lifestyle
 - regular exercise, healthy diet
 - eliminate alcohol, tobacco and illicit drugs
- medical
 - endocrine therapy (see [Endocrinology, E48](#))
 - treat retrograde ejaculation
 - discontinue anti-sympathomimetic agents, may start α -adrenergic stimulation (phenylpropanolamine, pseudoephedrine, or ephedrine)
 - treat underlying infections
- surgical
 - varicolectomy (if indicated)
 - vasovasostomy (vasectomy reversal) or epididymovasostomy
 - transurethral resection of blocked ejaculatory ducts
- assisted reproductive technologies (ART)
 - refer to infertility specialist
 - sperm washing + intrauterine insemination (IUI)
 - *in vitro* fertilization (IVF)
 - intracytoplasmic sperm injection (ICSI) after CF screening of patient and partner in patients with congenital bilateral absence of vas deferens

WHO Guidelines

Normal Semen Values

- Volume: 2-5 mL
- Concentration: > 15 million sperm/mL
- Morphology: 30% normal forms
- Motility: > 40% adequate forward progression
- Liquefaction: complete in 20 min
- pH: 7.2-7.8
- WBC: < 10/HPF or < 10⁶ WBC/mL semen

Mutation of cystic fibrosis transmembrane conductance regulator (CFTR) gene is associated with congenital bilateral absence of vas deferens and epididymal cysts, even if patient manifests no symptoms of CF

Common Terminology on SA

- Teratospermia: Abnormal morphology
- Asthenospermia: Abnormal motility
- Oligospermia: Decreased sperm count
- Azoospermia: Absent sperm in semen
- Mixed types, i.e. oligoasthenospermia

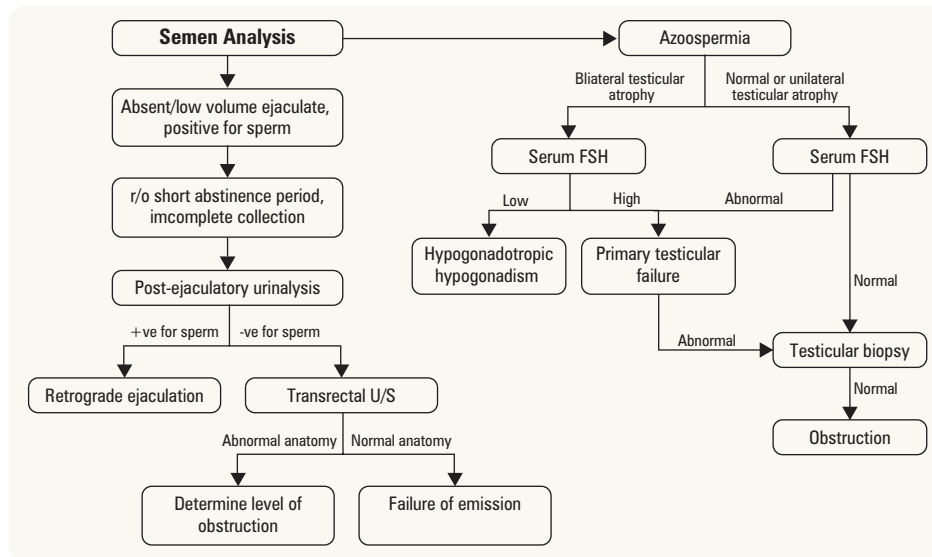

Figure 15. Infertility workup

Pediatric Urology

Congenital Abnormalities

- not uncommon; 1/200 have congenital abnormalities of the GU tract
- six common presentations of congenital urological abnormalities

1. ANTENATAL HYDRONEPHROSIS

Epidemiology

- 1-5% fetal U/S, detectable as early as first trimester
- most common urological consultation in perinatal period and one of most common U/S abnormalities of pregnancy

Differential Diagnosis

- UPJ or UVJ obstruction
- multi-cystic dysplastic kidney
- VUR
- PUVs (only in boys)
- duplication anomalies
- ureterocele
- ectopic ureter

Treatment

- antenatal *in utero* intervention rarely indicated unless evidence of PUVs with oligohydramnios

Majority of antenatal hydronephroses resolve during pregnancy or within the first year of life

2. POSTERIOR URETHRAL VALVES

Epidemiology

- the most common congenital obstructive urethral lesion in male infants

Pathophysiology

- abnormal mucosal folds at the distal prostatic urethra causing varying degrees of obstruction

Clinical Presentation

- dependent on age
 - antenatal: bilateral hydronephrosis, distended bladder, oligohydramnios
 - neonatal (recognized at birth): palpable abdominal mass (distended bladder, hydronephrosis), ascites (transudation of retroperitoneal urine), respiratory distress (pulmonary hypoplasia from oligohydramnios), weak urinary stream
 - neonatal (not recognized at birth): within weeks present with urosepsis, dehydration, electrolyte abnormalities, failure to thrive

- toddlers: UTIs or voiding dysfunction
- school-aged boys: voiding dysfunction → urinary incontinence
- associated findings include renal dysplasia and secondary VUR

Investigations

- most commonly recognized on prenatal U/S → bilateral hydronephrosis, thickened bladder, dilated posterior urethra (“keyhole sign”), oligohydramnios in a male fetus
- VCUG → dilated and elongated posterior urethra, trabeculated bladder, VUR

Treatment

- immediate catheterization to relieve obstruction, followed by cystoscopic resection of PUV when baby is stable
- if resection of PUV is not possible, vesicostomy is indicated

3. URETEROPELVIC JUNCTION OBSTRUCTION

Etiology

- unclear: adynamic ureteral segment, stenosis, strictures, extrinsic compression, stenosis, strictures, aberrant blood vessels
- can rarely be secondary to tumor, stone, etc. in children

Epidemiology

- the most common congenital defect of the ureter
- M:F = 2:1
- up to 40% bilateral, which may be associated with worse prognosis

Clinical Presentation

- symptoms depend on severity and age at diagnosis (mostly asymptomatic finding on antenatal U/S)
 - infants: abdominal mass, urinary infection
 - children: pain, vomiting, failure to thrive
- some cases are diagnosed after puberty and into adulthood
 - in adolescents and adults, the symptoms may be triggered by episodes of increased diuresis, such as following alcohol ingestion (Dietl’s crisis)

Investigations

- antenatal U/S most common, Doppler U/S (rare), IVP (rare), and renal scan ± furosemide

Treatment

- surgical correction (pyeloplasty), consider nephrectomy if <15% differential renal function

4. VESICoureTERAL REFLUX

Definition

- retrograde passage of urine from the bladder, through the UVJ, into the ureter

Classification

- primary reflux: incompetent or inadequate closure of UVJ
 - lateral ureteral insertion, short submucosal segment
- secondary reflux: abnormally high intravesical pressure resulting in failure of UVJ closure
 - often associated with anatomic (PUV) or functional (neuropathic) bladder obstruction

Epidemiology

- estimated ~1% of newborns, but not well known
- incidence and clinical relevance higher in children with febrile UTIs and prenatal hydronephrosis
- risk factors: race (white > black), female gender, age (<2 yr), genetic predisposition

Investigations

- focused Hx, particularly of voiding dysfunction (frequency, urgency, diurnal enuresis, constipation, encopresis)
 - also screen for signs of infection (UTI, pyelonephritis, urosepsis) and renal failure (uremia, HTN)
- initial evaluation of renal status, growth parameters, and blood pressure is warranted in any child with VUR due to high incidence of renal scarring
 - height, weight, blood pressure
 - Cr

VUR Grading (based on cystogram)

- **Grade I:** ureters only fill
- **Grade II:** ureters and pelvis fill
- **Grade III:** ureters and pelvis fill with some dilatation
- **Grade IV:** ureters, pelvis, and calyces fill with significant dilatation
- **Grade V:** ureters, pelvis, and calyces fill with major dilatation and tortuosity

Figure 16. VUR grading (based on cystogram)

- U/A, C&S
- renal U/S
- DMSA renal scan if at high risk (greater sensitivity in detecting structural defects associated with dysplasia, renal scarring or pyelonephritis; entails radiation exposure)
- family screening is controversial

Treatment

- spontaneous resolution in 60% of primary reflux
 - in lower grades (I-III), goal is to prevent infection or renal damage via medical treatment and monitoring
- medical treatment: daily ABx prophylaxis at half the treatment dose for acute infection (see Table 8, U12 - TMP/SMX, trimethoprim, amoxicillin, or nitrofurantoin)
- surgical treatment: ureteral reimplantation ± ureteroplasty, or subureteral injection with bulking agents (Deflux® or Macroplastique®)
 - indications include failure of medical management, renal scarring (e.g. renal insufficiency, HTN), breakthrough UTIs, persistent high grade (IV or V) reflux

5. HYPOSPADIAS

Definition

- a condition in which the urethral meatus opens on the ventral side of the penis, proximal to the normal location in the glans penis
- depending on severity, may result in difficulty directing urinary stream, having intercourse or depositing sperm in vagina

Epidemiology

- very common; 1/300 live male births
- distal hypospadias more common than proximal
- white >> black
- may be associated with ventral penile curvature, disorders of sexual differentiation, undescended testicles or inguinal hernia

Treatment

- early surgical correction; optimal repair before 2 yr
- neonatal circumcision should be deferred because the foreskin may be utilized in the correction

6. EPISPADIAS-EXSTROPHY COMPLEX

Definition

- a spectrum of defects depending on the timing of the rupture of the cloacal membrane
 - bladder exstrophy: congenital absence of a portion of lower abdominal and anterior bladder wall, with exposure of the bladder lumen
 - cloacal exstrophy
 - ♦ exposed bladder and bowel with imperforate anus
 - ♦ associated with spina bifida in >50%
 - epispadias (least severe)
 - ♦ urethra opens on dorsal aspect of the penis, often associated with penile curvature

Etiology

- represents failure of closure of the cloacal membrane, resulting in the bladder and urethra opening directly through the abdominal wall

Epidemiology

- rare: incidence 1/30,000, M:F = 3:1 predominance
- high morbidity → multiple reconstructive surgeries, incontinence, infertility, reflux

Treatment

- surgical correction at birth
- later corrections for incontinence, VUR, and low bladder capacity may be needed

Defer circumcision in patients with hypospadias

Figure 17. Classification of hypospadias (*account for 75%)

Nephroblastoma (Wilms' Tumor)

Etiology

- arises from abnormal proliferation of metanephric blastema

Epidemiology

- 5% of all childhood cancers, 5% bilateral
- most common primary malignant renal tumor of childhood
- average age of incidence is 3 yr

Clinical Features

- abdominal mass: large, firm, unilateral (80%)
- HTN (25%)
- flank tenderness
- microscopic hematuria
- nausea/vomiting

Treatment

- always investigate contralateral kidney and renal vein (for tumor thrombus)
- unilateral disease: radical nephrectomy ± radiation ± chemotherapy
- bilateral disease: nephron-sparing surgery following neoadjuvant chemotherapy

Prognosis

- 5 yr survival 80%

Cryptorchidism/Ectopic Testes

Definition

- abnormal location of testes somewhere along the normal path of descent (external inguinal ring > inguinal canal > abdominal)
- ectopic testis (testis found outside its normal path of descent) is most commonly located within a superficial pouch between the external oblique fascia and Scarpa's fascia (Denis Browne pouch)
- differential diagnosis
 - retractile testes
 - atrophic testes
 - disorders of sexual differentiation (bilateral impalpable gonads)

Epidemiology

- 2.7% of full term newborns
- 0.7-0.8% at 1 yr old

Treatment

- orchiopexy
- hormonal therapy not proven to be of benefit over standard surgical treatment

Prognosis

- reduction in fertility
 - untreated bilateral cryptorchidism: ~100% infertility
 - paternity rates: 53%, 90%, and 93% in formerly bilateral cryptorchid, formerly unilateral cryptorchid, and normal men, respectively
- increased malignancy risk
 - intraabdominal > inguinal
 - surgical correction facilitates testicular monitoring and may reduce malignancy risk
- increased risk of testicular torsion (reduced by surgical correction)

Normal Testicular Development and Descent *in Utero*

2nd mo: Testicle begins to form

4th mo: Begins to take on its normal appearance and migrates from its origin at the kidney to the internal inguinal ring

7th mo: The testis, surrounded in peritoneal covering, begins to descend through the internal ring, inguinal canal and external ring to terminate in the scrotum

Disorders of Sexual Differentiation

Definition

- formerly known as intersex disorders
- abnormal genitalia for chromosomal sex due to the undermasculinization of males or the virilization of females
- considered a social emergency

Classification

1. 46 XY DSD
 - defect in testicular synthesis of androgens
 - androgen resistance in target tissues
 - palpable gonad

A phenotypic male newborn with bilateral non-palpable testicles should be considered 46XX with salt-wasting CAH and must undergo proper evaluation prior to discharge

2. 46 XX DSD

- most due to CAH (21-hydroxylase deficiency most common enzymatic defect) → shunt in steroid biosynthetic pathway leading to excess androgens
- undiagnosed and untreated CAH can be associated with life-threatening electrolyte abnormalities in the newborn (salt-wasting CAH)

3. ovotesticular DSD

4. mixed gonadal dysgenesis (46 XY/45 XO most common karyotype)

- presence of Y chromosome → partial testis determination to varying degrees

Diagnosis

- thorough family Hx noting any consanguinity
- maternal Hx, especially medication/drug use during pregnancy (maternal hyperandrogenemia)
- P/E: palpable gonad (= chromosomal male), hyperpigmentation, evidence of dehydration, HTN, stretched phallus length, position of urethral meatus
- laboratory tests
 - plasma 17-OH-progesterone (after 36 h of life) → increased in 21-hydroxylase deficiency (CAH)
 - plasma 11-deoxycortisol → increased in 11-β-hydroxylase deficiency
 - basal adrenal steroid levels
 - serum testosterone and DHT pre- and post-hCG stimulation (2,000 IU/d for 4 d)
 - serum electrolytes
 - chromosomal evaluation including sex karyotype
- U/S of adrenals, gonads, uterus, and fallopian tubes
- endoscopy and genitography of urogenital sinus

Treatment

- steroid supplementation as indicated (e.g. CAH)
- sex assignment after extensive family consultation
 - must consider capacity for sexually functioning genitalia in adulthood, fertility potential, and psychological impact
- reconstruction of external genitalia between 6 and 12 mo
- long-term psychological guidance and support for both patient and family

Enuresis

- see [Pediatrics](#), P9

**Selected Urological Procedures****Bladder Catheterization**

- catheter size measured by the French (Fr) scale – circumference in mm
- each 1 mm increase in diameter = approximately 3 Fr increase (standard size 16-18 Fr)
- should be removed as soon as possible to reduce the risk of UTI

Continuous Catheterization

- indications
 - accurate monitoring of U/O
 - relief of urinary retention due to medication, neurogenic bladder, or intravesical obstruction
 - temporary therapy for urinary incontinence
 - perineal wounds
 - clot prevention (24-28 Fr) for CBI
 - post-operative

Alternatives to Continuous Catheterization

- intermittent catheterization
 - PVR measurement
 - to obtain sterile diagnostic specimens for U/A, urine C&S
 - management of neurogenic bladder or chronic urinary retention
- condom catheter
- suprapubic catheter

Causes of Difficult Catheterizations and Treatment

- patient discomfort → use sufficient lubrication (± xylocaine)
- collapsing catheter → lubrication as above ± firmer or larger catheter (silastic catheter)

Figure 18. Transurethral (Foley) catheters

- meatal/urethral stricture → dilate with progressively larger catheters/balloon catheter
- BPH → use coude catheter as angled tip can help navigate around enlarged prostate
- urethral disruption/obstruction → filiform and followers or suprapubic catheterization
- anxious patient → anxiolytic medication

Complications of Catheterization

- infection: UTI
- meatal/urethral trauma

Contraindications

- urethral trauma: blood at the meatus of the urethra, scrotal hematoma, pelvic fracture, and/or high riding prostate

Circumcision

Definition

- removal of some or all of the foreskin from the penis

Epidemiology

- 30% worldwide
- frequency varies depending on geographic location, religious affiliation, socioeconomic classification

Medical Indications

- phimosis and recurrent paraphimosis
- recurrent UTIs (particularly in infants and in association with other urinary abnormalities)
- balanitis xerotica obliterans or other chronic inflammatory conditions

Contraindications

- unstable or sick infant
- congenital genital abnormalities (hypospadias)
- family Hx of bleeding disorders warrants laboratory investigation prior to circumcision

Complications

- bleeding
- infection
- penile entrapment, skin bridges
- fistula
- glans injury
- penile sensation deficits

Cystoscopy

Objective

- endoscopic inspection of the lower urinary tract (urethra, prostate, bladder, and ureteral orifices), samples for cytology
- scopes can be flexible or rigid

Indications

- gross hematuria
- LUTS (storage or voiding)
- urethral and bladder neck strictures
- bladder stones
- bladder tumor surveillance
- evaluation of upper tracts with retrograde pyelography (ureteric stents, catheters)

Complications

- during procedure
 - bleeding
 - anesthetic-related
 - perforation (rare)
- post-procedure (short-term)
 - infections, e.g. epididymo-orchitis (rare)
 - urinary retention
- post-procedure (long-term)
 - stricture

Male Circumcision for Prevention of Heterosexual Acquisition of HIV in Men

Cochrane DB Syst Rev 2009;2:CD003362

Purpose: To evaluate the effectiveness and safety of male circumcision for preventing acquisition of HIV in heterosexual men.

Methods: The analyzed data is from three randomized controlled trials to assess the efficacy of male circumcision for preventing HIV acquisition in men in Africa.

Results: Medical male circumcision reduces the acquisition of HIV by heterosexual men (38%-66% over 24 mo).

Circumcision Status and Risk of HIV and Sexually Transmitted Diseases among Men who have Sex with Men: A Meta-Analysis

JAMA 2008;300:1674-1684

Purpose: To describe the association between male circumcision and HIV infection and other Sexually Transmitted Diseases (STDs) among men who have sex with men (MSM).

Methods: Meta-analysis of 15 studies (n=53,567)

Results: The associations between circumcision and HIV-positive and STDs were not statistically significant. Male circumcision had a protective association with HIV in studies of MSM conducted before the introduction of highly active antiretroviral therapy.

Conclusions: There is insufficient evidence to support that male circumcision protects against HIV infection or other STDs.

Male Circumcision

Pediatrics 2012;130:e756-e785

Study: Guidelines by the American Academy of Pediatrics (AAP).

Recommendations: The American Academy of Pediatrics radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of urinary tract infection, penile cancer, transmission of some sexually transmitted diseases, including HIV. There is believed to be no effect on penile sexual function, sensitivity or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

Note: The Canadian Pediatric Society (CPS) has not yet updated their position on male circumcision since 1996, which stated that the CPS is opposed to routine circumcision. A new statement is expected soon.

Radical Prostatectomy

Objective

- the removal of the entire prostate and prostatic capsule via a lower midline abdominal incision, laparoscopically or robotically
 - internal iliac and obturator vessel lymph nodes may also be dissected and sent for pathology (dependent on risk: clinical stage, grade, PSA)
 - seminal vesicle vessels are also partially or completely removed

Indications

- treatment for localized prostate cancer

Complications

- immediate (intraoperative)
 - blood loss
 - rectal injury (extremely rare)
 - ureteral injury (extremely rare)
- perioperative
 - lymphocele formation
- late
 - moderate to severe urinary incontinence (3-10%)
 - mild urinary incontinence ($\leq 20\%$)
 - ED (~50%, depending on whether one, both, or neither of the neurovascular bundles are involved in extracapsular extension of tumor)

Retropubic, Laparoscopic, and Robot-Assisted Radical Prostatectomy: A Critical Review of Outcomes Reported by High-Volume Centers

J Endourology 2010;24:2003-2015

Study: A systematic review to compare perioperative outcomes, positive surgical margin (PSM) rates, and functional outcomes in retropubic radical prostatectomy (RRP) laparoscopic RP (LRP) and robot-assisted radical prostatectomy (RARP).

Methods: Medline database was searched. Weighted means (based on number of participants in each study) were calculated for all outcomes.

Results: 58 articles were reviewed. LRP and RARP were associated with better perioperative outcomes compared to RRP. RRP, LRP, and RARP had similar post-operative complication rates ranging from 10.3-10.98%. RARP had a lower overall PSM rate than LRP, and RRP. RARP had the highest continence rate and mean potency rates.

Conclusion: In high-volume centers, RRP, LRP and RARP are safe options for treating patients with localized prostate cancer. LRP and RARP are associated with better perioperative outcomes and RARP showed lower PSM rates, higher potency and continence compared to RRP and LRP.

Transurethral Resection of the Prostate

Objective

- to partially resect the periurethral portion of the prostate (transition zone) to decrease symptoms of urinary tract obstruction
- accomplished via a transurethral (cystoscopic) approach using an electrocautery loop, irrigation (glycine), and illumination

Indications

- obstructive uropathy (large bladder diverticula, renal insufficiency)
- refractory urinary retention
- recurrent UTIs
- recurrent gross hematuria
- bladder stones
- intolerance/failure of medical therapy

Complications

- acute
 - intra- or extraperitoneal rupture of the bladder
 - rectal perforation
 - incontinence
 - incision of the ureteral orifice (with subsequent reflux or ureteral stricture)
 - hemorrhage
 - epididymitis
 - sepsis
 - transurethral resection syndrome (also called "post-TURP syndrome")
 - caused by absorption of a large volume of the hypotonic irrigation solution used, usually through perforated venous sinusoids, leading to a hypervolemic hyponatremic state
 - characterized by dilutional hyponatremia, confusion, nausea, vomiting, HTN, bradycardia, visual disturbances, CHF, and pulmonary edema
 - treat with diuresis and (if severe) hypertonic saline administration
- chronic
 - retrograde ejaculation (>75%)
 - ED (5-10% risk increases with increasing use of cautery)
 - incontinence (<1%)
 - urethral stricture
 - bladder neck contracture

Extracorporeal Shock Wave Lithotripsy

Objective

- to treat renal and ureteral calculi (proximal, middle or distal) which cannot pass through the urinary tract naturally
- shockwaves are generated and focused onto stone → fragmentation, allowing stone fragments to pass spontaneously and less painfully

Indications

- potential first-line therapy for renal and ureteral calculi <2.5 cm
- individuals with calculi in solitary kidney
- individuals with HTN, DM or renal insufficiency
- *patient preference and wait-times play a large role in stone management

Contraindications

- acute UTI or urosepsis
- bleeding disorder or coagulopathy
- pregnancy
- obstruction distal to stone

Complications

- bacteriuria
- bacteremia
- post-procedure hematuria
- ureteric obstruction (by stone fragments)
- peri-nephric hematoma

A Comparison of Treatment Modalities for Renal Calculi Between 100 and 300 mm²: Are Shockwave Lithotripsy, Ureteroscopy, and Percutaneous Nephrolithotomy Equivalent?
J Endourol 2011;25:481-485

Purpose: To describe the outcomes of a series of patients who underwent shockwave lithotripsy (SWL), ureteroscopy (URS) or percutaneous nephrolithotomy (PCNL).

Methods: Patients treated for intermediate-sized upper tract calculi (100-300 mm²) at a single tertiary center were included. Demographic and clinical data were collected from a prospectively maintained database.

Results: Of 137 patients, 38.7%, 29.9%, and 31.4% were treated with SWL, URS, and PCNL, respectively. Stone-free rate (95.3%) and single treatment success rate (95.3%) were highest for PCNL compared to SWL and URS ($p < 0.001$). When allowing for up to two SWL treatments, success rates became equivalent for the three treatment groups ($p = 0.66$). Auxiliary treatments were more frequent after SWL compared to URS and PCNL. Clavien grade complications did not differ between the three groups.

Conclusion: Up to two SWL treatments have equivalent success rate as compared to URS and PCNL. Hence, multiple SWL treatments may be a reasonable therapeutic option for patients who prefer SWL or who are not good candidates for alternative therapies.

Common Medications

Table 26. Erectile Dysfunction Medications

Drug	Class	Mechanism	Adverse Effects
sildenafil tadalafil vardenafil (PDE5s for use when some erection present)	Phosphodiesterase 5 inhibitor	Selective inhibition of PDE5 (enzyme which degrades cGMP) Leads to sinusoidal smooth muscle relaxation and erection	Severe hypotension (very rare) Contraindicated if hx of priapism, or in conditions predisposing to priapism (leukemia, myelofibrosis, polycythemia, sickle cell disease) Contraindicated with nitrates
alprostadil (MUSE®), PGE ₁ + phentolamine + papaverine mixture	Prostaglandin E ₁	Activation of cAMP, relaxing sinusoidal smooth muscle Local release (capsule inserted into urethra)	Penile pain Presyncope
alprostadil, papaverine (intracavernosal injection)	See above	See above	Thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) Painful erection Hematoma Contraindicated if hx of priapism, or in conditions predisposing to priapism
triple therapy also used: papaverine, phentolamine, PGE ₁			

Table 27. Benign Prostatic Hyperplasia Medications

Drug	Class	Mechanism	Adverse Effects
terazosin doxazosin	α_1 blockers	α -adrenergic antagonists reduce stromal smooth muscle tone Reduce dynamic component of bladder outlet obstruction	Presyncope Leg edema Retrograde ejaculation
tamsulosin alfuzosin silodosin	α_{1A} selective		Headache Asthenia Nasal congestion
finasteride dutasteride	5- α reductase inhibitor	Blocks conversion of testosterone to DHT Reduces static component of bladder outlet obstruction Reduces prostatic volume	Sexual dysfunction PSA decreases

Table 28. Prostatic Carcinoma Medications (N>0, M>0)

Drug	Class	Mechanism	Adverse Effects
leuprolide, goserelin	GnRH agonist	Initially stimulates LH, increasing testosterone and causing "flare" (initially increases bone pain) Later causes low testosterone	Hot flashes Headache Decreased libido
*diethylstilbestrol (DES)	Estrogens	Inhibit LH and cytotoxic effect on tumor cells	Increased risk of cardiovascular events (no longer available commercially in North America)
*cyproterone acetate	Steroidal antiandrogen	Competes with DHT for intracellular receptors: 1. Prevent flare produced by GnRH agonist 2. Use for complete androgen blockade 3. May preserve potency	
flutamide, bicalutamide	Non-steroidal antiandrogen	As above	Hepatotoxic: AST/ALT monitoring
*ketoconazole, spironolactone	Steroidogenesis inhibitors	Blocks multiple enzymes in steroid pathway, including adrenal androgens	GI symptoms Hyperkalemia Gynecomastia

*Very rarely used

Table 29. Continence Agents and Overactive Bladder Medications

Drug	Class	Mechanism	Indication	Adverse Effects
oxybutynin	Antispasmodic	Inhibits action of ACh on smooth muscle Decreases frequency of uninhibited detrusor contraction Diminishes initial urge to void	Overactive bladder Urge incontinence + urgency + frequency	Dry mouth Blurred vision Constipation Supraventricular tachycardia
oxybutynin, tolterodine, trospium, solifenacin, darifenacin, fesoterodine	Anticholinergic	Muscarinic receptor antagonist Selective for bladder Increases bladder volume Decreases detrusor pressure	Overactive bladder Urge incontinence + urgency + frequency	As above
mirabegron	β3 agonist	Beta sympathetic receptor blocker in the bladder; relaxes bladder during storage phase	Overactive bladder Urge incontinence + urgency + frequency	Blood pressure should be monitored
imipramine	Tricyclic antidepressant	Sympathomimetic effects: urinary sphincter contraction Anticholinergic effects: detrusor relaxation	Stress and urge incontinence	As above Weight gain Orthostatic hypotension Prolonged PR interval

Note: All anti-cholinergics are equally effective and long-acting formulations are better tolerated. Newer muscarinic M3 receptor specific agents (solifenacin, darifenacin) are equally efficacious as older drugs, however, RCTs based on head-to-head comparison to long acting formulations are lacking.

Peripheral Arterial Disease

Peripheral Vascular Anatomy

- see Figure 1

Acute Arterial Occlusion/Insufficiency

Definition

- acute occlusion/rupture of a peripheral artery, usually without a history of claudication
- urgent management required: treat within 6 h or irreversible ischemia and myonecrosis may result. Exception is in acute-on-chronic occlusion, because the buildup of collaterals allows time to investigate
- tends to be lower extremity > upper extremity; femoropopliteal > aortoiliac
- etiology embolic vs. thrombotic

Etiology and Risk Factors

Table 1. Clinical Categories of Acute Limb Ischemia

Grade	Category	Sensory loss	Motor Deficit	Prognosis
I	Viable	None	None	No immediate threat
IIA	Marginally threatened	None or minimal (toes)	None	Salvageable if promptly treated
IIB	Immediately threatened	More than toes	Mild/moderate	Salvageable if promptly revascularized
III	Irreversible	Profound, anesthetic	Profound, paralysis (rigor)	Major tissue loss Amputation Permanent nerve damage inevitable

Pro-Embolic States

- cardiac arrhythmias (AFib)
- endocarditis
- aneurysms

Hypercoagulable States

- congenital
 - group I (reduced anti-coagulants): anti-thrombin, protein C, protein S
 - group II: factor V Leiden, prothrombin, factor VIII, hyper-homocysteinemia
- acquired (increased coagulants): immobility, cancer, pregnancy/OCP, anti-phospholipid antibody syndrome, inflammatory disorders (e.g. IBD), myeloproliferative disorders (e.g. ET), nephrotic syndrome (acquired deficit in protein C and S), disseminated intravascular coagulation (DIC), heparin-induced thrombocytopenia with thrombosis (HITT)
- for presentation of embolus vs. thrombus (see Table 2)

Investigations

- history and physical exam: depending on degree of ischemia may have to forego investigations and go straight to OR
- ABI: extension of physical exam, easily performed at bedside
- ECG, troponin: rule out recent MI or arrhythmia
- CBC: rule out leukocytosis, thrombocytosis or recent drop in platelets in patients receiving heparin
- PT/INR: patient anticoagulated/sub-therapeutic INR
- Echo: identify wall motion abnormalities, intracardiac thrombus, valvular disease, aortic dissection (type A)
- CT angiogram: underlying atherosclerosis, aneurysm, aortic dissection
- conventional catheter based angiography: can be obtained in OR; prelude to thrombolytics

Figure 1. Peripheral vascular anatomy

Hypercoagulable State

Congenital

- Group I (reduced anticoagulants)
 - Antithrombin
 - Protein C
 - Protein S
- Group II (increased coagulants)
 - Factor V Leiden
 - Prothrombin
 - Factor VIII
 - Hyper-homocysteinemia

Acquired

- Immobility
- Cancer
- Pregnancy/Systemic hormonal contraceptives/HRT
- Antiphospholipid antibody syndrome
- Inflammatory disorders (e.g. IBD)
- Myeloproliferative disorders (e.g. ET)
- Nephrotic syndrome (acquired deficit in Protein C and S)
- DIC
- HITT

Treatment

- immediate heparinization with 5000 IU bolus and continuous infusion to maintain PTT >60 s
- if impaired neurovascular status: emergent revascularization
- if intact neurovascular status: time for workup (including angiogram)
- definitive treatment
 - embolus: embolectomy
 - thrombus: thrombectomy ± bypass graft ± endovascular therapy
 - irreversible ischemia (complete loss of power or sensation, absent venous and arterial dopplers, rigor): primary amputation
- identify and treat underlying cause
- continue heparin post-operative, start warfarin post-operative day 1 x 3 mo depending on underlying etiology

Table 2. Arterial Embolism vs. Thrombosis

Presentation	Embolus	Thrombus
Onset	Acute	Progressive, acute-on-chronic
Loss of function/sensation	Prominent	Less profound (due to underlying collaterals)
Hx of claudication	No	Maybe
Atrophic changes	No	Maybe
Contralateral limb pulses	Classically normal	Decreased or absent

Complications

- compartment syndrome with prolonged ischemia; requires 4-compartment (anterior/lateral/superficial and deep posterior) fasciotomy
- risk of arrhythmia and death with reperfusion injury
- renal failure and multi-organ failure due to toxic metabolites from ischemic muscle

Prognosis

- 12-15% mortality rate
- 5-40% morbidity rate (amputation)

Symptoms of Acute Limb Ischemia

6 Ps – all may not be present

Pain: absent in 20% of cases

Pallor: within a few hours becomes mottled cyanosis

Paresthesia: light touch lost first then sensory modalities

Paralysis/Power loss: most important, heralds impending gangrene

Polar/Poikilothermia (cold)

Pulselessness: not reliable

Differential Diagnosis of Claudication

Vascular

- Atherosclerotic disease
- Vasculitis (e.g. Buerger's disease, Takayasu's arteritis)
- Diabetic neuropathy
- Venous disease (e.g. DVT, varicose veins)
- Popliteal entrapment syndrome (e.g. Baker's cyst, tumor)

Neurologic

- Neurospinal disease (e.g. spinal stenosis)
- Reflex sympathetic dystrophy

MSK

- Osteoarthritis
- Rheumatoid arthritis/connective tissue disease
- Remote trauma

	Vascular claudication	Neurogenic claudication
Palliating Factors	Stop walking	Bending over/sitting
Provoking Factors	Walking uphill	Walking downhill
Pulses/ABIs	Reduced	Normal
Pain on Bicycling	Present	Absent
Motor Weakness after Walking	Absent	Present
Skin Changes	Present	Absent

Chronic Arterial Occlusion/Insufficiency

Etiology

- predominantly due to atherosclerosis; primarily lower extremities

Risk Factors

- major: smoking, DM
- minor: HTN, hyperlipidemia, family history, obesity, sedentary lifestyle, PMHx or FMHx CAD/CVD

Clinical Features

- claudication
 1. pain with exertion: usually in calves or any exercising muscle group
 2. relieved by short rest: 2-5 min, and no postural changes necessary
 3. reproducible: same distance to elicit pain, same location of pain, same amount of rest to relieve pain
- critical limb ischemia (CLI)
 1. includes rest pain, night pain, tissue loss (ulceration or gangrene)
 2. pain most commonly over the forefoot, waking person from sleep, and often relieved by hanging foot off bed
 3. ankle pressure <40 mmHg, toe pressure <30 mmHg, ABI <0.40
- pulses may be absent at some locations, bruits may be present
- signs of poor perfusion: hair loss, hypertrophic nails, atrophic muscle, skin ulcerations and infections, slow capillary refill, prolonged pallor with elevation and rubor on dependency, venous troughing (collapse of superficial veins of foot)
- other manifestations of atherosclerosis: CVD, CAD, impotence, splanchnic ischemia

Investigations

- non-invasive
 - routine blood work, fasting metabolic profile
 - ABI: take highest brachial and highest ankle (dorsalis pedis artery or posterior tibial artery) pressures for each side generally
 - ♦ ABI <0.90 abnormal, rest pain appears at <0.30 (see Table 3)

- CTA and MRA: excellent for large arteries (aorta, iliac, femoral, popliteal), may have difficulty with tibial arteries (especially in the presence of disease). Both require IV injection of nephrotoxic contrast (iodinated contrast for CT, gadolinium for MR)
- invasive
 - arteriography: superior resolution to CTA/MRA, better for tibial arteries, can be done intraoperatively

Table 3. Ankle-Brachial Indices

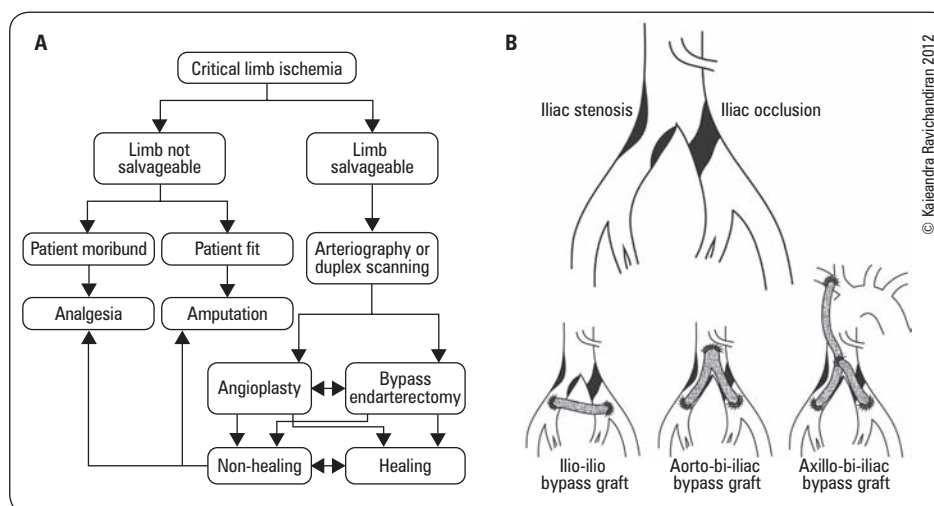

ABI Recording	Degree of Ischemia
>1.20	Suspect wall calcification (most common in diabetics)
>0.95	Normal/no ischemia
0.50-0.80	Claudication range
<0.40	Possible critical ischemia

Treatment

- conservative
 - risk factor modification (smoking cessation, HbA1c control, treatment of HTN (ACEI), hyperlipidemia (statin), antiplatelet therapy (ECASA))
 - exercise program (30 min 3 times per wk): improves collateral circulation, oxygen extraction at the muscle level
 - foot care (especially in DM): keep wounds clean/dry, avoid trauma and pressure on wounds
- pharmacotherapy
 - antiplatelet agents (e.g. ECASA, clopidogrel)
 - cilostazol (cAMP-phosphodiesterase inhibitor with antiplatelet and vasodilatory effects): improves walking distance for some patients with claudication
- surgical/endovascular
 - indications: severe lifestyle impairment, vocational impairment, critical ischemia
 - surgical options
 - ♦ endovascular (stenting/angioplasty)
 - ♦ endarterectomy: removal of plaque and repair with patch (usually distal aorta or common/profunda femoral)
 - ♦ bypass graft sites: aortofemoral, axillofemoral, femoropopliteal, distal arterial
 - graft choices: vein graft (reversed or *in situ*), synthetic (polytetrafluoroethylene graft (e.g. Gore-Tex®) or Dacron®)
 - ♦ chemical sympathectomy: sympathetic plexus destroyed with EtOH injection into nerve plexus, may stimulate vasodilation (rarely effective)
 - ♦ amputation: if not suitable for revascularization, persistent serious infections/gangrene

Prognosis

- claudication: conservative therapy: 60-80% improve, 20-30% stay the same, 5-10% deteriorate, 5% will require intervention within 5 yr, <4% will require amputation
- for patients with CLI (rest pain, night pain, ulceration or gangrene): high risk of limb loss (which carries 25% risk of death at 1 yr)

**Figure 2. Treatment options for CLI**

(A) Algorithm for the treatment of CLI

(B) Surgical treatment options for the treatment of aortoiliac disease

Aortic Disease

- see 2010 ACCF/AHA/AATS/ACR/ASA/SCA/SCAI/SIR/STS/SVM Guidelines for the Diagnosis and Management of Patients With Thoracic Aortic Disease. *J Am Coll Cardiol* 2010;55(14):e27–e129 for details

Aortic Anatomy

- see Figure 3

Aortic Dissection

Definition

- tear in aortic intima allowing blood to dissect into the media
- Stanford classification: Type A (involve the ascending aorta) vs. Type B (do not)
- DeBakey Classification: Type I (involves the ascending aorta, aortic arch, and descending aorta), Type II (confined to the ascending aorta) and Type III (confined to the descending aorta distal to the left subclavian artery)
- acute <2 wk (initial mortality 1% per hour for type A dissections)
- chronic >2 wk (mortality levels up to 75-80%)

Etiology

- most common: HTN → degenerative/cystic changes → damage to aortic media
- other: connective tissue disease (e.g. Marfan's, Ehlers-Danlos), cystic medial necrosis, atherosclerosis, congenital conditions (e.g. coarctation of aorta, bicuspid aortic valves, patent ductus arteriosus), infection (e.g. syphilis), trauma, arteritis (e.g. Takayasu's)

Epidemiology

- incidence of 5.2 in 1,000,000
- M:F = 3.2:1
- small increased incidence in African-Americans (related to higher incidence of HTN)
- lowest incidence in Asians
- peak incidence 50-65 yr old; 20-40 yr old with connective tissue diseases

Clinical Features

- sudden onset tearing chest pain that radiates to back with:
 - HTN (75-85% of patients)
 - asymmetric BPs and pulses between arms (>30 mmHg difference indicates poor prognosis)
 - ischemic syndromes due to occlusion of aortic branches: coronary (MI), carotids (ischemic stroke, Horner's syndrome), splanchnic (mesenteric ischemia), renal (AKI), peripheral (ischemic leg), intercostal vessels (spinal cord ischemia)
 - "unseating" of aortic valve cusps (new diastolic murmur in 20-30%) in Type A dissection
 - rupture into pleura (dyspnea, hemothysis) or peritoneum (hypotension, shock) or pericardium (cardiac tamponade)
 - syncope

Investigations

- CXR
 - pleural cap (pleural effusion in lung apices)
 - widened mediastinum
 - left pleural effusion with extravasation of blood
- TEE: can visualize aortic valve and thoracic aorta but not abdominal aorta
- ECG: LVH ± ischemic changes, pericarditis, heart block
- CT (gold standard), aortography, MRA: 100% sensitive and specific
- blood work: lactate (rule out ischemic gut), amylase (rule out pancreatitis), troponin (rule out MI)

Treatment

- pharmacologic
 - β-blocker to lower BP and decrease cardiac contractility
 - use nondihydropyridine CCB if there is a clear contraindication to β-blockers
 - target sBP of 110 mmHg and HR <60 bpm
 - ACEI and/or other vasodilators if insufficient BP or HR control
- surgical
 - urgent surgical consult if thoracic aortic dissection diagnosed or highly suspected
 - Type A to cardiac surgery, Type B to vascular surgery

Figure 3. Aortic anatomy

- resection of segment with intimal tear
- reconstitution of flow through true lumen
- replacement of the affected aorta with prosthetic graft
- correction of any predisposing factors
- post-operative complications: renal failure, intestinal ischemia, stroke, paraplegia, persistent leg ischemia, death
- 2/3 of patients die of operative or post-operative complications
- Type A: requires emergent surgery with cardiopulmonary bypass
 - ♦ may require
 - hypothermic circulation for transverse arch dissections
 - resuspension of aortic valve
 - aortic valve replacement
 - coronary re-implantation for aortic root involvement
 - ♦ initial mortality rate without surgery is 3% per h for first 24 h, 30% 1 wk, 80% 2 wk
- Type B: managed medically in absence of spinal/mesenteric/limb malperfusion syndrome
 - ♦ <10-20% require urgent operation for complications
 - ♦ treatment can be surgical or endovascular
 - ♦ require follow-up over time to monitor for dilation
 - ♦ role for early endovascular intervention controversial (2013 INSTEAD trial)
- with treatment, 60% 5 yr survival, 40% 10 yr survival

Does This Patient have an Acute Thoracic Aortic Dissection

JAMA 2002;287:2262-2272

	LR + (95% CI)	LR - (95% CI)
History		
HTN	1.6 (1.2-2.0)	0.5 (0.3-0.7)
Sudden onset of pain*	1.6 (1.0-2.4)	0.3 (0.2-0.5)

Investigation		
Enlarged aorta or wide mediastinum*	2.0 (1.4-3.1)	0.3 (0.2-0.4)

*Combination of findings increases LR+: if no findings LR+ 0.1, if one LR+ 0.5, if two LR+ 5.3, if three LR+ 6.6

Aortic Aneurysm

Definition of Aneurysm

- localized dilatation of an artery having a diameter at least 1.5x that of the expected normal diameter
 - true aneurysm: involving all vessel wall layers (intima, media, adventitia)
 - false aneurysm (also known as pseudo-aneurysm): disruption of the aortic wall or the anastomotic site between vessel and graft with containment of blood by a fibrous capsule made of surrounding tissue
- aneurysms can rupture, thrombose, embolize, erode, and fistulize

Classification

- thoracic aortic aneurysm (TAA): ascending, transverse arch, descending
- thoracoabdominal
- abdominal aortic aneurysm (AAA): 90-98% are *infrarenal*
 - suprarenal: involves one or more visceral arteries, but does not involve the chest
 - pararenal: renal arteries arise from aneurysmal aorta, but the SMA origin is not aneurysmal
 - juxtarenal: the renal arteries originate from normal aorta, but are immediately adjacent to aneurysmal aorta (there is no nonaneurysmal aorta distal to the origin of the renal arteries)
 - infrarenal: The aneurysm originages distal to the renal arteries (there is nonaneurysmal aorta distal to the origins of the renal arteries)

Etiology

- degenerative (atherosclerotic)
- traumatic
- mycotic (*Salmonella*, *Staphylococcus*, usually suprarenal aneurysms)
- connective tissue disorder (Marfan syndrome, Ehlers-Danlos syndrome)
- vasculitis
- infectious (syphilis, fungal)
- ascending thoracic aneurysms are associated with bicuspid aortic valve
- risk factors: smoking, HTN, age >70, family history

Epidemiology

- incidence 4.7 to 31.9 per 100,000 for AAA and 5.9 per 100,000 for TAA
- high risk groups
 - ≥65 yr
 - M:F = 3.8:1
 - PVD, CAD, CVD
 - family history of AAA

Figure 4. Classification of aortic dissection (black arrow indicates where the dissection begins)

ACC/AHA 2005 Guidelines define an AAA when the minimum AP diameter of abdominal aorta ≥3.0 cm

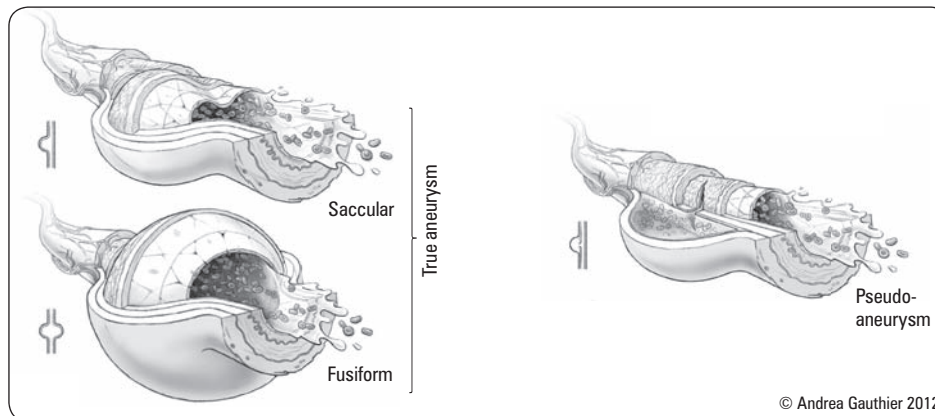

Figure 5. Classification of aneurysms

Clinical Features

- associated diseases: HTN, PVD, CAD, COPD, renal insufficiency
- most commonly in the abdominal aorta (50% abdominal aorta, 40% thoracic aorta, 10% ascending aorta)
- common presentation: due to acute expansion or disruption of wall
 - syncope
 - pain (chest, abdominal, flank, back)
 - hypotension
 - palpable pulsatile mass above the umbilicus, pulsatile abdominal mass in two directions (expandable)
 - airway or esophageal obstruction, hoarseness (left recurrent laryngeal nerve paralysis), hemoptysis, or hematemesis (indicates thoracic or thoracoabdominal aortic aneurysm)
 - distal pulses may be intact
- 75% asymptomatic (discovered incidentally)
- uncommon presentation
 - ureteric obstruction and hydronephrosis (often with inflammatory aortic aneurysm)
 - gastrointestinal bleed (duodenal mucosal hemorrhage, aortoduodenal fistula)
 - ♦ aortocaval fistula
 - distal embolization (blue toe syndrome)

Investigations

- blood work: CBC, electrolytes, urea, creatinine, PTT, INR, type and cross
- abdominal U/S (100% sensitive, up to ± 0.6 cm accuracy in size determination)
- CT (accurate visualization, size determination)
- MRI (accurate visualization, limited access)
- aortogram (only for EVAR)
- Doppler/duplex (rule out vascular tree aneurysms elsewhere, e.g. popliteal)

Treatment

- conservative
 - cardiovascular risk factor reduction: smoking cessation; control of HTN, DM, and hyperlipidemia
 - regular exercise
 - watchful waiting, U/S every 6 mo to 3 yr depending on size and location
- surgical
 - when risk of rupture greater than or equal to risk of surgery (>5.5 cm)
 - risk of rupture depends on
 - ♦ size
 - ♦ family history of rupture
 - ♦ rate of enlargement (if >0.4 cm/yr): >1 cm diameter expansion per year defines "rapid expander"
 - ♦ symptoms, comorbidities (HTN, COPD, dissection), smoking
 - elective AAA repair mortality 2-5% for open repair (1-2% for EVAR); elective TAA repair mortality $<10\%$ (highest with proximal aortic and thoracoabdominal repairs)
 - consider revascularization for patients with symptomatic or 3-vessel CAD before elective repair of aneurysm
 - indications
 - ♦ general: ruptured, symptomatic, mycotic, associated with acute Type A dissection or complicated Type B dissection or when risk of rupture is greater than risk of surgery (size >5.5 cm or >2 x normal lumen size)

Classic Triad of Ruptured AAA

Congenital

- Hypotension/collapse
- Back/abdominal pain
- Palpable, pulsatile abdominal mass

CCS PAD Guidelines 2006

Recommend AAA Screening Among:

- Men aged 65-74
- Women aged 65 with cardiovascular disease and positive family history of AAA
- Men aged 50 and above with a positive family history

CCS PAD Guidelines 2006 recommend AAA Follow-Up Based on Initial Size

Size	Guideline
<3.0 cm	Repeat ultrasound follow-up in 3-5 yr
3.1-3.4 cm	Repeat ultrasound in 3 yr
3.5-3.9 cm	Repeat ultrasound in 2 yr
4.0-4.5 cm	Repeat ultrasound in 1 yr
≥ 4.5 cm	Referral to vascular surgeon and repeat ultrasound every 6 mo
If >1 cm growth in one yr	Referral to vascular surgeon for consideration of repair

Management of Ruptured AAA

- ABCs
- No imaging (hemodynamically unstable)
- Straight to OR (confirm diagnosis by laparotomy)
- Crossmatch 10 units packed RBCs

Risk of AAA Rupture

Size (diameter)	1 yr Rupture Risk
<4 cm	0%
4-4.9 cm	1%
5-5.9 cm	5-10%
6-6.9 cm	10-20%
7-7.9 cm	20-40%

Endoleak Types

Definition: persistent blood flow into the aneurysm sac

Type I: ineffective seal at ends of graft

Type II: backflow from collateral vessels

Type III: ineffective seal of graft joints or rupture of graft fabric

Type IV: flow through pores of graft fabric

Type V: endotension, with continued expansion of the aneurysm without apparent flow into the sac

- ♦ ascending thoracic aortic aneurysms
 - symptomatic, enlarging, diameter >6 cm or >2x normal lumen size, >4.5 cm and aortic regurgitation (annuloaortic ectasia); ≥4.5-5 cm in Marfan syndrome
- contraindications: life expectancy <1 yr, terminal disease (e.g. cancer), significant comorbidities (e.g. recent MI, unstable angina), decreased mental acuity, advanced age
- surgical options
 - ♦ open surgery (laparotomy or retroperitoneal) with graft replacement
 - possible complications
 - early: renal failure, spinal cord injury (paraparesis or paraplegia), impotence, arterial thrombosis, anastomotic rupture or bleeding, peripheral emboli
 - late: graft infection/thrombosis, aortoenteric fistula, anastomotic (pseudo) aneurysm
 - ♦ endovascular aneurysm repair (EVAR)
 - newer procedure; high success rates in patients with suitable anatomy and experienced centers
 - advantages: preferred to open surgery in ruptured AAA for patients with suitable anatomy, decreased morbidity and mortality, procedure time, need for transfusion, ICU admissions, length of hospitalization, and recovery time
 - disadvantages: endoleak rates as high as 20-30%, device failure increasing as longer follow-up periods are achieved, re-intervention rates 10-30%, cost-effectiveness is an issue (devices are very expensive), radiation exposure
 - complications
 - early: immediate conversion to open repair (<1%), groin hematoma, arterial thrombosis, iliac artery rupture, and thromboemboli
 - late: endoleak, severe graft kinking, migration, thrombosis, rupture of aneurysm

Peripheral Venous Disease

Deep Venous Thromboembolism

- see [Hematology](#), H33

Superficial Venous Thrombosis

Definition

- erythema, induration, and tenderness along the superficial vein; usually spontaneous but can follow venous cannulation

Etiology

- infectious: suppurative phlebitis (complication of IV cannulation; associated with fever/chills)
- trauma
- inflammatory: varicose veins, migratory superficial thrombophlebitis, Buerger's disease, SLE
- hematologic: polycythemia, thrombocytosis
- neoplastic: occult malignancy (especially pancreatic)
- idiopathic

Clinical Features

- most common in greater saphenous vein and its tributaries
- pain and cord-like swelling along course of involved vein
- areas of induration, erythema, and tenderness correspond to dilated and often thrombosed superficial veins
- complications
 - simultaneous DVT (up to 20% of cases), PE (rare unless DVT)
 - recurrent superficial thrombophlebitis

Investigations

- non-invasive tests (e.g. Doppler) to exclude associated DVT

Treatment

- conservative
 - moist heat, compression bandages, mild analgesic, anti-inflammatory and anti-platelet (e.g. ASA), LMWH, ambulation
- surgical excision of involved vein
 - indication: failure of conservative measures (symptoms that persist over 2 wk)
 - suppurative thrombophlebitis: broad-spectrum IV antibiotics and excision

Type I

Type II

Type III

Type IV

Type V

© Marissa Webber 2015

Figure 6. EVAR endoleak

Migratory superficial thrombophlebitis is often a sign of underlying malignancy ("Trousseau's disease")

Varicose Veins

Definition

- distention of tortuous superficial veins resulting from incompetent valves in the deep, superficial, or perforator systems
- distribution: greater or short saphenous veins and tributaries

Etiology

- primary varicosities: venous valve incompetence or obstruction
 - contributing factors: increasing age, systemic hormonal contraceptive use, occupations requiring long hours of standing, pregnancy, obesity
- secondary varicosities: DVT, malignant pelvic tumors with venous compression, congenital anomalies, arteriovenous fistulae

Epidemiology

- primary varicose veins are the most common form of venous disorder of lower extremity
- 10-20% of population

Clinical Features (Not Correlated with Varicosity Size)

- diffuse aching, fullness/tightness, nocturnal cramping
- aggravated by prolonged standing (end of day), premenstrual
- visible long, dilated and tortuous superficial veins along thigh and leg
- ulceration, hyperpigmentation, and induration (secondary varicosities)
- Brodie-Trendelenburg test (valvular competence test)
 - with patient supine, raise leg and compress saphenous vein at thigh, have patient stand – if veins fill quickly from top down then incompetent valves; use multiple tourniquets to localize incompetent veins

Complications

- recurrent superficial thrombophlebitis
- hemorrhage: external or subcutaneous
- ulceration, eczema, lipodermatosclerosis, and hyperpigmentation

Treatment

- largely a cosmetic problem
- conservative: elevation of leg and/or elastic compression stockings
- surgical: high ligation and stripping of the long saphenous vein and its tributaries, ultrasound-guided foam sclerotherapy, endovenous laser therapy
- indications for surgery: symptomatic varix (pain, bleeding, recurrent thrombophlebitis), tissue changes (hyperpigmentation, ulceration), failure of conservative treatment, cosmetics

Prognosis

- benign course with predictable complications
- almost 100% symptomatic relief with treatment if varicosities are primary
- good cosmetic results with treatment
- significant post-operative recurrence, especially with sclerosing agent injection

Chronic Venous Insufficiency

Definition

- venous insufficiency and skin damage

Etiology

- calf muscle pump dysfunction and valvular incompetence (valvular reflux) due to phlebitis, varicosities, or DVT
- venous obstruction

Clinical Features

- pain (most common), ankle and calf edema – relieved by foot elevation
- pruritus, brownish hyperpigmentation (hemosiderin deposits)
- stasis dermatitis, subcutaneous fibrosis if chronic (lipodermatosclerosis)
- ulceration: shallow, above medial malleolus, weeping (wet), painless, irregular outline
- signs of DVT/varicose veins/thrombophlebitis

Investigations

- Doppler U/S (most commonly used)
- venography (gold standard), or ambulatory venous pressure measurement (not often used)

Treatment

- conservative
 - elastic compression stockings, ambulation, periodic rest-elevation, avoid prolonged standing
 - ulcers: multilayer compression bandage, antibiotics PRN
- endovenous: laser or radiofrequency ablation, or foam sclerotherapy
- surgical
 - if conservative measures fail, or if recurrent/large ulcers
 - surgical ligation of perforators in region of ulcer (GSV/LSV ligation and stripping)

Carotid Stenosis

Definition

- narrowing of the internal carotid artery lumen due to atherosclerotic plaque formation, usually near common carotid bifurcation into internal and external carotids

Risk Factors

- for atherosclerosis: HTN, smoking, DM, CVD or CAD, dyslipidemia

Clinical Features

- may be asymptomatic
- symptomatic stenosis may present as TIA, RIND, or stroke
- retinal insufficiency or infarct permanently or temporarily (ipsilateral amaurosis fugax), (see [Ophthalmology, OP37](#))
- MCA contralateral occlusive symptoms

Investigations

- CBC, PTT/INR (hypercoagulable states)
- fundoscopy: cholesterol emboli in retinal vessels (Hollenhorst plaques)
- auscultation over carotid bifurcation for bruits (do not correlate with degree of stenosis)
- carotid duplex: determines severity of disease (mild/moderate/severe stenosis or occlusion)
- angiogram: "gold standard" but invasive and 1/200 risk of stroke (not for screening)
- MRA: safer than angiogram, may overestimate stenosis
- CTA

Treatment

- control of HTN, lipids, diabetes
- antiplatelet agents (ASA ± dipyridamole, clopidogrel) ~25% relative risk reduction
- carotid endarterectomy (generally if symptomatic and >70% stenosis)
- endovascular angioplasty ± stenting

Prognosis

Table 4. Symptomatic Carotid Stenosis: North American Symptomatic Carotid Endarterectomy Trial (NASCET)

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
70-99%	26% over 2 yr	9% over 2 yr
50-69%	22% over 5 yr	16% over 5 yr
<50%	Surgery has no benefit with 5% complication rate	

Table 5. Asymptomatic Carotid Stenosis: Asymptomatic Carotid Atherosclerosis Study (ACAS) and Asymptomatic Carotid Surgery Trial (ACST)

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
70-99%	26% over 2 yr	9% over 2 yr
60-99%	11% over 5 yr	5.1% over 5 yr (ACAS)
50-69%	11.8% over 5 yr	6.4% over 5 yr (ACST)

Prevention of Disabling and Fatal Strokes by Successful Carotid Endarterectomy in Patients Without Recent Neurological Symptoms: Randomized Controlled Trial

Lancet 2004;363:1491-1502

Study: Asymptomatic Carotid Surgery Trial (ACST), a RCT with follow-up at 5 yr.

Patients: 3,120 asymptomatic patients with significant carotid artery stenosis were randomized equally between immediate carotid endarterectomy (CEA) and indefinite deferral of CEA and were followed for up to 5 yr (mean 3.4 yr).

Main Outcome: Any stroke (including fatal or disabling).

Conclusions: In asymptomatic patients with significant carotid artery stenosis, immediate CEA reduced the net 5 yr stroke risk from about 12% to about 6%. Half of this 5 yr benefit involved disabling or fatal strokes.

Lymphedema

Definition

- obstruction of lymphatic drainage resulting in edema with high protein content

Etiology

- primary:
 - Milroy's syndrome: congenital hereditary lymphedema
 - lymphedema praecox (75% of cases): starts in adolescence
 - lymphedema tarda: starts >35 yr
- secondary:
 - infection: filariasis (#1 cause worldwide), post-operative
 - malignant infiltration: axillary, groin or intrapelvic
 - radiation/surgery (axillary, groin lymph node removal): #1 cause in North America

Clinical Features

- classically non-pitting edema
- impaired limb mobility, discomfort/pain, psychological distress

Treatment

- avoid limb injury (can precipitate or worsen lymphedema)
- skin hygiene
 - daily skin care with moisturizers
 - topical treatment of fungal infection; systemic treatment of bacterial infection
- external support
 - intensive: compression bandages
 - maintenance: lymphedema sleeve
- exercise
 - gentle daily exercise of affected limb, gradually increasing ROM
 - must wear a compression sleeve/bandages when doing exercises
- massage and manual lymph drainage therapy

Prognosis

- if left untreated becomes resistant to treatment due to subcutaneous fibrosis
- cellulitis causes rapid increase in swelling; can lead to sepsis and death

ESSENTIAL MED NOTES 2015

COMPLETE, CONCISE, AND UP-TO-DATE INFORMATION

Essential Med Notes is a premier study resource for the USMLE Step II and MCCQE medical licensing exams. This edition provides concise and comprehensive information on the objectives covered by these exams, including the most recent best practice guidelines and up-to-date trials for clinical practice. Essential Med Notes is an excellent resource for clinical rotations and this text contains 30 subject-specific chapters:

Anesthesia and Perioperative Medicine

Cardiology and Cardiac Surgery

Clinical Pharmacology

Dermatology

Emergency Medicine

Endocrinology

Ethical, Legal, and Organizational Medicine

Family Medicine

Gastroenterology

General Surgery

Geriatric Medicine

Gynecology

Hematology

Infectious Diseases

Medical Imaging

Nephrology

Neurology

Neurosurgery

Obstetrics

Ophthalmology

Orthopedics

Otolaryngology

Pediatrics

Plastic Surgery

Population Health and Epidemiology

Psychiatry

Respirology

Rheumatology

Urology

Vascular Surgery
